NUMBER 1.

The Engagement Ring.

A little figure was rubbing its eyes as it struggled upright upon a seat in a tiny summer house in a tiny garden in the suburbs of Maidstone. It was spring weather, and sleep overcomes one so in the languid days of May. At least, it was certain slumber had overtaken Rose Maple, and she had slept through the whole time she should have been perfecting herself in her French lesson. For how was she ever to reside in Paris without knowing any more than to say a few sets of phrases out of her exercise book?

Rose's French grammar had fallen to the ground during her nap, and she stooped and picked it up with a long sigh of sleepiness. Then, as her eyes fell on the title page, where, in a bold text was inscribed her name, in connection with the words, "From Roland," a blush spread over her face, and her slumber was completely dissipated by a rush of happy thoughts. Turning the leaves of the book, to find the place where she was studying, she looked casually at the fourth finger of her left hand, thinking of the engagement ring wherewith it was bound; but the finger was empty and

51
105
CA

forlorn—no ruby sparkled there. She uttered a cry of alarm. She remembered seeing the ring almost the last thing before she fell asleep.

She sprang to her feet, and looked about her in a bewildered manner. Even the most strong-minded of us are superstitious about some things, and Rose was so concerning the ring which was the sign of her betrothal to Roland Wallace. The two lovers had consecrated the

grass and leaf that grew under the seats, she looked on the seats themselves, but she found nothing.

By this time the blond face was pale, having lost its blushes of memory and surprise, and the clear hazel eyes were clouded.

She stood for a moment reflectively, at the door, trying to persuade herself that she was very silly to feel all at once so despondent. It was but a ring after all.

BRO. M. W. CADLE, ASSISTANT G. C. E.

Brother Cadle is a member of Div. 179, Sedalia, Mo. He worked his way up from a wiper, was promoted to engineer in 1879 on what was then the Illinois Midland, now Terre Haute & Indianapolis and joined Div. 155. He went to the Missouri Pacific in 1884 and transferred his membership to Div. 178. He was a part of the G. C. of A. on that road from 1887 to 1892, when he was elected Chairman, holding the position until his election of Assistant G. C. E. at the Los Angeles Convention, May 31, 1904.

trinket by special promises when he had put it on her finger.

Trying to console herself with hopes of finding it, she scrambled over every inch of the little place, uplifting every blade of

grass and leaf that grew under the seats, which it was a token, it had been Roland's mother's ring—it had been the betrothal sign for two generations in his family—and now it was lost.

"Because my hand was unworthy," thought Rose, with tearful eyes.

A voice from the house called, impatiently:

"Rose, Rose! your French master has come."

With a mighty effort, Rose conquered her tears, took her book and went to the house. In the hall she met her cousin Rachel, who looked at her with a surprised glance, and caught her by the

with the most disastrous affliction out there in the summer house. Has some irregular verb completely subdued you? Here, let me take the grammar a minute; I can set you right directly. What word is it?"

Rose retained the grammar with rather too decided a movement. She was indignant that everyone should persist in thinking her so childish. She would have passed by without replying, but Rachel

BRO. E. W. HURLEY, ASSISTANT G. C. E.

Brother Hurley is a member of Div. 439, Boston, Mass. He was in the service of the N. Y., N. H. & H. System for some twenty-five years, associated with committee work most of that time, was for many years Chairman of the G. C. of A. on that system, and held that position when elected Assistant G. C. E. at the Los Angeles Convention, on May 31, 1904.

sleeve, as she was going by without speaking.

"What in the world is the matter?" asked Rachel, in a soft voice, examining with comprehensive glance the face of Rose. "You look as though you had met

stood still before her. Then said, angrily:

"It has nothing to do with verbs, and I don't want to discuss the subject now. Let me go to monsieur."

"Oh, I beg your pardon," said Rachel,

immediately stepping aside, and speaking with the utmost good humor. "I only wanted to assist you if possible."

Rose went through the next room, thinking it was always so—cousin Rachel always kept her temper, always polite, and she consequently very often appeared at immense advantage, and it was usually before someone whose opinion she valued. What made Rachel, while she was apparently so kind and obliging always, so

not yet learned the fluent use of the words "antagonistic" and "uncongenial," or she would many times have consoled herself with them.

When she entered the library, where she usually took her lessons, a gentleman rose and came forward, took her hand, pressed it slightly, and looked with undisguised admiration at his pupil, who was not at all conscious of his manner at that moment, though she experienced a

BRO. H. E. WILLS, ASSISTANT G. C. E.

Brother Wills is a member of Div. 125, Clinton, Ia., was in the service of the C. & N. W. for a long term of years, being promoted to the position of engineer in 1868, and was for many years Chairman of the G. C. of A. for that system, and Chairman of the Legislative Board of Iowa. He was elected Assistant G. C. E. at the Los Angeles Convention on June 3, 1904.

often irritate her beyond endurance? It was very strange. According to all appearances, Rose ought to have loved her cousin very much, and been thankful it had happened so that she was an established inmate of the family. Rose had

diversion from her troubling thoughts. Monsieur looked as all Frenchmen ought to look—and a vast number of those who find their way to this country fulfill their duty, and present to us just such a face and figure as did Rose's teacher. He was

below medium height, slender, swarthy, with heavy dark hair and eyebrows, small eyes, beard a la Napoleon III., mustache waxed elaborately. But all Frenchmen do not possess such insinuating address, such politeness that is devotion itself, such tact, such gentle modulations of voice, all combined with an apparent unobtrusiveness, and then he was in reality a Parisian, and talked good French with a good accent.

A very fitting man, you will say, to be Rose Maple's teacher, while her lover was away. He was, in truth, a perfect jewel for a teacher; if a pupil did not learn rapidly and correctly, it was no fault of his.

Rachel North had once been a pupil of his, and it was she who procured his services in behalf of her cousin; for Rose, as the future wife of Roland Wallace, would be obliged to reside for several years, at least, in Paris, and it behooved her to know something of the language.

"Mademoiselle is not in the mood for her lessons today," he said, as she sat down opposite him, in her little low rocking chair; for she was accustomed to rock furiously, when trying to recall a rebellious conjugation.

"No; I am not in the mood," she said, sadly, his well-modulated tones rather soothing to her. "But we will begin, if you please, though I am sure I am more terribly ignorant today than usual even."

"Because something troubles you," he said, apparently in no humor at all to begin his task.

It was noticeable, if anyone had thought of it, that it required a remarkably long time for his lessons at that house—much longer than it took for the three romping boys who were blessed with his services next door. Monsieur was very kind and sympathizing, and Rose's heart was heavy.

"Yes, I have lost something very valuable—to me—and it's very mysterious about it. I cannot understand."

Monsieur, thus addressed, instantly looked at her left hand, and exclaimed, in a low voice:

"It is your ring! It is gone! That is, indeed, a loss!"

And monsieur, urged by his profound pity, took the hand in his, held it a moment, contemplating it with a kind of deprecating admiration; and then suddenly he raised it to his lips, and kissed it fervently.

Rose drew it away with a start and blushed, and monsieur exclaimed, in a half whisper:

"Oh, pardon me! Pardon me! You must have pity on a man tempted by such a beautiful hand, it is your fault,

mademoiselle; you should not expect men to be indifferent."

Then he turned hastily, and opened his book, not without a covert glance at the girl, to see how she took his boldness. But, as he rightly conjectured, that boldness was so strongly veiled—so pretended as an irresistible impulse, for which he was not accountable—that Rose thought it would be foolish in her to be angry. So, with burning cheeks, she also opened her book, and began hastily and blunderingly to translate. He let her go on, gently correcting the most flagrant mistakes; and when she had done, he read it to her in such a way, that she realized, for the first time, that it was an impassioned love passage from "Corinne," and she blushed still more as she listened.

When monsieur was going down the garden walk, after his instruction was over, it happened that Rachel was standing beneath the lilac bush at the gate; and standing so that she could not be seen from the house.

"How do you get on?" she asked, as monsieur paused by her side.

"Charmingly. I have kissed her hand with fervor today, and have gazed at her with my soul in my eyes, as the novels say," was the answer.

"Pshaw! Your soul!" exclaimed Rachel, with a laugh. "That sight must have touched her heart. Shall you win the little simpleton's affection?"

"That remains to be seen," he replied, "but the sport bids fair to be really enchanting. She is a divine child!"

"Oh, yes! So all the gentlemen think—including Roland Wallace. But he wouldn't fancy hearing you speak of her in that way."

Rachel ceased speaking, and drew something from her pocket, holding it out to her companion, and saying: "Can you make good use of that?"

"It is the lost ring!" he exclaimed, taking it in his hands, and smiling as he read the words engraven within it, "Faithful forever."

"So you found it? Oh, I see—the plot thickens. That Wallace is a fortunate man in that he is beloved by two such women. What will you have me do now? I am half resolved today to take the blonde child for my wife when her lover is alienated."

"The blonde child may be your wife, for all that I care," said Rachel's softly bitter voice; "but I predict that you'll find a vein of real character beneath her pretty ways. She isn't shallow, though she is childish. Win her if you can. Wallace comes back in a month. Keep the ring; let him know you have it as a gift from her before he sees her on his return, then the marriage may

not be so near. Both are proud enough, and you have wit enough to make this small conspiracy a success."

"And then?" asked monsieur with his black eyes on her face.

"Then Wallace may return to the fancy

he once had for Rachel North," was the low answer, given with a good deal of malice in her tones.

"Thanks," said monsieur. "I now thoroughly understand our game, I am playing for a wife—unless I change my mind. Adieu, my friend."

And monsieur having bowed over his companion's hand, walked down the road; while Rachel sauntered slowly back to the house, and found that the whole household were uniting in a grand search for Rose's lost ring, and she kindly joined in the hunt.

Monsieur managed so dextrously, that even in the next three weeks people surmised that it was just possible that Rose Maple was being consoled for the absence of her lover. Rachel, whose scheming brain had resolved upon success, made no scruple to prevent the one letter that Rose sent to Roland, before he started for home, from ever reaching its destination. She sincerely wished monsieur might have the first telling of the ring story to Roland.

Notwithstanding appearances, monsieur knew inwardly that he had made no impression on the heart of Rose; but she liked to be with him—he amused and interested her, and she was thankful for anything that should help get away the time that still remained before Roland would come.

Monsieur could very well bide his time; he felt sure she would turn to him when the crisis came, and Rachel knew the proud temper of Roland too well to expect he would seek an explanation after having listened to the story awaiting him.

Monsieur had business in Dover the day Roland was to arrive; and it was he whom Wallace first saw when he sprang upon the wharf. He had only seen the Frenchman for half an hour, once, in company with Rachel; but he knew he was Rose's teacher, and he greeted him cordially, and accepted his invitation to dine with him.

When monsieur removed his gloves, and poured out a glass of wine to celebrate the happy return, Roland's eye was caught by what seemed a familiar spark on monsieur's hand, but thinking himself mistaken, he drank his wine, then looked again at the well-shaped fingers.

Yes, there it was, or the facsimile of the ring which had been one of the first things his baby eyes had seen. He stared hard at it, neglecting his dinner. Meanwhile monsieur was gaily chatting, but Roland heard not a word of what he was saying. At last he exclaimed excitedly: "I hope you will pardon me, but I must ask where you procured that ring? It is peculiar. I could have sworn there were not two rings of the same pattern in the world."

Monsieur's manner became instantly one of delicate confusion, and Roland's heart grew more and more fiery, his face flushed, his eyes burned, it could not be possible. The glowing hopes with which he had left the steamer were crushed back upon his soul.

"The ring was given me by one very dear to me," said the Frenchman, in a carefully modulated tone. "I have nothing to say on the subject, save that if a lady, young and inexperienced, finds that she has given her troth to a man whom she discovers that she does not really love, it remains for that man, if he is a gentleman, to release her honorably, and stifle his pain as best he may."

It is impossible to describe the sweetness of monsieur's tone—the pity, the deprecation, and yet the firmness of it.

Roland listened as to the voice of doom. Rose had been mistaken; this Frenchman had been her companion during many of the days of his absence, and she had discovered that she had given her troth to the wrong man! "It remains for that man to stifle his pain as best he may." These words rang dully over and over in his brain, which seemed suddenly deadened.

He sat silently for many moments, leaning his head on his hand trying to recall his mind to him, so that he could think contentedly. At last he looked up and said, "Allow me to take the ring a moment?"

Monsieur took it from his finger, and handed it to him without speaking. Yes, there was no mistaking it—there was the very stone—one or two scratches on the gold he remembered, and the words, "Faithful forever."

He returned it, saying, in a high voice, "Thank you. Miss Maple showed extremely strange taste in bestowing this upon you. But love may explain everything." He rose from the table. "Excuse me; I wish to catch the next train."

Monsieur felt that he must know if he was going to Rose, though he hardly believed that possible, and he said, "For Maidstone?"

"No," was the reply, haughtily; "for my country-seat in Hampshire."

And Rowland walked out, very erect, with a very white face and glazed-looking eyes.

"Ah! ah!" muttered the Frenchman, looking at him. "I'll wager my life that he doesn't turn to Rachel for consolation; but what may time do? with an after-thought concerning Rose."

In a few days he returned to Maidstone, and walked out to the residence of the Maples. He rightly judged that Roland would have written before this time, re-

leasing Rose, and he hoped he might aid in restoring serenity to her mind.

"How is she?" he asked of Rachel, who came first into the parlor.

"She is well, apparently—only fully ten or twelve years older than when you saw her last. There she is; I don't care to be enlivened by her presence. You've done admirably."

And Rachel left the room as Rose entered from the garden.

Monsieur, well poised as he was, could not refrain from starting slightly as he saw how correctly Rachel had spoken. This woman who greeted him coolly and composed, had, indeed, the features and figure of Rose Maple, but the features were sharper, the eyes large and cold; the figure had an erectness that suggested almost an aggressive self-reliance.

With amazement, monsieur found that he could not resume his former familiar manner, and on every successive visit he became more and more convinced of the fact. She gave up her French lessons; but he begged the privilege of calling and it was accorded in the same manner she would have loaned him a book.

He persevered in his acquaintance for a year, and at the end of that time he decided that Rose Maple wasn't the girl he thought she was, and he dropped her from his friendliness, heartily wishing he had never touched the stolen ring.

Meanwhile Rachel North had made it convenient for her to spend the greater part of the year in Hampshire, near Roland's abode—for he had suddenly decided to remain at home for a while. She saw him often, but he did not even remember that he had ever fancied the dark and not unhandsome face of Rose's cousin. Failing entirely where she hoped for success, Rachel suddenly married a wealthy widower, and blossomed as one of the most fashionable women at the West-end.

Not many months after her marriage, Roland received the following note from Monsieur, who finally discovered he had a heart and conscience, though not oversensitive ones:

"My dear Monsieur Wallace—Pray let me relieve myself from a wicked secret. The ring you gave to Rose Maple was stolen from her—though not by me—and given to me to do as I did with it. Consequently, Mademoiselle Rose knows not, to this day, why you released her. I return the ring with my blessing."

As I do not know the precise time it requires for the train to reach Maidstone from Roland's abode in Hampshire, I cannot tell how much time passed after the receipt of that letter before the ruby ring

was again on Rose's finger, and Rose's weeping face hidden on Roland's shoulder.—*Leslie's Illustrated Newspaper.*

The Death of the Old Year.

ALFRED TENNYSON.

Full knee-deep lies the winter snow,
And the winter winds are wearily sighing:
Toll ye the church-bell sad and slow,
And tread softly and speak low,
For the old year lies a-dying.
Old year, you must not die;
You came to us so readily,
You lived with us so steadily,
Old year, you shall not die.

He lieth still: he doth not move:
He will not see the dawn of day.
He hath no other life above.
He gave me a friend, and a true true-love,
And the New-year will take 'em away.
Old year, you must not go;
So long as you have been with us,
Such joy as you have seen with us,
Old year, you shall not go.

He frothed his bumpers to the brim;
A jollier year we shall not see.
But, though his eyes are waxing dim,
And though his foes speak ill of him,
He was a friend to me.
Old year, you shall not die;
We did so laugh and cry with you,
I've half a mind to die with you,
Old year, if you must die.

He was full of joke and jest,
But all his merry quips are o'er.
To see him die, across the waste
His son and heir doth ride post-haste,
But he'll be dead before.
Every one for his own.
The night is starry and cold, my friend,
And the New-year, blithe and bold, my friend,
Comes up to take his own.

How hard he breathes! Over the snow
I heard just now the crowing cock.
The shadows flicker to and fro:
The cricket chirps: the light burns low:
'Tis nearly twelve o'clock.
Shake hands before you die.
Old year, we'll dearly rue for you:
What is it we can do for you?
Speak out before you die.

His face is growing sharp and thin.
Alack! our friend is gone.
Close up his eyes: tie up his chin:
Step from the corpse, and let him in
That standeth there alone,
And waiteth at the door.
There's a new foot on the floor, my friend,
And a new face at the door, my friend,
A new face at the door.

'Twixt Game and Salad.

The game course was just being removed when the first message was delivered. The butler whispered it to Harrison, their host, and Harrison leaned toward young Grant with the "I-hate-to-alarm-you-but-be-prepared-for-the-worst" air.

What he said was, "Something wrong up at your mother's, Harry, and they want you at once."

Grant turned sharply. "Where—"

"From the club, Jenkins says."

The pretty girl on his left murmured, "I'm sorry," and tried to gather the fro-frous of her chiffon gown out of the

While he was pulling on his top coat the second call came. He went to the telephone in person. It was a cousin by marriage.

"Hello! That you, Harry? Awfully glad to have reached you. They've been telephoning all over town for you. Something wrong with your mother."

"What?" demanded Grant, sharply.

"Can't say, but they seem on edge to get hold of you."

Young Grant hung up the receiver, grabbed his hat from the hands of the man servant and dashed down the steps. At the next corner was a cab stand. He offered the Jehu an extra dollar to make extra time, and the cabby took him up.

way of his feet, which had suddenly turned as heavy as lead. Murmurs of conventional sympathy rippled the length of the rose-lit table. Young Grant turned in the doorway. The pretty girl—her name was Ethel Merrifield—was playing with her salad fork, and he thought there was just a trace of anxiety in her face. Was it for him and his? No, he remembered as he bowed gravely to Mrs. Harrison and slipped through the curtains—his feet had become tangled in her frock. Doubtless, he had ripped the frail fabric into shreds.

They plunged through the black mist of the rainy fall night. The hansom swayed and banged mercilessly. The cabby was making good his promise. The door of the hansom was swung shut with a vicious bang and caught Grant's finger. He pulled it away with an indefinite realization of pain. Then there came to him suddenly a mental picture of his mother's slender figure, arnica bottle in hand. To be sure, there had been times when he had resented being "babied," but there was always comfort in that phrase, "Brave little man," the tonic

MEMBERS OF DIV. 586, RICHMOND, IND.—COURTESY E.M.O. W. L. SCOTT, P. A. E.

employed after the binding-up process was over.

Somehow he had forgotten the rose-lit dinner table, the gracious hostess, the polished, confident host—even the pretty girl on his left.

He leaned forward to see the name on the next street lamp, and the window of the hansom blew in, the framework striking him full in the face. It was an ugly blow, and again he saw the mother of his boyhood days. There had been a night—the memory returned vividly at this moment—when his mother had sat by his side through the grim watches of midnight and the cold, pulseless hours of dawn, never relaxing the divine grip of motherhood on the little life he had tried to snuff out at a premature Fourth of July celebration.

He groaned aloud. To be sure, when one's mother insists upon making her home with a married daughter possessing three noisy children and a shiftless husband, the son who has business and social prospects cannot be blamed for taking up his abode at bachelor apartments, but then he ought to see his mother once a week at least—no, it ought to be twice a week.

The hansom stopped with a jerk that nearly threw him through the door. He tossed the man a bill, and asked no change. He sped up the steps, and was still holding the electric button with a nervous pressure when the astonished maid threw open the door. He pushed her aside and ran into the dimly lighted hall. Of course his sister must economize, but at a time like this, why didn't she—

He paused and drew his breath sharply.

There, in the narrow circle of lamp-light, in the small drawing room, sat his mother, her hands clasped on the cover of a new magazine, her white hair piled in stately puffs and draped with the familiar mantilla of Spanish lace, a mildly expectant expression on her thin face.

"Mother!"

"Harry, my dear boy, I am so glad you have come! Here's a letter from a lawyer. It has been worrying me all day."

Young Grant took the letter mechanically, and his mother prattled on.

"You know, dear, I am so afraid of the law. It beggared your father, and drove Aunt Maria into an asylum. I wish you would not go to law. Is it anything important, Harry?"

Harry Grant crushed the letter in his hand. He wanted to say things.

"Just a note from the lawyer who straightened up that little affair of yours with the Dobbins brothers. After I paid his bill I sent him a case of wine. He had been particularly decent about the

whole thing. This is a note of thanks for the wine, that's all."

Then there came back to him the memory of the rose-lit table, the gracious hospitality and the girl on his left.

"Why, in time—" he burst out. Then he caught the happy, child-like relief in his mother's face—and he laughed. He kissed her, and they spent the rest of the evening together, and she told him for the twentieth time the story of how the law had beggared his father.

* * * * *

"And Grant laughed. He said, to save his soul, he couldn't help it. It was all so absurd, the nasty half hour he had had in that cab all for nothing, and the placid way in which his mother took the whole thing. Think of being yanked away from one of the Harrison dinners and laughing about it! It's funny what a fuss women make over nothing. Now, the old lady might have known that a business letter sent to a chap's house is not important. But they must do just so much stewing! It's a wonder he didn't swear instead of laugh!"

It was Jack Follensbee who spoke, and Ethel Merrifield smiled at him across the tea table. She was serving at the Art Club tea.

"Do most men swear under such circumstances?"

"Well, rather," said Follensbee, carelessly. Then he added over his shoulder as he moved away, "I know I should."

The crowd had thinned somewhat when Harry Grant arrived and claimed his tea from the fair server. They carried their cups to a corner among the palms, but the tea turned cold.

"I am afraid I spoiled things a bit the other night at Harrison's," he was saying. "I was awfully cut up, somehow, and I have an idea that I ruined your gown when I stumbled away from the table."

"What makes you think so?" she inquired gently.

"Oh, you looked a bit anxious, and I thought I'd put my foot in it literally."

The girl's hand trembled. She was rich and proud. Young Grant was rich in family connections only, and he, too, was proud. Her voice was low and tender.

"Yes, I was anxious—for—you."

Grant looked straight into her eyes. Then he took away her cup and set it beside his own on the tabourette.

"I—I hardly dared to think you cared."

"I wasn't quite sure myself—but that laugh decided it."

And though she tried to explain, Harry could not understand. Perhaps that was because he was too happy to be logical. Perhaps it was just because men do not understand how light a feather will turn

the scales of a woman's love, yes, even so light a thing as a laugh—at the right moment.—*Philadelphia Inquirer.*

A Venture in Fiction.

"There must be some interesting story! There always is about such places. Think hard!" said Miss Cobden.

Dr. Marshall smiled at the pretty, earnest face turned to him. Girls like Miss Cobden were as rare in Eliotville as strawberries in January, and the doctor, fully awake to this fact, was making the most of her stay in the quiet old town.

Fortunately at this period, the general status of health in Eliotville was considerably above par—fortunately for the doctor, for he was a conscientious young man, and would never have neglected a patient even for such merry eyes and bewitching mouth as Miss Cobden possessed. As it was, he was free to spend most of his time in her society; to drive with her among the hills, and to walk with her across the fields, where already, with the opening spring, Mother Nature was working her countless miracles.

"Interesting stories are rare here," said the doctor. "Really, I can't recall a single local incident that isn't either sordid or commonplace."

"Oh, I'm sure there's one," Miss Cobden said. "Every town has its traditions and its folk-lore. Think hard," she urged again.

"I'm afraid I don't know them, then," he said. "Hold on, though! The very one! Stupid I didn't think of it before."

"Produce it!" the girl commanded. "I'm all attention."

"Do you remember that little house up among the hills?" asked the doctor, "the tumble-down, weather-beaten affair with the honeysuckle at the door?"

Miss Cobden nodded.

"Once," said he, "a very pretty girl lived there. She eloped with a young fellow from the next town. They drove like mad over five miles of the worst road in this section to the parsonage, with papa on a foaming black mare following hot on their trail."

"How interesting!" said Miss Cobden. "Tell me all about it."

And this the doctor proceeded to do. He told the story well, giving color to every little detail. Miss Cobden listened raptly. The color in her face came and went, and her eyes shone.

"It's just the sort of a story I wanted," she declared as the doctor finished. "I want to see the little old house again and the parsonage, too, and the bridge—in fact, the whole of that ride."

The doctor leaned forward in his chair.

"Suppose," he suggested, "we drive over the route Friday afternoon—just as they did, lickety-split, as if papa were after us on a foaming black mare. Would you care to?"

"It would be immense," she asserted with enthusiasm.

Friday afternoon the doctor pulled up before the house of Miss Cobden's aunt, with whom she was staying. He wore an immaculate frock coat, and a shining high hat gave him quite a distinguished air. Miss Cobden laughed gaily as he helped her into the buggy.

"I wanted to make this as realistic as I could," he explained, "so to borrow local phraseology, I 'handsomed up.'"

"That," she said lightly, "was just why I put on my best bib and tucker. Of course, that other couple wore their best clothes."

"And their understudies can do no less," laughed the doctor.

They drove along the winding roads to the little house among the hills. The doctor reined up the horse in the little driveway.

"Now," said he, "here is where the ride begins. Sit tight, for I promise you I shall make it as exciting as possible."

"Do," urged the girl.

"Imagine papa standing in that side door," he said. "He is muttering profound curses and otherwise misbehaving verbally. Now he starts for the barn to saddle the black mare. We're off!"

He touched the horse with the whip and they flew down the drive into the roadway. Down the little hill they sped, the doctor urging the horse into a break-neck run. When they reached a little hollow he turned to the girl.

"Papa in sight yet?" he asked, anxiously.

She laughed gaily as she caught the spirit of the thing, and looked back.

"Not yet," she said in a nervous little voice.

The pines and cedars flew past as they galloped up another hill.

"It was here, probably," the doctor explained, "they first sighted papa. Do you see him yet?"

"Yes," she said, "he's galloping down the hill."

"Is he gaining on us?" asked the doctor.

"I don't think so," she replied with absurd gravity. "But hurry! oh, hurry!"

The doctor shouted to the horse and the buggy swayed from side to side on the uneven road. The girl's cheeks were flushed and her eyes sparkled. They thundered across a little bridge.

"It was here," said the doctor, "the

wagon came near upsetting and he put his arm about her lest she be thrown out."

Suiting the words, he slipped an arm about Miss Cobden. She gasped, sat very erect for a moment and then nestled against his broad shoulder. He could have shouted with delirious joy.

On they flew, the buggy banging recklessly, and the doctor's left arm holding the girl close to him. Presently they came to the foot of a steep hill.

"The parsonage is at the top of the hill," said the doctor, "and it was about here their horse fell down, and they ran up the hill afoot. I can't make Dolly fall down, but we'll let her graze along the side of the road. Quick!"

He reined in the horse, jumped out and lifted Miss Cobden to the ground. Then he caught her by the hand and they ran lightly up the hill. At the top was a small white house, and before it they stopped, panting breathlessly.

"Such was their ride," said Marshall, dramatically. "Shall we repeat the climax? Shall we go in?"

The girl's eyes opened wide.

"I—I—took out a license—er—this morning," panted the doctor without looking at her.

"Papa has—has reached the foot of the hill. He's—he's starting up now," said the girl, also looking away.

* * * * *

After the parson had kissed the bride and told the groom what a lucky fellow he was, they left the parsonage and went down the hill, hand in hand again. The shadows were lengthening eastward and frogs were beginning to pipe.

"Do you suppose that other couple were as happy as we are?" the girl asked.

"They couldn't possibly have been," the doctor chuckled.

"Why?" she asked.

"Well," said he, his eyes on the saffron colored clouds in the west, "when you insisted on a story, I—er—I had to venture into fiction."

She stopped short. He was aware that both her hands were on his shoulders.

"Anyway, it's the finest story in all the world, dear," she said.—*Philadelphia Inquirer.*

A Nantucket Christmas of Long Ago

A TRUE STORY.

The old, gray, weather-worn house stood with its back to the cliff, shielded from the storms. The great stone chimney rose like a tower from the roof, just over the place where the four rooms met below, so that each one could have its

fireplace. My hostess was pointing out this chimney one day when it suggested to her this story of a Christmas long ago.

"My father was captain of one of the old whalers," she began, sitting down on the doorstep with me, "and his ship was long overdue. It was late in December and terrible weather, and mother was so sad and fearful that we, too, felt she must be right and poor father would never come back. The day before Christmas I couldn't stand things so any longer, and I said: 'Let's do something to cheer up! Let's have a candy pull with all the girls here tonight!' My sister jumped up and said, 'Let's!' as if she felt just as I did. Mother said we might, so we hurried out and asked sixteen girls. The Nantucket boys were as fine a set as you'd find anywhere, but we didn't ask one, just for the fun of the thing, to see what they'd do. By night they knew all about it and vowed they'd get even some day.

"When the girls were all there we hung the great iron pot full of molasses on the crane in the kitchen chimney and sat around and told stories while we waited for it to boil. Presently mother called us to come into the front room and see how the weather had cleared all of a sudden and how the moon was rising right out of the sea. It did look beautiful, and we all stood looking till someone exclaimed that if we didn't look out the candy would surely burn, and then we hurried into the kitchen—and the candy was gone, kettle and all! Gone entirely, though all the windows and doors were fastened for the night, just as we had left them. No one could have come in or out of the house without our seeing him, either, for both the front and back doors had been in sight all the time. Well, we hunted and listened and looked, but not a trace was to be found of the candy. It just looked like witchcraft.

"By and by, all the girls went home excited enough, and we went to bed, but we could not sleep. If ghosts had not done it, who had? And who but a ghost, and a strong one at that, could ever have lifted and carried off that heavy iron kettle all boiling hot?

"We did not have Christmas trees in those days, and we did not give presents, either, because it was thought to be wrong, but we had a grand Christmas the next day in spite of that, for father's ship got in early in the morning, and by noon he was with us, and when he undid his bundles there were presents for everybody. It was about the happiest day in our lives.

"By and by we told him about the candy, and how he laughed at us. 'Ghosts,' he said, 'ghosts in Nantucket! I'll rout them out.' So he went and

looked up the chimney. Then he went out and climbed up to the roof and called us girls to come. We only had to climb up the cliff at the back of the house and step right out on the roof, and father, being a sailor, could walk on the ridge pole as if it had been flat. The snow on the cliff was all trampled down and black with soot, and there was molasses candy hardened everywhere. So, of course, we guessed in a minute how it was. Those boys had been watching us, and when we left the room they just pulled the kettle right up the chimney. We found afterwards that they had a rope with a hook all ready.

"When they found that we knew, they

I had it made up and wore it to be married in, so that I never forgot it. Taking it altogether, that was a pretty nice Christmas."

She sat smiling to herself like a girl again as she looked up at the huge old chimney up which went the Christmas candy, and out toward the beach where the Christmas whale had lain.—*Caroline Benedict Burrell, in Ram's Horn.*

A New Year's Wish.

A little tenderer each day
To all who hold me dear;
A little sweeter in my home,
May I become this year.

CATALINA ISLAND, CAL., FISH.

Fish caught by Bros. J. J. Sheehy and C. J. Singleton. The fish weighed 28, 26, 22 and 20 pounds respectively.—Courtesy Brother Sheehy, Indianapolis, Ind.

brought it back, and the girls came in and we had another candy pull that afternoon. But before that we had all been to the shore to see a very wonderful thing. When father went away he said: 'If I bring a whale back with me you girls shall each have a silk dress.' We never had thought of it, for whales were always found away out at sea, but it happened that as they were near home they found one and just towed it in, and there it was Christmas morning, right on the Nantucket sands. And that was the way I got my first silk dress, and the next year

O, may my eyes, that plainly see
My neighbor's faults, grow clear
To sins and errors in myself
As fades the passing year.

As the chill winter frosts give way
To sunshine's sweet appeal,
May to the winter of my heart
Love's gentle radiance steal.

And thus upon life's barrenness
Shall flowers and fruit appear,
Each season bringing heaven's gifts
To bless my happy year.

Marketing for Magyar Maidens.

The Magyars are the dominant people of Hungary, especially on the plains, and they have some queer customs, especially in the manner of selecting wives. A writer visiting Hungary tells an interesting story of the annual maiden market as he saw it in Bodony:

The girls were mostly handsome, well-proportioned Magyar types, who, in their artlessness, did not seem to find anything improper in the short cut of their skirts, which barely reached below their knees. They wore shirt waists of light material, dark shawls crossed over the breast, aprons, and thick, red or blue stockings in low shoes. Some were bare-headed, while others had large gray kerchiefs tied over their heads in a peculiar fashion.

On both sides of the village street gingerbread bakers and gew-gaw dealers had erected canvas tents for the sale of their wares. There were acrobats and fakers, and an organ grinder turned the crank of his instrument with the rapidity of the merry-go-round in front of which he was stationed. The cars of the merry-go-round were filled with giggling girls, while others strolled about in small groups among the tents, admiring and commenting on the goods, and being followed by their elder relatives.

The young fellows, with their friends, lined the street, eyeing the girls and exchanging remarks about them. Whenever a group of the latter stopped in front of a stand, which happened quite often, in order—as it seemed to me—to give the lads a chance to approach, one or the other young man would step up and begin a conversation with a girl who had attracted his attention.

I was much interested in the proceedings; in fact, enough so to spend several hours in Bodony, during which, with the help of my Ratfa host, I learned all about the annual maiden market, the main features of which are the following:

The preliminaries, generally, consist in the young man buying the girl, who has made some impression on him, a gingerbread heart or something similar, and an inquiry as to what village she nails from. He addresses her with the familiar "thou," while she uses the conventional "maga," corresponding to the English "you." The conversation which follows is not very clever, being more or less restricted to good-natured banter.

During this conversation this girl is critically eyed by the relatives of the young man, who carefully inspect her whole appearance. After awhile they join in the conversation. If everything seems to be satisfactory, the young couple walk off arm in arm, while fur-

ther negotiations are carried on by the two families interested, for the girl's relations are present to conclude the bargain. These negotiations turn about the household articles, such as furniture, feather-beds, etc., live stock and land, which are to form the dowry of the girl, and the dickering lasts sometimes the greater part of the day.—*The Pilgrim*.

Pa Goes Christmas Shopping.

Maw was complainin the Other day about How mutch trouble it was Goin Chrismus shoppin with the stores So crowded you couldn't hardly git thrue and everybuddy tryin to see Which could tramp on your toes the Offunest in a given Time.

Paw didn't pay enny a Tenshun till He got thru readin about the Laitest base ball deal. Then he throwed the paper Down and says:

"What's that?"

So maw told him agin, and paw says:

"I tell you what I'm agoin to Do. I'll git a Day off and we'll go and Finish up this job all at wunst. It makes me sick To hear this Foolishness about shoppin troubles all the Time. If wimmen would no how to Go at it they wouldn't have no Bother. The way to Do is make up your mind what you Want to git and Then go and By it without Runnin all over the sitty and examinen all the Fall and winter stiles of folden beds and sossidge grinders when you no frum the start that you are agoin to git a solud silver teaspoon what was marked down From sixty sents. You go along and Watch me this time, and it'll save you lots of trouble in the Fewture."

Paw got his Day off all rite, and Aunt grace come over to Take care of the baby and the pupp becos maw sed it was a Shame if me and Little albert Diden't get a Chanct to see the sites.

When we got Down town and was pushen thru the crowd pretty soon we Come to a place where they was a turtable Jam, and all the people was tryin to Git ahed of each other and some Had thare Hats knocked down over thare eyes, and Everybuddy was pullen or pushen, and paw Let go of Little albert's hand and hollered, "Hello, here's a fite goin on," and tried to rush in where it was. After while He found a noopenin, and that was the Last we Seen of him fer a long time.

At last I cot site of Him ftiin his way Out agin By comin Side ways with a glassy look, and I Hollered:

"What was it, paw?"

"Thay was Sellin salt sellers with solud Silver Tops on them in Here fer five sents

apeace today," paw says, "and I Bot ten."

"What on Erth do we want with Them?" maw ast. "We got all we need."

"Well, we can remember our frens," paw says. "They'll Come in handy if we git presents from people we Diden't expect to send ennything to."

By the Time we got whare maw could Stand off and look at paw she seen that three of his overcoat buttons was tore out by the roots.

Then we got in an immense place whare thay had toys and Things, and I gess the old Feelen he used to have When he was a boy got into paw agin. Enny way he

"That's enuff to make Even a gote feel Sheepish."

Then paw rose up and sed:

"Do you mean to Insinewate that I'm a gote?"

Everybuddy around thare was laffen so I couldn't hear what the man ansered, and He went away while paw was Settlen fer the sheep.

Over at the next counter they was Sellen Bibles what was Damaged by water. They was a turrable crowd around.

"I never new before," paw sed, "that peepke thot so mutch of the Bible, But I gess thay don't want it fer home use. Thay can always give it to Sumbuddy else without maken them

wanted to wind up Every Thing what would go, and purty soon we come to a Sheep which would Blatt if you pulled its Tale. They was a Big crowd around and a Clerk was Doin the pullen, But as soon as he quit paw got to the Frunt, or mebbly you ot to say the rear, with Little albert and Took a hold. Sumthing seemed to Stick, and paw Give a jerk and the tale come off. Paw held it in his hand kind of sapisred fer a minut and a Tall man with fur around the Bottum of His overcote sed:

mad. So we mite as well git a few, too."

By fiten purty hard he got Up to the counter and found one that wusen't Badly damidged. So a lady with a Dubble chin reached over and Took it away from him, and while paw was tryin to Find out what she ment by it they crowded him away and maw come hurryin around frum behind a post and ast Whare Little albert was.

After paw had hunted nearly all over the store we found Him whare they was a Little train of Cars runnen on a Track,

and paw got interested and Staid a Long time watchin the Fun and resten Up.

"Well," maw says, "what you goin to git fer Aunt Grace?"

"I dunno," paw ansered.

"I thot you had your mind all made up," maw told him, "so you would only Haft to pick out what you wanted when you Got Here."

They was three or fore men Come chasin a pickpocket about that Time, and one of Them run agin paw and

ner in the Small of paw's back. Paw couldn't move the Sled.

"It beats the dickens," paw sed, "that Everybuddy Hast to Take the first Car comes along or die in the attempt."

"Yes," Sumbuddy sed, "why didn't you wait fer the next one?"

Paw was too Bizzy tryin to find whare the plenty of room up in frunt was to anser.

After we got Home maw says:

"Well, paw, did you get Everything you wanted?"

Paw set the Sheep without enny Tale on the floor and handed maw the Ten salt sellers and sed:

"What do You mene? It ain't a man's place to By Chrismus presents. Some winmen Don't use enny reason a tall. By George, they want a man to ern the munny and then they ain't satisfied but think He ot to go out and sho them how to spend it. This hole Chrismus Business is carried too far enny way."

By that time the pupp seen the sheep and made a jump at it, and when paw Got it away thay wasen't ennything but the tale in His vest pocket what was enny good.

GEORGE.

GREAT NORTHERN BLACK-THROATED LOON.

nearly shoved Him thru a pile of drums, and they went Tumblen all over the Flore.

Paw didn't stay to Help pick them up, But sed if he didn't git out in the open air purty soon whare he could Draw his breth agin they would Be three more Helpless orfuns in the world.

When we was goin Home Little albert neerly got Smuthered in the car, and a Lady with a Sled set the end of one Run-

The Great Northern Black-throated Loon.

SOUTH NORWALK, CONN., Nov. 7, 1904.

EDITOR JOURNAL: I send you herewith a photograph of a loon which was shot on Tupper Lake in the Adirondack Mountains by Bro. Wm. R. Thompson, of Div. 59.

In the book entitled "Among the Water Fowl," by Herbert K. Job, I found the following in regard to the loon:

"Though grebes and loons may not actually flock together, they have enough in common to make it proper to class them alike with the 'submerged tenth.'"

* * * * *

"Here is a picture: The cold gray dawn of a November morning breaks over the misty, heaving sea. My boat is anchored a quarter of a mile from shore. Very dim, as yet, appear the bluffs of Manomet, and below them the rocks, piled there by the Titanic forces of the winters' gales.

"From the north comes the bellow of the whistling buoy off 'The Gurnet' at the entrance of old Plymouth harbor.

"The fishermen, one by one, are rowing out past in their dories to haul their lobster pots and to fish for cod, every hail of theirs made audible by the megaphone of the mist.

"Presently the whistling of wings makes me look up, to see gray forms

that rapidly pass into the haze. Soon there arises a series of mild laughter-like cries, weird sounds, indeed, yet fitting perfectly with the surroundings.

"Near they come, and nearer, but it seems like minutes before I see one, two, three great birds, with long necks widely outstretched, and feet extended rudder-like behind, rapidly advancing, a hundred feet above the water, straight toward the boat.

"Lying in the stern of the dory, tossed by the waves, and not over warm, it must be confessed, for hours I watch the loons and other fowls come and go. Sometimes it is the big fellow, the Great Northern Loon, but rather oftener the smaller red-throated species—whose throat, however, has now lost all traces of its summer redness. Usually a loon can seldom be forced to fly even when it has very limited space for diving. Here is a typical instance to the point.

"One perfectly calm day in October a friend and myself noticed a large loon out on Lake Nippenickett and we decided to give it a chase, and see how it would act. We soon found that its main plan was to keep out in the widest part of the lake and avoid being driven in to the shore.

"It varied its tactics too, apparently with the direct intention of deceiving us. Sometimes after diving it would emerge straight beyond us, sometimes off to one side, or even behind us, having swum toward us and gone under the boat.

"Once when we succeeded in driving it

HEAD OF DEER SHOT BY BRO. W. R. THOMPSON IN THE ADIRONDACK MOUNTAINS.

into a cove, finding itself close to shore, it turned, and swimming under us was out in open water again, ready for another chase.

BRO. W. R. THOMPSON AT LEISURE, MEMBER DIV. 59.

"Sagacious bird!—Whoever invented that phrase 'crazy as a loon'? The only excuse is that the bird's notes resemble wild laughter.

"The small loon is not known to nest in the United States, but in many places along our northern border the larger one makes its summer home on the wild lakes."

MRS. W. R. THOMPSON.

The Talk of Good Society.

People of the Older Generation Who Can't Understand What Young People Are Saying.

It has been suggested lately that a primer of slang is needed by persons wishing to get along in good society. Certainly the use of slang has greatly increased in the Fifth avenue world.

Said a stately old lady the other day, apropos of some admiring comments which followed the departure from the room of a vivacious young matron.

"I should enjoy her more, I think, if I always understood what she was talking about. I suppose I am very old-fashioned, for I find often that I really need a key to the conversation of the younger members of society.

"Now, for instance, the other day my granddaughter said to me confidentially, 'I really think Miss Dash is getting dotty,' and at my look of inquiry she added, "'nutty," you know."

"Of course, I didn't know until she explained that both words meant silly. She afterward explained, with some condescension, I thought, that 'bats in the belfry,' 'talking through your hat,' 'wheels in your head,' 'Chinks,' 'Oh, dope,' and 'don't queer yourself' are all used to express doubt of a statement or of the speaker's mental condition, and I also learned that to show marked disbelief one need only say, 'Here's your hat; must you go?'"

"When I thanked her, she said, gaily, 'Don't try to use those words yet, grandma, or you will fall down,' meaning that I might get mixed up."

"We had a house party over Thanksgiving," laughed another matron with gray hair, "and I wish you had been with us. I think your education in slang might have been hurried along considerably."

"'She's a slick piece of furniture,' I heard my son say to a chum, and I found he was talking of a girl friend.

"'Yes,' was the answer, 'and Jones has got quite bally over her.'

"'Oh, Jones always gets on to every peach,' returned my son. 'When it comes to mashing he is the whole push.'

"'Boys,' I interjected, 'you will be late for dinner.'

"'Just hold it off, mother, will you, till I climb into my evening clothes?' was the answer I got.

"At the dinner table one night two of the men exchanged a remark that showed an understanding between them, and at once there were cries of 'Make me next,' 'Buy me a ticket,' 'I'm off the rain,' etc. I was quite bewildered until it dawned upon me that that was the new way of saying, 'Let me into the secret.'

"'I declare,' I said to my daughter soon after, 'half the time I don't know what you young people are talking about.'

"'Well, make a stab at it,' she answered blithely, and, somewhat stunned, I concluded the expression must be the modern version of 'try, try again.'

"Before I could ask, though, she handed me a note of thanks from a prospective bride to whom she had sent a present. It began:

"'It was great of you to send me that dandy dish.'

"'To think of calling you great for sending a trifling present, and a dish a dandy!' I commented, handing the note back, and my daughter looked surprised.

"I have no doubt she writes to her friends in precisely the same style, for a few days later when we went to view her friend's wedding presents, she exclaimed the first thing:

"'Oh, what a bully tea set!'"

"I believe, though, that bully is now a household word, and used to describe anything from ice-cream to a journey to Africa; so why not a tea set?"

"Just then a girl friend of my daughter came along and said to her, 'What a daisy hat you have on.'

"'Like it?' she asked in return.

"'Yes, indeed, it suits you down to the ground.'

"'That's right,' chimed in one of my daughter's male admirers, who was at her elbow, using an expression which I believe he utters nearly every time he speaks.

"My daughter, I am pained to say, was unmistakably pleased. I spoke to the young fellow who was to be best man at the wedding, and asked if he knew whether his friend would live in town or in the suburbs after he was married.

"'You can search me,' he responded quite seriously.

"Thinking he had not understood, I repeated my question, at which he had the grace to blush and confess that he did not know, which was the translation, I found, of his first speech."

"On the way to Tuxedo last week," said the hostess, entering the discussion, "there was a gay and very talkative party just opposite us in the parlor car.

"Miss Smith is invited,' said one of the ladies.

"She's my rave,' exclaimed a young man.

"Yes,' supplemented another. 'When it comes to making love to that girl Bob don't sit down. He hogobbles (appropriates) her on all occasions.'

"Oh, come out of the tall grass,' was the other's good natured rejoinder, which my husband said meant the same as 'Oh, come off,' or 'stop your jollying.'

"Do you really admire Miss Smith so much?' curiously persisted the lady.

"Sure,' answered Bob.

"That's a black eye for you, Kitty,'

"After that I concluded I could not afford to criticise other people."

"Up to a certain point I don't mind slang at all—in fact, I rather like it," frankly confessed a woman who is worth millions in her own right, "but I am afraid we are beginning to borrow from the Bowery; and that I do object to.

"The other night, for instance, at a dance I heard that charming Miss Dash say to a young man:

"Come, let us go to the buffet and feed our faces."

"I am told that phrase originated in a down town music hall."—*New York Sun.*

BROTHERHOOD CREW L. S. & M. S. RY.

laughed the other man, who, in an aside, told Bob that Kitty was down on Miss Smith. Then he went on tantalizingly: 'You ought to see Bob rubber for Miss Smith at all the dancing classes.'

"Rats!' cried Bob. 'Run dry, will you!'

"I was inclined to be disgusted for I haven't lived in New York very long, but my husband, as we got off the train, whispered in my ear:

"Miss Smith is a very swagger girl, and her father has a cinch with a big railroad corporation.'

Lost on the Prairie.

While in Washington a short time ago the Rev. John Eastman, of South Dakota, a member of the Mewakantan Sioux, related a fearful experience he once had on the prairie, lost and nearly frozen to death.

"It was a Saturday night," said Rev. Mr. Eastman, "and I had just finished my dinner and was sitting by a good fire thinking over my sermon for the next day when it occurred to me that I ought to go

out to the barn and see to my horse. I had driven twenty miles that day and was tired when I put him out and had not blanketed him. Fortunately I put on an old overcoat, but without a lantern I started out.

"The night was black, and a blizzard was on. The wind was in my face, and the fine hail came like shot from a gun. It fairly bit my cheeks. As I crossed the garden I turned to have the wind at my back and catch my breath. I saw the light in the house glowing faintly through the sleet. It was the light or the want of it that gave me the suspicion I had lost my way. I had turned around and walked backward awhile with my head bent and not looking for the house. Then when I did look I couldn't see the light. I knew I had gone far enough to reach the barn if I was ever to get there, and I realized I had gone wrong in some way.

"I began to arouse myself and look for the barn. I had gone there so many times I would have said I could get there with my eyes shut and my feet and hands tied. But I couldn't see it and soon began to learn that I couldn't get near it by zigzagging back and forth. I don't know how long I cruised around as a dog would search a trail. It probably was only a few minutes, but it seemed an hour. It was the longest part of the night's experiences. I was slow to confess to myself that, keen as I believed I was in prairie craft, I was really lost and could not help myself even a little bit. I suppose I went around in a circle, but there was no proof to my mind of the fact.

"The place was the prairie at Flan-drean, where I now live. It is as level as this floor and is now well settled, but then it was miles to any other house. Every inch of the prairie was like every other inch. When I knew I was lost, I made up my mind to be as long as possible freezing to death. I gave up trying to find the barn and just walked without thinking where I was going. I kept saying, 'Walk, walk, walk!'

"Of course I went with the wind a good deal. But I realized I ought not to, and as a moral duty I religiously faced it. This fancy saved my life. I kept fighting something all night. I pounded myself and called myself a fool a thousand times. I even kicked myself now and then.

"Then I began to feel sleepy. It grew on me, and I thought I would lie down and rest, for I was very tired. But I rebelled against this as a piece of folly. I kicked myself and again called myself a fool. Then the first I knew I was down on my hands and knees in the snow.

I guess I did not realize my danger. I remember I noticed the snow drifting around me. I had my back to the wind. I had found horses and cattle frozen to death standing with their backs humped up against the wind. You see, I have big lungs and am strongly built. I kept breathing good and strong all the time. I clinched my hands and kept saying to myself, 'Live, live, live!' It was a sort of will power. I suffered fearfully all the time with the cold. My clothes seemed like so much paper rustling on my stony limbs. The snow got deeper.

"The snow kept creeping on up over my back, and I stayed as still as I could, so as to let it roof me over. It was inky dark when it finally covered me entirely, and I was where it would be days before they would find me. Then I wondered how long I should lie there, and I thought of the wolves that might come when the snow had thawed a little and scratch down to me and begin to gnaw my frozen flesh.

"In this way my mind went wandering on from one idea to another. I succeeded in keeping myself alive by thinking. I felt better after awhile. I did not know it, but it was warmer there under the snow. My breath melted a little hole up through the drift. The air was cold, but it was the sweetest relief in the world that it was still and not cutting like a million whiplashes. The snow around me got so I could press it back, and it would pack and stay, so I had a little room to move. I was still fearfully cold, but in comparison with the suffering earlier in the night I was as warm as toast.

"It was about this time I noticed I could see a button right under my eye on my coat. The night had passed, and it was daybreak. My mind took the fact in slowly. I did not dare to get up or move. I deliberated whether I should try to get up. I almost decided not to do it. And then, with a snort and a grunt, I was on my feet and shaking off the snow. I shall never forget the agony of that moment. If there was a muscle in my body that did not fairly shriek in a protest of pain, it must have been in parts that were frozen. But I took a step forward and then tottered along and gradually learned again to walk.

"The sky was clear, a few stars shone faintly in the western horizon. The wind had gone down. In the half light I could see what I thought was a house some distance away. I struggled on painfully toward it, rubbing snow on my face as I went to take out the frost. As I drew near the house I saw some one coming from the opposite direction. It was my wife. She and the boys had been up all night, and with the first light of morning

had gone out to find me. I had been lost within eighty rods of my house. My wife fired the gun and called the boys back. They were all very glad to see me alive. Everything at the barn was all right. I preached that day, although I was very stiff and sore."—*Exchange*.

Nicknames of State Residents.

The nicknames of the citizens of the several states are as follows: Alabama, lizards; Arkansas, toothpicks; California, gold hunters; Colorado, rovers; Con-

vania, Pennanites and leatherheads; Rhode Island, gun flints; South Carolina, weasels; Tennessee, whelps; Texas, beef heads; Vermont, Green Mountain boys; Virginia, beadles; Wisconsin, badgers.

Report of the Commissioner of Immigration.

Upon the whole, the report covering the last fiscal year which has just been made by Frank P. Sargent, the Commissioner General of Immigration, is a satisfactory and encouraging presentment of a subject in which the country has a vital and

GIDEON HAWLEY, ONE OF THE OLDEST ENGINEERS ON THE L. S. & M. S. RY.—COURTESY G. F. CROSS, DIV. 3.

necticut, wooden nutmegs; Delaware, muskrats; Florida, fly-up-the-creeks; Georgia, buzzards; Illinois, suckers; Indiana, hoosiers; Iowa, hawkeyes; Kansas, jayhawkers; Kentucky, corn crackers; Louisiana, creoles; Maine, foxes; Maryland, craw thumpers; Michigan, wolverines; Minnesota, gophers; Mississippi, tadpoles; Missouri, pukers; Nebraska, bug eaters; Nevada, sage hens; New Hampshire, granite boys; New Jersey, blues, or clam catchers; New York, knickerbockers; North Carolina, tar boilers and tuckoes; Ohio, buckeyes; Oregon, webfeet and hard cases; Pennsyl-

abiding interest. It shows that immigration of late has declined in volume and improved in quality. This is excellent. There is still plenty of room here for the right kind of people, but the day when almost any kind of an immigrant was welcome who was willing to shoulder a pick or wield a shovel has gone by. The supply of unskilled labor, especially as it has been congested in the chief cities of the Atlantic slope, is amply equal to the need, and excessive immigration along this line strongly tends to depress the wage rate below the level of a decent subsistence.

This is something to be deprecated and as far as possible to be prevented. It is in the highest degree desirable that every American citizen should be able to earn enough to live on in comfort and to put something aside for the inevitable rainy day, and so far as it interferes with this consummation immigration is unwelcome. Mr. Sargent's figures show that the trans-Atlantic exodus continues to come chiefly from southern Europe, and especially from southern Italy. To such an extent is this the case that nearly one-fourth of all the immigrants who landed here were Italians, although of these nearly 40,000 fewer came than within the previous twelve months. Italians are not reputed to make the best kind of immigrants, but much of the unfavorable opinion with regard to them which used to prevail was due to prejudice and has been expelled by experience and observation. Their worst faults are their disposition to huddle together in the cities and their fondness for going back to Italy as soon as the modest sum which is there accounted a competency has been accumulated, but it is not too much to hope that they may get over that. If they could be induced to apply themselves to the cultivation of the soil, instead of merely laboring in the cities as hewers of wood and drawers of water, it would be a great change for the better. There is room and a place for them in the Southern States, where they would find a congenial climate and a healthful, profitable occupation, and where there is great need for the service they have it in their power to render.

Mr. Sargent rightly says that the advantageous distribution of the people seeking new homes in this country is a problem loudly calling for solution. There can be no doubt about that and it would be well for Congress to take the matter in hand. Nothing in this direction has yet been attempted and much that would be of the highest value could without any great difficulty and with a moderate expenditure of money be achieved.—*Plain Dealer.*

One Who Never Experienced Poverty Afraid Charity Will Pauperize the Poor.

An investigator who, to dispel the ennui of a purposeless and pampered life, devotes her spare moments to a course in dilettante philanthropy, called at the salvage depot of the Salvation Army, in the hay market, Tuesday.

For fifteen minutes she bored Captain Joplin with her views and theories for "the uplifting of the submerged classes." She hoped the army was careful to help only "worthy poor." The danger of

"pauperizing the poor" was a thing to be guarded against.

It was with relief that Captain Joplin turned from the visitor to a young German who had come for help. He was a giant in stature, broad-shouldered and deep-chested, but his sunken cheeks were evidence that he had fasted long. He wanted food and a place to sleep; he was willing to work.

Captain Joplin wrote an order for a meal at a nearby restaurant and gave it to the applicant.

"Come back when you have eaten, and I will have work for you," said Captain Joplin, and the German went away.

"Do you know that man?" asked the investigator.

"No."

"How do you know he will come back after he has eaten?"

"I don't know."

"Do you mean to say you feed strong, able-bodied men like the one who was just here without investigation?"

"Yes."

"Isn't there danger of pauperizing the poor by such a course? Aren't you encouraging them in their improvident ways of living?"

"I hope not," said Captain Joplin.

The investigator disapproved, and had the bad taste to show it. Finding in Captain Joplin an unappreciative listener, she mumbled an adieu and departed. The sturdy captain stood with feet wide apart, his hands thrust deep in the pockets of his coat, and turned a baleful glare on the innocent door through which the investigator had passed. He bottled up his wrath a minute longer and then exploded.

"The pauperization of the poor," he quoted. "Polly wants a cracker."

"Why, captain!" cried his wife, in remonstrance.

"Don't you talk. You've heard that kind of talk before, too. Investigate a man's past while he starves to death! I'll bet a cooky that German fellow comes back to square his account. I'll bet another cooky that that woman got her ideas from a lecturer or a book and has been preaching them as gospel truth ever since. A lot she knows about poor folks—she who has never stood in need of a square meal in her life!

"I always get excited when anybody talks the pauperization of the poor to me," the captain explained. "It was a difference of opinion on this very question which resulted in my giving up the ministry in England years ago. A certain millionaire member of my congregation insisted on making a hungry man wait for food until his past had been looked into; I opposed him; I found that

most of the congregation sided with him, so I left the church and joined the Army.

"Now what is it that philanthropists are trying to do? To so systematize public charity that begging will be impossible and work will be within reach of all men. Good.

"What have they done so far? They have systematized the heart out of charity. Their institutions have become burdened with officialdom, and officialdom has made the officials hard as rocks.

"Thousands of dollars are spent yearly in Cleveland in salaries for investigators. Instead of making begging impossible, they are making beggars of poor men.

"Now let me tell you a Salvation Army story. A few weeks ago a young man came here. He had just come from a hospital. He had pulled through a siege of typhoid. All his money had gone to pay the hospital.

"I gave him warm underclothes. I gave him money. I gave him temporary shelter. Finally he got work. I did not see him again until day before yesterday. He came to me and said:

"How much do I owe you?"

"Nothing," said I.

"Oh, yes, I do," he replied, and threw a dollar on my desk.

"But I don't want your money," I objected. "You don't owe me anything."

P. & L. E. ENGINE NO. 108 AND CREW.—COURTESY BRO. P. L. MILLER, MEMBER DIV. 148.

An investigator getting \$2,000 a year, leans back in his swivel chair, and asks the applicant for help such questions as these:

"What's your name?"

"What's your father's name?"

"Your grandfather's name?"

"Where were you born?"

"When?"

"How long did you live in Pittsburg?"

"Where did you go from there?"

"Why?"

"So it goes, every conceivable kind of question, fired with rapid-fire swiftness, until all self-respect is lost to the applicant under the pitiless catechism.

"Then give it to the next fellow you meet who is up against it."

"Did I pauperize that man? Yet suppose he had proved worthless and ungrateful. A professional pauper is the mongrel of humanity. If you should find a mongrel cur in the gutter, suffering the pangs of starvation, would you give him food or investigate his past to learn if he is worthy? You would feed the cur, because you know the clamoring of an empty stomach will not await the pleasure of an investigator.

"Hello! Didn't expect you back so soon. There's some wood down stairs that needs sawing. Come on."

These last words were addressed to the young German, who, his stomach and heart full—one of food and the other of gratitude—had come back to pay his debt.—*Cleveland Press.*

The Voice of the Church Rings Out for Labor—Declarations of Three Ecclesiastical Bodies.

The growth of interest in the moral and social aspects of the labor question is indicated by the increasing attention paid to that subject by churches. Both the Protestant Episcopal and the Congregational Churches have made inquiries into the subject through committees, and their reports just made public are highly instructive. Pope Pius X., through an official letter, repeats the interest in labor expressed by his predecessor.

"The organization of labor is essential to the well-being of the working people," is the conclusion of the Standing Commission on the Relations of Labor and Capital, of the Protestant Episcopal Church, after three years' investigation.

The members of the Commission are: The Bishop of New York, Henry C. Potter; the Bishop of Massachusetts, William Lawrence; the Bishop Coadjutor of Chicago, Charles P. Anderson; the Rev. R. H. McKim, D. D.; the Rev. George Hedger, D. D.; the Rev. C. D. Williams, D. D., Samuel Mather, Jacob Riis, and George Pinckard.

Concerning the causes of industrial disturbances, the Commission reports:

"We are agreed in the conviction that the causes of the violence of the past three years in Pennsylvania, in Colorado, and in Illinois, are not so much economical as moral.

"The strike commonly begins in distrust. The reason at the heart of it is that the master has as little confidence in the good will of the men as the men have in the good faith of the master. The employer and the employed, separated by our industrial conditions at such a social distance as to make fraternal understanding difficult, make their bargain one with another, under these conditions, not as partners, but as competitors. Where distrust and antagonism are well founded, there is nothing for it, so far as the Church is concerned, except conversion. They who are at fault are to be admonished, on the one side against prejudice and passion, and on the other side against covetousness and the sins which proceed from the inordinate love of riches.

"Where distrust and hostility are unfounded, the Church may afford an opportunity of conference. The capitalist and the laborer are alike sons of the

Church. They may not sit in the same seat, or even in the same building; that is largely a matter of locality. But there is as much loyalty to the Church and to the Divine Head of the Church in the one class as in the other. The voice of the Christian religion reaches both capital and labor. The Church helps to remove the moral causes of industrial strife when she brings these different members of her family into better acquaintance."

Concerning the "aim and spirit of labor organization," the report says:

"We perceive among our clergy and laity alike much ignorance (frankly confessed and deplored) as to the principles which are involved in the conflicts of the industrial world. At the same time, it is plain that an enlightened public opinion is one of the determining factors of the situation. Every industrial dispute involves three parties—the employer, the employed and the public; and the public eventually casts the deciding vote. Thus a serious social responsibility rests upon every Christian citizen, and more especially upon the Christian minister.

"We call attention to the analogy between certain offenses, past or present, of both the capitalist and the churchman. Thus the employer's black-list corresponds to the union's boycott, and both are akin to the major excommunication. The lock-out and the strike are of the same nature, and there is no great difference between such endeavors to employ the argument of famine and an interdict which deprives a people of the blessings of spiritual life. The question of the closed shop is like the question of the closed state. Men whose Puritan ancestors strove to maintain a state whose privileges should belong only to members of the Church, ought to be able to understand the struggle of their brethren to maintain a shop in which no man shall serve except a member of the union. They may not agree with these brethren, but they ought to appreciate their self-sacrifice. The laborer has learned from the capitalist to despise order and break law. He has learned from the churchman to pursue the dissenter with menace and violence. The recent tragedies in Colorado do not follow at a far distance the massacres which in the sixteenth century ensued upon the withdrawal of Holland from the ecclesiastical union.

"While, then, we condemn the tyranny and turbulence of the labor union, and call upon the law to preserve the liberty of every citizen to employ whom he will and to work for whom he will, we deprecate the hasty temper which, in condemning the errors of the unions, condemns at the same time the whole movement with which they are connected. The offenses

of the union are as distinct from the cause for which the organization of labor stands as the Inquisition is distinct from the Gospel.

"In the face of a prejudice and an hostility for which there are serious reasons, we are convinced that the organization of labor is essential to the well-being of the working people. It is based upon a sense of the inestimable value of the individual man. 'The cause of labor is the effort of men, being men, to live the life of men.' Its purpose is to maintain such a standard of wages, hours and conditions as shall afford every man an opportunity to grow in mind and in heart. Without organization the standard cannot be maintained in the midst of our present commercial conditions.

"This report is designedly general in its terms, but there is one matter which we are constrained to commend in particular to the consciences of Christian people. We do not undertake to say how much of the blame of child labor belongs to the employer and how much to the parent. But we do say this, that the employment of children in factories and mills depresses wages, destroys homes, and depreciates the human stock. Nothing is so important in any community as a human being. Whatever interferes with the education of a child contradicts the best interests of the nation. We call, then, on Christian employers as on Christian parents to endeavor after such betterment of the local and general laws as shall make the labor of children impossible in this Christian country.

"In the name of our common Master, we ask the attention and energy of the Church to the removal of this and other crying evils. Thus shall we assist in setting forward the kingdom and obedience of our Lord and Savior, Jesus Christ."

THE POPE AND LABOR.

The following letter, signed by Mgr. Merry Del Val, Papal Secretary of State, and addressed to the International Society for the Protection of Workmen, indicates the interest taken by Pope Pius X. in labor:

"My sublime master, the pontiff, desires me to express to you that, like his predecessor, Pope Leo XIII., he is in hearty accord with all movements intended to benefit workmen.

"The pontiff, in particular, desires it understood that he favors with all his heart any lightening of the burden of the men and women who work with their hands. Work should be so regulated as to conform to the physical ability of the workmen; it should be regulated to fit the sexes; it should be regulated to permit of the stoppage of all work on Sundays.

"The workman should be protected against employment and employers that have no regard for his dignity as a man and a citizen. That endangers his morality and interferes with his family life.

"The holy father trusts that you will devise peaceful means to realize the above ends. If you do, your efforts will be crowned with success, and all good governments will regard them with sympathy. On his own part, the pope will be happy to assist you with advice and prayer."

THE NATIONAL CONGREGATIONAL COUNCIL.

The report of the Labor Committee of the National Congregational Council recounts the inquiries into the industrial situation by its members, David N. Beach, Washington Gladden, William J. Tucker and William A. Knight, Secretary. Their investigation has included much correspondence, the study of industrial strife in the field and attendance upon a convention of the American Federation of Labor and a conference of the National Civic Federation. The Committee recommends the appointment of similar committees by each state organization of the church and affiliation with kindred committees of other denominations and with non-ecclesiastical bodies that work for industrial betterment.

Upon the industrial situation the Committee reports:

"We have a labor problem because we have large freedom, education, democracy, in which aggressive and acquisitive human beings are struggling for personal and social expression and betterment. The deep tendencies and the surface conditions of modern industry result in that consolidation of the forces employed, and the forces of the employer, that express themselves in the former instance in unionism, and in the latter in the various types of employers' associations. Apparently unionism is something more than that valuable phase of present-day industry, collective bargaining, for unionism stands for the introduction of democracy into industry, the right of representation in the conduct of business. More fundamental than any other practical question, such as the closed shop or freedom of contract, is this underlying demand of representation in the conduct of industrial enterprises. To achieve it is the core of intelligent unionism, which seems fast passing into industrialism, and to resist it is the purpose of much of the counter organization of employers. The result appears on the surface in suspicion, resistance, lawlessness, violence,—the common hard features of much of the present industrial struggle. It is not our part to discuss this phase of the question. We simply state it, as a primary and

inevitable element in the present contest.

"We believe that organization of labor and that organizations of capital are inevitable, and that these forces are to be dealt with intelligently and humanely, and that any policy that means the utter subversion of one force to that of the other is certain to result immediately in intensifying the already ominous tendency to class division and class warfare. Constructive politics, under the forms of law and tempered by the justly critical force of public opinion, are being framed by conservative leaders on both sides, and for these results we can hopefully wait.

"We urge upon trades-unionists and upon employers in the meantime the right use of power and the cultivation of such a sense of responsibility as will conserve social well-being for the present and for the future. The spirit of the marauder, by whomever shown, should be checked, and industrial organizations both of employees and employers should become as they may become, strong forces in behalf of law and order."—*Nat. Civic Federation Review*.

G. W. R. Widows and Orphan Fund.

The representatives and delegates of the G. W. R. Sick, Pension, and Widows and Orphan Funds, held a special general meeting at Paddington on 15th inst., to consider the reconstruction of the Widows and Orphan Fund which has exhausted its resources and owes £3,000 to the G. W. Company and last year spent nearly £2,000 more than its income from all sources.

A scheme has been drafted by the committee to reduce the benefits, the company promising an additional £2,200 per annum, making £5,200 per year or 1½d. per week per member.

The scheme was explained to the representatives by Mr. Griffin of Landore, and numerous amendments submitted from the various districts, which were divided into three groups, the majority of these were to propose to pay an additional 1d. per week provided the company would subscribe an additional 1d. to that already promised. After considerable discussion, the representative of the company stated definitely that the company's promised contribution must be considered final, also conditional upon acceptance of the scheme or additional payment from the members and such modification of the scheme of reconstruction as the additional contributions would allow. The other amendments were one from Paddington to take all the surplus from the Sick Fund above £2,000 to enable the Widows and Orphan Fund to meet its liabilities. This was met by the chairman pointing out that the Sick Fund was a registered so-

ciety and ruling the amendment out of order, which seemed to surprise the Paddington delegates, whose idea of sound finance for friendly societies would do credit to the late lamented Whitaker Wright himself.

An amendment from Bristol, to the effect that payments should be made on a graduated scale according to wages and all receive the same benefit, was lost for the want of a seconder.

The amendment finally put to the meeting was that the members pay an additional 1d. per week (making 3d. per week), and such modifications of the scheme be made as the additional contribution would allow, and was carried; also a resolution that members be supplied with voting papers (1) for committee's scheme of reduction of benefits without further contributions, (2) or the amendment as carried above; this so that the members will have the opportunity of saying what is their will in the matter and how they will meet the present and future liabilities, which are estimated at £25,000 per annum 20 years hence at present rate of benefits.—*London Railway Review*.

The Editor of the *Review* commenting upon the above says:

It is from no desire to embarrass the reconstruction of this fund that we would point out: 1st, the unsound nature of its past financial basis; 2d, the undemocratic nature of its constitution and the whip-hand which the company's contribution gives them; and 3d, the undesirability of these funds attached, as they are, of necessity to the company. The generosity of gifts to funds of this description is certainly not of the unmixed kind; the financial basis of practically every such society has been proved unsound, hence a burden has been thrown upon the present subscribers which they have no right to bear. Parliament should not allow any more such schemes to be foisted on the men at the request or bidding of the directors. We do not know if the G. W. have Parliamentary sanction in this case, but we presume that this is the fact, and also that the Act empowers them to make the present alterations. Can anyone answer this point?

Gleanings from the London Railway Review.

A public meeting in connection with the Walsal Branches of the Associated Steam Railway Servants was held in the Temperance Hall on the 20th ult. Mr. J. Thickett presided over a crowded attendance, supported by Alderman Dean, Councillor and Mrs. Addison, Councillor and Miss Millerchip, Rev. E. Melville Durbin, Mr. H. Hands (Board of Guardians), Mr. C. Taylor (president of the Harness Ma-

kers' Association), and about 80 representatives from the various Trade Unions, Co-operative Society, and Ladies' Guilds in the town. The following resolution was moved by Mr. W. H. Baker, and seconded by Councillor Millerchip: "That past experience having proved that unity is essential to obtain and maintain fair terms for labour, this meeting calls upon all workers outside their unions to at once enrol themselves therein, and seeing the present position in which Trade Unions are placed owing to judge-made laws urges all workers to unitedly utilise their votes towards returning men to the House of Commons who are thoroughly in sympathy with the democratic aspiration of the workers."

Mr. Richard Bell, M. P., in supporting the resolution, said it seemed strange that it should be necessary at this period to preach combination to workingmen when the latter had before them such practical illustrations of its benefit to particular industries. It was no use workingmen complaining about conditions of employment and social and political conditions when the latter were the work of their own hands. There was particular necessity for railwaymen to combine seeing that the railway companies are now adopting all sorts of systems of economic working. Railway companies were building larger locomotives, but no consideration was given to the men who took the 50 per cent. heavier loads than they formerly did. The driver in charge had greater responsibilities, greater risks, and greater strain all round by managing these bigger trains, and the fireman had greater manual labour. In no instance did he know of any consideration having been given for the extra strain involved, and the explanation was that the men had been content to do the additional work without pressing for additional remuneration. He believed he was correctly representing the views of many of the railway directors when he said that if the railwaymen of the country were organised, and would show that they were pretty well unanimous on this question, the directors would concede them some reconsideration of the conditions which now existed. To illustrate his point he quoted figures to show that the tonnage carried by railway companies last year was over 7,250,000 tons more than 1901, but the locomotives used ran 13,000,000 less miles, the actual decrease being really much greater when the large increase of traffic was taken into consideration. The average mileage per year for one locomotive was 18,000 miles, and the new method of working the traffic meant a displacement of 722 locomotives, each of which would have employed four or five men. The matter did not end here, as the rail-

way companies had increased the hours of signalmen and shunters from eight to ten, on the ground that the number of trains had been decreased, although the traffic in bulk had actually increased. It was monstrous to think that workingmen took these things lying down. (Hear, hear.) Efforts had been made to pass a Prevention of Accidents Bill, but it was little more than a dead letter. The last returns, if worked out, meant that in 12½ years every railway shunter in the kingdom was either killed or injured, in 15½ years every goods guard was killed or injured, and, taking drivers, firemen, guards, and shunters as a whole, in 25½ years every one would be killed or injured. This was far too serious a state of things to be allowed to continue, and he believed whatever the cost the companies should be forced to incur it to save such a loss of life and limb. In the evening Mr. Bell addressed a mass meeting for railwaymen and their wives at No. 2 Clubroom, Pleck.

More "Permission."

Fendalism dies hard. The idea that the employees on the railways are absolutely at the bidding of the company night and day, and even when they are supposed to be "off duty," takes a lot of killing. That it has not been killed sooner is due largely to the men themselves, and partly to tradition and the exigencies of the case. There is no particular reason to doubt the genuineness of the following circular which has just been published by the L. B. & S. C. Company. It is the G. E. over again, only in a slightly more polished and courteous form. However, here is the circular:

Circular No. 1,408.

London Brighton & South Coast Railway,
General Manager's Office,
London Bridge Station, S.E.,
October 21st, 1904.

Candidature for office on District and Public Councils, and similar public bodies by the servants of the company.

DEAR SIR: As there have been recent instances where members of the staff have expressed their wish to become candidates for positions on the above public bodies, and as the directors desire to grant permission when the duties of the public offices in question do not interfere with the applicants' duties with the company, the directors have given instructions that in future the chief officers of the different departments will decide whether or not permission can be granted and all applications must be made to them.

Yours truly,
WILLIAM FORBES, General Manager.

When will the companies realise that their contract is only that part of a man's time they pay for, and that they have no right to anything beyond. We fear it will not be until the men are organised sufficiently to make their rights respected.—*London Railway Review*.

Correspondence.

All contributions to our Correspondence and Technical columns must be in not later than the 10th of the month to insure insertion.

Articles must be written on one side of the paper only. Noms de plume may be used, but every article must be signed with full name and address of the writer to insure insertion.

We shall be glad to receive articles on any subject of general interest to the fraternity.

All communications are subject to revision or rejection, as the Editor may deem proper.

The Editor does not assume responsibility for the opinions expressed by contributors in this department. C. H. SALMONS, Editor and Manager.

An Absentee's Regret.

I'm sorry, exceedingly sorry.

I couldn't accept the invite;

It cost me an ocean of worry

For more than that day and that night;

Because I knew many good fellows

I haven't swapped lies with for years,

Were waiting with mouthfuls of "hellos"

To greet me and help on their cheers.

It's very delightful to listen

To saintly old sinners expound—

Whose eyeballs with sympathy glisten—

The reason "my engine" don't pound;

And how they are piling up ducats,

And picking rich meat from the bone,

With plenty of pie in their buckets,

And chock-full of praises for Stone!

I missed the glad hands of such Brothers,

Those big-hearted fellows of yore,

Besides presentation to others,

All burdened with friendship galore;

And also the smiles of sweet ladies,

Whose cheeks would be nicely ablaze,

More handsome than sirens of Cadiz,

Extolling my doggerel lays!

Dear Prenter, old friend of long standing,

I lost the big shake you'd bestow,

And sound of your voice so commanding,

As out to the stage-front I'd go;

And all the loud laughs at your sallies

The house would responsibly give,

The moment 'twould light on your allies

And roast me without a reprieve.

Dear friends, from my heart's depths endearing,

I'm grateful for kind words bestowed;

A chap, if but faithfully steering,

Will meet a few such on life's road,

Whose sympathy soars like a blessing,

And soothes him in every degree,

Like touches of angels caressing,

The way your kind message did me.

—SHANDY MAGUIRE.

Trouble and Triumphs of Travel.

BY SHANDY MAGUIRE.

Now that the directory has been dispensed with and the space it occupied put at the disposal of scribes to air their notions, I take advantage of the generosity of the management and also would be pleased to take the reader with me in my lucubrations, for a trip across the continent and return, if he desires to accompany me—in his mind—and if he does, I will agree to bring him back again some time or other, if I don't get left by the way from a slit in the gizzard, made by the scythe in the skeleton hands of old Death.

About one year ago, in December, 1903, I was having letters come to me from California a deal more numerous than formerly. The time of the convention to meet was not so very far away in the future, and the Committee of Arrangements was getting a gait on accordingly. I was devoting more time daily and nightly to the thought how was I to get to Los Angeles without investing in the railroads leading to there, and not being able to think the way out to my satisfaction, or to merit the approval of the girl who was to accompany me, my old friend, R. W. Kelly, of Los Angeles, kept me pretty well posted on what was going on in the committee towards the reception to be tendered to the delegates and visitors. Instead of being thankful for the information, I wished him seated upon the top of one of the horns of the moon so he couldn't be tantalizing a poor devil, who never considered himself any good at walking, and with no other prospects of getting there. He capped the climax of my patience in one letter I got from him in early March, when he, with a poor crippled hand, penciled it to me from the hospital where he was convalescing from the terrible scalding he got in the collision he came out of in a miraculous manner with life, and in it he said, "Every member is working with an untiring determination to give yourself and all others the time of your lives." Well! I had but poor hopes of enjoying

it. D. J. Brown, of Napa, wrote me many interesting letters in his very eloquent style, telling me of California and its beauties, and placing his residence at our disposal for a sojourn as long as we could enjoy his big-hearted hospitality. The question would bob up from the depths of my bowels, "How are we to get there?"

In early April the delegate to my own Division, Morris Barry, used to drop in on me to keep me advised on how the transportation question was progressing. Sometimes the free travel stock was at a premium, and again, the bears of the chances of free rides were roaring rampant in a depressed market, to use a commercial phrase. One day he came in and told me that all going off his road, the R. W. & O. Division of the N. Y. C., had to pay their way from Chicago to Los Angeles and return. "The jig is up," I replied, "that puts an end to my hopes, I cannot go." There never was a young kid who was denied the pleasure of staying out all night with his chums to see a circus come into town in the morning felt any worse than I did at the news. I thought of the hustle I got on me at Norfolk to gain votes for the next convention to go to Dick Kelly's villa, and when Los Angeles won out, I thought of my old heart-ache saying as confidentially as if she had a private understanding with the Creator that life would be spared, "Oh, I am so glad, we will see California," and I sighed to think of love's labor lost, and a couplet of the old song sprang to my lips as Mr. Barry was taking his leave, which ran thus:

"There's many a slip twixt the cup and the lip,
Like the slip the poor gauger had on the green."

Oh, yes, I had many old saws at my tongue's end to console me in my disappointment, and to the member I gave articulation to another from Burns,

"The best laid schemes of mice and men, gang
aft a glee."

Gentle reader and fellow traveler, you are by this time satisfied that I got left and that you need not keep my company any longer, but don't be in a hurry to turn back; bide a wee.

On this particular day I came home to dinner in a very melancholy mood. My lady love read me like an open book, and before I spoke, just from a glance at my face, she said, "What's the matter?"

I replied, "I have just been informed that crossing the desert on the way to California is a very dangerous undertaking for anyone in poor health."

"Why?"

"Well, on account of the sand storms and sultry air. I hear it is stifling nearly all the time, and only people of robust health and lungs made of sole leather are safe."

"Why didn't you tell me all this before I set my mind on going?"

"I didn't hear it until this forenoon. It was 'Jim' Currie who told it, he just left me."

"Why didn't Mr. Currie come to the house?"

"He hadn't time; he sent his regrets by me. You know he wouldn't lie and he knows the condition of your health pretty well."

It was a sad disappointment to her as well as to me, and I had no way to discourage her but to tell her about the desert, the sand storms and the lack of water, and so on, so as to not have her feel so keenly the loss of the trip. Neither could I corroborate my tale of woe with any more reliable and truthful witness than Mr. Currie, for she knew he wouldn't lie. It is a grand thing to be like Caesar's wife, "above reproach," or like the immortal Father of his Country, who would not lie and have an established standing amongst men of character for veracity. Alas! and alas! I am not noted for browsing in such pastures. I believe really that a lie told in a good cause is just as good as the truth—and better—but a tyro doesn't want to dicker at the business. It takes an expert, and although I have no pretensions to aspire to distinction in the ranks of prevaricators, yet in this instance I did very well with the assistance of dear old Currie, that I had pointed out to me a score of times as a model of what a God-fearing-wife-admiring husband should be.

For a few evenings after the visit of Mr. Berry we used to sit in the gloaming talking of our disappointments. I concealed my own anguish at the ill-luck staring me, and enlarged with what little power of persuasion I had on my fear of any mishap occurring to "Old Sweetness" for the want of breath, going over the desert, although I never knew a shortage of it when she had me "up for punishment" in all my life. However, I was trying to make capital by displaying such anxiety for her sake, and not concerned about my own feelings at all.

About the 3rd day of May I got a letter from Kelly, stating "no" would not be taken for an answer, that I should come. "But," said he, "if by any chance you fail to get here for the opening, send me your poem, which you no doubt have written, and I will have Brother Everett read it." "Yes," I mentally said, "I'll send you a poem, in a horn."

I replied to that letter the same day and I notified him that there was no use in him supposing I had any intention of going, unless he would go to Myer Hurlley and get us transportation from Chicago to Los Angeles and return, adding, "I will try an old friend of mine in Bellevue, O., who saved me from walking ties in World's Fair year, and got me from Buffalo to the Windy City, and I know he'll do it again," having Bro. H. J. Phipps in mind.

(To be continued.)

Dat Blessed Judgment Day.

When dat Judgment Day am comin'
An' de winds am blowing' high,
An' we hear dem clouds a rumblin',
In dat high and lofty sky,

Niggers den will stop dere sinnin',
Waitin' for dat Gabriel horn,
De bad ones will stand a chinnin',
Wishin' dey had ne'er been born.

Den things will be fearful
For de niggers dat am bad,
An' things will be tearful
For de niggers dat look sad.

Dey ought to have been prayin',
'Stead o' sinnin' dere pathway,
An' dere's no use a brayin'
On dat Blessed Judgment Day.

N. R. HATHOEN.

A Short Sermon on Money.

MASSACHUSETTS, Dec. 7, 1904.

EDITOR JOURNAL: For several years I have been a sub-collector for our Division. I reluctantly took the position; doing so simply to share in the work. At first I collected the assessments for insurance, but gradually other things were added, until today I have gained an experience that makes the position of train dispatcher simply child's play, and Job would take to the woods.

Every member of the insurance knows that the assessments are called regularly once a month. By actual experiment, only six out of a hundred ever offer to pay until asked, and three of these, only, know the correct amount.

Taking into consideration that members who have not paid have their names read at regular meetings to remind them to be more prompt the next month, it is a fact that it is the same names that are read each month, so much so that it would be perfectly safe to have the list set in type.

During the time I have been collector but one member forfeited his insurance, and he hardly slept until he was reinstated. He had been asked for the money not less than fifteen times during the two months. To get this Brother reinstated made so much extra work for all concerned. I pay the assessments of the careless now, knowing I will surely get it back.

A Brother will pay his June assessment on the 29th. He is probably a Brother I do not see very often, but I meet him the next month on the 12th and ask for his money.

"What? You around again so quick as this! Why, I paid you one the other day."

I then take out my book of explanations and find one appropriate to his case, and very humbly add that were he to die his wife would get the insurance, not I.

Then there is the Brother who is "sure he has paid," although you hold before him the current receipt. He does not pay, but says he will look it up, when he knows very well he never saves his receipts. You see him again in two weeks;

you catch a glimpse of him just leaving the roundhouse; you drop your work and hurry after him. He cannot possibly pay you, he has just time enough to get to the depot to catch a train for home.

Does this Brother pay you the next time you meet? Oh, no; he has only five dollars to last him until pay-day, and he will surely pay you then. But you tell him to hand over two dollars or he will forfeit his insurance. The look on his face would make a good model for Sargent to paint an angel.

Now comes the Brother who is out of town. He cannot read the assessment notice in the JOURNAL. Each month he must be especially notified. You send him a note by some Brother going up his way. The Brother carries the note for ten days before he sees him, and when the money is finally received it is just in time to have his name read off as a delinquent.

As long as I am writing on this subject, I want to speak of a very small matter, too small perhaps to even think about.

You are in the depot, having just finished a run. You have looked your engine over and are filling the hard grease cups. A Brother comes along, one whom you see every day, and wants to pay his insurance. Of course, you wear kid gloves and can easily remove them to find his receipt, then put your hand in your pocket for your wallet to make change for his ten-dollar bill. You lack just one dollar in order to make the correct change, so you must hunt around for somebody with ten dollars worth of change. The chances are you cannot find any one, and the Brother does not pay you, and wonders why you do not carry more change; when, if he only knew, you had changed four ten-dollar bills before you started out on your run that morning.

We have on our road, by a majority vote of our members, a salaried chairman of the General Committee of Adjustment. We pay this chairman by four special assessments of one dollar each, which are called for twice each year.

Our new schedule increased our pay

from thirty-five cents up to one dollar and eighty-five cents per day, according to the number of miles or hours.

What puzzles the collector is the reason this assessment is not only more quickly but more cheerfully paid.

When we voted to have a salaried chairman, there were a few of us who believed his salary was to be paid in good U. S. coin. I know the chairman thought so, because he gave up a good run to accept the position.

He gets the salary all right, but how do the collectors get it in order to pay him?

A few of our members have not contributed one cent toward this salary. A large number are months behind in their payments.

Now, this is not on account of poverty; neither is it willful neglect. It is simply carelessness with compound interest.

COLLECTOR.

An Interesting Retrospective Letter.

MALVERN, PA., Dec. 7, 1904.

EDITOR JOURNAL: Just a line to express my appreciation and the pleasure derived from reading the late articles from the pen of my old friend, Cy Nixon, whose subject seemed to be the welfare and some history in connection with Divisions 45 and 109.

The writer knows nothing of the latter Division, but does know a good deal of the early history of No. 45, and with your permission he will go away back of that so ably presented by his friend Cy, and try to connect with him at his starting point.

When the writer looks back to the inception of Div. 45, it seems almost like undertaking to write ancient history, as it is so far away in the dim past; but be that as it may, the incidents of its early life were of such a strenuous nature and so forceful were the actions of those connected with the Division and those opposed to it that it has left a bright and polished spot on his mind that will remain there while life lasts.

It was forty years ago the past summer that W. D. Robinson, then Grand Chief

of the Brotherhood of the Footboard, sent a representative out to interest the locomotive engineers in this new order and to organize Subdivisions where he in his judgment deemed advisable, or at points where the greatest interest in the new order seemed to center.

He was met in Harrisburg and brought to Philadelphia in charge of W. R. Irwin, then engineer on the Pennsylvania Railroad, and after looking over the ground, though meeting with very little encouragement, he wisely considered Philadelphia a fruitful place to establish a Division.

The engineers were notified and a date and place set to organize, but at the appointed time no one presented himself but the engineer who brought the organizer from Harrisburg.

He, however, was made a member and was invested with the power to organize and build up a Division in the interest of the Brotherhood of the Footboard, and thus during the summer of 1864 Division 45 came into existence and W. R. Irwin was declared its first Chief Engineer.

At this time there was a feeling of unrest among the engineers as well as the officers of the various railroads in the East, and papers were scanned closely for any bit of information from the West, where the feeling was very bitter against the new order, and where conflicts had already arisen to the detriment of the engineers who were putting up a strong fight for the good of the order, and the men gave the matter very careful thought before venturing on the ground they knew so little about; hence, the Division was very slow about getting started.

The second man made a member was Frank Irwin, and then followed Chris Hoffmaster, Pud Strouse, Bert Lengel, Johnnie McNeal, and I think, Gus Jefferies, seven in all, and at that number it remained until after the Rochester Convention, where the writer had the honor of representing the "little seven," as we were familiarly known at the convention, and I may add here that the delegate had to get there the best he could, as he was without transportation and the penalty for asking for it for such a purpose would

have been an instant discharge, nor did the members, outside of the Chief, know they were represented until a partial report from the delegate was read to them at their meeting the following Sunday.

During all of this time the feeling ran very high and every effort was made to stamp out the foothold we had gained, but the "little seven" were firm and steadfast and argued to the officers that nothing but good could come out of it and that time would prove that the Brotherhood would present them with a better class of men than they had ever known. The arguments were of little avail and the members were badgered on every move. Meetings could not be held, but the officers seemed to know all about them and as a last resort the Division held its meetings on the locomotives in the roundhouse with every man on the alert for spies.

Those who were not members were cajoled into the belief that they would be the favored ones and those who were members would be dismissed, and it would only be a question of time when this would be done.

This, together with the disastrous strike on the Michigan Southern, kept the membership down, and it was only after the Rochester Convention in 1865 that the membership began to increase.

From that time on the Division began to prosper and it was soon able to verify its early assertion that a better class of men would develop and that the railroad companies would be the gainers thereby.

Many things could be touched upon to show the oppression under which this Division existed, but it would take up too much of your valuable space to go into detail, and I will close by saying that if Division 45 still has the minutes of the meetings of these early days they have gems that will make good reading for those who were not members at the time when it required nerve to be a Footboard man.

FOOTBOARD.

"Engine Driver."

ANGELS CAMP, CAL., Dec. 6, 1904.

EDITOR JOURNAL: In the November number of the JOURNAL, Mr. J. Snowden

Bell justly criticises the absurd English custom of calling a locomotive engineer an "engine driver." Mr. Bell evidently believes in calling things by their original and proper names. He says the imported name is a misnomer. In the first place, it is a little mistake of Mr. Webster's—probably he didn't know that an engine driver is located on the axle instead of in the cab, or he might have defined an engineer as being an engine runner. Snobbery cannot change the long established rule of calling one who runs an engine an engineer. In England the marine or stationary engineer is an engineer, but the gentleman who stands in the abbreviated cab on the railway is dubbed the "driver"—because he has a cab, such as it is, he's a cab driver—from the English point of view, I reckon, and that they didn't call him "cabby" must have been an oversight.

The true word is engineer. It is easier to speak or write engineer than engine driver. The latter term is the definition of one kind of engineer, and it is not good form to call things by their definitions; to do so is a waste of words or printers' ink. A preacher is not termed a "sermon deliverer," nor a gunner a "gun firer"; then why should an engineer be called an "engine driver?" An engineer, in this sense, may run a locomotive, marine or stationary engine, and the definition, "engine driver," doesn't indicate his branch of service.

Engineers of the civil, electrical and mining kinds have a fashion of affixing the initials of their profession to their names. Mr. E. Grissinger, whose interesting and instructive articles on electricity are having another welcome run in the JOURNAL, is an E. E.; while another writer who also imparts valuable information writes his name with three applications only—Robert H. Blackall.

Now, I suppose that if a locomotive engineer were to sign himself to an article or write it on a hotel register, as Horatio Speedum Reachrod, L. E., it would be greeted with a derisive smile in the railway and roundhouse circles where he moved. Yet why shouldn't he so put the

finishing touch to his name? I have a friend who thinks it is very sensible, and in a way helpful, for a person to initialize the right side of his name. He has a "pocket" mine in the hills a few miles from Angels Camp, and when he comes to town for supplies he doesn't always remember all the things which his wife requests him to get at the stores. When asked why he didn't jot down the things in a memorandum book before he left home, he said it was much easier to remember than it was to read his own or his wife's handwriting. I hailed him one evening in the office of the Angels Hotel, where, with his arms full of bundles, he was bending over the register and trying to decipher the names of the latest arrivals. "Howdy do?" said he, without looking up, "if I wasn't loaded like a pack mule I'd shake hands with you. I've got a loaf of bread, package of tea, new frying pan and coffee pot, two codfish, three yards of beefsteak, twelve pounds of calico, dollar's worth of tobacco, hair comb and a spool of thread, and soon as I see if that mining man from San Francisco has come to buy my gravel claim as he promised, I'm going straight home before I lose some of my goods. Last time I got home I was shy a fancy silk shirt-waist, and when the madam found it out—Hello, here's that high-toned electrician here again—Algernon Thompkins Kilowatt, E. E.—By George! that reminds me," and my friend hurried out and into an adjacent department store, from which he shortly returned to the hotel with another bundle in his pack.

"Now, I guess I'd better get in my cart and go home," said he, "for I've got 'em this time, you can bet your bottom dollar."

"Got what?" I asked.

"A pair of shoes," he replied. "My wife told me to be sure not to forget this time to get her a pair of fine number sixes, double E in width, or there'd be a scrap. It was lucky that I saw that electrician's name on the register. Say, he knows how to sign his initials in full, don't he? I've a good notion from now

on to write P. M. after my name for pocket miner; it may serve to remind some poor chap of something he's forgotten."

"If you do, you'll be taken for a post-master," said L.

"So much the better," said he, "it may remind somebody of a letter which his wife has given him to post."

I asked a noted cowboy, an old-time Indian fighter, if he wasn't properly speaking, a vaquero. After thinking the matter over a bit the cowboy said, "Well, pardner, to speak the cold truth, I fear that the march of this hustling money-getting civilization has shorn the followers of my learned profession of their rightful title. The time was, when, mounted on my fleet steed, I skimmed o'er plain a proud vaquero, dead shot and champion wild rider of the West, and if you will glance through the pages of literature, you will read that I sometimes went out of my way to shoot up and scalp about 90 per cent of a tribe of 'Injuns,' in order to rescue a beauteous white maiden from their clutches and bear her away in triumph to friends and safety, but after the advent of the railroads I became known as a buckaroo, then a cowboy, and now I'm a common cow puncher and broncho buster. It ain't right. It ain't a survival of the fittest."

Let engineers be thankful that they and the locomotive were named long before the discovery of the automobile.

FRED W. CLOUGH.

Benefits of a Conference.

WILMINGTON, DEL., Dec. 7, 1904.

EDITOR JOURNAL: The article in the last issue by Bros. A. M. Cousins and J. E. Henley, of the N. & W. system, I found extremely interesting from several points of view. I think the N. & W. officials have at last solved a problem that has been puzzling railroad managers for many years. The burden of the men in authority used to be, "How can we get the men in the ranks interested in the company's interests?" That has changed. The men in the ranks are

now asking, "How can we get the bosses interested in the company's interests?" There has been in the past few years a woeful lack of concentrated action in the various departments; one seems determined to pull against the other. If, like the N. & W. people, the various departments would hold conferences, the weak points would be exposed. Most systems are now paying overtime after a certain number of hours for a day; this time eats up thousands of dollars monthly; the men are financially benefited, but physically injured. Very much of this overtime is unnecessarily made, and the men in active service see it every day. One crew blocks another, one yardmaster pulls against another, one road foreman pulls against another, and so it goes down the line; small delays soon become large ones and overtime results. I have never met a man who wanted to make overtime. The road men take desperate chances to get over the road, so as to have as much time at home as possible. The people in authority manipulate the train crews in such a manner that there is absolutely no team work. The engineer gets a different fireman each trip, the conductor gets a different crew, one doesn't understand the methods of the other and consequently friction results. The engines are worked in like manner, they are not permitted to remain in long enough to keep them in order. If a man in active road service offers a suggestion to better conditions it is said that he is a confirmed kicker and wants to run the railroad, etc. Many appointments are made to official positions which are given to men who have absolutely no practical experience. Mr. L. E. Johnson, President of the N. & W., seems to be one of the very few men in the railroad business who is aware of the fact that he doesn't know it all, and is not too old to learn. The N. & W. system is certainly to be congratulated upon having such a reasonable and reasoning corps of officials and employees, and the yearly receipts will, I am sure, prove the wisdom of their course of action.

Yours fraternally,

GEO. M. KERN, C. E. Div. 109.

Non-Attendance.

ALTOONA, PA., Dec. 8, 1904.

EDITOR JOURNAL: There is a subject I would like to hear discussed through the columns of the JOURNAL and get the sentiments of the members, thereby stirring up the dormant energy and force of the Brotherhood at large, especially Div. 287, on the subject of non-attendance of the members.

It seems to me that all the time is taken up fighting over finances, petty or personal grievances, which should be devoted to the good of the order.

The first of our mottoes being "Justice," I think we should fully consider the meaning of the word, and adhere strictly thereto.

We should, as a Brotherhood, try to render to the company that gives us employment, the very best service we can in return for the many favors we received from them. If compensation and conditions under which we labor are unjust, we should go to our superiors in a gentlemanly, manly way, and endeavor to have them adjusted.

Now, then, to be just to our employer we should be up-to-date in all things pertaining to our work, such as the handling of the air brake, economical use of fuel, oil, furniture, fixtures, etc., a thorough understanding of the signals, rules and regulations governing our Division.

I think if each Subdivision would devote an hour to the discussion of these subjects it would create an interest among the members, and help to educate them to the highest standard of a locomotive engineer.

Supposing that a majority of the members are like those of Div. 287, I presume that some members stay away because old "Bill," or "Bob," or "Andy" have too much to say. Now, dear Brothers, if you come to the meetings and wish to air yourself I can guarantee you that "Bill & Co." will keep quiet and give you a chance.

Other members will not attend because they were defeated for office at previous election of officers. They imagine that

the members have them spotted, and that their presence is not wanted. Now, dear Brothers, such is not the case; you are wanted at the meetings; we would like to see and hear you, for I know you would show a spirit of fairness in the belief that the majority must rule.

I think if each Subdivision would devote more time to the discussion of subjects of interest to all members and the Brotherhood at large, such as air brake, signals, schedule, rules and regulations, and machinery, they could create an interest in the meetings that would cause all good, loyal, true, honest and fair-minded members to attend without having the F. A. E. send notices to them that they must attend the meetings once in three months or be expelled.

Hoping that Brother Charley will not consign this to the waste basket, and that it will result in a thorough discussion of the subject, I am

Yours fraternally,
"BOLIVAR."

Officials of the N. & W. Commended.

PORTSMOUTH, O., Dec. 5, 1904.

EDITOR JOURNAL: The November JOURNAL contained a letter from Bro. J. E. Henley, Secretary of the G. C. of A. of the N. & W. Ry., giving an account of a meeting held at Roanoke, Va., in compliance with the request of President L. E. Johnson. The meeting, no doubt, was beneficial to all present, and was entered into with zeal and earnestness, and the topics and questions laid before them were fully discussed. Upon adjournment and returning home I could not help but review that which had transpired; also to think of the possible results of such meetings where the officers of a railroad and the representatives of various classes of mechanics and laborers come together and discuss the past and present conditions upon mutual, friendly and equal terms.

I have advocated this plan for some time, knowing that if conducted properly great and good benefits would result. To conduct such meetings properly would

depend upon the honesty of all concerned, and to impress upon all that they were working jointly to accomplish a certain purpose—the success of the road and its operation upon safe, sure and practical methods.

There is no question in my mind that a railway official, a general manager, for instance, who is thoroughly conversant with human nature and naturally endowed with the talents essentially necessary, could by a series of meetings with employées readily keep in touch with the details of an entire system; for information would be obtained that otherwise does not come out, for the simple reason that the mechanic or laborer does not get the opportunity to speak. There are masters in all trades; talent and genius among all workmen; but not all workmen, though masters of a trade, have the ambition and energy to give the benefit of their knowledge without the asking, or who are contented with their present conditions and positions and do not aspire to greater. Yet these men would, when opportunity afforded, unhesitatingly give their ideas for the benefit of their employer.

In the operation of large railway systems, from the president down, the officers must depend upon their subordinates for a faithful performance of duty, and must naturally accept their subordinate officers' reports. Should there be any irregularities or methods in practice which, if reported, would not be approved, would it not be an easy matter to frame such report as to meet the approval of superior officers? Hence, the meetings would expose such irregularities, and all others, should any exist, such as train movement, engine and shop management, etc.

The labor organizations meet a large expense maintaining committees to adjust the grievances of their members—grievances in many instances created by some ill practice or impractical method, which would be aired at these meetings; consequently the number of grievances, and engine failures, too, would decrease, saving both time and money to all concerned.

There are many advantages both in favor of the company and the employees to be derived, in my opinion, and I am confident that a series of these meetings would prove profitable and be a means of elevating the employees to the highest standard.

Brother Henley's praise of the officers of the N. & W. is truthful and not intended for flattery. They certainly have the good-will of the employees, and it is evident that the officers, especially the general officers, show favor to the employees upon every opportunity, and are as considerate of their welfare and interests as circumstances will permit; and I, for one, certainly appreciate that fact, and am glad that this friendly condition exists, for we must agree that where there is mutual and friendly co-operation of all concerned in the management of as large a system as the N. & W. Ry. that the best results are possible.

I consider the above a good subject for discussion by those who take an interest in Brotherhood affairs, and would like to hear what others' opinions are.

Yours fraternally, Div. 511.

Lack of Interest in the Referendum Vote.

FORT WILLIAM, ONT., CAN., Dec. 8, 1904.

EDITOR JOURNAL: In looking through the Correspondence Department of the December JOURNAL, I could not help noticing the remarks of "Skinney" on the referendum vote.

There certainly was something wrong outside the cussed indifference of a majority of the membership when such a small percentage of votes were polled.

I hope and I do not think a very large percentage of what we will call lost votes could be accounted for by the same excuse as Div. 243, for the first official intimation we received, except through our General Chairman, was the announcement of the result of the poll, and I am persuaded our vote, though small, would have been "Yea" unanimously.

I, myself, would like to see some system

devised by which every available member would be supplied with a voting blank, and all votes not returned be counted in the affirmative. Perhaps some system like this might stir up some of the lazy or indifferent members—if only those who, knowing that no returns count contrary, are always prepared to let things “go as they are” and never expect or want to get out of the old rut. A contrary vote is far more satisfactory than an unexpressed opinion.

Yours fraternally,
SKINNEY THE SECOND.

eran engineers of the M., K. & T., Brother Maynard firing for Brother Willis in the early seventies, while Brother Willis enjoys the distinction of being the second oldest engineer on the system, the beginning of his service dating back to the Civil War, of which he is a veteran.

Appreciating his knowledge of a locomotive, his steady nerve, manly bearing and civility of manner, his congenial companionship and popularity among men, Mr. J. J. Frey, President of the system, for a decade in the eighties preferred Brother Willis to pull his family special

HOME OF BRO. MAYNARD.

Veteran Engineers at Home.

The above picture is of the home of Bro. R. M. Maynard, Div. 556, New Franklin, Mo. It was photographed by Mr. A. H. Wade, Brother Maynard's efficient fireman, who is proprietor of one of the finest art studios in the country.

On the veranda are Mrs. Maynard and the wife and daughter of Bro. F. Aspelmier, also of Div. 556. In the front is Brother Maynard presenting to Brother Willis, Div. 556, some official notes of Brotherhood work.

Brothers Maynard and Willis are vet-

continuously during his term of presidency.

In years, Brother Willis has reached the allotted time of man, but, as he is wont to do with man, he seems to have cajoled Father Time by his affable and congenial manner to refrain from stamping those marks of age upon his erect figure and manly brow, for in appearance and activity he is scarcely forty.

His seniority and ability have placed this popular gentleman and Brother upon one of the best runs of the system, a preferred passenger, running from New

Franklin into the city of St. Louis, and his friends, who are legion, wish for him that he may enjoy active service among them for many years to come.

P. H. HANDLY, Div. 556.

Shorter Hours.

ST. LOUIS, MO., Dec. 8, 1904.

EDITOR JOURNAL: When I see the almost complete indifference with which the resolution adopted at our last convention and laid before the Brotherhood at large in defense of shorter hours, I cannot refrain from raising my voice in defense of the resolution, as it is what I have looked for and hoped for. It is true there are some in our membership who have a choice run, get good pay and do not wish to be molested in any way, but the great majority of us work too many hours, and as we are a Brotherhood, we should stand for what benefits that Brotherhood. When I joined the ranks in 1882 we were then the envy of all other labor organizations, but it seems we are in the background today in some respects. In this age we are dealing with today; yesterday is past and there is no reverence for the past. If we are not abreast with the times we must fall back and it is plain that we are less alive than many other orders who stand for the betterment of their condition.

In 1882 the poor coal miner was to be pitied, but since then he has come up out of the dust of degradation and despair and he stands today a respected citizen. This is especially so in the anthracite region of Pennsylvania.

The ice man in St. Louis will bring you no ice on Sunday; if you can't take enough on Saturday to last over Sunday, you must go without. The ice man is with his family on Sunday, and the railroad man is juggling around the yard with cars; others are hauling them over the road, and who condemns the ice man for such an achievement—not one—and I do not think these ice men are very Puritanical any more so than the butchers or other trades unions; and in passing I hope the question of wages will be given a rest for a while. The engineer who

makes two hundred dollars a month will not have any more money in the end than the one who makes one hundred. That sounds absurd—it is nevertheless true in most cases. We as railroad men can better our condition and at the same time hold the moral support of the public and our employers. It is a great satisfaction to know you are bettering your condition and still keeping within the line of justice. Let us not isolate ourselves from all social and intellectual touch with the world; if we do we will be called cowards. Fraternally yours,

GEO. A. CLARK.

The Best You Have.

PHILADELPHIA, PA., Dec. 4, 1904.

EDITOR JOURNAL: To all the readers of the B. of L. E. JOURNAL I wish a Happy New Year; no doubt a wish that we all express with our tongues, but never do anything by our acts to help those about us to have a happy New Year. In the October JOURNAL, page 749, is an article by F. H. Sweet, called "The Best You Have." It will do us all good to read it and follow the advice given, and brings to mind these words: "As ye sow, so shall ye reap." Where we give love, love will return; where we give tears, the same will come back. Oh, some will say life is too short to try, but let us all try to make some one else happy and the result will encourage us to continue it, for I believe that there are more good people with good desires in the world than there are bad people with bad desires.

To begin, my Brothers, let us be sociable. When you go to your Division greet every Brother with a hand-clasp—with a cheery "How are you?" and see how gladly it will be returned by the Brethren; and if there are any visitors there, they will know you and remember you after they go away, and in some after day you will not feel lonely in their Division. Be patient and kind to the little children in your locality, and it will come back to you in kind. I have seen a woman who objected to their play, to their voice, and so forth, and her life was made miserable, as she tried to make theirs, and all that

childish ingenuity could think about was used to torment her, and within a square a woman encouraged their play, patted their cheeks, was kind in chiding them, etc., and everything around and about her was safe, and they were only too anxious to please her.

If you are sick, be patient and cheerful with everybody and see how many friends you will have about you. Don't, because you are sick, try to be cross at everybody else because they have not the same disease, but live on to make some one happy in your own feeble way. Be kind and courteous to your Brothers on the road; pity them in their troubles. A kind word to one in distress is needed much oftener than your almighty dollar. Oh, how much happiness is lost to ourselves by our omissions of duty, which cost so little to give. You old fellows can bring a happy smile to that old darling's face by just putting your hand on her shoulder and asking her if she is tired, or advising her to quit for today; and we young fellows can do the same, if we are a little thoughtful in many ways.

Make no foolish resolutions the first of the New Year, but quietly begin each day to do something to please some one. Go to the man you have not been friendly with for five years and greet him, and mark the result. Speak kindly to the one struggling against many troubles; bring a smile to the face of him who seems unable to smile. They say "misery loves company," but I do not believe it; and I have been told that in the surgical ward of a hospital at times there is more fun than in any other place on earth. I do not care to go there, but it satisfies me that people can be happy anywhere. So, first, be happy with yourself. How best to be that is to lose yourself in making others so. The sweet song says:

"For life is the mirror of king and slave,
'Tis just what we are and do;
Then give to the world the best you have,
And the best will come back to you."

There is nothing impossible in this, and the world would appear brighter and our wishing of a Happy New Year would become a reality. Finally, Brethren,

whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report, if there be any virtue and if there be any praise, *think on these things.*

Fraternally,

C. B. NIXON.

Happy New Year.

EDITOR JOURNAL: As we stand beside the grave of the dead past we behold only the darkness of oblivion, and not until the grave digger—Time—lets fall the last shovelful of earth to form the mound and has placed the head-stone to mark the spot, do we turn from the melancholy reflection of the wasted days of the past year to see the wreath of immortelles which has been placed upon the grave sparkle into life as we turn away and hear the greeting: "Happy New Year!" The year of past trials is gone. In some instances it may have been a wrecked life, vanished riches, the poor grown poorer, social ambition destroyed, the student failing to reach the height in knowledge he had aspired to, or the idle and ignorant having carelessly allowed the precious hours to slip away unimproved and unappreciated.

In reviewing the dark side of the retiring year, no matter how sad the past events have been, there is always a cheerfulness and helpfulness which fills the soul with delight and causes the pulsation of the heart to throb with joy at this salutation of the new year's greeting. No matter how burdened we may have been, as all of earth's millions have their own sorrows and tears, on this particular morning we should meet one and all with renewed hopes and aspirations, for, as the good Book tells, "when we have put our hand to the plow, look not back." It is the past; let it go. Live from *today!*

Untried responsibilities may come with the new year. Let us buckle on the armor as necessity requires for the struggle; polish up our dispositions and brush away the tears of regret for wasted hours. "If sorrow linger in the soul and eat

at its heartstrings like a canker, let the 'Happy New Year' make light the burden. If confiding love has been unrequited, and beneath the mask of a smile you carry the image of a broken idol, let the 'Happy New Year' cheer you to the hopeful reward its future days may bring!"

Time works wonders and heals many wounds. The salutation on a New Year's morning is a soothing balm to the heart laden with sorrow; it fills the soul with renewed hope and expectation—that after the darkest night the dawn of morn may bring forth the day of promised reward.

Experience with the world has taught us that the saying of an anonymous writer is true: "We often create our own misfortune by our mistakes." We are often led by impulse to do and say the things we have cause to regret. The word once spoken is like an escaped bird that cannot be recaptured. It falls harshly upon the ears of friend or foe alike, and like the ripple made by the pebble thrown in the lake, its waves spread and spread until they reach the furthestmost shore.

"If the world seems cold to you,
Kindle fires to warm it!
Let their comfort hide from view
Winters that deform it.
Hearts as frozen as your own
To that radiance gather;
You will soon forget to moan,
'Ah! The cheerless weather!'"

"If the world's a wilderness,
Go build houses in it!
Will it help your loneliness
On the winds to din it?
Raise a hut, however slight;
Weeds and brambles smother;
And to roof and meal invite
Some forlorn brother.

"If the world's a vale of tears,
Smile till rainbows span it!
Breathe the love that life endears,
Clear from clouds to fan it.
Of your gladness lend a gleam
Unto souls that shiver,
Show them how dark Sorrow's stream
Blends with Hope's bright river!"

As we are entering upon our duties of the new year, let us resolve, and make a special effort, to guard against saying or doing the things we may so soon have cause to regret. Let us but accomplish

this and our happiness and success for the coming year are assured, and our record will show that we have endeavored to speak only kind words and perform only kind deeds to our brotherhood of men.

As the last spadeful of earth falls on the dead year's grave—1904—let us bury with it all jealousies, unkind words, rash acts and animosities of the past, and begin the year 1905 with our hearts joined in one grand chorus, ringing with the joyous salutation, Happy New Year to All!

"Farewell, old year, the rustle of whose garments,

Fragrant with memory, I can still hear,
For all thy tender kindness and thy bounty
I drop my thankful tribute on thy bier."

Yours fraternally,

J. PUFFENBERGER.

Too Many Lukewarm Members.

ROCHESTER, N. Y., Dec. 8, 1904.

EDITOR JOURNAL: In the December JOURNAL, page 914, Shandy Maguire tells what happened to him some years ago when he wrote an article for the JOURNAL, which reminded me of a similar case which happened to myself.

I was not one of the "heavy-weights" nor one of "those who stood in with the Editor," consequently my letter, one written in reply to a "roast," was returned marked "rejected."

I got back at him by sending the article to another journal, just as it was returned to me, and it was printed in full with an explanation of why it was published in that journal, instead of the B. of L. E. JOURNAL.

"Skinney," page 915, struck the nail squarely on the head when he said, "Ninety-ninths of our members are so slow about anything pertaining to the B. of L. E." And let me add to his statement, that those same members who never attend meetings, and who want the G. C. of A. to straighten out their snarls, are the ones to kick against paying the G. C. of A. assessments and put off paying them, regardless of how steady they have been working, until they are threatened with expulsion.

There are too many lukewarm members in the Order. The work is (in most Divisions) left to a very small percentage of the members to do, and those who do not attend meetings complain of what is done and what is not done by those who do try to keep the Division alive.

The result of the referendum vote lately submitted to the members at large will fairly illustrate how many take interest actively in the Brotherhood affairs.

Those who voted on the questions represent those who attend meetings and take an active interest in the affairs of the B. of L. E. To those active members is due the credit of keeping and making the B. of L. E. what it is today. Long may they live!

Those who would not vote on these questions represent those "who forget what evening their Division meets."

Even on the appeals to the legislative bodies to enact laws requiring every man placed in charge of a locomotive as an engineer to have actually served an apprenticeship of three years as a locomotive fireman, laws which would have the effect of preventing inexperienced men from being placed in charge of engines pulling passenger trains, some of our members refused to sign. Why, no one knows, they can give no reasonable excuse themselves.

In reply to J. J. Conrad, page 918, on subject of printing Division Addresses in every issue of the JOURNAL, I wish to say for one, I am opposed to the printing of the addresses in each issue. It is expensive and unnecessary. I have for a long time thought it poor policy. With the addresses published once in six months there is no good reason why every Brother cannot have a list of Division Addresses. But few changes in officers of Divisions occur between elections, and with elections once in two years it looks to me like a poor business proposition to pay about \$500 per month for the one thing to be published over and over again.

I think the Convention did a wise act in doing away with publishing the addresses in every issue, when every member can have a list of addresses always handy by

simply preserving the copy of the JOURNAL containing the list. A very small minority of the members ever consult the list of addresses, and a much larger percentage than many think never read the JOURNAL.

I am opposed to rejecting advertisements for the purpose of making room for the list of addresses. Brother Conrad says: "It is more than a little annoying to be deprived of the one privilege we could boast of prior to this action." I fail to see where we have been deprived of any privilege. The fact that Brother Conrad has been addressed as F. A. E. of Div. 209, and he never was, nor is now, F. A. E. of any Division, shows of how little use it is to print the list of addresses in every issue. Whose fault is it if not that of the party addressing? Could he not have preserved one copy of the JOURNAL containing the list? He certainly knew that the addresses would only appear once in six months, unless he belonged to the class who do not read the JOURNAL.

Brother Conrad says, "In my opinion, the few are not justified in passing such laws for the many who are in duty bound to submit." Does Brother Conrad want the whole membership of the B. of L. E. to assemble in Convention to make laws?

The few always make the laws to govern the many. If certain laws are wanted, or not wanted, by a majority of each or any Division, the delegate from such Division or Divisions should be sent to the Convention instructed how to vote on such questions.

I have never attended a Convention as delegate, but will venture to say that the delegates, by a large majority, go to the Convention uninstructed. Usually, the delegates are men in whom the members of the Division sending them have confidence, and are satisfied their delegate will assist in passing such laws as seem best.

Do you instruct your state and national representative what laws to pass? The few there make the laws for the many.

When it comes to referring a question to the membership at large to signify whether they want or do not want certain

laws enacted, just refer back to the results of referendum vote and see how small a percentage of our members know whether they do or do not want certain laws. There are too many who "do not know what they do want." There are many who, if asked to express an opinion as to what action should be taken on certain questions by the Convention, will reply, "Oh! I don't know, I will leave that to our delegate."

Everyone has a right to his own opinion and if Brother Conrad, or any other Brother, thinks it better to have the addresses in every issue, they have just as good a right to think so as I have to think my way. Let it be according to the wishes of the majority and for the good of all.

Fraternally yours, B.

Blame the Organizations.

PORTSMOUTH, O., Nov. 28, 1904.

EDITOR JOURNAL: The recent report of the Interstate Commerce Commission showing the number of railway accidents may be appalling and astonishing to many who are not versed in railway matters. The press, ever on the alert for news and information, has made inquiries as to the cause of railway accidents. Some railway officials have expressed themselves, attributing the cause to human error, incompetency and negligence of employees, due to the influence of labor organizations, and directly blaming the organizations to a greater or less degree. Also a number of other causes have been advanced, but I have yet to learn where any have made mention of the principal cause of accidents, the majority of which can be charged to this cause.

I venture to state that if an impartial investigation of all railway accidents where engineers are concerned were made by competent judges, who would endeavor to learn the motive or incentive which leads to accident, they would discover that where the engineer or conductor has been blamed the incentive in a majority of cases is due to an effort to make "time." From my experience, I am convinced that "time" is the principal cause.

The railroads have rules sufficient to insure the protection and safety of the traveling public and the safe movement of their trains if the rules are conformed to. The violation of rules in which rear-end collisions occur, overlooking slow orders, approaching block and order signals, stations and railroad crossings, especially when heavy fogs prevail, with train not under full control, are all violations, which in many instances are due to the effort of the engineer to make a certain showing to represent schedules for which no time allowance is made. Why do the people who ride on railroads, either as passengers or employees, wish to rush through life or to accomplish so much in the shortest space of time when they are aware of the risk they run, if we are to accept some of the reasons as advanced by railway officials as to the cause of accidents?

To the above question I would like to hear the opinion of some of our Brothers expressed in the columns of the JOURNAL. I consider it a very serious question, and one worthy of thought and effort.

Some railway officials condemn the labor organizations, giving reasons that seem to me very flimsy, claiming that the officers are compelled to keep in their employ men whom the company would be much better off with them out of the service than in it, but that these men are maintained due to the influence exerted by the union. My opinion of a man, especially a railway official, who would make an assertion like that to the public is that he is too narrow-minded, impractical, and utterly unfit to hold a responsible position as an officer of a railway, one of whose principal duties is the training and government of men, fitting them for the service and making them reliable and trustworthy, as the railways of this country require.

A competent, practical and experienced official systematizes his road, having a system for every movement, and sees that it is maintained, knowing that a perfect and practical system gives a sure result and makes reliable and trustworthy employees. Where a perfect system is

maintained there is no excuse for violation of rules or failure to perform a duty; and when such violations occur or failure to perform a duty, it is due to negligence or incompetency, and it is up to the official and not to the labor organization to settle the matter; and if common-sense judgment is impartially rendered and justifiable discipline properly administered, the organizations have no ground for interference. But railroads that have rules for the government of employees and the movement of trains and fail to enforce them according to their meaning, but have practices and methods relative to the same rules which give altogether a different result, are bound to have accidents, for they cannot systemize a road with a set of rules where the practices are so widely at variance with the rules; and where rules mean one thing and practices another, confusion and disorder reign and the opportunity to educate and train men to a standard of reliability is lost.

The two principal qualities which are essential to the successful railway employer are perception and comprehension. All employers are not largely gifted with these talents, and when not endowed by nature with them it is necessary to develop them by training, and this can only be done by a perfect system and the value placed upon their situations by the employees. If the officers have endeavored to make the situations of the employees as appreciable as they can, this would be a great incentive to employees to make the greatest effort to qualify themselves to give a satisfactory service.

Again, a road with such a reputation would have the advantage of selecting from those who made application for positions the highest types of the applicants—those who are of the higher order of intelligence and have the ability to become trustworthy. This element would certainly appear if the proper disposition towards employees was displayed, a disposition to treat them fairly and impartially upon business principles, appreciating the faithful performance of duty well done.

The idea of railway organizations inter-

fering with railway officials in conducting a road is preposterous. Any road on which an officer's time is so much taken up by committees in an effort to adjust grievances can be safely set down as a road whose officers are not as practical as they should be, a road that has not a perfect system, and consequently the employees are more or less imposed upon or unjustly dealt with; and an organization that would not resent an imposition or unjust treatment at the hands of an impracticable person or persons would not deserve the title that the B. of L. E. has earned.

Hoping to hear from some of the Brothers upon this question, I remain,

REUBEN.

Not a Good Place for Lung Troubles, but a Good Place to Live.

LOS ANGELES, CAL., Dec. 7, 1904.

EDITOR JOURNAL: If you will kindly allow me space I would like to express my views to the many friends and Brothers who read our valuable JOURNAL, on the inconsistency of people afflicted with that dread disease, consumption, leaving their homes and friends to come to the Pacific Coast, especially Southern California, expecting to effect a cure, or even to prolong their lives, for after several months of careful study, noting the condition of poor unfortunate beings who have left their eastern homes on a long journey to the land of flowers, some of them presumably by advice of their physicians, who know that they were past help and not wanting them to die on their hands. No doubt some of them have disposed of their belongings either by sale or mortgage for a nominal sum, only to meet disappointment and find themselves homeless, money gone and dependent on the charity of those whom they have no claim upon, sooner or later to pass away and be laid in the potter's field with no friend or relative to keep the grass green over their graves, or even follow them to their last resting place. It is no uncommon thing to see a funeral procession composed of the hearse, and one carriage containing the pallbearers, winding its way to some

place of burial with some unfortunate who has passed away without friend or relative to offer a word of consolation in his last moments. The secret organizations of this city certainly do honor to themselves whenever a member passes away, let him be from home or abroad. That also is getting to become a burden, but they continue to fulfill their obligation to a Brother with becoming fortitude.

My Brothers, those of you who have not had the opportunity to study the situation in person can hardly realize the condition of affair in this land of sunshine and flowers. There are great opportunities on this coast for healthy people who have a little capital to invest, outside of living in, I believe, one of the most congenial climates in our broad land. Consumptives should seek a climate where the air is light and dry; it is full of damp on this coast. As I said before, there are good opportunities here for healthy energetic people. With the opening of the Salt Lake Railroad and the Panama Canal this coast is going to see a revolution that will be a surprise to the most fastidious, up-to-date business man, and the young man that gets in on the ground floor will be able to pass his declining years in peace and luxury where all kinds of fruit and flowers are a continuous luxury.

To my Brothers and Sisters in the north and east, I know full well how to sympathize with you for the next few months, hugging the stove and paying coal bills, while I hug (not the girls) but the shady side of the street. If any of you should happen to get off the track and fetch up at Los Angeles, don't slight me, but call at the Hotel Palms, one of the pleasantest homes in the city. I won't promise to spread a banquet for you, but will try to make your stay pleasant. Having retired from railroad service after a varied career of thirty-seven years, I have no railroad news to impart, only that I called on a certain master mechanic near San Francisco and asked him for a job. He looked at me a few moments and said, "You are too d—d old for any use," turned on his heel for the roundhouse, and the engines were so thick and high I lost sight of him; the Brother that introduced me stood five minutes, more or less, then said (leaving out the strong language), "What do you think of that?" I said, "Maybe the next Congress will pass a law to kill us after we get gray or worn out in the service." I think I had better call a halt before the Editor kicks.

Fraternally yours,
C. R. GURNEY, Div. 419.

Engine Driver Snobbery.

HOBOKEN, N. J., Nov. 17, 1904.

EDITOR JOURNAL: In this month's number of the JOURNAL is a letter from Mr. J. S. Bell protesting against the use of the words "engine driver" by two New York papers. If Mr. Bell will pause a moment and think, he will remember that the New York *Herald* is so "decidedly English, you know," that it invariably speaks of our engine crews as the "driver" and "stoker." The New York *Sun* never hesitates to throw a slur on labor, particularly organized labor. Moreover, if Mr. Bell and I have in mind the same "prominent railway journal" which also attempts the use of the same misnomer, I want to remind him that the editor is a "canny Scot," who really can't see anything very good on this side of the pond, except the good American dollars.

Yours truly,
E. BURGOYNE, Div. 171.

The Guardians of the Passengers.

VINCENNES, IND., Dec. 12, 1904.

EDITOR JOURNAL: Probably most persons who have traveled by rail at night have had their thoughts turned to those who with their hands upon the throttle and scoop watch between them and death.

Often when the night has been black and boisterous with angry storms, or cold and desolate in midwinter, we have lain down in our snug berths listening to the clatter of the swiftly moving train, with a sense of security because we knew there were two noble men standing in the cab watching with vigilant eyes against danger.

There they are, gazing along the track, conscious that hundreds of lives are entrusted to their care, that these hundreds of sleeping passengers are resting calmly in the conviction that they will not fail to do their duty.

They are all strangers to them. At the stations while the train waits for the passengers to take their meals, none of them think it worth while to speak to these knights of the rail. They are going somewhere—they are—who knows even their names?

The conductor, brakeman and porter are brought more or less in contact with them and they know something of each other; there is a little mutual fellowship at least. But the engineer and fireman stand apart, their faces are begrimed with soot, their clothes soiled, and their hands are hard and unseemly.

On the road, after a long night of

travel, they are not an object of prepossessing appearance, and yet these men through the long hours of the night have faithfully performed their duty. Sober, cool and vigilant they have brought their charges to the end of the journey in safety.

The travelers scatter to their homes or pass on to other scenes, praising the railroad for the admirable system of their road and comfortable accommodation afforded; while perhaps the greater portion give not a thought to the brave engineer and fireman whose faithfulness guarded them from accident and death.

There are obligations between man and man which can never be compensated by dollars and cents, let the pay be just and liberal, but let there be likewise a remembrance that they, the loyal engineer and fireman, have risked their lives for us, and a prayer for the benediction of God be upon them. Fraternally yours,
W. M. S. HINDS, Div. 289.

the time our contracts allow us for rest. More than this, the man who spends his time off duty browsing around the streets or at the race track or gambling when he ought to be asleep, is just as unsafe as the one who stays on his engine long hours to make a large check. Think of a man who tries to make 5,000 or 6,000 miles a month in freight service, and then when his dulled mind stumbles into some trouble bellowing about his hard luck or of unjust discipline.

The cost of living in the last few years has increased very much faster than our rate of pay, and very many of us are trying to keep up our standard of living by making more miles than ever before.

Get a November copy of the *Review of Reviews* and read this article very carefully for yourselves.

HENRY M. REECE, Div. 339.

Statutory Regulation of Hours in Train Service.

RALEIGH, N. C., Dec. 6, 1904.

EDITOR JOURNAL: There recently appeared in the *Review of Reviews* an article by Edward A. Moseley, Secretary of the Interstate Commerce Commission, on railroad accidents in the United States, which would be profitable reading for every man in railroad service, and especially to the men in train service, as well as the officials directly charged with regulating this service.

We do not know what experience Mr. Moseley may have had in railroad life, but some of the conclusions he reached are of prime importance to us who go to make up the train service. His proposed reforms are divided into seven items, of which the third is one to which I desire in this letter to invite especial attention. In it he suggests the introduction of rigid laws governing the hours of labor of railroad employees engaged in train service.

How often do we allow our greed for a large check to send us out on the road when we well know our physical condition is not such as to give the service the railroad company has a right to expect, and how many of our ranks have lost their limbs or lives by reason of a dulled brain caused by long hours on duty, misreading an order or overlooking a train!

If traced to their first cause, no doubt very many of the delays, broken drawtimbers, slight derailments, etc., involving small cost, are fairly charged to this reason also. We can largely correct these things ourselves by *all* insisting on having

Railroad Employees' Home.

Perseverance.

BY GEMINI.

Agone the old year, with its care and its sorrow,
 Its pleasure, which never to us shall return;
 No thought for the past, we but hope that the
 morrow
 Will far brighter prove as of new joys we learn.

The past has been pleasant, the present is sweeter,
 The future new pleasures of life may reveal;
 As older we grow, time scampers on fleetier,
 'Till age's cold finger upon us we feel.

The future now beckons, with witching endeavor,
 To charm us, but still we her face cannot see.
 A mist hides it o'er. Will it do so forever—
 Will life's pathway ever thus overshadowed be?

No! no! Perseverance will yield us the wages
 Which she only pays to the workers who strive;
 No sluggard she e'er to her service engages.
 Press on! till at last we in safety arrive.

Arrive at the goal where fair laurels are waiting,
 Where honor and glory our portion will be;
 Where anthems of melody, new joy creating,
 Rise and go forth, heavy laden with gle!

Happy New Year to All.

FRATERNAL SISTERS: We have been so busy since our return from the land of

flowers that time has flown away as if on wings. The thought that it is time for Christmas and New Year greetings comes as a shock that startles us into a realization of the things that are.

Our organization has grown to unexpected dimensions, and as we review the records of our Subdivisions we feel that the members have advanced *with* the organization, and are better fitted for the duties of this life by the associations that result from organization. Since the convention we have added to our chain twenty-two links, which are as follows:

- Div. 324, at Fort William, Ont.
- Div. 325, at Great Falls, Mont.
- Div. 326, at Columbia, Pa.
- Div. 327, at Hillyard, Wash.
- Div. 328, at Tamaqua, Pa.
- Div. 329, at Council Grove, Kan.
- Div. 330, at Trinidad, Col.
- Div. 331, at Roanoke, Va.
- Div. 332, at Philadelphia, Pa.
- Div. 333, at Lorain, O.
- Div. 334, at Du Bois, Pa.
- Div. 335, at Allentown, Pa.
- Div. 336, at Yoakum, Tex.
- Div. 337, at Belleville, Ont.
- Div. 338, at Staples, Minn.
- Div. 339, at Kern, Cal.
- Div. 340, at Trenton, N. J.
- Div. 341, at Creston, Ia.
- Div. 342, at East St. Louis, Ill.
- Div. 343, at Burlington, Ia.
- Div. 344, at Champaign, Ill.
- Div. 345, at Logansport, Ind.

We congratulate ourselves that this is the best growing record the order ever made in the same length of time. We hope the good work will go on until every Division of the B. of L. E. has an Auxiliary and every Brother's wife becomes personally interested in the Auxiliary.

I have been greatly interested and pleased with the letters written by our Sisters for our department of the JOURNAL, and hope they will continue the exchange of thought on subjects of interest to the order.

At our late convention the subject of insurance claimed our most earnest attention. The thought that we must provide against heavy assessments in the future by changing our present system was presented to us. We as a body were unpre-

pared to decide so important a question, so it was left until later. Meanwhile we must think, study and plan for this feature of our order, which we prize so highly; bearing in mind that that form of insurance is best which, for its proper continuance, takes the least amount of money from our members.

When V. R. A. officers present their views through the pages of our JOURNAL, as I hope they will in the near future, do not hesitate to ask questions and express your views; it is for the benefit of each member. Remember every member is a shareholder in this institution and should shoulder her share of the responsibilities.

Our V. R. A. is a very important feature of the Auxiliary, but not the most important. I hold that the fraternal tie is the tie that binds true hearts together. It elevates us above the selfish desires that are so human and makes us feel a nearer kin to God.

We realize that the strength of our order is in the members individually. We know the temptations to discouragement are many, and the member who resists them is the winner of many battles. We urge you to keep up the struggle until every member of your Division will strive to help another up the hill of life before thinking of her own elevation.

Before these lines go to print Christmas will have passed. Allow me to express the hope that yours will be a merry one and that the coming year may be full of blessings. Full well we know that—

" Into each life some rain must fall,
Some days be dark and dreary,"

but if we strive to brighten the lives of those who are under the cloud, our sky will clear and we will reap the harvest of a mind at ease.

Yours earnestly and fraternally,
MRS. W. A. MURDOCK, G. P.

"A Happy New Year."

This is a greeting which is not bounded by latitude or longitude, and there are few places in the civilized world where it is not annually heard.

In all sincerity I join the great host of

well-wishers and extend to our many readers a salutation which has for centuries been the expression of feelings of friendship and good-will.

Standing on the threshold of the New Year, there is something pleasant, and yet something sad, in "thinking of the days that are no more."

The threads that run through the web of life are of many colors. Last year there were welcomes and farewells, smiles and tears, sunshine and darkness, successes and failures, encouragements and discouragements.

But if it be true that "the best of prophets of the future is the past," we can each learn something from our past experiences that will better fit us for the duties of the coming year.

So, when the year is dying and the midnight bells "ring out the old, ring in the new," let us, like the god Janus, from which the month of January is named, look forward as well as backward, and by the light of past experience accomplish more than we have ever done, not simply by diaries and resolutions, but in the consciousness that "a life spent worthily should be measured by a nobler line—by deeds, not years."

Let us all join hands and hearts and make for each other a "Happy New Year." M. E. CASSELL, G. V. P.

Voluntary Relief Association.

As we stand at the entrance of the New Year with the salutations of joy and peace still ringing in our ears, we naturally ask, "What next?" The Book of 1904 is closed, the transactions and records cannot be erased. Whether they have been to our credit or disgrace, each will learn, for results return to remind us of the wisdom or weakness of every act.

Our only *real* successes are measured by the degree of self-mastery we have attained; and if we have reached any peaceful and spiritual height, it has been through honest and upright endeavor to do justice to all. As far as any of us have placed self first, regardless of the rights and needs of others, in the same degree

have we built a rotten foundation which will not serve in a permanent structure. This rule for growth for the individual holds good when applied to club, lodge, or church.

As members of the V. R. A. we have reason to be thankful for the degree of prosperity which is ours. In one year we have gained two-thirds as many new members as in the two years previous, and though there have been more forfeitures than we desire, the net increase is encouraging. The laws enacted last May are, as far as can be judged, a great improvement and when thoroughly understood by all, the machinery will work with less friction than ever before.

This year will be the most important in the history of the Association, because for the first time the delegates have referred a question, viz: "Rating of assessments according to age," and next fall the members will vote upon it.

The resolution recommending the adoption of age rating was made not as a passing thought or fad, but after a careful study of conditions.

After medical examination and age limit were required, confidence in the V. R. A. was strengthened and though it was prophesied that no one would join, a larger number of applicants have asked admission than ever before; and the result has been most salutary.

But now another fact confronts us—a rapidly increasing death rate—1904 having recorded an increase of nearly 70 per cent over the number found in 1903. The question, "What causes this?" is most pertinent and the answer is that as the average age of the members increases, the death rate increases also.

There is no need for a panic over this matter, the V. R. A. never was in such good condition as today, but it harbors a system of assessing which, in time, will ruin the Association. It works in a circle as follows: The average age increases; more deaths follow; more assessments must be called to liquidate the claims; more forfeitures will result which nearly always occur among the younger members; this increases the age

average and decreases paying members, so again we must increase the number of assessments called in order to pay claims.

After the above is repeated enough the result will be a membership composed of those who are too old to join other associations, the death rate will be so great and consequent assessments will be so high that no one can pay them. Then *will follow* the inevitable.

Age rating aims to assess each one according to the burden her membership brings the association, thus bringing justice to all, and the sooner the V. R. A. substitutes such a system for the present unjust one, the better.

I urge each Division to cause this article as well as transactions of convention, pages 245 and 246, to be read in open meeting, and some time be devoted to discussion.

I will be pleased to answer all questions asked by individuals, or better still, by Divisions, where my letters could be read aloud and discussed.

Each member should enlighten herself on this subject that her vote may be intelligent and thus bring the greatest strength and prosperity to our beloved order.

"The world advances, and in time outgrows
The laws that in our fathers' days were best;
And, doubtless, after us some purer scheme
Will be shaped out by wiser men than we,
Made wiser by the steady growth of truth."

MARY L. ROBERTSON.

A New Year's Wish.

Dear, eager little boy,
With many an earnest plan
For the slowly coming years,
When you shall be a man.

Do you wish the years to fly
As you are growing tall?
Feet and inches only make
A big boy, after all.

It is not strength of muscle,
It is not man's attire;
No! 'tis something nobler far,
That brings what you desire.

'Tis firm and loyal purpose
To stand by what is right—
The gentleness that helps the weak,
True mark of noble knight.

The courage when the truth demands
To take the losing side,
The kindness to defend the oppressed
And see them justified.

The will to serve your brother's need
In whatever way you can—
'Tis this, my boy, that you desire,
For 'tis this to be a man.

And so my New Year's wish shall be,
May you the time employ
To form a character that makes
A noble, manly boy.

P. M. A.

Grievance from Canada.

TORONTO, NOV. 28, 1904.

Some time has elapsed since Div. 161 has contributed anything to the pages of the JOURNAL, but the fact of being silent so long makes us none the less active. In fact we are kept quite busy struggling along by ourselves. We regret very much that our Grand Officers do not think it worth while to visit, cheer and encourage us. We feel that this is not as it should be; we help support the Grand Office, and feel we are entitled to a visit from them at least once a year without being invited. True, we have the Fourth G. A. V. P. and she is doing splendidly without the least incentive to help her. Not many can or would be willing to leave home at any time when there is nothing in it to recompense them for the time and trouble, while those who receive salaries do not come near us. We do not forget the fact that Canadian Divisions are in the minority, but if there were an incentive for a Sister to go about and work and visit there would be many more in a very short time. Last week we received copies of the new by-laws and report of Convention. On reading them over we noticed a woful lack of consideration for Canadian Divisions. I always understood our society was international, but when a vote had to be taken whether we receive the most minor office in the list of Grand Officers we consider we weren't even shown courtesy, not taking our rights into consideration in the least. We have had many visitors since Convention and the same questions have been brought up. We have arrived at the same conclusion that as our

just due we are entitled to more than the most minor office as well as a voice in Executive Council. I trust before next Convention we will have many more Canadian Divisions, and at that Convention our interests will not be entirely overlooked. We are not writing up this article for controversy of any kind, simply for the rights of Canadian Sisters and Divisions. Trusting Sister Edithess will not consign this to her waste basket we remain,
Sincerely yours, CANADA.

A Bazar Description.

When Div. 33, Moberly, Mo., does anything out of the common, she wants her Sister Divisions to know it. She does not believe in "hiding her light under a bushel." Query—why a bushel—that always puzzled me. Wonder if no other article would do as well to hide it under. Well, the one thing we are especially proud of now is, that we have a \$300 piano bought and paid for in the last year by entertainments. The last payment was made in November, from the proceeds of a bazar. This was rather a unique affair, and as we are always glad to get new ideas for entertainments we very naturally conclude you are also, I will tell you about our bazar. We had booths representing the six working days of the week, and in each one were articles for sale, appropriate to the day represented. Monday, washing day, this booth was very little decorated except with clothes pins. There were for sale clothes pin aprons, laundry bags, gingham aprons and soap; refreshments, sandwiches and coffee. The Sisters presiding were dressed in the costumes of the day, with sleeves rolled up, kitchen aprons and no collars, too much hard work for frills on blue Monday. Tuesday, ironing day, was all trimmed in white, for tables, patent ironing boards draped in white and for sale with small nickel-plated shirtwaist irons and stands, waxers, ironing aprons, holders, etc. Popcorn was the refreshment served. The ladies wore dark dresses, white caps and aprons. Wednesday, mending and darning day. This booth

was, perhaps, the most handsomely decorated. Two shades of green crepe paper formed festoons and rosettes, and tiny gourds used as darning balls were strung and festooned all over the front of the booth, some plain, others striped, bright and dark green, and yellow and green. Suspended from the sides were two pretty fancy work baskets, flowers were in profusion, stocking bags, housewives' needle cases, work bags, etc. were on sale. Cider and gingerbread formed the "piece de resistance." Thursday, reception day. The ladies were handsomely attired to receive their guests, to whom they served chocolate and wafers. Here all the fancy work pieces, such as pillows, point lace handkerchiefs, dresser scarfs, and all the other dainty articles were on sale. The decorations were also fitting to the day. Friday, sweeping day, the ladies were attired in sweeping regalia, having donned dust caps and white aprons, and having these for sale, also cheese cloth dusters stitched in colors. They served cake and cream. A large grab bag was found here which gave amusement to young and old. Each lady in the Division contributed several articles to this, and it was understood each article was to be worth 5 cents, the sum charged for a grab, and every one got his money's worth, and many much more than this. Saturday, baking day, was the most loyal of all, for they decorated in the colors of the order, purple, blue, red and white. Here was sold home-made bread, cakes, pies and jumbles, and oyster stew, celeri, pickles and coffee were served. I do not know whether it runs in the R. R. line to be good cooks, but it surely is so here. The general committee, Sisters W. A. Flowers, J. C. Eagen and W. P. Carlisle, worked very hard for the success of the bazar. They divided the lodge into six sections, each to work for the day it represented, and all did well. The Sisters donated the fancy work, and home-made bread, cake and pies, but all other expenses were paid from the proceeds, and we netted \$78. The Brothers assisted and patronized all the booths, and went away full and thankful.

Hope I have not been too lengthy in my description, but if I have I am like the old man who very much desired something, and decided, at last, he would pray for it. After fervently beseeching for the boon he craved he added, "Oh, Lord! I am not like some people, *always* pestering you, and if you will hear my prayer and grant my request, I promise *never* to bother you again." So, print this, and I promise not to bother you again, anyway until next time.

COR. SEC. DIV. 33.

Protection.

The divine principle of protection has a deeper significance than any other on which our social fabric is reared, except perhaps love. The word protection implies more than self-preservation, the so-called first law of nature, for it is as broad as the world in its scope. It is instructive in the lower orders of life, it is the first impulse of the painted savage, and is the governing thought of the civilized mother whose life is centered in the protection of her helpless babe. The working of the beautiful sentiment is seen at its best in the home and loved ones, where the devoted father is toiling for their protection. Communities are organized for the same purpose, and so on to the great banding together of people into a nation in which protection is had by being prepared to resist the aggression of other nations, the needed protection being furnished by well equipped and manned armies and navies. The record of our own United States in this respect stands pre-eminent, not in point of numerical strength of its navy, but in the brains on the bridge and behind the guns. Our 1,600 ton battleships are a guarantee that we shall be protected on the sea, and we know too well of the prowess of our boys in blue to fear for protection on our free soil. A protection every American citizen is proud to feel he will have wherever the stars and stripes are unfurled. President Roosevelt, at the head of our happy and prosperous people, has given us the best of proof that our interests shall be protected, by wearing the uniform and

fearlessly engaging the misguided Spaniards when our protection of down-trodden Cuba was resented. In the council halls of the nation are the representatives who are constantly framing legislation for the protection of the interests of all. The same is true of all of our representative bodies, and is well exemplified in the efforts of the President of our G. I. A., who is doing such a splendid work for our organization and our protection. It is also true of our loved ones at the throttle, who have not only a care for their own protection but that of those on the train behind them; and also the wife and little ones at home.

Protection may be said to be the bulwark of our existence as a people, since without it the weak would go down before the strong, and our tenure of life as a nation would be problematical. The proof that it is God's gift is seen in the protection of a loving Providence.

MRS. A. H. WALES, Div. 274.

From East to West.

I.

There comes one day a fairy bright
And laid within my hand a gift.
" 'Tis a talisman of love," quoth he,
" At sight of which all gates will lift;
Go hie you away to the sea."

II.

I turned my face towards set of sun,
With gift close clasped in hand;
" For sure," said I, " 'tis salt in the air
The west wind brings from over the land,
From shore of distant sea so fair."

III.

I sat me down in coach that was fine,
Drawn by steed of fire and steam,
That wheezed and puffed, groaned and moaned,
As through the night it sped with scream,
Carrying me farther and farther from home.

IV.

In the morning light I caught a glimpse
Of the world just waking from out its sleep;
The soft wind waved the grain and corn;
There were cattle in pasture, flocks of sheep,
And homes that sheltered loved ones from storm.

V.

As I journeyed on and the nights went by,
Each morning the scene it changed for me;
There was less and less of the peace of man,
Of grass and grain and green of tree,
But more of the part when life began.

VI.

Cactus and sagebrush, far-reaching sand,
Rocks piled up till they reached the sky;
The snow it glistened with silver sheen,
Under the light of the sun hung high,
On crest of mountain that stood supreme.

VII.

As I gazed afar o'er hill and plain,
The desert bare, and mountain high,
Vaster and vaster it seemed to grow,
Nearer and nearer God came nigh
Till my very soul at his feet lay low.

VIII.

At last, one day, I was waked from my dreams
By a shrill voice calling " Roses cheap!"
Quickly I raised the window wide,
And buried my face in their fragrance sweet
As swiftly we sped down the mountain side.

IX.

Into the valley of pure delight,
Of fragrant flowers and fruit of gold,
Where nature her banners of color unfurled,
And wove them into beauty untold
Down into the garden of the world.

X.

How was I greeted in that far off land,
In that wonderful city with heavenly name?
" Smile in a glass, 'twill smile back at you;"
Friend and foe gave me welcome the same,
And the legend of old to me was proved true.

XI.

The sun it shone with a golden light,
The ocean's breath was like new made wine;
The green waves broke, then rolled to my feet,
I dipped my hand in the salt sea brine,
And my heart was filled with joy complete.

XII.

For I had reached at last the distant sea,
I had drank my fill of pleasure sweet,
In the land that is set like a gem where the tide
Comes in from distant shores to greet
The sun-kissed hills it rolls beside.

LOUISA TUTTLE ARMOUR.

A New Division in Virginia.

One more Auxiliary has been added to the list of our fast growing prosperous Order, and happy indeed are its members to tell you that it is located in Old Virginia, at Roanoke, the headquarters of the Norfolk & Western Railway.

About a year ago Div. 301, of B. of L. E., moved to this place from Radford, where it had always been located, having as its members the Radford Division Engineers of the N. & W. Sister R. B. Adams, at the request of several of its mem-

bers, decided to help them to have an Auxiliary at this point (one having been previously granted at another place), so with Sister Derflinger, wife of F. A. E., and several others, withdrew from 68 to organize the new Division, and after two months of watching, waiting and corresponding, the Grand President granted us a charter, so Div. 331 comes into the ranks, having been named Vena Adams, for the only daughter of Bro. R. B. Adams, who is Chief of 301, and Sister Adams, who was formerly Grand Sentinel of the Order.

By request of our Grand President we were organized by Mrs. John Carlin, of Creve, Va., assisted by Sisters Jones of 87 as Marshal, Cahill of 68 as Secretary, and German of 68 as Chaplain, to whom we return many thanks for helping to make our organizing day a success. Much credit for the new Division is due to the untiring efforts in our behalf of Brother and Sister Derflinger, also Bro. Glen Smith, and we would be ingrates indeed if we did not make mention of the fact that the money for our charter was given by Bros. Stott and Koontz. We are very proud of the fact that we have so unanimously the good-will of our Brothers, and sincerely hope that we may grow in their esteem and always deserve the confidence that has been given us, and that we will be a credit to our noble Order and the Grand President, who saw fit to entrust to our keeping the much prized charter under which we work. Thanking you for space in your deservedly popular pages, and promising to let you hear from us again, I am sincerely yours in F. L. and P.

MRS. ROBERT SPANGLER,
Secretary Div. 331.

Division News.

It has been quite a while since anything has been heard from Golden Heart Div., 222, Norfolk, Va., and I thought I would tell the Sisters that we are doing nicely. We have lately had four new members to come in, and all seem interested in the work.

On Thursday, November 3, we spent a most delightful as well as profitable day with Rock Castle Div., 87, Crewe, Va. Leaving our homes at 7:40 we arrived in Crewe at 11:45, and were met at the depot by Sister Carlin and many of the ladies, who escorted us to Mrs. West's, where we rested and chatted until dinner was announced, and, Sisters, it was a dinner long to be remembered, everything being served in the most tempting way to suit even the most dainty epicure, and saying we did it ample justice would be putting it mildly. Dinner over and it being time for the meeting, we all went down to the hall. We then proceeded to go through all the work, and the time came all too soon for leaving. We returned to Mrs. West's for supper, which we thoroughly enjoyed. Having only a little while left we started for the train, arriving home all right and on time, counting it one of the happiest and best spent days of the year.

SISTER H.

DIVISION 293, Hoisington, Kan., has long been silent, as we have been organized nearly two years, this being our first introduction; being such we hope it will appear in print to the readers of the *JOURNAL*, thus escaping the waste basket. We have a very congenial Division, each one working in harmony with the others,

and meeting regularly. Our membership is small as is also our town, but some day expect more members as we have several bachelor Brothers who seem to be contemplating matrimony.

Have had several socials to replenish our treasury, for our motto, Charity, is ever in the minds and hearts of Div. 293. Have also had social functions which were enjoyed by the families of our Division.

The last event was in the nature of a surprise on our worthy President, Sister Mary Gleadall. The ladies and their families met at the residence of Sister Anderson, our very efficient Guide, and then proceeded to the home of Sister Gleadall.

In the darkness one would have thought the crowd was a pack of howling Indians, but when the doors were thrown open and the electric lights turned on Sister Gleadall recognized her friends in various characters. The organ-grinder was there playing the famous songs of the streets; women from the Orient with loose robes and flowing sleeves; the tramp was on hand with his wife and five children starving at home; the ever-crying newsboy made his appearance selling copies of the *Hoisington Dispatch*; Aunt Catharina on her way to the World's Fair, and the "Dutch Heiress," with her friend, the "Dude," produced a great deal of merriment. The evening passed pleasantly with games and music until 11 o'clock, when a bountiful supper was served.

After all were seated our genial Sentinel, Sister Goodwin, arose and in a few well chosen words presented our Sister hostess with a beautiful crescent pin set with garnets, as a token of appreciation for her interest taken in the Order.

About midnight the crowd decided to adjourn, and yet they lingered as if unable to break away from a scene of so much mirth and happiness; finally with one great effort they gathered up organ-grinders, band-boxes, newspapers, umbrellas, music boxes and various other articles and bade Brother and Sister Gleadall good night, wishing them a safe and pleasant journey to the World's Fair city.

MARY HEATH, Sec.

W. W. WILLIAMS, Memorial Div. 266, Rock Island, Ill., has been silent for some time, not because we have nothing to say, as we could write a large volume if we should tell all we have done in the last year and all to a purpose. Although we are not large in number we are great in self-esteem, and always accomplish what we undertake. Last December we held a sale of fancy and useful articles which increased our treasury several dollars. Although a note of thanks was sent to each one we wish again to thank each Sister Division who so kindly donated to our sale. Later on we had a card party in B. of L. E. Hall, at which we served refreshments, which netted us a neat sum.

In August we held our annual picnic on Campbell's Island. The day was perfect, and as many of the Brothers who could, joined us, and as the Sisters are all good cooks it is needless to say our tables were laden with good things to eat, which was heartily enjoyed. As evening came we wended our way home, all saying they were glad to have been there and hoped we could repeat it next year. On November 4th we held an apron sale and served refreshments, and realized a nice sum. The only trouble was we did not have aprons enough for the demand, although we had a large number to start with.

Once a month we hold our sewing circles at each other's homes, much work is accomplished, besides the good cheer it brings and increased sociability. On November 5th the Sisters planned a neat surprise upon the Brothers of Div. 60, which was triumphantly carried out. After their meeting their Chief, Brother Arnold, who was let into the secret, gave us permission to be admitted. We had all gathered near by and when the signal was given we were admitted, and all filed in the hall headed by our President, Sister Arnold, who carried a mysterious looking package. The Brothers looked rather amazed, as none of them had an inkling what was to take place. When Sister Arnold, in a graceful manner, presented them, in behalf of the Sisters, a handsome set of new regalia, words were inadequate to express their surprise and de-

light. Brother Arnold, in behalf of the Brothers, in a felicitous speech accepted the gift, and before equilibrium had been restored Sister Carl Williams, in behalf of the Sisters, in a neat manner, presented Sister Arnold with a cut glass berry dish as a small token for her untiring effort in behalf of the Division. To say that Sister Arnold responded, it was almost impossible, but actions were louder than words in this case, being another complete surprise. Another surprise was in store for the Brothers when the Sisters brought forth a dainty lunch, which was heartily enjoyed. After a while spent in sociability all left for their homes, hoping the Sisters would call again, disproving the old theory that a woman could never keep a secret. Yours in F. L. and P.,

Sec. Div. 266.

It is a long time since Passumpsic Div., 81, Woodville, N. H., has been heard from, but if we have been quiet we are still alive and prospering, and hope to continue so.

November 8 we gave a supper and dance in Division Hall from 5 to 7:30. Clam chowder and other good things too numerous to mention were served, and our Sisters received many compliments on cooking and serving the supper.

At 8:30 came the grand march, led by Past Chief J. W. Buckley, of Div. 572, B. of L. E., and Mrs. Cummings, wife of G. E. Cummings, Superintendent of White Mountain Division, B. & M. R. R. Madam Brock's orchestra, of St. Johnsbury, Vt., furnished good music, and dancing was enjoyed until a late hour. Ice-cream and cake was served during the evening.

After all the bills were paid we had \$37.50 left to put in our treasury, and I assure you we felt quite proud.

The committee having charge of the entertainment were untiring in their efforts for all to have a good time, and that they succeeded was very evident, for it was a very nice, quiet party and all enjoyed themselves. Such an entertainment means lots of work, but the members of Div. 81, Woodville, N. H., are willing to work as well as play.

Yours in F., L. & P., J. E. B.

A DELIGHTFUL surprise was tendered our President, Sister Noleman, by Div. 84, Springfield, Mo., on July 16, it being her birthday. A good many of the members, with their husbands, were in attendance, and a general good time was enjoyed by all. The most pleasant feature of the evening was the presentation to Sister Noleman of a beautiful jardiniere and pedestal, after which refreshments were served to about fifty.

Bright and early on July 20 two large wagonettes, filled with Division members and their husbands and children, wended their way to Mount Pizgah, where a most enjoyable day was spent and two hearty meals eaten on the beautiful picnic grounds. The children were especially delighted with the privilege of wading the creek, and two older ones we know of indulged in the pleasant pastime, too. Just ask Sisters Burns and Du Buque if they know who they were.

On October 11, it being our regular meeting day, Sister President called us to order, and was conducting the order of business when a fierce alarm was sounded at the outer door. The Sentinel came in with a frightened look and announced that the hall outside was full of Brothers demanding admittance. She was instructed to admit them, and then Sister President inquired: "Why this intrusion?" Chief Noleman, of Div. 83, responded in his happy manner, and informed us that they had come laden with best wishes, good will and an abundance of ice-cream and cake. Bro. Martin brought along his splendid phonograph and furnished delightful music for our entertainment. Welcome, Brothers. Come again.

Just one word for our Sewing Club before closing. Our year for 1904 closed November 8, and this is what we have accomplished: About \$57 was given to charity—\$10 to the Widows and Orphans' Home, \$10 to the Highland Park Home, and the balance to home charities; and \$25 we have in our treasury. This we consider a good year's work, all under the able management of Sister Noleman and her efficient assistant, Sister Fitch.

SENTINEL, Div. 84.

LEHIGH Div., 321, Lehigh, Pa., asks for space in the JOURNAL for the first time to show our sister Divisions what we are doing. We were organized last April, with sixteen members, and we are still taking in others.

We enjoy our meetings, and too much praise cannot be given Mrs. Geo. Riley, of Mauch Chunk, Pa., who organized us, and who has kept her watchful eye upon us, often visiting us and giving us encouragement and instruction. We enjoy her visits, and also the visits of all the Sisters of Div. 80. We are a young Division and need helpful words, which are always appreciated.

May all our sister Divisions have continued prosperity, and may we all work for the good of the order.

SEC., Div. 321.

THE ladies' sewing circle of F. S. Evans Div., 99, held a sale and supper at Engineers' Hall, Boston, Mass., November 19, which proved a success and added a neat sum to the treasury. The fancy table contained many useful as well as ornamental articles which found ready buyers. The mystery table contained many mysterious looking packages which netted a neat sum as did also the table of salted peanuts, corn balls and various sweets. The dainty handkerchief donated by the President of the Division, Mrs. Annie Batchelder, was drawn by Mrs. Minnie Cobb. The handsome sofa pillow fashioned by the willing hands of Sister Hathaway's daughter, Mrs. Annie Moore, was drawn by Mr. Davis, and the substantial looking blankets were drawn by Mr. Bruce. The piano was presided over by Engineer Charles Fisher's daughter, Miss Lizzie Fisher, who handled the keys with skill, showing her practice and experience as a fine pianist. Miss Woodman favored us with dancing as did also Sister Chase with her fancy steps. Old-time dancing was indulged in until a late hour, Miss Fisher furnishing music for the same.

INSURANCE SECRETARY.

Div. 21, Atlanta, Ga., of the G. I. A., sends greetings to all sister Divisions and

wishes to give a short account of some of the work we have accomplished and some of the entertainments which we have had during the last six months. In the summer we had two lawn fetes, later a rummage sale, still later simultaneously on the evening of Oct. 21, Sisters Mayo and Ray gave a candy pulling at their homes in different sections of the city. These were for the pleasure of the children and the benefit of the G. I. A. Both were complete successes. I will add that all our money-making schemes have been successes; but don't think, Sisters, that the almighty dollar is all that we are striving for. We use it as "the means to an end," for many hearts and many burdens are made lighter by kindly ministrations, and help in time of need from our beloved order.

We have just received a stimulus to do even better than we have ever done, for our first President, Sister Jas. S. McKibbin (now President of Div. 128, of Indianapolis, Ind.), has been with us again after an absence from our city of over twelve years. She came back to us with such love and enthusiasm for the G. I. A. it positively inspired us.

On the 6th ult., from 8 to 5 P. M., our Grand Guide, Sister Chas. H. Weekley, gave a reception in honor of Sister McKibbin. The day was perfect. About two hundred called to pay their respects to her charming guest. Sister Weekley was assisted in receiving by Miss Annie Williams and Sisters McKibbin and Scribner, President of Div. 21. Chocolate, cakes and mints were served in the dining room by several pretty young ladies gowned in white. The color scheme of the dining room, yellow and white, was effectively carried out in chrysanthemums and butterflies. Butterflies were suspended in the air and everywhere, and as a pleasing souvenir of the occasion, a tiny hand-painted butterfly was pinned to the shoulder of every guest. Fine music added to the charm of the occasion.

ON THE night of the 16th ult., Div. 21 also gave an entertainment in honor of

our first President at the spacious and lovely home of Sister J. D. Kitchins.

The novel feature of the entertainment was that every guest was given a tiny bag containing twenty-four beans, and whoever could make another say "yes" to any question could claim a forfeit of a bean. When a certain time was up and the beans were counted it was found that Miss Laura Welch had been more successful than anyone else in getting men, maids and matrons alike to say that little word to her; in fact no one could say her nay, and to her the prize, a Gibson picture, was awarded.

Music, flowers, refreshments and genuine hospitality all tended to make the evening delightful. Before it ended our President, Sister Scribner, in behalf of Better Half Div., 21, presented to Sister McKibbin a souvenir spoon. She was so surprised that for the time being she was speechless, but at our next meeting she gracefully and feelingly thanked us all for our little gift.

By invitation she told us about the study club of Div. 128 and how they met at the homes of different Sisters once a month, and after finishing the program light refreshments were served and then a plate was passed around on which every Sister was expected to place a dime. The refreshments were very simple and were prepared and the expenses defrayed by several Sisters so that it would be very easy for each Sister to do her part. She also told us about the ladies of their Division going to their hall occasionally and spending the whole day there in a very informal way. Each brought some one article of food and they invited their husbands and children to call on them there and have luncheon with them. Those "all day meets" as she called them she said brought them more closely together. We felt that her talks were for the good of the order.

Hoping I shall not take too much of your valuable space and wishing the Sisters one and all a happy and prosperous New Year, I am,

Yours in F., L. & P.,
COR. SEC., Div. 21.

G. I. A. Voluntary Relief Association.

TOLEDO, O., Jan. 1, 1905.

To Division Insurance Secretaries, V. R. A.:

You are hereby notified of the death of the following members of the Association, and for the payment of these claims you will collect 50 cents from each member carrying one certificate, and \$1.00 from each one carrying two; providing, however, that no one be assessed on a certificate, if the application for same was dated later than November 30, 1904.

ASSESSMENT NO. 189.

Died Nov. 11, 1904. Sister George Brow, aged 63, of Div. 17, Detroit, Mich. Cause of death, aortic insufficiency. Carried one certificate, dated May 21, 1892, payable to Grace B. Graham, granddaughter.

ASSESSMENT NO. 190.

Died Nov. 19, 1904. Sister Sadie Hadlock, aged 50, of Div. 143, of Elkhart, Ind. Cause of death, organic heart disease. Carried one certificate, dated May 1, 1902, payable to Claire and Blanche Austin, daughters.

ASSESSMENT NO. 191.

Died Nov. 23, 1904. Sister Ida G. Clement, aged 43, of Div. 143, Elkhart, Ind. Cause of death, cancer. Carried one certificate, dated Aug. 29, 1898, payable to Walter E. Clement, husband.

ASSESSMENT NO. 192.

Died Nov. 30, 1904. Sister Joanna Godfrey, aged 49, of Div. 45, Somerset, Ky. Cause of death, acute tuberculosis. Held one certificate, dated July 10, 1901, payable to Veronica C. Godfrey, daughter.

ASSESSMENT NO. 193.

Died Nov. 9, 1904. Sister Pearl Shambow, aged 29, of Div. 37, Little Rock, Ark. Cause of death, appendicitis. Carried one certificate, payable to Geo. T. Shambow, husband.

Members will pay their Insurance Secretaries on or before Jan. 31, 1905, or be marked delinquent; in order to reinstate must pay a fine of 10 cents on each certificate besides the delinquency. Insurance Secretaries must forward to General Secretary and Treasurer not later than Feb. 10, 1905, or stand delinquent till remittance is made.

Assessments Nos. 191, 192 and 193 will be paid from the Fund.

Members in good standing Nov. 30, 1904, forty-seven hundred and eighty-eight in the first class, and nineteen hundred and eighty-five in the second class.

In notifying the General Secretary of the transfer of a member from her Division, the Insurance Secretary should state date when transfer card was granted, By-laws page 87, Section 7.

Some Divisions, beginning with No. 1, have been notified to send in certificates for rewriting, according to action of late convention. Several months will be required to complete the task, and each Insurance Secretary will receive instructions in time to make collection.

MRS. GEO. WILSON, Pres. V. R. A.

MARY L. ROBERTSON, Gen'l Sec'y and Treas.

Contributions for this department must be received by the Editor on or before the 12th of the month to be in time for the succeeding issue.

New York Duplex Air Pump, No. 5.

BY R. H. BLACKALL.

Figs. 1 and 2 illustrate a new pump gotten out by the New York Air Brake

Company. It is especially designed for the long freight air trains of today, and it is claimed that this pump will supply sufficient air for air trains made up of the new 10-inch equipment, also for the usual parasites found on the engine.

It will be noted that this pump is the same as their other duplex pumps as to its operation, since no material changes have been made along this line. There are, however, several changes made in the con-

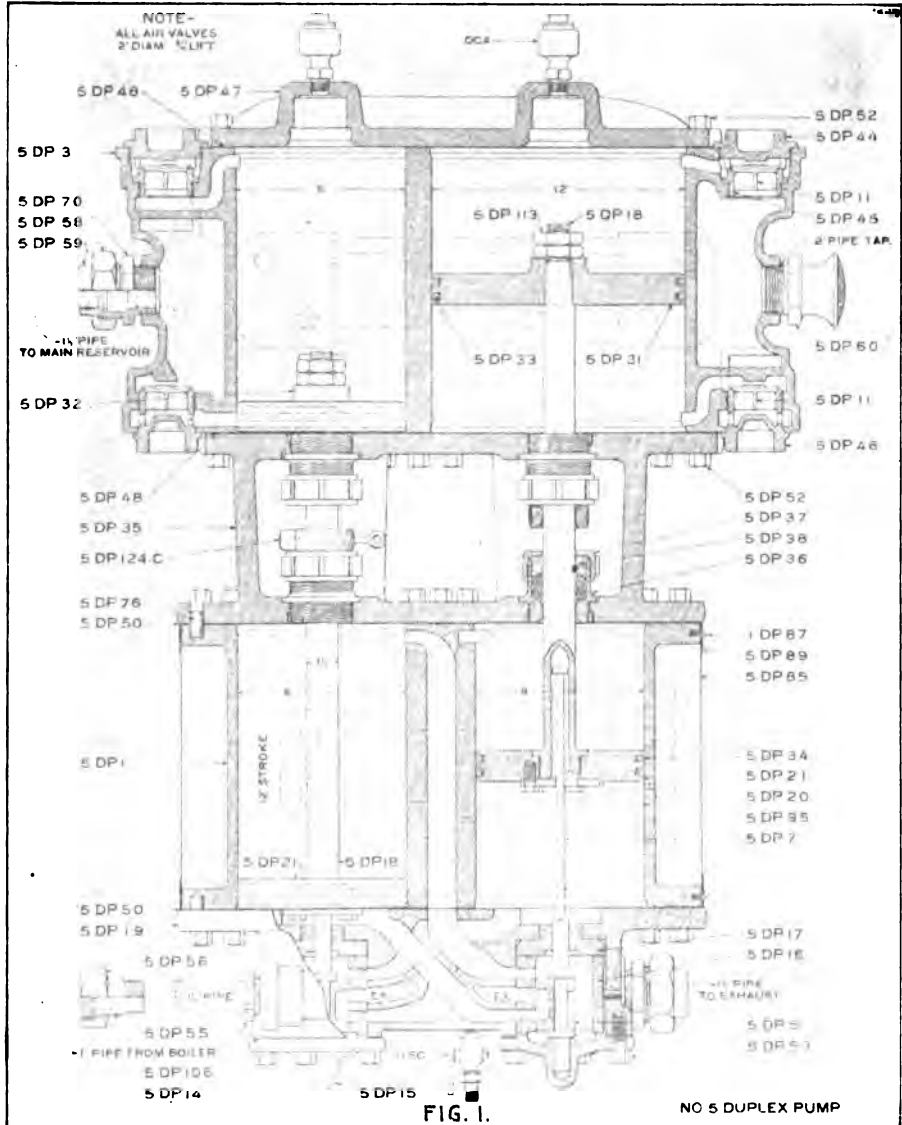

FIG. 1.

the older form of pump, to permit of air reaching the high-pressure cylinder from the atmosphere. This is especially desirable in this pump since the stroke has been increased.

Changes have also been made for the purpose of facilitating repairs such as removing slide valves. Instead of being screwed into place, as in the number 2 pump, the caps are secured by tap bolts. The use of separate cages for each of the different air valves makes it possible to use the same size of air valve throughout the pump, thus simplifying repairs.

NEW YORK OIL CUP.

In the September number of the JOURNAL was illustrated an oil cup gotten out by the New York Air Brake Company. It was found that this oil cup would feed the oil out too quickly in service, thus giving the pump too much lubrication at the beginning of the trip and not a sufficient amount at the latter

IMPROVED OIL CUP CAP.

end. Experiments have been made to make the same amount of oil last over a greater period of time. The accompanying illustration shows a slight modification in the valve shown in the September JOURNAL. It consists in drilling the stem of the cap with three holes, as shown, which holes permit more of the air that reaches the top of the oil, as already explained, to pass back to the pump instead of so much oil being forced through when the oil has dropped considerably, and the volume of air is greater above the oil than is the case where the cup is about full. The greater volume, being capable of more expansion, would force the oil to the pump quickly and in larger quantities. The escape holes drilled in the cups

at present, it is claimed, tend to make a cup of oil last over a greater period of time.

QUESTIONS AND ANSWERS.

C. V. D.—Q.—I had a train the other day that went into emergency almost every time I made a service application of the brake.

My idea was that there was a triple valve that had a weak graduating spring that caused it, but in talking with one of the boys he seemed to think that the trouble was a broken graduating pin. Would like to hear what you think of it.

A.—Either of these things would cause the action you describe, but in all probability neither was the actual cause. The thing that is almost always responsible for this occurrence is a dirty condition of the triple valve. While a broken graduating pin or a weak spring could cause the trouble the latter could only do this on a very short train, and the latter is a condition that is practically never found now, although it was occasionally found years ago when some of the first triple valves were in service, in which the graduating valve did not have a bearing on the shoulder of the piston as at present. I have not encountered a case of a broken pin in ten years, and it is safe to say that this trouble is a thing of the past. With this condition existing it is a question if the trouble would be experienced on a long train since the tendency would be for the triple valve to move the slide valve to a position such that the air would pass down by the removed portion of the slide valve, past the emergency piston which is a loose fit, and on into the brake cylinder. In connection with this explanation it should be remembered that the reduction of pressure on a long train is very slow in a service application and the port through the triple in any case is only open sufficiently to permit of the pressure in the auxiliary reservoir reducing as fast as is that in the train pipe.

With a weak graduating spring no bad effects would be felt unless the train were very short, that is, so short that the air was being taken from the train pipe faster than the auxiliary reservoir pres-

sure could escape to the brake cylinder.

In about 99 cases out of 100 the dirty condition of the triple valve is responsible for undesired quick action,

B. K.—Q.—On the road where I work I know that the brake cylinders and triple valves are cleaned at least once a year and yet we seem to have quite a good many brakes that will apply all right but they will creep off. They don't release through the triple, but just sneak off, as the boys say. Shouldn't the packing leathers go a year all right if properly cleaned and oiled?

A.—The leathers should go a year all right under ordinary conditions if the work is done properly and if grease is used for lubricating instead of oil. The oil works to the bottom of the cylinder and lubricates the bottom of the leather all right, but the top gets dry causing it to leak. Some roads also have the practice of cleaning brake cylinders and putting them together without testing them. In this case the leathers may or may not be all right and the trouble may be in the joint between the auxiliary reservoir and brake cylinder. The nuts on the bolts holding the two together should be drawn up each time the cylinder is cleaned. This is a point which is greatly neglected and one which is very important in the maintenance of brakes. It is also very essential to tighten the nuts on the bolts which fasten the cylinder to the sills of the car, since when these bolts and nuts become loose, the train pipe connection to the triple valve is strained every time the brake is applied, thus tending to greatly increase the amount of train-pipe leakage.

R. G. K.—Q.—I am hauling passenger trains on the road where I work and have no trouble with the trains I haul one way, but have to use great care in order to not break in two on the trains I haul the other way. The trouble I have is in causing bad jerks when I make a release at slow speeds. I have a large main reservoir on the engine and should think that I ought to get a proper release at all times, but have broken in two once or twice when making a release. In order not to handle the train roughly I have to come to a stop before releasing if I get down

below ten miles an hour. The train I haul one way has eight cars, but the one I have coming back is about the same train except that I have on the rear of it three or four sleepers. Can you tell me any way I could handle the brake so I would not have to stop, for I don't like to lose the time I have to in order to make the stop.

A.—From the description of your difficulty it would seem that the trouble you experience is due to the fact that the sleepers you have in your train one way are equipped with retaining valves; this means that the exhaust opening is somewhat restricted and that the rear brakes are retarded in their release by the restriction of the exhaust port. This causes the slack to be pulled out, and when the rear brakes do finally release, the slack runs in hard due to the recoil of the draft springs. There is no way to avoid the resultant jerk unless your engine is equipped with the straight air or unless all cars are equipped with retaining valves. You might be able to do away with the jerk by pulling your reverse lever over part way after your driver brake was about released. This latter is merely offered as a suggestion for trial and as a possible and partial remedy.

Sometimes the jerk of which you speak is caused by the engineer using steam too quickly after making a release, but it would seem that the other cause is the more likely in this case.

S. C. W.—Q.—How could an engineer tell if a discharge valve were stuck in the air cylinder of the pump? I know that a pump is likely to work lame if one of the valves is stuck, but I want to know if there is any other way to tell without taking the valve out?

A.—This may be told in the following manner: If the pump is making a slow up stroke open the oil cup; if it then works all right it shows that the air that is being compressed is not getting an opportunity to escape properly except when the oil cup is open. If the pump is making a slow down stroke remove the plug in the middle of the lower head and the operation of the pump will be as ex-

plained in connection with the top valve.

S. K. M.—Q.—Can you tell any good reason why it is that we don't seem to slide as many wheels as we used to? There are more slid because there are so many more air cars now; but the flat spots, when there are any, don't seem to be so bad, nor so many in proportion.

A.—One particular reason consists in the fact that in the old days a train would be controlled by but a few cars for making slow-ups and making stops where it was not necessary to use the hand brakes. As a result it was necessary for the few brakes that were coupled up to do a much greater amount of work. For instance, if the train were entirely equipped with air, as it is in many cases at present, a light reduction would stop the train in a comparatively short distance, so that even if a pair of wheels should be slid; no damage would result on account of the short distance in which the sliding occurred. With the same length of train, but with only a few cars of air coupled up, it would be necessary to make a much heavier reduction of train-pipe pressure to bring the train to rest and the brakes had to operate during a much longer time and over a much greater distance. In this latter case, if a wheel should slide there would manifestly be a much greater chance for flat spots, and bad ones, to result.

The more general use of air brakes is one of the strong arguments for an increase of braking power on freight cars since, with a full train of air, stops are made more quickly and with a brake cylinder pressure that averages so much less that the chance for sliding is less and the chance for doing damage, even if the wheels do slide, is small owing to the fact that the wheels slide but a comparatively short distance. It is a common practice to use a train-pipe pressure of 90 pounds on loaded trains, and in fast freight service, and this is practically the same as using a braking power of 90 per cent based on a train-pipe pressure of 70 pounds. Stuck triple valves due to poor maintenance are responsible for most of the flat wheels nowadays.

W. M.—Q.—I would like to have the

JOURNAL explain why it is that the drivers will sometimes slide more easily on one set of drivers than they will on another when the engines are the same weight and class and have the same braking power. I have not been able to figure this out and yet I run two different engines that are the same, and experience trouble with the one and not with the other.

A.—This condition is occasionally found to exist, and it is a hard problem to always determine just what is responsible for the action; if the piston travel is the same in either case the engines are of the same weight, both gauges are correct and the engines are run on the same train, that is, the same time of day.

An engine on a night or early morning run may slide its drivers more, due to the different rail conditions. The gauge on one engine might be out of adjustment. The tire might be the harder in the one case. If the valves were set differently on the two engines there might be a greater back pressure in the one case; the back pressure would also act to retard the revolutions of the drivers, and while the braking power might be the usual 75 per cent it could, with any back pressure, have the effect of actually being greater than this. The kind of brake shoe also has a bearing on this matter, and in some cases the flange of the brake shoe is found to be of a wedging nature until such time as the wheel has had an opportunity to grind the shoe to a condition such that the fit will be as it should be.

NEW YORK CENTRAL ELECTRIC LOCOMOTIVE.

But a short year ago the world was shocked at the terrible accident in the New York Central Tunnel coming out of New York.

Immediate steps were taken to alleviate the danger which threatened the lives of the thousands of people who were carried through the tunnel daily, the outcome being the immediate and serious consideration of the electrification of the road at certain points. The results of their research has already born fruit in the shape of a powerful electric locomotive, which type will be used to handle the traffic between New York and Croton, a distance

of 84 miles, and a distance of 24 miles on the Harlem River Division as far as White Plains. These sections of the road are now being equipped electrically, and from thirty to fifty of the electric locomotives will be ordered to take care of the through train service on this part of the road.

One of these locomotives will make schedule time with a 450-ton train, and when the train exceeds this tonnage two engines will be coupled together and operated by the multiple control system, which permits both engines to be operated from either. It is expected that this method of operating the trains will make a marked saving in the operating expenses, as well as build up the suburban service.

The following are the general dimensions of this locomotive:

Number of driving wheels.....	8
Number of truck wheels.....	2
Total weight.....	95 tons
Weight on drivers.....	69 tons
Length over buffer platforms.....	37 feet
Diameter of drivers.....	44 inches
Normal rated horse power.....	2,200
Maximum horse power.....	3,000
Normal draw-bar pull.....	20,400 lbs.
Maximum starting draw-bar pull.....	32,000 lbs.
Speed with 500-ton train.....	50 m. p. h.

Only four miles of track was available for testing the engine, but with an eight-car train a maximum speed of 63 miles an hour was obtained, while 72 miles an hour was attained with a four-car train. These speeds could have been exceeded had there been greater track space.

LOCOMOTIVE TESTS AT THE ST. LOUIS EXPOSITION.

Those who have attended the St. Louis Exposition and have seen the elaborate locomotive testing rack erected by the Pennsylvania Railroad, will recollect with pleasure the grandeur of the scene displayed when the locomotive under test was running at a high rate of speed. Owing to the heating of the journals, etc., they were unable to get any test of engines running at high speeds for any considerable length of time, but this has been accomplished during the month just past, and the particular day chanced to be Thanksgiving. The locomotive was a four-cylinder Cole Balanced Compound,

and this was the first engine that they were able to run upwards of 260 revolutions per minute continuously. The first test was at 57 miles per hour for two hours; the second was at 66 miles per hour for an hour and a half, and the third was at 75 miles per hour for a full hour, this last trial being at a speed of 82) revolutions per minute. The load which corresponded to the work the engine was doing corresponded to a train of five Pullman cars.

A test at high speed was looked upon as one of the impossibilities, judging by the results of the first efforts, and it was certainly gratifying to those in charge of the test, as well as the onlookers, to have the feat accomplished.

FACTORS AFFECTING THE VISION OF ENGINEERS AND FIREMEN.

The following is an abstract of an article which appeared in the *Railroad Gazette* of November 25, which article was an abstract of a paper presented to the Western Railway Club by Dr. Wilson M. Black.

The opinions expressed by Dr. Black are based upon tests and observations made while riding 5,000 miles by day and by night and in all kinds of weather on different roads.

He concludes from his investigations that the best known standard of binocular vision and color perception is none too good, and it must be quick vision. Owing to the fact that there are so many things which make it difficult to see, such as escaping steam, steam and soot which strike the cab windows, ice formed by steam and sleet on the windows, dust caused by passing trains, rain, wind, the glare of the fire when the firebox door is open, etc., that the best of vision is none too good.

He notes that very good results are obtained by using a shield over the firebox door to protect the eyes of the engineer from the glare of the fire, and draws attention to the fact that it is impossible for the fireman to see signals properly immediately after having worked at his fire.

Attention is drawn to the fact that it is very severe on a fireman's eyes to pass a

rigid test after having fired for five or six years, during some of which time it is necessary for him to shovel from three to ten tons of coal into a firebox in from two to five hours. He is of the opinion that it must be a good pair of eyes that will stand the usual test without first permitting them a period of rest for recuperation.

With the electric headlight, which contains so many desirable features, the divergent rays throw an immense disk of reflecting and refracting particles directly before the engineer, thus making it extremely hard to see signals. He suggests the advisability of building these lights on the principle of searchlights, so that parallel rays would be thrown, and be deflected to strike the track about one hundred yards ahead of the locomotive. This suggestion was carried out practically on the Burlington with decidedly good results. It was done by using an extension to cut off the divergent rays and a diaphragm to reduce the ray to a nine-inch diameter.

It was noted that with an electric headlight it was very difficult to judge distances as when noting the approach of an engine equipped with an electric headlight.

Experiments were made by using different colored lenses, and it was found, with one exception, that amber-colored lenses gave perfect results. With them all parts of the cab and firebox could be seen distinctly, as could all signals except the green, which could not be seen quite so great a distance. By using the amber lenses signals could be seen distinctly immediately after removing the eyes from the bright fire.

Left-handed firemen have trouble in passing the test with the right eye; right-handed firemen have the same trouble with the left eye. The reason for this is that the eye in question is exposed most to the changing rays and the heat.

Ninety per cent of the men questioned use some form of eye protection from the snow, mist, rain, sleet and wind.

A small objection to the use of lenses is that when looking into the cab after they have been exposed to the cold they are

clouded and the vision is impaired for a few moments. This is offset by the fact that the naked eye when moved from a warm place to the cold first has to accustom itself to the changed conditions and cannot distinguish objects clearly for a few moments. Dr. Black found that a large lens afforded a better protection against the elements, as well as smoke, cinders, flying coal, dust, etc.

While there is a great difference in signal lights, due to the poorer care given the same, experiments showed a difference of 77 per cent in the amount of original illumination transmitted by the poorest and the best roundels.

He believes that "if the vision of men examined for promotion after five years' service and those re-examined in service falls below the required standard, and such vision could be remedied by the use of glasses, they may safely be promoted and allowed to remain in service. Glasses must be worn if they are necessary to obtain adequate vision. Protection to the eyes, more especially if needed to correct any refractive error, is of great benefit.

"Glasses are not a hindrance to engineers, and their use should be allowed when required to protect the eyes or to bring the eyes up to the required standard, but no person should be accepted into service requiring them or who will accept a plus $1\frac{1}{2}$ or 2 D."

Electricity—Primary Batteries and Their Uses.

BY ELWOOD A. GRISSINGER, E. E.

Following the line of thought in the preceding paper, the next method of producing electrical energy is that of the voltaic cell or primary battery. At this point, too, the practical field is reached, for this simple element is used in signaling apparatus, telegraph, telephone, electric bell and other miscellaneous work where small currents at a low voltage are employed. Such batteries can be used for heavier work, but the cost of maintenance is far beyond that of any other method.

Primary batteries are divided into two distinct classes, those for open circuit

work and those for closed circuit work. There is yet another division known as the wet and dry battery. The wet battery is one in which the solid elements or plates are joined together through the medium of a liquid which is always an acidulated solution. The dry battery contains no liquid, but has the space usually occupied by such taken up with a pasty material. Batteries for open circuit work are those employed for the operation of electric bells, telephones, and such other work as requires only an intermittent use of current. Closed circuit batteries are employed upon telegraph lines and the like where the work is almost or is likely to be continuous over a long period of time. Dry batteries are only suitable for open circuit work.

The common forms of voltaic cells are known as the Daniell, Gravity, Fuller, Le Clanche and Edison La Lande. For testing purposes and a sort of unit cell, chloride of silver cells are used. The above are all wet batteries. Among the dry batteries are those known as the Gassner, Mesco, etc.

The battery best known to all of us is the Calland cell or so-called gravity battery; and by still another name, "the crowfoot," because of the peculiar shape of the zinc. By referring to the accompanying cut:

GRAVITY BATTERY.

It will be seen that the solid parts of this cell consist of a glass jar, copper and zinc element. The positive pole is made of thin sheet copper. A pure rubber or gutta percha covered wire leads from the positive pole through the solution, where connection can be made to the outside circuit. The zinc, as will be noticed, is so cast that it will support itself from the edge of the jar. Into this zinc is inserted a small brass thumb-screw by means of which the connection from the other side of the circuit can be made. To put a gravity cell in service, place the copper element in the jar, bringing the end of the rubber-covered wire outside. Spread the leaves of the copper and distribute about two and one-half to three pounds of copper sulphate or "bluestone" crystals in the bottom of the jar. Hang the zinc upon the side of the jar and fill the vessel with clear water until the zinc is covered to the depth of half an inch or more. Make connections to the copper and zinc terminals and the cell will very soon produce its normal voltage. Attaching a copper wire to zinc and copper, in other words, "short-circuiting" the cell for a short time, will hasten the process of bringing the battery into full working order. Likewise, the insertion of a little blue vitriol from another cell already in working order will produce a still better effect. The solution should soon acquire a rich blue color up to within a short distance of the zinc. As long as the blue color is present the cell is in good shape, but if this color changes to brown it is an evidence that the battery has deteriorated and needs attention. If a muddy deposit shows on the zinc or drops to the bottom of the jar, it is evidence that the cell is not used enough. The zinc should be kept covered with water.

Electricity is produced by this type of cell at the expense of the zinc. The latter is technically known to be electro-positive to copper; that is, electricity will flow from it to copper. In general, the action which is supposed to take place in such a cell is, the oxygen attacks the zinc, forming zinc oxide, which latter displaces the hydrogen of the sulphuric acid, mak-

ing sulphate of zinc. The hydrogen which has been released attacks a molecule of the bluestone, displacing the copper of same, which is likely to adhere to the copper or positive pole of the cell, the hydrogen then combining with the sulphur and oxygen of the copper sulphate or bluestone and forming sulphuric acid. This last unites with a fresh portion of zinc oxide, and so on. The zinc is gradually dissolved and copper deposited in the bottom of the cell. The more such a cell is used the easier it is to keep it in condition. Cells which are used but locally may require renovation in three or four weeks' time, while those in operation continuously on heavy-worked telegraphic circuits have been known to last as long as seven or eight months.

THREE GRAVITY CELLS IN SERIES.

To prevent creeping of the salts, when a battery is first set up, the inner and outer surfaces at the top should be given a coat of paraffine. If this is not done, salts of zinc will creep along the outside of the jar to the bottom and perhaps cause a leakage of current from one cell to another, thereby diminishing the strength of the battery.

The difference of potential of a gravity cell is approximately 1.07 volt. Every cell should give such a voltage. Connecting a number of such cells in series will give an E. M. F. of 1.07 times the number of cells so connected, and in which condition the number of amperes they will furnish will be the amperes of one cell or .5 of an ampere. If the same number of cells are connected in parallel

or multiple, the voltage across the terminals will be the voltage of one cell, while the amperes will be the sum of the amperes of all the cells so connected. The internal resistance of each gravity cell is approximately 2 ohms. By internal resistance is meant the resistance from positive to negative terminals through the liquid and plates. Series and parallel methods of connecting cells are shown in the cuts.

The Daniell cell has the same chemical action noted in the gravity battery. Its E. M. F. is the same and elements the same, except that the zinc element is placed within a porous cup containing dilute sulphuric acid, the whole being immersed in the copper sulphate solution.

The Fuller cell is often used where a strong current is wanted. It is in general

use in Great Britain for telegraphic work, and has found a large field in this country in connection with local and long-distance telephone work. It differs very materially from the gravity cell. The plates used are zinc and carbon. The zinc plate is cone-shaped and about the size of an ordinary plumb-bob, and is placed within a porous cup containing a dilute solution of sulphuric acid. A carbon rod is placed aside of the porous cup and the outfit placed within the customary battery jar, which latter contains a solution composed of three parts bichromate of potash, one part sulphuric acid and nine parts water. This solution is to be kept from flowing over into the porous cup. The common name for this solution is *electro-potion*. In the bottom of the porous cup,

oftentimes, about two ounces of mercury are placed for the purpose of amalgamating the zinc. Amalgamation is not always sought. When it is, however, the reason for it is that commercial zinc contains metallic impurities, which have such an electrical relation to the zinc as to cause a current to be set up within itself and in opposition to the main current, thereby reducing the efficiency of the cell. Coating the zinc with mercury tends to make the surface of the same uniform and gives a better cell.

The zincs of gravity cells are often amalgamated with mercury for the same purpose. The E. M. F. of a Fuller cell is

zinc and potash. Hydrogen liberated from the water combines with the copper oxide, forming water, and pure metallic copper drops to the bottom of the cell. If a layer of battery oil is placed over the liquid, evaporation and creeping of salts is prevented. The E. M. F. of this cell varies from .98 to .75, its internal resistance being very low, only about .025 ohm. Such a cell will furnish a current of 30 amp. on short circuit.

In all "open circuit" batteries polarization is likely to progress very rapidly. This causes a rapid fall in the strength of the current which the cell can produce. Polarization is practically a counter-electro-

THREE GRAVITY BATTERIES CONNECTED IN PARALLEL OR MULTIPLE.

2.02 and the internal resistance one-half an ohm.

The Edison La Lande battery possesses features peculiarly its own, and enjoys a very wide use for telegraphic work. The plates used in this cell are zinc and copper oxide. Potassium oxide or caustic potash dissolved in water is the solution used. Both plates are suspended from a cover, which fits the cell closely. As in the gravity battery, the hydrogen gas is made good use of and polarization of the cells prevented. It is, therefore, suited for continuous and heavy service. The action of the cell is as follows: The water of the solution is decomposed, its oxygen combining with the zinc and forming zinc oxide. The latter combines with the potash and forms a soluble double salt of

tro-motive force set up in the cell; that is, a voltage in opposition to the useful E. M. F. Polarization is caused primarily by the gases which, liberated by chemical action, adhere to the negative plate. Hydrogen, for example, is as much electro-positive to copper as is zinc. Therefore, if hydrogen is formed in a cell containing a copper or other plate to which it is electro-positive, it will, unless other disposition is made of it, adhere to that plate, and there will be an E. M. F. set up between it and the plate, and in opposition to the main E. M. F. The result is, the strength of the battery is decreased by just that much. The Gravity or Daniell cell shows another use for the hydrogen gas which may be formed, in that it combines with the sulphur and oxygen

of the bluestone to form sulphuric acid, there being none of the gas left to produce polarization to any appreciable extent. For this reason the cells just mentioned are capable of working continuously. In other forms of batteries where the hydrogen cannot be so disposed of, depolarization agents are introduced which take up the hydrogen that might be formed and restores the cell to normal condition shortly after the same has gone out of use temporarily.

In telephone work and signaling, a very familiar type of battery is known as the Le Clanche cell, of which there have been produced a great many varieties. In this form of cell shown herewith, a depolariz-

LE CLANCHE TYPE OF CELL.

ing agent has been introduced, thereby largely minimizing polarization. The agent used is peroxide of manganese. As in the Fuller cell, the plates of this are zinc and carbon; but differently disposed and formed and immersed in a different solution. The zinc element is in the form of a rod about a half inch in diameter, immersed in a solution of sal-ammoniac. The carbon is in very coarse grains and mixed with the manganese peroxide, all placed within a porous cup, which is sealed over, with the exception of one or two small apertures. The porous cup is then placed in the jar con-

taining the sal-ammoniac and zinc rod. The inside and outside of the jar, near the top, should be coated with paraffine to prevent creeping of the salts. Only enough sal-ammoniac should be used to give a saturated solution, otherwise crystallization is likely to occur, and the crystals adhering to zinc and carbon impair the cell. The E. M. F. of such a cell is about 1.47 and internal resistance one ohm. The voltage will drop rapidly if the cell is short-circuited.

As regards dry batteries, there are many different forms on the market. On account of their freedom from climbing of salts, accidental spilling, etc., they have become very popular for all kinds of service. These batteries will last from six months to two years, depending upon the service. A well-known form of dry battery consists of a zinc cell about eight inches long and three inches in diameter. This cup forms one plate and has a binding post attached to it. Into this cup is placed, without touching, a cylinder composed of manganese and carbon, forming the other plate of the cell. The space between carbon and zinc is filled with a compound composed of three parts of plaster, one part chloride of zinc, two parts water, one part sal-ammoniac and one part zinc oxide, all by weight. The E. M. F. of the cell is about 1.4, with an internal resistance of one ohm. It will give a practically constant current during its life.

The batteries treated of in this paper embrace those in use in this country, and with which every reader is likely to come in contact.

The Middle Order System.

ST. THOMAS, ONT.

EDITOR JOURNAL: You ask through the columns of your valuable JOURNAL the opinion of enginemen regarding their approval of the "Middle Order," used by certain systems, as a preventive of accidents.

In submitting my humble opinion to your readers I am actuated by no other incentive than to see instituted on all roads a system whereby the deplorable loss of life resulting from mistakes made

in the transmission and execution of train orders, will be reduced to a minimum.

It is as you state a question requiring the serious thought of every railroader. Unfortunately the public are too ready to believe, and the press to permit to appear in type, statements derogatory to the high standard of intelligence and efficiency of the members of our noble organization. On behalf of those noble fellows, who are often rendered unfit for service through overwork or who are so loaded down with responsibilities as to make mistakes not only possible but probable, I make this reply. Engineers are fallible and therefore as liable to mistakes as other people in the world; but while the mistakes of others are excusable or can be covered up, those made by engineers are frequently accompanied by loss of life and destruction of rolling stock.

It is evident that the time is at hand when steps must be taken to ferret out the causes of accidents and apply a remedy. The report of the Interstate Commerce Commission on Train Accidents is a dreadful one, and it is time that such reckless loss of life should be checked. While there may be a small percentage of accidents directly traceable to the conduct or criminal negligence of the man at the throttle, still by far the greater number can be attributed to no other cause than a faulty system of train dispatching.

To overcome this trouble it appears to the writer that the system of dispatching should be simplified to a greater extent than it is on certain roads at the present time. Too many train orders to look after and keep in mind is one of the great evils of modern railroading. On certain roads it is not an uncommon sight to see the conductor headed for the engineer with—well, about an arm full of train orders, which must be kept in mind at all times. This ought not to be. One running order should suffice to fill the bill. In this way an engineer's duty is continually before him and he has, therefore, his orders well in hand. But give him five or six to look after and in addition a poor steaming engine, green fireman and bad rail, and the chances are that if he is not exceptionally watchful something will occur. Increase the number of orders and you increase the danger to life and property. Reduce the number of train orders and you reduce the chances for accidents through neglect, or I should say oversight, as every engineer is certainly anxious for his own welfare to do his duty.

In your letter you ask the opinion of engineers regarding the "Middle Order." The Middle Order cannot be used by Standard Code roads without materially

increasing the number of orders to be delivered by the operator and executed by the engineers.

On the road on which the writer is employed we are using what might be called the "Middle Order," with results that at once appeal to observers and creditable alike to the company and its employees.

The system of which I speak has been in use for the past twenty years and we have the distinctive record of not having killed a single passenger, nor has there been a passenger injured in a head-on collision in all that time because of the fact that no such collision has occurred.

This system is known as the "Single Order," because there is but a single order in effect at a time. Before a "meet" is made the operator at the meeting point must be given an order to hold each train for the other; therefore, a non-telegraph station cannot be made a meeting point. If the operator at any station cannot be raised a meet cannot be made at that station. There must be but a single holding order at any station and it must include all the trains to be held. The holding order is always given whether the meet is at the schedule meeting point or not.

Before a holding order is repeated to the dispatcher, the operator must set the train order signal to show red and there is a device attached to every train order signal which automatically tells the dispatcher when the signal is turned against us. After the train order signal is displayed both trains are given their moving orders. At certain stations named in the rules trains must receive a moving order and this single moving order will carry them to the next order station. Passenger trains go over the division time and time again and the only moving orders they hold are the words "No orders." The engineers approaching a meeting station are reminded of their orders by seeing the train order signal displayed, and as a result the system is one that gives the utmost satisfaction. I will send our JOURNAL a copy of our rules and regulations for the information of our Brothers if desired. I wish all the Brothers could have the same thorough system introduced on the roads on which they are employed as we have on the Michigan Central railroad. If such were the case I am satisfied that the number of accidents would be reduced to a decimal.

Trusting that other members will deem it their duty to express their opinions, I will not at the present time ask for more space in your valuable JOURNAL. Thanking you sincerely, I remain,

M. J. McANDREW, Div. 132.

Train Orders.

JERMYN, PA., Dec. 10, 1904.

EDITOR JOURNAL: In reply to Bro. J. V. Blasdel, of Div. 504, will say he would wait at Teton until Extra 517 arrives, or he has further orders. Clearance does not affect his order.

I would like to have the Brothers reply to this order: A is southern terminal, B and C are stations between, and D is northern terminal. Southbound trains have right of track. Leaving A on regular train 32 I got following order:

Train 32 will take siding and meet first 31 at C and second 31 at B. What shall I do at B, take siding or hold main track?
C. L. HOYT, Div. 468.

HOISINGTON, KAN., Nov. 24, 1904.

EDITOR JOURNAL: In answer to Brother Lindsey's question on train orders, Standard Rules, page 862, November JOURNAL. If I were on Engine 352 I would hold main line at Batavia, as the words, "instead of" have superseded all of the first order; eastbound trains having right over trains of same class in opposite directions. If I were on engine 354 I would head in at Batavia, as if I had a straight meet order. As my answer to Brother Lindsey did not get there in time for the December JOURNAL, I am glad to see that Brother Blasdel has stopped him, but some one had better flag Brother Preston. If that passing track at Batavia is on a curve there will be a head-end.

In answer to Brother Blasdel, a clearance is all I want.

N. A. ANDERSON, Div. 433.

SOMERSET, KY., Nov. 30, 1904.

EDITOR JOURNAL: As the eastbound trains have the right over westbound of the same class, unless otherwise directed, Extra 352 would hold main line at Batavia.
J. I. GATCHINGS, Div. 363.

MINGO JUNCTION, O., Dec. 17, 1904.

EDITOR JOURNAL: I have a question I should like to ask through the JOURNAL. A, B, C and D are four stations. B is a junction where trains may be run in two different directions. In order to facilitate the movement of trains a register is provided, and D is a terminal. I get an order at A like this:

Engine 898 will run Extra A to D and will meet Extra 102 and Extra 199 at A and Extra 114 at C. On arrival at B find first-class Train No. 12 has registered arrival, but has not departed from B; and I get this order:

Work Extra 41 will work between C and B until 3:30 P. M. with right over Extra 898. Work Extra 41 arrives at

B at 2:55 P. M., registers and engine leaves as No. 12.

Is the register sufficient to let me out of B before 3:30 P. M. or is an order necessary?
GEO. W. LANCE.

At What Distance Can a Train Be Stopped?

ELIZABETH CITY, N. C., Dec. 1, 1904.

EDITOR JOURNAL: I wish to ask some of the better posted Brothers: About what distance a freight train of 30 cars, loads and empties, could be stopped on a 10-foot descent per mile with a speed of 30 miles per hour, with 11 cars cut in, but from some unknown cause only three cars worked at time of accident? After the accident the cars were tested and it was found that 8 out of the 11 worked O. K.; 2 of the other 3 were piped cars and 1 cut out. The engine was a 55-ton engine, with an exceptionally good brake.

Also, is it right to exhaust the train line after 20 pounds service reduction has been made, or would you go to emergency position; and if having to leave engine, is it practicable to reverse engine after using every means to stop, where life and property are at stake? Fraternally yours,

C. D. MORRIS, Div. 456.

PITTSBURG, PA., Dec. 12, 1904.

EDITOR JOURNAL: Replying to the above letter would state that I am unable to give you any information as to the distance required to stop the train as outlined in Mr. Morse's letter.

In regard to the amount of train-pipe reduction permissible, would state that where it is desired to stop as quickly as possible with a service application, that a 25-pound reduction of train-pipe pressure be made. This amount is also permissible if a 20-pound reduction has been made and the train has run some distance so as to give time for the brake cylinder pressure to leak away. This extra 5-pound reduction will usually equalize the reservoir and cylinder pressures on any cars having long piston travel.

The emergency application is always to be used where there is danger of striking an obstacle, a switch should be open, or any conditions similar to this. It is not considered good practice to reverse an engine after applying the brakes, since this practice will slide the drivers, thus flattening them, while at the same time the retarding power is greatly reduced. Tests to proving this latter point were made some years ago on the N. C. & St. L. These tests showed conclusively that a brake in good condition would stop an engine much quicker than the application of the brake combined with reversing the engine.
ROBERT H. BLACKALL.

The Journal

Published monthly, 307 Society for Savings Bldg.
CLEVELAND, OHIO.

CHARLES H. SALMONS, - Editor and Manager.

Address all matter for publication—Correspondence, Technical and Link Departments, changes in Division Addresses, Special Notices, and address of Outside Subscribers to C. H. SALMONS, S. G. E., Editor JOURNAL.

No reading space will be sold for advertising purposes under any circumstances.

All money matters should be addressed to W. B. PRENTER, F. G. E., 307 Society for Savings Bldg. Send New York or Chicago draft, Express money order or Postal order, but never send personal check. Also send the name and address of all members Initiated, Reinstated, Transferred, Expelled, Suspended, Withdrawn and Deaths to the F. G. E., as per Section 16 of the Statutes.

Changes in Address of the JOURNAL and orders for Division supplies should be addressed to D. EVERETT, T. G. E., 307 Society for Savings Bldg.

Advertising Department matter and all correspondence relating thereto should be addressed to W. N. GATES, 409 Garfield Bldg., Cleveland, O.

JANUARY, 1905.

Greeting the New Year.

To our fifty-two thousand five hundred readers the JOURNAL extends hearty greetings, wishing one and all a most Happy New Year and, all the year, 1905.

Thanksgiving for all the bountiful blessings that came to most of our readers during 1904, and Christmas with its tokens of love, ought to glorify the old year and put all in a mood to give a most hearty welcome to the new. And if each one is inspired with faith, hope, charity and loyalty; with these essentials of the Golden Rule forming the basis of our pledge "to do those things which we ought to do," we may consistently look into the future with pleasant anticipations, and if we practice these principles, little assurance is needed that 1905 will be all that we could wish, in material benefits, in multiplied fellowship and broadened sympathies, essentials of peace and happiness.

There has been a steady influx of new members during the year 1904; some have dropped out because of some failure in not living up to their obligation, but the increase has been exceedingly gratifying.

We regret that there should be any backsliders, and regret that every man who runs a locomotive does not see that his best interest would be conserved by a membership in that institution, which, in fact, fixes and maintains the bettered conditions under which he works. While the B. of L. E. does not desire men to

come in against their will, we think they ought to feel a desire to be a part of our Brotherhood, which by virtue of more than forty years of loyal effort, and many sacrifices made for principle's sake, have resulted in establishing civil service rules, right to be heard in self-defense, large advance in rate of pay, overtime to be paid at fixed rates, hours of rest when needed, and an insurance department for the benefit of the families, the whole work of the Order tending to bettered conditions and higher moral ideals. Every engineer ought to desire to join and, to contribute his share to its maintenance, share in its deliberations, and the social up-building of the class it represents.

Among the good resolutions for 1905 should be, *pay all dues in advance*. Not to ask the F. A. E. and insurance collector to do something you would not do for another yourself, run after, once, twice, thrice, and then pay out of his pocket to keep harm from coming to you or your family. Every member ought to be ashamed to do this, yet there are many that do, and just to test how much better you will feel yourselves if you are punctual in all your obligations, resolve to pay your Grand Dues in advance so the officers of your Division can comply with the law and put your Division right in April, for the current year. Surprise the F. A. E. and, above all, the Brother who has to run after you every month for your insurance and see how much better you will feel yourself.

To resolve to be punctual in all things and live up to it, will cure nearly all defects in our business relations, and add greatly to our own and our associates' pleasure. If each member does his duty to the best of his ability, honestly striving for the best interests of all, he will conserve his own interest best, and we shall have a glorious year 1905.

National Civic Federation.

The National Civic Federation has expanded equal to the fondest hopes of its principal promoter, the late Senator M. A. Hanna, and the scope of good it has accomplished has exceeded the most sanguine expectations of all interested in it; and now is reaching out by adding a new department of Industrial Economics, composed of prominent educators, heads of departments of political economy in universities, representatives of the pulpit, editors of the daily press, politico-social magazines, trade and technical papers whose readers include all the great employing interests, among whom are those most antagonistic to organized labor, and more than twenty ed-

itors of papers and magazines which are read by millions of wage earners.

We believe the organization of the new department will be specially beneficial to the latter class, for it gives opportunity to present the attitude of labor organizations, causes that make them necessary and the good they are doing, not only for those who are members, but that the bettered conditions they bring are not only not injurious to the public, as Parry and many others say, but are decidedly beneficial.

About one hundred editors were invited to join, and nearly all accepted and attended a meeting of the National Civic Federation on December 15, and we believe everyone felt that in bringing together every class of interest, so they could get better acquainted, enter into the discussions of the various phases of this greatest subject now before the American public, it would be of great benefit to all concerned, correcting many erroneous opinions and modifying extreme views, and we believe these associations with their attending education influences, will eventually leave very small space in public opinion for such men as Parry and his association organized for the purpose of destroying organized labor.

The permanent organization of this department will be effected at the next meeting which will occur the latter part of January or beginning of February, when the JOURNAL will give space to the subjects which come before this body, and a synopsis of the discussion, and point out with such ability as we possess the direction of the influence exercised by it.

Books Received.

"Letters from an Old Railway Official to his Son, a Division Superintendent," by Charles De Lan Hine, which appeared serially in the *Railway Age*, proved of such extraordinary interest that they have been put in book form. The author of these letters has had the discipline of railway work, from the position of brakeman up to that of superintendent, and not only possesses a wide range of practical knowledge, but is able to analyze cause and effect, to see an employee's position with the clear conception of practical experience, and in one of his letters says what many have not yet learned. "You will have to discipline men, but that can be done without parting company from your good manners. It is always easier to lead men than to drive them."

The book will be found exceedingly interesting to railroad men in every department of service, some thought for each to retain to his own benefit in guiding his own conduct. Price \$1.50. The *Railway Age*, Publishers, Chicago, Ill

The last four volumes of "The Science of Railways,"—Supervision of Cars—Supervision of Locomotives—Telegraph and Telephone, and the Four Cylinder Compound Locomotives, complete the set of twenty volumes, by Marshall M. Kirkman, which makes a valuable collection for railroad officials, coming as they do from the pen of one with experience in each phase of railroad work. This set is sold to railroad men at \$36 per set, published by the World Railway Publishing Co., 79 Dearborn St., Chicago, Ill.

"Tom Keenan, Locomotive Engineer," Fleming H. Revell & Co., 158 Fifth Ave., New York City, price \$1.00, is a graphic portrayal of a struggle in the moral up-building of locomotive engineers, and Tom Keenan in particular, who is a member of the Brotherhood of Locomotive Engineers, and is still at work spreading the gospel of higher moral ethical life, which has done so much for railroad men in the past. The picture of the life of Brother Keenan, depicted by his biographer, Mr. Nason Jones, is extremely interesting, and would be a valuable acquisition to the library of every railroad family; it is so graphic in situations and trials that beset Tom, and of his struggles to conquer, that few will put the book away if they begin its perusal.

The Historic "General" is the title of a very interesting book descriptive of that most dramatic incident in the Civil War, the Andrews Raid, when a few Union soldiers in disguise found their way some 200 miles inside the Confederate lines, and stealing the engine, the "General," undertook to run the engine over the Western & Atlantic Railroad, and destroy the bridges, as it was one of the most important transportation lines in the Confederacy. The book comes to us through the compliments of the author, Mr. R. W. McBryde, Freight Dep't Nashville, Chattanooga & St. Louis Ry. Mr. McBryde being a South Carolinian, there is a slight bias, which is natural, but his story is decidedly interesting. Price paper cover, 25c; cloth, 50c; flexible seal, 75c.

Published by McGowan & Cooke, Co., Chattanooga, Tenn.

Twentieth Century Locomotives, by Angus Sinclair Company, 136 Liberty St., New York City. Price, \$3. The book contains 670 pages, dealing with the designing, construction, repairing and operation of modern locomotives. Quick repairs on the road is given a prominent place; definitions of terms, useful tables and large size illustrations of standard types of locomotives, with full description, all of which go to make a useful and modern compendium of the locomotive.

Illustrated Points for Men on the Head End, by W. G. Wallace, published by the World Railway Publishing Co., 79 Dearborn St., Chicago, is in the shape of a book the size of our Constitution. It covers briefly the practical technicalities of the locomotive with 35 illustrations, and tables are also supplied to figure traction power, train resistance, revolution of drivers, piston speed, seconds per mile, table of decimal equivalents, etc.

Up-to-Date New York Air Brake Catechism, by Robert H. Blackall, author of **Westinghouse Air Brake Catechism**, published by Norman W. Henley, 132 Nassau St., New York City, price \$1.25, contains 250 pages, fully illustrated, the subject presented in the question and answer form, which brings out every feature, and makes the whole subject easy of comprehension.

LINKS.

OWING to an election being held annually by the Auxiliary Divisions and their inability to get the changes in on time for the January number, the addresses will not appear until the February JOURNAL. All changes in officers of Subdivisions of the B. of L. E. and Divisions of the G. I. A. must be in this office on or before the *fifteenth* of January or changes cannot be made until the August number, when they will appear again. This process is by virtue of an act of our last Convention, and the matter is not optional with the Editor; hence, compliance with the above notice is necessary if the Division Addresses are to be correct when issued, and we hope this will be given the attention necessary to bring about the desired result. EDITOR.

WE desire to call the attention of the officers of all Subdivisions to Sections 40 and 41, page 14, Constitution, and Section 16 of the Statutes, prescribing the duties of the F. A. E. relative to forwarding his annual report to the First Grand Engineer.

Section 40 means that all Subdivisions shall have paid their Grand Dues for the year 1904 on or before December 31.

Section 41 means that on or before April 1, 1904, the Grand Dues should have been paid for all members reported on your roster December 31, 1903, for the current year 1904, and from April to December ought to be ample time to prepare to meet the requirements on December 31.

So, if any Subdivision fails to get the password for the first half of 1905, they should hardly need to have the cause explained.

BRO. E. T. McLAUGHLIN, a popular member of Div. 227, has been appointed Road Foreman of Engines on the Eastern Division of the R., W. & O. System, with headquarters at Watertown, N. Y., in place of Bro. C. D. Shaft, who has been transferred to the Western Division, with headquarters at Oswego, N. Y.

F. W. SMITH, F. A. E., Div. 227.

BRO. SILAS M. OWEN, of Div. 327, has been appointed General Night Foreman for the Terminal Railroad Association at Fourteenth street, St. Louis, Mo., having charge of all terminal and foreign engines. This is a very responsible position, and the management have made no mistake in selecting a man who is in every way qualified and fitted to fill it to the satisfaction of both the company and the men; and while we, the members of Div. 327, extend to the management our appreciation for their kindness in promoting one of our number, we also extend to Brother Owen our congratulations and unqualified support.

H. A. W., F. A. E., Div. 327.

THE second annual ball under the auspices of Div. 11, B. of L. E., and Div. 128, G. I. A., Indianapolis, Ind., will be given on January 25 in Tomlinson's Hall. An invitation of the highest type of the printer's art enclosing a complimentary ticket, came to the editor through Bro. Wm. M. Blythe, F. A. E., for which we extend our sincere thanks.

We predict a very pleasant evening for all who are fortunate enough to be their guests on January 25, for they know how to do things right in the Indiana Hub. Be sure to go and share in it.

BRO. G. C. BAILEY, F. A. E. of Div. 448, presents his Patent Cab Heater in the advertisement department of this number. It is a subject that will doubtless interest many, especially engineers in the cold sections of the country. A warm cab contributes both to comfort and safety. Every cab in a cold country should be provided with some means of comfort, that those who are in it may always be in condition for active movements when required.

BRO. L. N. RICE, of Div. 200, was Nov. 7, 1904, promoted to the position of Traveling Engineer of the Chicago & Milwaukee, Chicago & Jamesville, Chicago & Council Bluffs, Racine & Southwestern, Rochelle & Southern and Evanston Divisions of the C., M. & St. Paul Railway, with headquarters at Savanna, Ill.

Brother Rice joined the Brotherhood in 1879 at Winona, Minn., and in 1884 be-

came a charter member of Div. 200, was its first F. A. E. and continued in that capacity for a number of terms. He has subsequently filled the positions of Chief Engineer and Secretary of Insurance and served on both local and General Committee of Adjustment, all with credit to himself and his Division.

He has always been an earnest worker for the Brotherhood and could be relied on to lend his aid to any cause he thought just and fair.

In his promotion Div. 200 loses one of its best members, but we congratulate and wish him every success in his new field of labor.

Faternally,
HARRY R. CALEHAN, Div. 200.

To Insurance Secretaries and Members:
—Having received a number of complaints from Insurance Secretaries about the carelessness, if not indifference, of some of the insured members in their Divisions, in not paying the monthly Insurance Assessments, and requesting me to take the subject up with the membership at large, I have decided to do so through the columns of our JOURNAL, and do not think I could more forcibly cover part of the ground than the following letter does, in which this Insurance Secretary says: "I suppose you know as well as I that the rank and file of our members, with few exceptions, never read our By-laws and Constitution to know for themselves the exact laws, but, as a rule, take the word of our few members who do read our laws, as to what the duty of our members is in regard to paying their Insurance Assessments and keeping their Insurance in force. The great number of our members who let their Insurance become delinquent, are members who have the idea that the Insurance Secretary should hunt them up to get their Assessments. I do not know if all the Secretaries have the trouble that I have or not, but if I did not hunt up a great lot of my people I would have to report more of them delinquent than I do. Please note the large list I have this month. I have laid off my run a trip to try and keep them in line. My idea in writing these circumstances is to get you to publish an article in the JOURNAL for January, calling the members' attention to their duty in being prompt to pay their Assessments and the penalty of their failure to do so. Very few members realize that their insurance is of no value if the assessments are not paid when overdue. I hope that you will have the law in regard to this subject published, and a good article in connection with it, to see if we can get our members to realize the importance of being prompt in getting their assessments in

the hands of the Division Secretaries."

This is not an isolated case, but exactly what many of our Insurance Secretaries have to contend with. The members do not seem to realize that the work of a Division Insurance Secretary is the most trying and difficult office in a Division. The compensation is no inducement to the officer; however, it is a work that has to be done, in the interest of the wives and children and other dependents of the members, and the least the members can do is to pay their assessments promptly, and in such manner as to put the Secretaries to as little trouble and expense as possible, for after paying postage, buying express or postoffice orders or New York exchange to remit the money collected each month, to home office, he has very little left for the many hours of labor given the Association each month.

Each member should carry his money to the Secretary, or conform to any arrangements made by the Secretary for mutual convenience in paying these assessments. Sections 25 and 26, page 80, (Insurance Laws) should be read and thoroughly understood by every insured member, for this reason: Any member failing to pay his assessments within the thirty days from the date under which it is levied, forfeits all right to any benefits for both himself in case of loss of a hand, a foot or an eye, and his beneficiaries in case of death. Many of our members have misconstrued Section 30, page 81. This law simply provides for a member's being reinstated without undergoing an examination and making application as a new member. This becomes a necessity to save the Insurance of sickly members, or those over the age limit, where by mistake, accident or carelessness, their Insurance Assessments were not paid within the first thirty days.

For any number of days you pay assessments after the time limit, as published in the JOURNAL each month at the head of the assessments in same, you are paying your money for nothing, as you are not protected one minute after the thirty days expire. Quite a number of Secretaries have asked that they be allowed to remit as late as the 20th of each month, so they would not have to report so many of their members as forfeited. This would only tend to encourage the members in going, probably, half of each month unprotected. In other words, instead of paying their assessments within the thirty days allowed by law, they ask to be allowed to pay it sometime during the following month, which means that they take the risk of losing all benefits from their Insurance for any period after the expiration of the thirty days up to the date the assessment is paid. Because of this fact,

we have determined to adhere strictly to that part of Section 15, page 77, which requires us to notify the Chief Engineer of any Division whose Secretary does not have his report and remittance at the Home Office on the 10th of each month, and we expect each Insurance Secretary to take this as full notice of our intentions in the matter. If the members do not pay you report them forfeited, and we will cancel the Insurance, thus avoiding any possibility of litigation, and placing the responsibility where it belongs, on the members themselves, if anything should happen to them. Fraternaly,
W. E. FUTCH, Pres.

EDITOR JOURNAL: I enclose herewith copy of House Bill 7041, which was introduced in the House on December 11, 1903, by Congressman A. L. Bates, of Pennsylvania, and was referred to the Committee on the Judiciary. This same measure was introduced in the Senate on February 3, 1904, by Senator Boies Penrose, of Pennsylvania. It was numbered S. 4092, and is now in the hands of the Senate Committee on Interstate Commerce.

This measure has been urged by the railroad brotherhoods during the last three sessions of Congress. Every member who reads it will appreciate its value to railroad employees if enacted into law, and I write to ask you if you will please publish a copy of it in the next issue of your JOURNAL, and ask your Divisions to petition their Senators and Congressmen for its passage. Thanking you in advance, I remain,

H. R. FULLER, Legislative Representative,
WASHINGTON, D. C.

Liability of Common Carriers by Railroads.

In the House of Representatives, Dec. 11, 1903, Mr. Bates introduced the following bill, H. R. 7041, which was referred to the Committee on Judiciary and ordered to be printed:

A BILL,

Relating to liability of common carriers by railroads in the District of Columbia and Territories and common carriers by railroads engaged in commerce between the States and between the States and foreign nations to their employees.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That every common carrier by railroad engaged in trade or commerce in the District of Columbia, or in any Territory of the United States, or between the several States, or between any Territory and another, or between any Territory or Territories and any State or States, or the District of Columbia, or with foreign nations, or between the District of Columbia and any State or States or foreign nations, shall be liable to any of its employees, or, in the case of his death, to his heirs at law, for all damages which may result from the negligence or mismanagement of any of its officers, agents, or employees, or by reason of any defect or insufficiency in its cars, engines, appliances, machinery, track, roadbed, ways or works.

SEC. 2. That in all actions hereafter brought

against any such common carriers by railroad to recover damages for personal injuries to an employee, or where such injuries have resulted in his death, the fact that the employee may have been guilty of contributory negligence shall not bar a recovery where his contributory negligence was slight in comparison to that of the employer.

SEC. 3. That no contract of employment, insurance, relief benefit, or indemnity for injury or death entered into by or on behalf of any employee, nor the acceptance of any such insurance, relief benefit, or indemnity by the person entitled thereto shall constitute any bar or defense to any action brought to recover damages for personal injuries to or death of such employee: Provided, however, That upon the trial of such action against any such common carrier by railroad the defendant may set off therein any sum it has contributed toward any such insurance, relief benefit, or indemnity that may have been paid to the injured employee, or, in case of his death, to his heirs at law.

SEC. 4. That nothing in this act shall be held to limit the duty of common carriers by railroads or impair the rights of their employees under the Safety-appliance Act of March second, eighteen hundred and ninety-three, as amended April first, eighteen hundred and ninety-six, and March second nineteen hundred and three.

It is hoped the Brothers will give this their earliest attention.—Ed.

Div. 145, B. of L. E., sincerely thanks Mrs. M. J. Watts, widow of the late Brother Watts, of No. 3129 Arapahoe street, Denver, Col., and Bro. J. F. Ensign, C. E., of Div. 186, for their maternal and fraternal nursing and more than kind attention to William Sherwood, son of Bro. Richard Sherwood, of this Division, during his last illness and decease, while he was in the land of strangers, far from the loved ones at home.

E. J. RAUCH, F. A. E., Div. 145.

Div. 496, Texarkana, Tex., held a special meeting on the evening of November 30, it being called for the purpose of meeting with and listening to our Assistant Grand Chief, M. W. Cadle. We had but a short notice of his coming, but we gathered as many of the Brothers together as possible and visiting members from Divs. 219, Marshall, Tex., 201, Tyler, Tex., and 216, Pine Bluff, Ark., and all enjoyed the evening, for we seldom witness such enthusiasm as was manifested by the Brothers, it being the first time a Grand Officer had visited Div. 496. After a short address by our Chief, Brother Cadle took the gavel and we went through the ritual work. Brother Cadle then addressed the members for an hour, and we were so interested that it did not seem half so long. After Brother Cadle's address came short speeches from Brother Bartholo-

mew, of Div. 201, Bros. Wm. Wright and Lyman S. Roach, of Div. 496, and others. After closing the meeting the members were loath to part, and gathered in little groups in the hall, shaking hands and talking reminiscently of the good old days that have gone and of the prospects before them; but finally good nights were said, with everybody pleased with the meeting and expressing a hope for more of the kind. Fraternally,

W. A. SMITH, F. A. E., Div. 496.

On November 27 twenty-five members of Div. 644, Galesburg, Ill., loaded their goat into the baggage car of "Our" Train, No. 9, and started for Beardstown, Ill., to organize Div. 665 at that place. The time on the train was pleasantly spent in conversation and in playing jokes on the "boys."

We arrived at Beardstown at 12:30 P. M., and were met by the committee, consisting of Brothers Harmon, Fisher, Spence and Clinton, who put the whole crowd into carriages and took them to the Park Hotel for dinner.

After dinner we proceeded to the hall, where Div. 644, with the following officers: G. H. Eno, C. E.; J. L. Kelsey, F. E.; D. J. McMullin, S. E.; J. R. Howe, F. A. E.; Geo. Rodecker, S. A. E.; J. C. Fletcher, Chaplain; and Chas. Johnson, T. A. E., initiated 28 candidates into the B. of L. E. The goat performed his labors successfully and a strong Division was formed, with the following officers: C. R. Harmon, C. E.; Jas. Spence, F. E.; Coleman Berry, S. E.; R. A. Guthrie, F. A. E.; F. R. Greve, S. A. E.; E. R. Borden, T. A. E.; W. R. Williams, Guide; F. Hamilton, Chaplain, and J. A. James, Sec. of Ins.

After the election of officers a magnificent banquet was tendered Div. 644 by the new Division and a general good time was had at table. Chief Engineer Eno, of Div. 644, acted as toastmaster and introduced the speakers in a happy way by mentioning some little personal peculiarity of each that was noticeable. The following made speeches: Bros. Harmon, Spence, Borden and Fisher, of Div. 665; Bros. Howe, Sullivan, Fletcher and Harmon, of Div. 644; Bro. Coffee, of Div. 159, Cedar Rapids, Ia., and Bro. Ashway, of Div. 51, Burlington, Ia.

After the banquet we returned to the Division room and installed the officers. During the session an alarm was heard at the door, which was answered, and found to be caused by a committee from the B. of L. F., O. R. C. and B. of R. T., who came to offer their congratulations and present to the new Division several boxes of cigars. Each made a short address, which was well received, and the thanks

of the Division were tendered them. After the installation ceremonies were over Div. 665, upon motion, adjourned without form to meet on December 4 at the same place.

The members of Div. 665 served lunch about 10:30 P. M. to the visiting Brothers, and at 12:30 A. M. we took the train, with Engineer Hamilton, one of the newly-made Brothers, at the throttle, for home, believing that the work done would accomplish much good for the order on the C., B. & Q. Ry. We arrived at Galesburg at 8:30 A. M., November 28, tired but happy.

JAMES R. HOWE, F. A. E., Div. 644.

THE first annual ball given by Div. 602, Champaign, Ill., took place at the Elks' Auditorium, on Thursday, Nov. 30, of which a local paper says:

Ninety couples participated in the grand march, which was led by Mr. and Mrs. P. L. Hayes, assisted by Thomas Inskip of this city and Miss Lela Hayes of Centralia. Included among the dancers were thirty-one Illinois Central engineers, some of whom have been members of the Brotherhood for forty years. Over 200 pink carnations, the emblematic flower of the Brotherhood, were given away as favors to dancers.

The program consisted of twenty-four numbers and several encores. Parry's orchestra of ten pieces was at its best, and the music called forth many expressions of praise. In the midst of the program, between 12 and 1 o'clock, the dancers adjourned to Clark's restaurant, where lunch was served.

The decorations consisted of a large electric emblem, with the monogram "B. of L. E." in colored lights. Fifty incandescent lamps glowed in green, yellow and red, the standard colors of the Illinois Central system. Florist Yeats had transformed the stage into a bower of green and beautiful colors.

Visitors were present from Centralia and Indianapolis. The managers say that Foreman Homer D. Howard and Trainmaster Fred Ehretzman contributed to the success of the ball by arranging for substitutes and extra men as engineers so that as many of the members of the Division as possible could lay off to attend the ball.

The various committees in charge of the ball were as follows:

Arrangements—P. L. Hayes, W. P. Buckles, Thomas Inskip, George Brookbank, W. F. Fluck, Frank Isaacs, A. L. Barnard, J. J. Arie, Robert Scott and P. C. Ketchum.

Floor—Thomas Inskip, J. J. Arie, W. J. Ryan, Charles Shauger, A. L. Barnard and Clarence Mullikin.

Reception—W. P. Buckles, A. Lang, G. L. Tenney, E. C. Sabin, J. F. Weise, F. C. Sabin, H. D. Howard, J. M. Henderson, S. D. Walkup and Robert Scott.

J. T. Harahan Division was organized on March 29, 1903, and has fifty-eight members. Prior to the organization of this Division Champaign engineers were members of the Division at Centralia. The officers of the local Division are as follows: Chief Engineer, P. L. Hayes; first engineer, Thomas Inskip; second engineer, George Vaughn; first assistant engineer, E. C. Sabin; second assistant engineer, Roy Turner; chaplain, C. J. Sabin; guard, W. F. Fluck.

A SPECIAL meeting of Friendly Hand Div., 218, B. of L. E., Ashley, Ind., was called to order on December 5, by our Chief Engineer at 2 P. M., who announced that the meeting was called for the purpose of initiating seven candidates who were in waiting. As we had with us our Assistant Grand Chief, E. W. Hurley, he was given the chair. Brother Hurley conferred the work on our newly-made Brothers with great credit to himself and the order, after which he gave us a very interesting talk for the good of the order, after which we closed.

We then met with our ladies at the B. of L. E. Hall, and at 6 P. M. the Brothers and their ladies repaired to Hotel Lennox, where the tables were spread and covers laid for fifty-eight, a second table of about fifty being served. The tables were beautifully arranged and decorated with vases of cut flowers and loaded with the very best that could be had to tempt the most epicure, the work being done by the ladies of the Auxiliary Div., 263, and they deserve much credit and thanks.

Tuttle's orchestra furnished the music during the supper. After supper was over a reception and program was given in the B. of L. E. Hall. Speaking, singing and music were enjoyed by all. We also had several games which caused a great deal of fun and laughter. Brother Hurley held the large crowd spellbound with one of his interesting talks, and several others also responded with a short talk. All dispersed at a late hour with many pleasant thoughts that they had spent a very enjoyable evening, and hoped the day would not be far off when Friendly Hand Div., 218, would give another banquet and reception. A MEMBER OF DIV. 218.

THE enormous passenger traffic of the World's Fair season is indicated by a report of the Terminal management, given out on December 12, tabulating the enormous passenger business done at the Union Station during the seven months of the Fair, reflecting eminent credit upon all the officials and employees at the great terminal. Total number of trains, 91,560; 457,688 cars. Daily average, 436 passenger trains; 2,180 cars. During September and October the daily average was about 520 trains and 2,600 cars. In some instances as high as 84 trains were handled in the station in 60 minutes.

Pieces of baggage handled, 1,739,000. About 10,000,000 people is the estimate for the whole season. Tickets sold, 847,776, amounting to \$3,289,292. As all the visitors to the Fair held round-trip tickets, and as all the railroads have downtown ticket offices, the above sales, which are an increase of about 100 per cent, can be better appreciated. About 80 per cent

of all this business was handled during the hours from 6 A. M. to 9 A. M. and from 6 P. M. to 9 P. M.

In appreciation of the splendid service rendered by the employees, the engineers in particular, on the Terminal Railroad of St. Louis during the World's Fair, the following letter was issued:

MR. C. F. SMITH, Road Foreman of Engines:

Dear Sir:—It is not necessary for me to say to you that the World's Fair closed with midnight, December 1st, as of course we are all aware of that fact. However, I desire to compliment you and your assistants for the manner in which the heavy World's Fair traffic was handled, and will be pleased to have you extend to your forces my thanks, as well as congratulations, for the manner in which each individual executed his duty, and also the interest they took in their work and their hearty co-operation.

The World's Fair business was handled in the best possible manner, and I defy any organization to be effected which would improve on the handling in any manner. It was only done, as I have said before, through the hearty co-operation and conscientious work of all the employees, which I will always remember in years to come. While I know that at many times the ordeal has been trying; still it has always been met with a smile, which has been very gratifying, indeed, and I wish to extend to you all my most hearty congratulations and well wishes for the future.

[Signed] I. L. BURLINGAME, Supt.

ON Nov. 29th about twenty of the Brothers of Div. 622, Alliance, Neb., together with members of the G. I. A., met and repaired to the home of our Brother C. A. Gleason to surprise that worthy and his estimable wife. Brother Gleason being absent from home at his place of business was sent for and certainly experienced a complete surprise on his arrival home. The ladies had brought some well-filled baskets, and after a pleasant evening spent in games and social intercourse, all sat down to a fine supper prepared by the ladies of the G. I. A.

After supper our Chief Engineer, Bro. S. A. Franklin, being present, was called upon for a speech. He responded with the following poetry which well expresses the high esteem in which Brother Gleason is held by all the Brothers. The poem in part is as follows:

If I should talk for half a day
As hard as I could grind,
I couldn't say in my poor way,
The half that's on my mind.

In praise of one who does our work
With patience and endurance,
Who keeps our book without a crook,
And attends to our insurance.

To our correspondence he attends,
And with it takes great pains;
He does it good, just as he should,
And our Division thereby gains.

He is always ready with hand or pen
To assist a worthy Brother,
And fraternity shows wherever he goes,
As we all should do to each other,

The railroad now he does not serve,
The reason you may surmise;
That he has grit as well as wit
Was shown in this affair.

He didn't starve, nor even beg,
For at other things he's handy;
He runs the store at the semaphore,
And sells peanuts and candy.

Should you pass by, don't run the board;
Go in and get a clearance,
And spend a dime while you wait for time,
And watch its disappearance.

He'll not hold you up for all you have,
For that is not his way;
He will treat you square if you go in there
At any time of day.

The man I mean is our F. A. E.,
He is always just the same;
I will tell you so that you may know,
C. A. Gleason is his name.

All present voted this one of the most pleasant evenings ever spent in Alliance, and wished Mr. and Mrs. Gleason many happy years in the future. L. B. S.

THE celebration of the fortieth anniversary of the organization of Div. 16, Galion, Ohio, occurred on Dec. 12, 1904, and proved a very interesting and enjoyable affair.

There were afternoon open sessions of Divs. 16 and 167 in their respective halls in the I. O. O. F. and Dennig halls. At the meeting of Div. 16 a smoker was enjoyed until the arrival of the grand officers at 2:30 o'clock, after which an instructive and social session was held. Remarks and reminiscences were given by W. S. Stone, Grand Chief Engineer, Deloss Everett, M. A. Ricksecker, Jack Pinckney, Charles Pinckney, E. H. Fralic, J. D. Wemple and others. Div. 167 met in Dennig hall, to meet the Grand President, Mrs. A. W. Murdock of Chicago. A delightful social session was held, after which a light luncheon was served.

A charter was granted for Div. 16, to John Brunton, Dec. 12, 1864, and one of the charter members, Bro. Jack Pinckney, in his reminiscient talk said, "We met in the garret of the old Long Block and had tallow candles for light. A strike on the Michigan Southern & Northern Indiana made railroad companies oppose the organization of the Brotherhood, and in consequence we had to steal up singly to our meeting for fear of being caught and summarily dismissed by the company. Engineers at this time were paid \$2.50 per day, and the first increase was to \$2.75, and was brought about by the B. of L. E."

The public meeting was held in Armory Hall, which was well filled by 8 o'clock P. M., Bro. Edward Kavanaugh, C. E. of Div. 16, presiding, from which we glean the following from the *Galion Inquirer*:

The program was opened with prayer by Rev. W. A. Perrins, pastor of the First Presbyterian Church, after which the Metropolitan Orchestra rendered a delightful selection.

Mr. W. J. Geer, in place of Mayor D. O. Castle, who was ill, made an address of welcome in which he expressed the hearty welcome of the citizens to the Knights of the Throttle. Brother Ricksecker made response, closing his remarks by thanking Mr. Geer for his warm words of welcome.

Mrs. F. E. Tracht and son then delighted the audience with a musical selection, which received hearty applause.

The address of the evening was made by W. S. Stone, of Cleveland, Grand Chief Engineer of the Brotherhood. His subject was, "The old order changeth, giving place unto the new." He spoke in part as follows:

"It is fitting that on an occasion like this, the celebrating of the fortieth anniversary, that our remarks in part at least should be retrospective. We can hardly realize in glancing at the past, so swiftly are the changes taking place, that instead of doing so for centuries we are only looking back one generation. There are many men living, and perhaps in the sound of my voice tonight, who can remember the 'white topped prairie schooners' and the great overland journey by oxcarts and mule teams to California, that required six months to make, and the route was marked by the bones of perished expeditions, who either perished from thirst or exposure, or else had met death at the hands of the Indians. There are men still living who can remember when the hardy frontier man was fighting Indians in the Mississippi valley. So swiftly have changes come in recent years and so closely has the railroad builder followed on the heels of the explorer that it is difficult to realize the magnitude of the transformation achieved. Today a journey across our continent is only a pleasant trip of less than a week.

No nation can develop without means of transportation for its products, and the demand for railroads was only the natural outcome of events, and perhaps no other one thing has done so much to place our country in the front rank of the world's great powers as our railroads. With the railroads came a demand for skilled workmen of a new class to operate them, and so the railroad engineer came to view, little dreaming of the prominent part he was to play in the years to come. In the United States today we have about 210,000 miles of railroads employing 1,250,000 men in running and caring for these railroads. With the families dependent upon employees of the railroads

and their related industries over 7,000,000 people draw their support from the railroads of our country.

"In my opinion there is no more responsible calling than that of the locomotive engineer. You go down to the depot and you go to bed in your Pullman with as little thought or care as if you were in your own home, and the night express pulls out of the depot, with its load of humanity and goes flying into the night. Did you ever think of the load of responsibility that an engineer carries on his shoulders? Oh! well, they say, he is paid big money for it. When you consider the risks he takes and the loads he carries I say to you frankly, no engineer is paid one-half enough.

"In 1839 when Eriksson's little toy locomotive weighing about three tons ran at a speed of 80 miles per hour it was regarded as the greatest feat the world had ever known. Today 400-ton express trains thunder along at 75 miles per hour.

"It does not matter if you agree with me, and believe in labor unions or not, this fact remains, that the public is vitally interested in our railroad labor organizations. The hours and conditions under which they work, the wages they receive, the personal character of each employee, concerns not only the employees themselves, but concerns everyone of the vast multitude who daily travel on our railway trains, and trust all they hold dear on this earth to the skill and faithfulness of these railroad men.

"The stand that our order has taken for sobriety and uprightness of living, had they done no more than this should commend them to everyone who travels on our railway trains.

"But our organization has done more than this; organized in 1863 by 12 engineers in Detroit, Mich., for the purpose of improving their conditions and elevating their standing and character as men, they builded better than they knew, for I doubt if even in their fancy they realized the importance of the movement they had started or the vast influence the order would have in the years to come. That through all these years it has held its place in the front ranks of labor organizations, is due to the facts that it was founded on right principles, sobriety, truth, justice and morality, and that they took for their guidance the Golden Rule, 'Do unto others as you would they should do unto you.' But more than all this, it is due to the man who for thirty years was our leader. A man who stood head and shoulders above any man the world has produced as a labor leader. A man who not only preached its precepts, but who lived them every day of his life. A man to whose guidance and

wisdom is due the success of our organization. The B. of L. E. stands before the world today as a living monument to the life work of the late P. M. Arthur.

"The B. of L. E. was early compelled to form an insurance department for its members. This was made necessary on account of the high rates charged by the old line companies, due to the hazardous calling of the locomotive engineer. Today we are carrying insurance for our members amounting to seventy-two millions of dollars, and we have paid out to our beneficiaries the handsome sum of over thirteen millions of dollars. Over a million and a quarter of dollars last year. In addition to this we have given away over a million dollars in charity to the families of our deceased members, besides creating a pension fund whereby any of our old members who have no home and no one to take care of them, and who by disease or old age are unable to earn a living, are paid a stated sum each month.

"The B. of L. E. was the father of all the other railroad orders, yet today we have every branch of the service fully organized and each doing a grand and noble work in trying to elevate the standing and efficiency of their men. And they are succeeding because their aim is in the right direction. In addition to this, each of the railway orders has a Ladies' Auxiliary fully organized and each striving in every way possible to elevate the standard of the home and family life of the railroad men of our land; and much of the respect and success of our organization is due to their untiring efforts and loyal support.

"The B. of L. E. never have had a difference they were not willing to submit the whole question to arbitration, and we will pledge ourselves to abide by the board of arbitration's decision. The B. of L. E. carries out their contracts, and keeps them, but when capital takes the stand that there is nothing to arbitrate, then the only thing left for labor to do is to quit, or strike, as it is called.

"In the years to come, I believe capital and labor will come closer together. I believe many of the questions that arise can be settled by the spirit of 'Come, let us reason together.' The Golden Rule lived 365 days in the year would settle many of the so-called labor questions.

"In conclusion, I wish to thank you, one and all, for the pleasure of being with you tonight and having the opportunity of speaking to you. I thank you."

Prosper D. Gregg, of Div. 16, then convulsed the audience with a humorous sketch, entitled "Mr. Dooley on Christian Science," after which a quartette, composed of Mesdames C. F. Shauck and R. O. Morgan and Messrs. W. T. Resch and Wesley Koppe, sang.

In the absence of Rev. John Brunton, Rev. W. A. Perrins was called on and responded very happily, telling a story at the expense of M. A. Ricksecker, emphasizing Mr. Ricksecker's statement in his welcome response that he was silent on his engine, but, oh, how different when off. Mr. Perrins closed with a happy eulogy of the Brotherhood.

Miss Mabel Blush, of Cleveland, daughter of C. A. Blush, of Div. 818, then rendered a piano solo very artistically, after which Mrs. W. A. Murdock, President of the G. I. A., made an address.

Mrs. Murdock is a very forcible speaker and her address was full of interest. She spoke of the good work being done by the Auxiliary and urged the joining of all eligible ladies.

Herr John Ludwig, of Div. 124, Bucyrus, followed with a humorous German dialect song, and was compelled to respond to encores twice.

Deloss Everett, Cleveland, Third Grand Engineer, was called upon and responded with two funny stories, bringing down the house.

The regular program was closed with another selection by the Metropolitan Orchestra.

Remarks were then made by M. A. Ricksecker, who told of his early railroad experiences in a humorous manner; by John Wonderly, of Huntington, Ind., General Chairman of the Erie System representing the engineers, who congratulated Div. 16 on its long and successful career, which is not excelled anywhere; by A. N. Jenkinson, of Bellefontaine, former Chief of Div. 16, now Chief of Div. 121 at Bellefontaine; and by Grand Chief Engineer Stone. A reception was then held for all to meet the Grand Officers, after which adjournment was taken to the banquet hall.

THE BANQUET.

The banquet was held in Zimmerman's Hall, where covers were laid for 182 of the local and visiting members of the Brotherhood and their ladies. Mine Host Kopp, of the City Hotel, assisted by E. Doc Williams, catered, and the good things made the tables groan. The tables were prettily decorated with carnations, and carnations were given for favors.

Following the menu, remarks were made by Deloss Everett, M. A. Ricksecker and W. S. Stone, the banquet closing with the song, "God Be With You Till We Meet Again," led by Mrs. W. A. Murdock, the whole assembly joining in the chorus.

The committees of the celebration, and to whom much of the success of the affair was due, were as follows:

Arrangements—J. J. Daze, W. G. Rich-

ards, A. Gerhart, E. H. Poorman, W. H. Pfeffer.

Reception—J. T. Pinckney, J. D. Wemple, M. A. Ricksecker, A. T. Murray, W. R. Shade.

Invitation—C. F. Shauck, M. V. Green, J. Haley, Edward Kavanagh.

Music—J. B. Murphy, Edward Kavanagh, E. L. Humberger.

Program—M. A. Ricksecker, C. F. Shauck, P. D. Gregg, R. C. Case.

MISS MARY CAMPBELL CURRIE, daughter of Brother and Mrs. James C. Currie, was married on Wednesday evening, Nov. 23, to Mr. Edward Laterman, in the Bergen Reformed Church, Jersey City, N. J.

Green and white were the colors chosen for the gowns of the bride and attendants, and also for the decorations of the church. Graceful palms and white chrysanthemums were placed at the altar and the choir loft back of the pulpit had the same tone of decorations. Ropes of smilax separated the front pews, reserved for the members of the families, and the effect was very pleasing to the many friends who occupied the full seating capacity of the church.

The bride had attended this church for many years and in the early stages of her musical education had been soprano soloist in the choir, and as one of the best known singers in Jersey City, had been a member of several church choruses, and at the time of her marriage the leading soprano in "The Church of the Strangers" in New York, the choir of which, with Miss Lucy Nelson of Jersey City, in the place of Miss Currie as soprano, and other musical friends complimented the bride with their presence and their superior talents, and the music was of a very high order.

Previous to the arrival of the wedding party there was an organ recital. Mr. George Bauer, organist of the Church of the Strangers, played several fine selections, and Miss Josephine Emerson of this city played two violin solos, "The Prize Song," from the Meistersingers, and a Schubert Serenade with organ accompaniments. The quartet sang the bridal chorus from "Rose Maiden," and as the bridal party entered they sang as a processional the wedding music from "Lohengrin." After the betrothal M. Perceppi sang a basso solo which he composed, and which is dedicated to the bride. The recessional was "The Voice That Breathed O'er Eden."

Rev. Cornelius Brett, D. D., pastor of the church, performed the ceremonies.

The bridegroom and his best man, Mr. William Laterman, a brother, met the bride and her attendants at the altar. The bridal party was a large one, the four ush-

ers, Mr. George Ferguson of New York, Mr. Howard Knapp, of Brooklyn, Mr. Harry Edwards of Pittsburg, and Mr. Robert Deats walked first, following them came the first bridesmaids, Miss Foote and Miss Halsall, next walked Miss Reardon and Miss Maloney, the other bridesmaids. The maid of honor was the sister of the bride, Miss Margaret Currie. Green and white were blended artistically in their costumes. Gowns exactly alike were worn by the four maids. They were of white dotted net over pale green mousseline de sole.

The bride walked with her father, who gave her away. She was dressed in a robe of the same pretty lace that was used to ornament the gowns of her attendants.

The bride's flowers were white roses and lilies of the valley, the ends of the tulle streamers having bunches of the lilies fastened to them. Her veil was tulle and was worn over the face.

Following the wedding a reception for the bridal party and members of the families took place at the home of Brother and Mrs. Currie, 89 Van Reypen Ave., where like the church, the floral decorations were smilax, palms and white chrysanthemums, and the tables in green and white.

Many beautiful gifts were received, several from organizations to which the bride and bridegroom have belonged; among these a beautiful crown of pearls, the gift of the Young Woman's Guild of the church to which the bride belongs; the choir of which the bride is a member, sent a gift of silver; the bowling club to which the bridegroom belongs sent a handsome chair; a chest of silver from a group of friends in Cleveland, checks of liberal amounts, and a nest of tables from the card club of which these two have been members, were included in the many gifts.

Mr. and Mrs. Laterman spent the next ten days in Washington and traveling in the South, and returned to their new home on Madison Avenue.

May their lives be as harmonious as the music of the masters the bride sings.—ED.

BRO. S. N. ZENTMEYER, member of Div. 34, Columbus, O., recently retired from the service of the C. & M. B. Ry. Co., he having reached the age of 70 years, the limit at which the Pennsylvania Company retires its employees and gives them pensions, if in the service a pre-

scribed period.

Brother Zentmeyer was invited to the

offices of Mr. Meikle, M. M., to find some 75 of his friends assembled to express their good wishes and surprise him with handsome tokens of remembrance.

Mr. Meikle acted as spokesman, and what followed we glean from the Lancaster *Daily Eagle*:

"Mr. Zentmeyer, you see a few of your friends here gathered this afternoon to bid you a regretful farewell on your retirement from active service as an engineer on the C. & M. V. R. R.

As you are aware the Pennsylvania Co., of which we are a part, has established the rule of retiring an employee when he arrives at the age of three-score-years-and-ten. But though his work for them is finished they have not forgotten him, for the resultant benefit from work well done has been recognized by providing for his future comfort, and you, today, having reached your seventieth mile-stone, will be retired from active duty.

In looking up your record I first find your name recorded in March, 1856, as fireman, in which capacity you served till May, 1859, when you were promoted to freight engineer, and in October, 1863, as passenger engineman, which position you have held until the present time.

In all this service of nearly half a century, I can find but three times where accidents occurred that you were held responsible for the same. This is a record of which you may well feel proud, one that few men who follow the occupation of an engineer can boast.

Having known you for more than a quarter of a century I can, with pleasure, say that I have always found you ready and willing to do your part, always looking after the best interests of the company, attending to your engine and being careful to have it all right and ready for the next run.

Your friends here, and along the line, have commissioned me in their behalf to present you with this Masonic charm, as a small token of the esteem in which you are held by them.

They have also provided this large easy chair, that in your declining years, you may take that ease and comfort to which a busy, faithful life has justly entitled you. In presenting you these tokens of friendship, they have not forgotten that the success which a man may attain in life, is in a great measure due to that other better half of him, a true and loving wife; knowing you possessed this most essential part of man, they wish her to share the friendly feeling expressed by your fellow-workmen, they have asked me to make you the bearer of this watch with the wish that you may both live many years to enjoy the company of one another. If you measure these gifts by

the goodwill that accompanies them you will find them priceless."

Agent J. C. Hart was called upon and responded in a splendid speech of commendation of the aged engineer's noble life and work.

Engineer Dittoe, Mr. Enos Zentmeyer of Dresden, a former engineer, Conductor J. A. Skinner and Conductor Harry P. DeLoss made remarks, when Brother Zentmeyer, in a beautiful talk, thanked the boys for their splendid presents, and in a most entertaining manner referred to his long service on the road, and was given a great ovation by his nephews, as he called the boys.

The charm presented is set with three diamonds and cost \$100.

The leather chair is a massive one, and cost \$45, while the watch presented to his wife, is a beautiful timepiece, set with one diamond and has her name engraved in the cover. It cost \$45.

ON Thanksgiving Day a very pleasant party was given at the home of Mr. and Mrs. H. H. Scobie, 3405 Grand avenue, Duluth, Minn., in honor of Mr. Scobie. He has been a locomotive engineer for thirty-three years. He is the oldest engineer in point of service with the Northern

Pacific Railroad running into this city, and is at present in charge of the engine that pulls the passenger train between Duluth and Brainerd. The affair in his honor was arranged by his Brother engineers, and they presented him with a solid gold watch and chain, the presentation speech being made by Engineer Bardsley. Mr. Scobie responded feelingly. During the evening musical numbers were given by Mrs. J. E. Goodman, and cards were played. The luncheon was served by members of Ladies' Auxiliary Div., 299. Those present were:

Messrs. and Mesdames J. E. Goodman, Thomas Bardsley, A. C. Farrer, F. G. Clayton, A. Dahl, G. H. Craig, Willard Lincoln, J. A. Cullen, G. F. Watson and S. Van Wagner.

Mesdames McGlish and Doyle.

Misses Myrtle Craig, Alma Scobie, Geraldine Watson, Myrtle Bardsley, Irene Cullen and Katherine Cullen.

Messrs. Frank Scobie and John Clayton.

Brother Scobie commenced his railroad career at the age of 12. At that time his father died, and he was the oldest of a family of five children. He secured em-

ployment in the M. C. R. R. Shops at Michigan City, Ind. At the age of 15 he was promoted to the position of fireman and served as such till 1871, when he was promoted to engineer, in which capacity he remained with the M. C. R. R. till 1878, when he secured employment on the Northern Pacific Railway, where he has remained since that time.

He has always been a staunch and true member of the B. of L. E.; has often been tried and never found wanting. He served as delegate to the Atlanta Convention for Div. 144 and the St. Paul Convention for Div. 395; has been a member of the G. C. of A. on the Northern Pacific, and for a time served as its secretary, and has been F. A. E. of Div. 144 and C. E. of Div. 895, always doing his full duty and complying with our Constitution as he understood it.

J. A. CULLEN, Ins. Sec., Div. 395.

THE accompanying picture is of Bro. D. B. Smith, member of Div. 190, who has just been honored by the people of this community by being elected their representative to the house of delegates; he spent his entire business life in the service of the C. & O. Ry.

He was thrown on his own resou. at the early age of 12. Surrounded by no influential friends and with few opportunities for an education, he commenced life and by honesty and industry succeeded in raising himself to his present position.

He was born in Maryland near the theater of the campaigns of both armies. The time when he commenced life the territory from which he came was scarcely more than a desert, not having had time to recover from the devastating effects of the struggle between states. He went from a caboose car to the coal dock, which was considered a promotion at that time; from there to the machine shop as an apprentice and back to the road as a fireman. Later we find him as a successful engineman in the employ of the same company with which he commenced work as a boy. For twenty years he successfully filled this position and during that time he was honored by his fellows to the position of chaplain for his Division and then as chief engineer and delegate to the Milwaukee Convention. All of these positions were filled with honor to the organization that had trusted him. During all those years he has been a member of the First Baptist Church, and also

filled the position of deacon, and is today one of the pillars of what is one of the first churches in the community.

There are few people who could consistently say that the world is not better because Bro. D. B. Smith had lived in it. History may not accord him a very high place in its records, but history has ever been a blind goddess; she has ever stood as a guard at the gates of palaces and held her smoky torch upon the opaque facade of royal accession and blinded the lights streaming down upon the centuries from the creators of civilization.

Brother Smith will ever live in the memory of men who have had the opportunity to know him and who have trusted him with their confidence

with their families from Le Grande, Pendleton and Elgin were there, not only for the benefit they might derive in spending a day of recreation, but for the purpose of helping those that are helpless, namely, the inmates of the Railroad Men's Home, at Highland Park, near Chicago, Ill. As soon as it was known that the proceeds of the excursion was to be given to that home, the kind and generous-hearted people for which the Pacific Coast is noted, were ready to patronize the boys, and the net proceeds of the picnic were \$340.

Bro. T. R. McGibbon, for various reasons, deserves special mention for the prominent part he took in helping to make the excursion an unqualified success, be-

ELEVEN-CAR EXCURSION TRAIN OF PICNICKERS, O. R. & N. RY., COURTESY OF BRO. H. HENSON, DIV. 352.

ON August 21st the members of the O. R. C. B. of R. T., B. of L. F., and the B. of L. E. in Le Grande, Oregon, gave an excursion over the Oregon Railway & Navigation Line to Meacham, a very pleasant summer resort near the summit of the Blue Mountains, where a union picnic was held.

Several hundred people were gathered there for the purpose of enjoying themselves in the beautiful pine groves, scaling the rocky peaks, catching the wily mountain trout, rooting for the baseball teams, and to have a general good time in the fresh, pure, invigorating, Oregon mountain air. The business men and citizens

sides performing the duties that fell to him as one of the Committee on Arrangements he pulled the train, and report says that it was done with a marked degree of proficiency; but the vents of the day had

BRO. MCGIBBON AND COMMITTEE OF ARRANGEMENTS.

made such an impression on Bro. McGibbon, that it was deemed best to place the two cabooses next to the engine instead of on the rear as was the case on the outward trip, lest the close proximity of varnished cars might have an unfavorable effect on the Brother.

After the train arrived in Le Grande, on the return trip, it was noticed that Bro. McGibbon had no hair on top of his head, and the boys were puzzled to account for it, but after a few moments' reflection they decided that it was all caused by the fact that he had greeted so many ladies during the day, being very polite and quite a ladies' man, he made an attempt to lift his hat, but on account of natural embarrassment at such times he did not raise his hat to clear, consequently had worn the hair from the top of his head. But Mac says he is young, only 29, and will grow another head of hair, and it won't be gray either.

EDITOR JOURNAL: According to our custom Div. 325 held memorial services Nov. 19. We met in the Pitcairn Presbyterian Church on account of the location. The church people gave us a most kindly welcome and the church was ours for the evening. The exercises were also embellished by good singing, interspersed by old familiar hymns in which all could join. Div. 325 has had three bereavements since our last meeting for these services and mention was made of F. G. E. Ingraham, of whose sudden demise all are familiar. Resolutions of sympathy and regret were read by Brothers Bestwick, Ferron and McClelland on the loss of Brothers Raver, Ciskey, Boardman and Ingraham; but preceding this, our Chief, Bro. R. I. Cunningham, made a few introductory remarks of which we are proud. We had deemed Brother Cunningham worthy to be our Chief; we had not rated him as an orator. We had something to learn. His remarks were a revelation.

Assistant Grand Chief Wills was with us. He came to visit Div. 325 and had not anticipated taking part in a memorial service. He was travel-worn, almost ill; he had a long journey ahead of him, but forgot all about himself and joined with us. Brother Wills' few remarks would convince any one of the fact that there is a strong bond of sympathy and love binding the Brotherhood together.

The Rev. Dr. Cartwright, of the M. E. Church of Scottdale, Pa., preached us a most excellent sermon from the Revelation of John the Divine, second chapter, seventeenth verse. "To him that overcometh will I give to eat of the hidden manna, and will give him a white stone and in the stone a new name written which no man knoweth saving he that receiveth it."

The pastor, Rev. Kohler, made a few fitting remarks, and as it would be some little time before many of us could get a train for home he cordially invited us to remain in the church as long as we wished. We all joined in singing "Praise God From Whom all Blessings Flow," and were dismissed by the benediction. We wish but to add that any misgivings in the minds of those who attended these meetings as to the propriety of the same will disappear. We teach not sectarian religion, and we have no room for the infidel. We think the memorial idea praiseworthy and the effect ennobling.

MEMBER DIV. 325.

A VERY interesting meeting was held in the afternoon and an informal banquet given at the Division hall of Division 616, Brookfield, Mo., on December 6, when the honored guest and Brother was our worthy Ass't G. C. E., E. W. Hurley. To give a tip as to the speediness of the Brothers of Div. 616, when they undertake to do anything will say that about 5:45 o'clock P. M., when the Division had just listened to a most interesting and instructive talk from Brother Hurley, a motion was made, and carried, to appoint Bros. Geo. A. Fritz, Oliver Lucius and W. R. Knight as a committee to provide a spread for the evening; then the Division adjourned to meet at 7:30 P. M.

At 8 P. M. our Division was called to order by Bro. M. B. Campbell, C. E., and we enjoyed listening to some good advice given us by Brother Hurley. Some interesting remarks were made by Bro. R. W. Sweeney, an esteemed old member who has been totally disabled for about eighteen years, and our Brothers responded, together with Brother Fritz who, realizing his responsibility as one of the Committee on Refreshments, was making trips every minute between Division hall and the dining room, and every time he would enter the Division room he would make a motion to adjourn; so about 10 o'clock his motion was carried, to satisfy him, and everyone was satisfied when they found out what was awaiting them. The thirty Brothers seated themselves around the banquet table and partook of good things to eat that would have pleased a king, and after they started to eat there was no way of stopping them until the supply had been exhausted, and I venture to say that if the supply had been great enough they would all have been at that table yet. Brother Hurley, with the balance of the Brothers, could hardly waddle when they got up from the table.

They all decided then and there to make this committee a permanent one, with the understanding that the next time they must arrange for at least three times the number present.

We then returned to the Division room where everyone enjoyed a good smoke, after which all departed so well pleased that I suppose they all prayed (for the first time) that we might enjoy another such meeting in the near future.

F. R. HALLIBURTON, F. A. E.

EDITOR JOURNAL: South Baltimore Div. 97, of Baltimore, and G. W. Childs Div. 353, of Philadelphia, held a memorial service at William St. L. M. E. Church, Baltimore, at 2 P. M., Sunday, Nov. 20th, in memory of the deceased members of both Divisions. There were members present from Philadelphia, Baltimore and Martinsburg, W. Va., and a delegation from Div. 52, of Baltimore. There were also representatives from Ladies' Auxiliary Div. 27, of Philadelphia, Div. 110 and 172, of Baltimore. Div. 52, 97 and 353 of the B. of L. E., met at Div. 97's hall, 123 E. Montgomery St., at 1 P. M., and marched from there to the church in a body. Arriving at the church, at the request of the committee in charge, Mr. James Rice, Sec'y of the B. & O. branch of the Y. M. C. A., took charge of the program, delivering a very feeling address and also introducing the speakers. The singing was led by Mr. Harry Stallings, the choir leader of Abbott Memorial Presbyterian Church. The services were opened with the hymns, "When we Reach Our Home," and "Nearer My God, to Thee," after which a prayer was offered by Mr. James Rice. The next speaker was the Rev. Ira Spangler, pastor of Olive Branch Evangelical M. E. Church, which was followed by a solo by Mr. Stallings, "A Little While to Wait," which had a great effect on the congregation. The next speaker was Mr. William J. Kelly, a young member of the Baltimore bar, who in part said:

"Just as an oak, which had stood the fury of innumerable storms, falls with a crash to the earth from which it sprang, and as it seeks repose after centuries of activity, we have said, 'Well done, thy rest ought to be sweet.' We have often seen a beautiful sapling develop into a magnificent tree, symmetrical and flourishing; often we have enjoyed its grateful shade at noon-tide and have heard the whisperings of its mystic story in the cool of eve, and as we contemplated its great strength and admired its marvelous beauty, we said, 'It will outlive the ages.' But how soon was our dream to be dispelled, for out of the darkness, too deep for human ken to penetrate, came the lightning's blast and shivered the pride of our heart from branch to root, and it too fell to the earth. And so it is with man. When a patriarch who has lived out the years allotted to man passes into the realms of the

unknown, we regret the close of a useful career and the departure of an old friend, but are consoled by the thought that his life's work is o'er and that his crown, already gained, lacks no jewel to complete its glory. Responsibilities are placed upon all men in this world; to the lot of some fall grave responsibilities, and for a faithful discharge of these there is required a most noble man. On the head of him who controls and guides the destinies of a government, perhaps, rest many and grave responsibilities, but a faithful discharge of these does not, in any great degree, involve any danger to his own life, whereas, upon him who follows the avocation of a locomotive engineer, not only rests the responsibility for the lives of others, but his own life in the discharge of these duties is at all times in great danger.

Now, my friends, while we honor the soldier who dies in glorious battle, let us not forget him, who is too often forgotten, him who dies beside us in the peaceful but treacherous battle of life. Go, widow, child, friend and mother, hang the green garland of ivy on the cold tablet that like a specter beckons you to follow your beloved who was chilled most untimely by the frosts of death. In conclusion I want to address a prayer or petition to Heaven, in my own name and my own right, and in so doing I will use that expression which means so much, and will say of all your Brothers who lost their noble lives in the cause of duty, 'Let Their Souls Rest in Peace.'

The next speaker was the Rev. J. Wynne Jones, Pastor of Abbott Memorial Presbyterian Church, who spoke very feelingly for the enginemen, delivering a very fine address, touching on both the bright and dark sides of their lives, and paying a very high tribute to our late Grand Chief, P. M. Arthur, using him for an example for us to follow.

Mr. Stallings then sang the solo, "Watch Over the Widow and Children."

The Rev. Thos. Lowe then delivered an address on the motto of the Order, "Do unto others as you would have them do unto you," also dwelling upon our insurance.

The services were concluded by singing the hymns, "Keep Your Soul in Touch With Jesus," and "God be With You Till we Meet Again," after which the Rev. Ira Spangler pronounced the benediction.

There was one thing to be regretted very much in reference to this meeting, and that is the number of Brothers who could have attended from both Div. 97 and 353 to pay tribute to their deceased Brothers and did not. The addresses delivered by these able speakers and the singing by Mr. Stallings had a great effect, and cre-

ated a very warm feeling amongst those who attended. A few more of these meetings and we would not only be able to follow the motto of our Order but also to follow the Golden Rule, "To love your neighbor (Brother) as yourself." It has been truly said that "Clouds and sunshine, joy and sorrow, go hand in hand." But our aim should be perfect harmony.

While we had a large attendance at this meeting and know the good that was done, we hope that some of the absent ones will turn out at the next, and leave standing room only.

ONE OF THE COMMITTEE.

SPECIAL NOTICES.

While Bro. J. K. Fare, member of Div. 251, was in bed with measles in Leavenworth, Kan., some one stole his coat in which he kept his traveling card and other papers. If such card is presented it should be taken up and forwarded to Bro. E. H. Colip, F. A. E. Div. 251.

The address of Bro. Henry Kelley, member of Div. 336, Osawatomie, Kan., is very much desired by his family and Division. Last heard from in St. Louis, Mo. Address information to Bro. Geo. P. Reed, 3231 Roberts street, Kansas City, Mo.

The whereabouts of James Hunt, formerly employed by the B. & O. out of Grafton, W. Va., who mysteriously disappeared about three months since, is badly wanted. He is about 45 years old, dark complexion, with an impediment in his speech. His family are in distress and son very ill. Address information to Bro. G. A. Deck, F. A. E. Div. 284, 344 Washington street, Grafton, W. Va.

Charley Cory, who formerly ran out of Omaha on the U. P., will confer a great favor by corresponding with the widow of his brother, John Cory, who died last June. Will Charley or some one who knows of him address Mrs. John Cory, 14 W. Fifth street, Hutchinson, Kan.

The address of Edward E. Schaefer, who when last heard from was leaving Goodland, Kan., for Springfield, Mo., is wanted by Miss Emma Ellickson, Ft. Logan, Cal.

Will W. L. Young, who secured transportation over the Ft. Worth & Denver through being vouched for, write and explain matters to the one who vouched for him, Denny Ryau, 1100 St. Louis avenue, Ft. Worth, Tex.

Any one knowing anything of the whereabouts of Ervin Daily, who ran an engine on the Q. & M. Division of the C., M. & St. P. Ry. in 1893, will please notify J. T. Ryel, F. A. E., Div. 102, Austin, Minn.

Wanted—To know the whereabouts of Engineer F. M. Race, once of Fort Worth, Tex. Address W. Sells, 1250 Washington Av., Springfield, Mo.

Mrs. Mary C. Craft, wife of our deceased Brother, W. H. Craft, Helena, Mont., desires to thank the members of Div. 232, Livingston, Mont., of which her husband was a member, for the great kindness extended to her and her children, and says no order could have performed their duty more nobly or have given more kindly assistance in the hour of need.

Members of the following Divisions will correspond with the F. A. E. of their Divisions immediately:

Division—

251—E. W. Evans.
594—A. C. Mann.
J. E. Nelson.

569—H. H. Daniels,
John O'Leary.

OBITUARIES.

[In accordance with the action of the Ottawa Convention, no resolutions of condolence, obituary letters or poems will be published in the JOURNAL. All deaths will be listed under obituary heading only, with cause and date of death.]

Terre Haute, Ind., Nov. 11, of paralysis, Mrs. Lena Dougherty, wife of Bro. W. W. Dougherty, member of Div. 25.

Terre Haute, Ind., Nov. 13, Miss Mary Reden, daughter of Bro. J. J. Reden, C. E. of Div. 25.

Vicksburg, Miss., Oct. 22, killed in head-end collision, Bro. Wm. Schesler, member of Div. 281.

Moncton, N. C., Nov. 2, from injuries received, Bro. James McAuley, member of Div. 162.

Dayton, O., Nov. 21, Bro. Harry Gray, member of Div. 358.

Decatur, Ill., Nov. 13, Bro. J. P. Hine, member of Div. 155.

PREMIUMS FOR JOURNAL SUBSCRIPTIONS.

We have arranged with the Webb C. Ball Co., Watch Manufacturers, Cleveland, O., for three kinds of watches, which we are offering as premiums:

- 1st. **The Ladies' Queen Watch**, 17 jewelled, 14 karat gold filled case. Selling price, \$30.00. To obtain this send us \$30.00 with the names of 30 subscribers.
- 2nd. **Gentlemen's B. of L. E. Standard**, 17 jewelled, 14 karat gold filled case. Selling price, \$50.00. To obtain this, send us \$75 and the names of 75 subscribers.
- 3rd. **Gentlemen's 21 Jewelled**, 14 karat gold filled case. Selling price, \$60.00. To obtain which send us \$100.00 and the names of 100 subscribers. Money must accompany the names of bona fide subscribers.

Those who contemplate working for one of these premiums should begin now, so as to have the JOURNAL start with Vol. 39, January, 1905.

LOCOMOTIVE ENGINEERS' MUTUAL LIFE AND ACCIDENT INSURANCE ASSOCIATION.

Official Notice of Assessments 648-651.

SERIES F.

OFFICE OF ASSOCIATION, ROOM 803, SOCIETY FOR SAVINGS BUILDING, }
CLEVELAND, OHIO, JAN. 1, 1905.

To the Division Secretaries L. E. M. L. and A. I. A.:

DEAR SIRS AND BROS.:—You are hereby notified of the death or disability of the following members of the Association:

Four Assessments for payment of these claims are hereby levied and Secretaries ordered to collect \$1.00 from all who are insured for \$750, \$2.00 from all who are insured for \$1,500, \$4.00 from all who are insured for \$3,000, and \$6.00 from all members insured for \$4,500, and forward same to the General Secretary and Treasurer.

Members of the Insurance Association are required to remit to Division Secretaries within thirty days from date of this notice, and the Division Secretaries to the General Secretary and Treasurer within ten days thereafter, on penalty of forfeiting their membership. (See Section 25, page 80, of By-Laws.)

Secretaries in sending remittances will send same to and make all drafts, express money orders or postoffice money orders payable to M. H. SHAY, General Secretary and Treasurer. Secretaries located in Canada will please remit by draft or express money order. We will not accept packages of money sent by express, unless charges have been prepaid. The JOURNAL closes on the 18th of each month. Claims received after that day will lie over until the succeeding month.

NUMBER 2.

A Wreck and Its Lesson.

BY MEHTABEL CARTWRIGHT.

On a certain night not many years ago I was traveling over the Lehigh Valley Railroad. The train was an express and loaded with human freight. Idly I viewed the faces of the crowd, some asleep, others seeking a more comfortable position. We seemed to only touch the rails here and there, swinging and turning the many curves along the road. I soon let it rock me to sleep.

The engineer was behind time. With his hand on the throttle and cap pulled down over his manly face, the iron horse

sped on. Engineer and fireman were keeping a silent watch—when, all at once as they rounded a curve, a bloodcurdling sight met their gaze. It was shut off the steam! Apply the brakes! and two brave men had done their best. With a jerking bumping noise and screams of frightened men and women, I jumped to my feet. Rushing out I saw that monster engine down far below the track. Strong men were soon lifting the crushed and bleeding form of that brave engineer from the wreck, for he had stood faithful to the last. As I bent over him I saw by the light of many lanterns that he had made his last run. He looked up into my face and asked, "Are they all safe?"

NORWEGIAN CARRIAGE (STALKJAERRE).

The fireman stepped up with his broken arm, and the dying man clasped his other hand and said, "Oh, Jack, you are left to tell the story—I'm dying, Jack. Break the news to mother and tell her it is well." With these words yet trembling on his lips, his brave soul passed out.

* * * * *

In a beautiful vine-clad cottage in the old sunny South a few months ago, I had occasion to visit a sweet-faced old lady and she told me of her only boy, so brave and true, who had been killed on the Lehigh Valley Railroad. How Jack, his fireman, had come so far to break the news to his old mother. A bright light shone out from that dear old lady's face as she brushed away a last precious tear and said, "Do you know the last precious

One word of warning for this time. It is so fixed by the laws of Nature that all iniquities indulged in sooner or later carve their tell-tale lines on face and form. May the influence of this little story, full of truth, love and pathos, not only be felt, but may each and all be able to read between the lines. May it be a spark which shall be cared for and kindled into a moral flame that will burn and crackle around the world.

The Estimator's Story.

BY MARSTYN POLLOUGH POGUE.

Should it ever be your privilege to be a guest at a timber estimator's camp in the deep Canadian forest, ask the estimator

CEYLON MODE OF TRANSPORTATION.

letter I received was even more to me than any before, for in it he said, "Mother, not one oath has passed my lips in five years." What a revelation that was to me. God has long ago blessed the soul of that engineer.

Right here let me ask why we cannot have all our boys in the daily walks of railroad life, it matters not what trade, adopt the same moral determination. There is not a shop in the land that can not blush with shame at the vile oaths and disgraceful language that flow with every sentence, mostly from the lips of our future men. If every mouth were thus decorated and plainly viewed by all, how many mothers, wives and sweet-hearts would kiss those polluted lips?

to allow you a look into his log-book.

If he thinks you are worthy of the favor, he will hand you his diary and you will find its contents as entertaining as any romance.

The work of the timber estimator always has a picturesque setting; it is always dramatic and adventurous. The estimator himself is invariably an iron man, with a body trained to endure the most rigorous conditions, and a strong and acute mind.

We had paddled to camp one night when old Rochmont told us one of his adventures.

"Last winter," he said, "Spaulding (the walking boss) sent Louis Renault and me up here to make a close estimate of the timber in this limit.

"I want you to estimate every white pine standing within the boundary lines which Langton ran last summer," said the walking boss, "and put an ax mark on every tree that will make square timber. We want to know what we've got up there within a thousand feet."

"Of course, that meant weeks of hard traveling, but the snowshoeing was good, and we were allowed to hire two Indians to make camp and cook and haul the flat sleds.

"We traveled together from Wanosing to that valley down there, and we separated at that old dead pine. Renault and his Indian went east and I went west with my Indian. When we had finished our work we were to meet at the dead pine and travel back to Wanosing together.

"The weather was very cold; there was no crust on the snow; there were very few deer and the wolves were plentiful and hungry.

"Every evening the gray devils would approach the fire closer than I had ever known wolves to come before. They would remain until morning just outside the circle of firelight sniffing, snarling, and raising their long muzzles at intervals to send a chorus shivering through the sleeping woods.

"Their eyes reflected the light, and we fired many shots at the brutes from our Winchesters, aiming between the shining eyes. When the shot missed, the wolves drew back a few yards, but returned within a few minutes. When a wolf was killed or wounded the others leaped upon him and devoured him, leaving only his well-picked bones upon the snow.

"The proportion of bullets that hit was one to every ten, for it is difficult to shoot straight in the darkness.

"For three weeks we traveled through that part of the limit, and when I had finished my work, snowshoe trails crisscrossed the snow, showing how thoroughly I had done my work.

"I finished estimating at noon on the 1st of February, and we started for the valley of the big dead pine that afternoon.

"From where we boiled the pot at noon it was twenty-five miles to the val-

ley, but that is not a long afternoon's walk for two woodsmen when the snowshoeing is good.

"When we were within half a mile of the valley and descending the hill slope at a swinging trot, the hunting chorus of a wolf pack rang like a carillon of silver bells from the top of the spruce-covered hill that rose in a dark mass against the purple sky across the valley.

"When we got into the valley I expected to see Renault's campfire twinkling, but no red light shone among the scattered clumps of tamarack and spruce,

TURKISH LADY OF RANK.

and I felt a touch of disappointment, while in the moon glare the great dead pine thrust its tall spire into the sky, and its single skeleton arm pointed toward the east.

"A few minutes later we came to the edge of the brule, in the middle of which the dead pine stands, and I jumped with surprise, for I saw that a man stood with his back to the trunk, to which, apparently, he was bound. We shouted, and the man whooped joyously in answer. I gave a gasp of amazement, for I recognized Renault's familiar voice.

"That same moment the wolf pack bayed from the bottom of the hill on the other side of the valley, and a chill passed over my body. Bending on our snowshoes, we raced desperately toward Renault. When we were within twenty-five yards of him the wolves, giving tongue fiercely, leaped out of the shadow of the tamaracks on the farther edge of the brule.

"As we bounded up to the tree I wondered what tragedy had happened. The snow about the tree was trodden and

"My Indian, Michigan Shegaug, drew his buffalo knife and quickly cut the thongs. With a happy cry, Renault sprang away from the tree trunk and snatched up the ax with the bloody blade.

"The wolves were close. Shegaug and I tossed our rifles to our shoulders and emptied the magazines. Shegaug is a good shot, and I can shoot straight myself in daylight.

"But the wolves were approaching with flying leaps and the moonlight is very deceptive. Only two wolves were hit; four escaped the shower of bullets and sprang at us, answering the rifles with short barks.

"The fight lasted less than a minute.

"Renault jumped as the wolves closed in, and the pack leader bounded at his throat with bared fangs. Renault's ax swept upward and downward; the blade sunk into the brute's neck; the gray body fell heavily on the snow; Renault wrenched the dripping blade from the wound; the wolf writhed convulsively at his feet, then lay with twitching body while the blood spouted from the deep bite of the red ax.

"Renault stepped back with a grim smile and stood leaning on his ax; he had done his part.

"Michigan Shegaug dropped his empty rifle and pulled his buffalo knife from its sheath just as a big she wolf leaped up at him with a fierce snarl.

"Shegaug sidestepped and the beast's jaws clashed together. The Indian's long arm shot out sidewise; the ten-inch blade of his knife flashed downward as the wolf dropped to the snow at the end of his spring, and

Shegaug drove his big knife to the hilt into the animal's shoulder.

"At the same moment, one of the two wolves that were left sprang at me and I crushed its skull with my rifle butt. The other wolf halted and stood hesitant a moment, but when Renault, with a yell, moved toward it swinging up his ax, it turned and galloped away.

"Then we made camp and cooked and ate supper, and afterward, while Shegaug skinned the dead wolves beside the fire, Renault told me his story.

ALGERIA—MOORISH LADIES AND APARTMENTS.

stamped with moccasin tracks and snowshoe marks, and spattered with blood. Within a few yards lay the dead body of Renault's Indian, and the freezing corpse of a strange Indian was stretched at Renault's feet.

"An ax with frozen flakes of blood on its blade lay between the dead men, and the fresh snowshoe trail of several men led away westward.

"Renault was unhurt, but he was tied most securely to the trunk with strips of green mooseskin.

"He had finished his work two days before and he and his Indian, who was an Ojebway from Rainy Lake, had started for the valley. When they arrived there they found an Indian camp close to the big dead pine. It was Renault's opinion that these Indians were Algonkins from the Abittibe district who had been run out of that part of the country for good reasons by their own people and the officers of the Hudson Bay Co.

"These Algonkins desired to possess the Winchester rifles, and the tent, and blankets, and bacon, and flour, and tea of Renault and his Ojebway. So that evening following the simple primal rule, 'He takes who has the power, he keeps who can,' they had obtained possession of these things. Renault's Ojebway, a hard fighter, had been killed in the fight, also one Algonkin. Two other Algonkins had been badly hurt.

"When Renault was overcome, he was bound to the trunk of the dead pine and the Algonkins broke camp and hit the trail. But before they tramped away their head man made a birch bark horn, the kind of horn that is used for calling moose in autumn, and setting it to his lips, he imitated the howl of a wolf and kept repeating it until a pack of wolves answered him from beyond the hills.

"Fifteen minutes later the Algonkins were a mile away; we were trotting down the hillside toward the valley; the eager-footed wolves were stringing over the top of the opposite hill. It was a narrow escape for Renault, eh? That adventure will not soon pass from his memory, eh?"

Not Guilty.

BY MAY W. COOK.

"Hello! Jack, old fellow! goin' to lodge?"

"Why, hello, Pete, when did you get into D—? Haven't seen you for a month. Been sick, or just taking a little vacation to get better acquainted with that young engineer, who I hear has just lately stopped at your place? There—there, now, no more apologies. Yes, I'll

take a cigar, though I did make a small mistake in thinking the newcomer an engineer. Well, here's to the little miss, and may she grow to womanhood endowed with the same noble qualities as her Irish dad."

"Thanks, thanks, old man. Did you ask had I been to lodge since the election of officers? Why, yes, and the boys couldn't have elected a more unworthy dog to that noblest of offices—the chief official's chair, at your service."

"Why, Jack, how lucky! Congratula-

ALGERIA—BESKRA WOMAN.

tions seem to be in order all around; and here's to the biggest-hearted fellow that ever pulled an engine out of D—. I tell you, Jack, I'm an engineer, and I like the work; and talk about fraternal feeling—well, I'm glad I fired an engine long enough to join the B. of L. E. It's the greatest organization in the country. And do you know what makes it so? Well, a very few words will answer the question. It's only the very best men that are eligible to membership. I tell you, a fellow has got to be what he professes. He can't claim to be one thing and really be another,

"Did you say Dick Harvey was promoted to pulling a passenger steady? Well, Dick is a pretty good fellow, and I like him all right; but, honestly, I do not think it hardly right. Now, here, we both have run longer by four or five years than he has. Let me see, Jack; you have run an engine from D— to L— for near onto sixteen years, haven't you? And I have run from D— to M— on local for the last ten years, and ran nearly eight years on the main line, making almost eighteen years. Of course, I'm well enough satisfied, and yet it isn't just treating a fellow right; now, is it?"

A JAPANESE LADY OF RANK.

"Well, no, Pete, it isn't; but then you know there is a lot of favoritism on the roads nowadays, and nearly all the plums are handed out to favorites. Rank is not always attained by merit, you know. Then I just think this way, Pete: there is a time when restitution will come, and when it does it will be complete. As for me, I would just as soon run my old 167 on freight as any passenger run they have got. And then, another thing, Pete, no one can say, 'He's got a pull,' and there is no high official to thank. So cheer up,

old man; 'every dog has his day,' and advancement will surely come to those who wait."

As Jack concluded this last sentence, they reached the lodge door, and so we will leave them till two years later.

* * * * *

It seems strange how nature will weave into man's life a deep kindred love of brother for brother; create in man likes and dislikes, which in sympathy draw men's natures into closer communion with each other; and yet for small provocation those same sympathies that drew men together (that nature in man akin to the soul) are rudely dashed to pieces, all the barriers of friendship are suddenly broken down and the good of yesterday forgotten on the morrow, and sacred ties of fraternity are trampled under foot.

It was so with these two men—they who for years had been almost like brothers. Their friendship was broken off for a mere nothing. A coolness sprang up between them when Jack was promoted over Pete to be steady engineer on the Fast Mail.

Pete, who was sensitive and of a jealous nature, could not accept of Jack's promotion over himself. He reasoned that he was an older man, and that it wasn't right, no matter if he had been the cause of a bad wreck ten years before; they should not keep a man down forever for it. And, then, it was a bitter pill to see even a friend promoted over one.

Pete was one of the best fellows in the world, only he didn't sometimes just see things in the right light. After all, Pete was very human, and he imagined all sorts of things about Jack,

one in particular, that he was just a little swelled up on his new position, which was anything but true.

Jack could not understand his friend, and after repeatedly trying to bring back the friendship that had endured through their years on freight he gave up the battle; and as time wore on their relations became more strained, and the climax was reached when they met a year later at the Engineers' Convention, which made the two men, once such good friends, bitter enemies.

Jack had planned to take his wife with him to the convention, but when the time came her mother was sick and she did not wish to leave her, but insisted on Jack going alone, which he reluctantly did.

Pete and his wife had made big preparations for the convention. Florence (his wife) had never attended a convention, and Pete wished her to enjoy this one to her heart's content, and he insisted on employing a dressmaker at the house a month before the meet, for he told her there would be balls, operas and receptions until she couldn't rest—just one continuous round of pleasure for the ladies; for didn't they enjoy looking at the pretty gown of a sister, even though they were holding lodge and putting on quite a business air, and Pete wanted his wife to shine with any brother's wife at the convention. And well he might, for she was beautiful, intelligent and accomplished.

* * *

It was the night of the Grand Ball in the Masonic Temple. The month was May and the evening was chilly.

Pete and his wife had just finished a two-step, when a friend of by-gone days came up to renew his acquaintance with Pete.

Florence felt chilled, there being quite a current of air through the hall, so she hurried to the cloak room to get a silk shawl she had brought along to throw over her shoulders.

The cloak room was as all the cloak rooms are in those immense buildings for social gatherings, more of a reception room, with beautiful nooks and separate cozy corners here and there.

Just as she reached the inside of the door she ran almost into a man of middle age—a man with clean-cut, noble features; his hair tinged with gray. In all, one might not meet so handsome and strong a fellow as Jack Cavanaugh in many a day.

She gazed as one in a dream. Where had she seen that face? But at the sound of her name—"Florence!"—a smile of recognition broke over her beautiful face; for though she was thirty-four, time had dealt kindly with her, and she did not look over twenty.

"Florence! am I dreaming? Do I look

into the face of the girl I once hoped—"

"Why, Jack—dear old Jack! I never thought of seeing you. Where are you from? Oh! how pleased I am to see you. Where have you been all these years? Come, let us sit down here and have a talk; I'm tired anyway. Why, Jack, you don't know how glad I am to see you, and you look just like you always did, only you didn't have these," and she raised her small white hand to his temple.

Jack was overcome by this unexpected meeting, and could only stare at this girl of his youth.

She rattled on from one subject to an-

JAPAN—BUDDHIST HEAD PRIEST AND ASSISTANT.

other, but Jack was in a dream. The present had slipped away and he was back again in the old days of the past—going to and coming from church with Florence; he was standing by the old gate in the moonlight under the stars of heaven; the birds were whispering to each other in the bushes the song that he was whispering to her. She had seemed at first to listen; then the dark days had come for him and they had parted at the cross-roads—

Ah, Heavens! that was years ago, and

she was the love of his youth! He had formed other ties,—deep, sacred ties. Could it be that the old love was still alive—that love which he had fought so hard to cast out of his life? But his reverie was broken at the sound of her voice, saying: “My husband will be glad to know you. And do you know, Jack, I kept the promise you extorted from me, never to mention your name after we found out our mistake; and I have thought of you so often, and wondered where you were, that I nearly broke the

but he suddenly dropped it. He could find no words in which to answer her, but a feeling of intense hatred sprang up in his heart against the man who had won this fair woman—a feeling of almost jealous revenge. He did not tell her that he knew Pete, but tried to take her back with him to the old days.

Little did he think that the jealous eyes of Pete were on him then, as he devoured the beauty of the woman and lived over again the days when they were sweethearts. But Florence's mind was on the gayety around her, and she wished to dance. So they waltzed—once—twice—many times. How divinely she waltzed! Now rushing over him came those other days. How he longed to hold her always as in that mad waltz! How he wanted to take her away—keep her for himself! He thought that if he could only carry her away to some far-off island, to live—to breathe—to smile for only himself! But these were wicked thoughts for noble Jack Cavanaugh, and very foreign to his more sensible and honest nature.

Florence laughed, chatted, danced, little dreaming what was in her partner's mind. But it troubled her that she could not find Pete to introduce to him her old friend.

So Jack left her after promising to see her at the reception next day at Lady Grey's home.

* * *

When Mrs. O'Connel found Pete, she related her meeting with Jack Cavanaugh, saying: “He is an old friend, dear, and I wish you could have met him, and you will tomorrow at the reception, for he has promised to be there.”

Pete did not say much at this announcement for he reasoned that if Jack had spared her the pain of relating their unfriendliness, he surely would spare her.

“Well, Jack Cavanaugh, you are worse than I thought, and I have surely found you out. I knew you were much pleased with yourself and all swelled up on your undeserved advancement, but really, I did not think you were so low as to try to steal another man's wife, and I will watch you, curse you, and if in any way you seek to turn the current of

CONSTANTINOPLE—HOWLING DERVISH.

promise several times. I wanted to tell Pete about you. I know he would be interested, though he seldom speaks of men to me, and I have sometimes thought his life is so taken up with our two girls and myself that he never thinks of other people. But, come—you will, I know, find Pete O'Connel one of the best fellows you ever knew.”

Jack had taken her hand while she was speaking, and at this last sentence he gripped it so tight that Florence could scarcely keep from crying out with pain;

a pure woman's life, I will kill you."

Florence wondered tonight as they walked to their hotel what made Pete so unusually kind and attentive. She compared the handsome lover of her youth with Pete, and she could not help but admire him, but she was happy and never for a minute had she been sorry that she married "Honest Irish Pete," as he was called, for he was really the love of her life, and a kind and adoring husband.

It was 8 o'clock, and the guests had commenced to arrive at Lady Grey's.

The fine lady soloist had disappointed the committee on entertainment, but they had learned in time of the remarkable voice of Mrs. O'Connell, and had luckily obtained her consent to assist with the music.

Her voice had never seemed in better condition, and Jack Cavanaugh hovered near enough to watch every expression of her sweet face. Oh, was he mad! All the old love seemed to be gushing over his soul. He was completely enveloped in the past; the room was hot; the walls seemed to be swimming around. He must get out into the open air, or he would suffocate. Little did he care for the angry eyes of Pete O'Connell, which did not leave his face once. But just as he is seeking the open air—stay, what is that song she is singing? He will hear it out. 'Tis a low, sweet lullaby—a mother singing to her babe. Florence's face gradually fades away, and in its place another comes, singing that song—an infant clinging to her breast—his child and hers. He hears again the voice of Alice singing to their first-born, sees again her head pillowed on his shoulder, hears the low sweet whisper, "Yes, Jack, I love you. I think I must have always loved you, dear, even before I knew you." Ah, he was mad! Had he never after all appreciated the pure, sweet love of his little wife? Were years of devotion and the tender care of his offspring as nothing?

Ah, he had been remiss. As the last notes died away, so died almost ere it was born, his unholy love.

When he found the open air all the world seemed to echo Alice's words of

years long gone by, "I love you, Jack. I always loved you." How he longed for her now. A new love seemed to have been born for her in the last few minutes. Ah! she would have been repaid for all these years of devotion could she have seen his heart now.

But as he is communing with himself, someone breaks in on those sacred thoughts. "Sir, I wish to speak with you." It was Pete. They walked farther into the garden. Here hot words passed between them, for as always, it was

NORWAY—TROMSO LAPLANDER

useless to reason with a jealous person.

Pete refused to believe Jack when he candidly told him how Florence's song affected him, and how it had made a different man of him, how that his own wife had never seemed so dear to him as at the present moment.

But Pete was stubborn and they parted in anger. Jack went home that evening. Pete and his wife went home the following day.

Another three years roll around and

find Jack and Pete on speaking terms, but not much better friends.

It was about 10 o'clock P. M. Jack and his son Arthur, who had caught his father's engine out the last trip, were preparing to leave the engine when Pete's engine came flying down the main track and struck the big locomotive with terrible force. For one awful second they reared in the air like two gigantic monsters, then Jack's engine leaned to one side and fell. Jack was in some way caught and held under the cab. His son Arthur was thrown some distance and scalded.

ST. PETERSBURG, RUSSIA, COACHMAN.

Pete had put on air and he and his fireman had jumped just in time to save themselves. When Pete learned that Jack was pinioned under the wrecked engines he waded in through steam and hot water and endeavored to drag him out. But it was useless with tons of iron holding him fast.

Jack was entirely conscious and his first questions were for his son, and when told that he was not badly injured he begged pitifully for death.

"My God, Pete—Pete! I hear your

voice, Pete, Pete, for old times' sake—Pete, help me. Break the news to Alice—tenderly—you—Pete—Oh, God! What have I done to merit such suffering—"

Poor Arthur Cavanaugh was lying some little distance away and the suffering of his father almost crazed him. He imagined that Pete had caused the wreck through revenge, because his father, though a younger man, was pulling a passenger.

"My God! O'Connell! What a cur you are. How could you do it—you who used to be father's friend—you did it on purpose, and you shall pay dearly for it!"

He was too dazed to understand that his father's engine was on the main track instead of the roundhouse track where it should have been.

When the bystanders heard the angry words of Arthur Cavanaugh accusing Pete with causing the accident they let the words sink so deep in their hearts that they too believed he could have prevented the accident by putting on air sooner.

Although Pete was badly burned about the arms and hands, he did not seem to mind the pain. He made one more heroic effort to extricate Jack and then he realized that it was useless till further help came. He was so stunned with the cries of misery from Jack and the accusations from Arthur Cavanaugh, that strong man as he was, he fainted.

The wreck crew soon arrived on the scene and with them several doctors. Poor Jack was soon taken from the twisted irons that had held him captive. Soon after Pete had fainted the blessings of unconsciousness stole over Jack and though

he lingered several hours, he never spoke again.

Pete himself filled the other missions Jack had left for him. He broke the sad news to Jack's poor little wife, which at first completely prostrated her.

After the sad rites of the dead were finished, Pete found himself under arrest for murder.

It had in some way leaked out that the men were bitter enemies. Truly they had been, but in that last terrible trial, the old friendship had sprung to life in

Jack's dependence on Pete and as he saw that poor prostrate, suffering form, Pete had buried forever that bitter enmity.

It was a strange trial which lasted for months, and to make it doubly sad for Pete, while in prison he lost his beloved wife, and the blow almost killed him.

Mrs. Cavanaugh had somewhat recovered, and with her two daughters was almost a daily visitor at the prison.

She knew that the man was innocent of crime before Heaven, and that it was her son's bitter words that had placed him behind prison walls.

Arthur Cavanaugh visited him often and did all he possibly could in his behalf, for it was really his fault that Pete was behind the bars.

At last the trial was finished and the jury brought in the verdict: "We find the prisoner not guilty."

As Pete walked out of the prison, his two daughters and Arthur Cavanaugh by his side, one would hardly know the honest Pete of a few months before. His step is slow, and his hair has turned quite white. Pete never returned to the road.

Six years later we find Pete settled in a thriving town of the West. He has set up in business and is rapidly accumulating a fortune.

From the day Pete left prison he felt it a duty he owed to Jack, to look after and protect Jack's widow, and four years from that memorable day he married her.

Arthur Cavanaugh is engaged to beautiful Florence O'Connell. The wedding day is set and will take place in early June.

All seem happy and contented, but people know who look on the faces of father and mother that their life holds a story.

A Soldier's Valentine.

It was only a square of paper lace
Where roses and hearts entwine,
And beneath them a loving word or two:
Only a valentine.

A frivolous thing, in an envelope
All covered with cooing doves,
Forget-me-nots, and hearts, and darts,
And little ecstatic loves.

'Twas sent by a girl who kissed it once
As she stood in the whirling snow,
Where the lights from the corner store through
the storm
Sent out a hazy glow.

But your Uncle Samuel must have guessed,
No matter what else might wait,
That letter must go, posthaste! posthaste!
From here to the Golden Gate.

For across the river and over the hills
And the prairies on it flew;
It dodged a wreck, and it entered storms,
And once 'twas the last train through.

Then forth it put to the western sea,
Where the speeding waves upcurled:
And the cupids and love-birds sailed away
To the other side of the world.

N. P. ENGINE 1217—BRO. C. W. MEYER, DIV. 238; C. D. LOCKWOOD, LODGE 172, B. OF L. F.—MRS. A. BUNDY, PHOT'R.

O wonderful scrap of paper lace!
It went to a hospital bed,
Where a homesick soldier tossed and turned
And would not be comforted.

And somehow the soldier felt that day
Soft arms, whose pressure he knew,
And home, and love, and health, and hope
Thrilled him through and through.

And he felt new love for our Uncle Sam,
Who had lent his trains and men
And ships, that the whole wide world apart,
Two hearts might meet again.

—Florence E. Pratt, in the *Cleveland Leader*.

Keep Still and Be a Force.

When trouble is brewing, keep still.

When slander is getting on his legs, keep still.

When your feelings are hurt, keep still, till you recover from your excitement, at any rate.

Things look different through an unagitated eye.

"In a commotion once," says one, "I wrote a letter and sent it, and wished I had not. In my later years I had another commotion, and wrote a long letter; but life rubbed a little sense into me and I kept that letter in my pocket against the day when I could look it over without agitation and without tears. I was glad I did. Less and less it seemed necessary

real trouble meant; it has thrown all the sham worries and make-believe unhappiness into the background."

It is a rough and tumble world, where everyone has his own private little battle ground, and he is not much of a soldier who runs over and tells his neighbor about every little scratch.

Even when the great hurt comes—the real sorrow which shall transform the world for you, keep still.

But you will keep still then. As the depths of the river rush on more silently than a shallow, chattering brook, so the real grief sweeps noiselessly over the heart, numbing its cries to silence.

Silence is a massive thing. It is strength. It is grandeur.

Do not be a shallow, babbling brook.

FOUR GENERATIONS.—Reba Price, daughter, and to the right Mrs. Price, wife of Dr. E. E. Price, of Div. 401; to the left, Mrs. Price's mother, Mrs. Stenker; Mrs. Palmer, greatgrandmother, holding the baby, Reba.—Courtesy E. E. P.

to send it. I was not sure it would do any hurt, but in my doubtfulness I leaned to reticence, and eventually it was destroyed."

Time works wonders. Wait till you can speak calmly, and then maybe you will not need to speak at all.

When you have petty little worries and vexations, don't whine about them. Keep still.

At some later day you may come to know what real trouble is.

There was once a woman who never possessed real serenity of mind, until a great sorrow came into her life, then she said: "I never knew until now what a

Be the silent, onward rushing force of a mighty river. Be the calm, serene and silent depths of ocean.

Keep still!—*Philadelphia Evening Bulletin.*

Old Gorgon Graham's Good Advice.

"It's pretty hard to know how to treat a lie when it's about yourself. You can't go out of your way to deny it, because that puts you on the defensive; and sending the truth after a lie that's got a running start is like trying to round up a stampeded herd of steers while the scare is on them. Lies are great travelers, and

welcome visitors in a good many homes, and no questions asked. Truth travels slowly, has to prove its identity, and then a lot of people hesitate to turn out an agreeable stranger to make room for it.

"About the only way I know to kill a lie is to live the truth. When your credit is attacked, don't bother to deny the rumors, but discount your bills. When you are attacked unjustly, avoid the appearance of evil, but avoid also the appearance of being too good—that is, better than usual. Surmise and suspicion feed on the unusual, and when a man goes about his business along the usual rut they soon fade away for lack of nourishment."—*Ex.*

Hunger and Ideas.

If you wish to increase your imaginative powers, says a scientist, go without food. Abstinence from food till the pangs of hunger make themselves distinctly felt will quicken your mental powers and stimulate the flow of ideas, such ideas being of a kind that agree with the regular bent of your mind.

This seems to offer good prospects not only to literary men, but also to machine makers and all those who are on the watch for some improvement or invention that will revolutionize some industry. But you must be careful or you will overdo it. Prolonged fasting, according to the same authority, creates a desire to commit some horrible crime, makes you wild and cruel. The prolonged faster becomes a prey to hallucinations, is unable to sleep and likely to go mad. In short, abstinence from food for long periods—and "long periods" is a term that varies with the individual—induces the same effects as drunkenness.

Setting Colors in Fabrics.

It is impossible to tell whether a color is fast before washing, but by far the safest plan is to "set" the color before it goes to the tub for the first time. One of the best methods for settling delicate colors consists in simply making a strong brine of cold water and salt and soaking the garment from 12 to 24 hours. Of course this should be done just before going to the laundry, and the salt should not be allowed to dry in it. This is especially good for all shades of pink and green, and colors once set this way will be bright as long as it would be possible to expect it. A strong solution of alum and water is good, particularly with blue, and the more delicate shades of brown, but its effect is not so lasting as that of salt and it is sometimes necessary to re-

new the bath after the first three or four washings. Some people recommend solutions of lead and copperas, but as both of these are poisonous drugs, it is better to avoid them.—*Chicago Daily News.*

Value of Deep Breathing.

Every inch added to the chest means more vitality. One can live for days without food or water; without air one will die in a moment. This shows the great necessity of oxygen to the system. Remember also that oxygen burns away fat.

Here is a breathing exercise that can be practiced during the daily walk. Inhale, filling the lungs, while walking five steps; hold the breath during the next five steps; exhale, completely emptying the lungs, during the next five steps. Now inhale during six steps; hold the breath during the next six; exhale during six more. Continue the exercise, increasing the number of steps each time. After a few weeks you can use fifteen steps.

Try to breathe deeply at all times—that is, make both inhalations and exhalations longer in time. Do not breathe with the abdomen, as most fleshy people do, as this increases its size. Use the diaphragm or lower chest in breathing.—*Harper's Bazar*

Raw Apples Promote Health.

Ripe, uncooked apples are among the most valuable of our fruits. It has been said that any man who can and will eat two good-sized apples in the course of every 24 hours, will never have gout, and if this destroyer of comfort has already fastened its fangs in his system, apples will vanquish even the most persistent form of this legacy of luxurious living. Raw apples are much to be preferred for health reasons to those that are cooked. Heat makes chemical changes and destroys or vitalizes an acid that seems to act directly on the lime, salts and earthy matter created in the system by gouty and rheumatic conditions.—*Farmers' Review.*

Human Temperature.

"The highest temperature in a human being that I ever had experience with," said a well-known physician recently, "was 110 degrees, and this was in a case of thermic fever, or heat prostration, a class of fevers showing the highest recorded temperatures. But medical annals cite several instances where it has reached 112 and 113, death following, of course. Generally speaking, a body temperature of 110 is a point beyond which a human

being cannot live, and this intense heat cannot be endured for more than a few hours. Such abnormal temperatures rarely occur save in victims of heat prostrations."—*New York Post*.

The Ethics of Honesty.

In the course of a speech in the House one day recently a Congressman had a good deal to say about purity of motives, honesty, etc. Col. "Ike" Hill, Democratic whip of the House, heard the speech, and later fell into a philosophic mood while discussing the oration. Here are some gems of wisdom which fell from the Colonel's lips in the course of a brief monologue: "When a man makes a parade in the daytime of how honest he is, I always suspect that he does second-story work on dark nights. The difference between a man who takes a \$10 bribe and the man who takes a \$100,000 bribe is that the \$10 man gets his. When a free and untrammelled American citizen has a vote to sell, he generally stands in the market place. There never was a politician who dast be honest with himself."

Eating for a Husband.

When the parents of a young man in Russia decide that a certain young lady would make a suitable mate for him they say nothing about the matter to anyone, but on some evening they will drop around unexpectedly to the prospective bride's home and will stay for supper. During the meal they will keep a close watch on the young lady. If she eats fast she will perform her work speedily, if she goes neatly and cleanly about her plate she will perform her work neatly and cleanly; if she does not talk much she will work and not talk and prove a faithful and obedient wife to her husband; if she prefers rye bread to white she will be satisfied with her lot; if she does not gaze and stare at the visitors she will be a wife that will not continually pry into her husband's business, and if she immediately proceeds to clean up the dishes after the meal she will bring prosperity to her husband and will be economical with his money. A most peculiar thing about the marriage ceremony is the fact that when the couple enter the church both groom and bride make a dash for the platform on which is the pulpit. It is believed that the one whose foot touches the platform first will live the longer and the children will take after that one in size, health and beauty.—*N. O. Picayune*.

Servants in Russia.

The Russian servant is hired for one year, and is told exactly what his particular duty is to be. He then sticks to that one duty. As long as each servant faithfully performs the special duties of his position all is well, but the neglectful butler or cook or coachman is sent by the employer with a written note to the police judge, who after carefully investigating the complaints has a right to order bodily punishment or to write a bad mark in the book kept for this purpose.

In great Russian households often from twenty to fifty servants are kept, and even the middle-class families have two to four. The pay of these servants varies according to the line of work. While the "chiefs" in the kitchen of wealthy families often receive £800 a year, a cook in an ordinary citizen's employ gets no more than £12 a year, and a maid of all work never gets more than £5 a year. At Easter every servant gets a present, generally a suit or dress.

Every other Sunday the servants in a Russian household are entirely free. Their work stops Saturday night after supper, when the servants leave the house not to return until the next Monday morning. The employers never ask where or how the free time is spent.

Russian servants will pilfer. Since Russian ladies leave everything to the care of the servants, the latter do as they please.

The man servants smoke cigars belonging to their masters and pay frequent visits to the wine cellars of the house, but a gentleman would consider it "demeaning" himself to prosecute a servant for this.

The Russian servants will talk about fellow servants, but never about their employers. Even when they quit one place and take service in another family they would never mention anything about their former masters. This discretion goes so far that even the law considers it. In Russia the law excludes servants as witnesses against their former or present employers, so long, at least, as these servants are not suspected of having taken part in the crime.—*London Mail*.

Servant Girls in Germany.

In Germany the government takes a hand in the servant girl problem, as it does in almost everything else, and it has succeeded in partially solving at least one phase of the difficulty. It has reduced the servant girl's "flightiness" to a minimum; she cannot change places once a week the year around. For, when she

moves, the government, represented by the police, must know all about it, and, if there is any difficulty or dispute, disagreeable questions may be asked.

Indeed, the process of employing a servant girl is a good deal of a business transaction, with a decidedly official tinge. The girl comes to your kitchen and you agree with her about the wages, and she says she will stay. Then you must go to the police station and purchase for five pfennigs (about one cent) a white card, or blank, which has spaces for all sorts of information about the new "girl." You must write down her full name, where she came from, whether married or single, her trade, whether cook, chambermaid or waitress; her birthday and year,

cult for a girl to move about, or for the master to discharge her with small cause. Should it be necessary at any time for the girl to leave, there must be more dealings with the police. The householder now buys a green blank, or card, on which he reports with the same completeness of description the departure of his servant. And there must be no delay in any of these ceremonies, else the police, who have their fingers on every man, woman and child in Germany, and know just where each individual should be at any given time, will begin making inquiries, and if you have not reported you are taken before the magistrate and fined.

All this tends to prevent the rapid cir-

GROUP OF CHARTER MEMBERS OF DIV. 636 AND VISITING BROTHERS, SOMERVILLE, TEX.
—COURTESY C. O. H.

her nationality, her religion, her own home, and if married how many minor children she has, where they are and who their guardian is. The government always looks out well for the children, and sees that they are provided for comfortably, this being the more necessary because many, perhaps most, servants are married women with typically large families. At the same time that this blank goes in, the "girl" must also send a blank, reporting her change of place. Having done all this, you must see that the girl pays her regular fees to the insurance or death fund, so that she may not become a public charge in case of her death or disablement.

All this ceremony tends to make it diffi-

culation of servant girls so familiar to every American householder, in which the Claras followed the Maggies and the Katies follow the Claras in swift succession. Nor do the German "girls" expect such deference as those in America; they are industrious and quiet; they are willing to work for little or nothing, and to do any sort of disagreeable task; but, on the other hand, not so much is expected of them as in America, and their mistresses are perhaps more tolerant. It may be added, however, that the German "girl" has her regular Sunday soldier or policeman as well as the American girl; that is a problem which even the German government cannot solve.—*Cleveland Leader.*

The Objective.

London Railway Review.

"The altered conditions of service of the last five years have knocked all the spirit out of the men," is the opinion of a correspondent writing of the locomotive department on the Midland. "Railway workers," said a speaker recently, "were going lower and lower in the scale until they were becoming part of the railway machinery, and helping to crowd their fellows out of employment." These things are true. Locomotive men on some of our railways are being reduced to mere machines, whose sole function it is to work and eat and sleep. This process has been going on to such an extent recently that the men in this department of railway life are in danger of losing their manhood and sinking into the position of mere slaves. And to what is this evil due? It is due entirely to the conditions under which the men live and work. It is due to the long hours, to the short periods of rest, to the more intense work exacted, and to the general character of the work performed. We have called attention again and again to the changes which have been brought about, and which have resulted in such great saving in mileage and expenses to the companies at the expense of the men. These results can be tabulated and their effects weighed and pondered, but the evils to which we refer are so subtle, so silent in their influence, and yet so powerful in their ultimate results that they constitute the greatest menace to the *morale* of the men and even to their physical well-being. It is for that reason that we ask the men of the locomotive department to give serious consideration to their present position and to set before themselves as an objective the attainment of the obvious remedy—an eight-hour day.

The question of long hours has ever been the stumbling block among loco. men, and we are compelled to state that, in our opinion, they have been easily deluded by the transparent device of overtime and excessive hours into falling an easy prey to a lowering of their standard of life. Not only relatively, but actually, loco. men are worse off today than they were 25 and 30 years ago. They have not only made none of the strides forward which other grades and other workmen have made, but, except in very few cases, they are actually worse off than they were. And the reasons are not far to seek. So long as they could work plenty of overtime and get a fairly decent sum at the end of the week they have been careless of the greater and more important question of the standard rate and

the standard day. As a consequence, little by little, these have been interfered with by trip rates and mileage rates, until the results which we have pointed out have been attained. Not only so, but a fatal division has been created in the ranks of the men themselves, and instead of presenting a compact and undivided front—in one organisation—they have been fighting each other, with the consequences which might naturally be expected. There can be and will be no improvement until the ranks are closed up and the men are thoroughly united on one specific remedy. Men who want "big weeks" now in preference to a shorter standard working day will find they are gradually undermining their own position, sapping their moral fibre, and exposing themselves and their fellows to grave risks of physical deterioration. The intensity of the present work demands a shorter working day. While there are numbers of drivers and firemen who cannot get a full week, there are others working 12 and 15 hours per day, and making weeks of 80 and 90 hours. More than that, and worse still, there are numbers of extra men, especially during the recent bad weather, who have been called on duty regularly at the end of an eight hours' respite for a fortnight or more, being absolutely robbed of an opportunity to do anything but work, and eat and sleep, and with none too much of the latter.

The remedy for this state of affairs is thorough organization of the men, which, when complete, shall be devoted to the obtaining of an eight-hour working day and longer periods of rest. If the eight-hour day were instituted, and each day paid for on its own basis, *i. e.*, overtime to commence at the end of eight hours, and with proper provision for mileage rates where such exist, a large number of the other evils would disappear. There is no single reform which is so urgent, or which would yield such good results. It is necessary and just in itself, and would prove of incalculable benefit to the men and even eventually to the companies themselves. It is doubtful if the cost would be more than nominal, as it would compel a better arrangement and organisation of the work, from which the companies would receive a decided advantage. The men would be improved materially, physically and morally, and we venture to assert that the gain all round would be immense. It would automatically solve many of the evils of which the men complain, and others would be lessened almost immediately. We, therefore, appeal to loco. men to "lay aside every weight" which would hinder its attainment, to cast out their individual jealousies, to

make the necessary sacrifices now, and, above all, to perfect their organisation with a view to securing as their objective the solution of this hour's question. Railwaymen of all grades plump for an eight-hour day.

National Loco. Movement.

SIR: I shall feel obliged if you will give me an opportunity to have a few words with my fellow footplate men *re* above.

I am pleased to notice that the movement is being taken up in such a good spirit, and goodness knows it is time that a start was made to make some improvement in our conditions of employment.

ion is more than confirmed by passing events) that it should be one of one plank only, and that of eight hours per day, with, of course, safeguards so far as mileage is concerned. The question of wages should be left alone for awhile. We are at the present time doing two men's work, that is, when we compare our work now and what it was ten or twelve years ago. That being so, let us go in for reducing the standard day to one of eight hours.

It is useless for the railway companies to say that they cannot afford to do anything for us. They can afford to keep a lot of useless officials at high salaries, who can go away for a month, and in some cases two or three months, without others

BALTIMORE & OHIO MAKING A NEW YARD NEAR PITTSBURG, PA.—Full Brotherhood crew manning the engine with Bro. J. F. Bainter, of Div. 379, at the throttle, and construction gang.—Courtesy J. F. B.

What with large engines, heavy loads and high speed, the lot of the footplate men has become almost unbearable. Then again the badly equipped state of some of the engines, especially those on the London & North-Western Railway, so far as brake power, repairs and sand is concerned, is to say the least a perfect disgrace to a company holding the position that company does. But nothing will be done to improve things until the men on the L. & N. W. and other railways show by proper organisation their determination to have their lot improved. So far as a programme is concerned, I have for a long time held the opinion (and that opin-

being appointed in their places. The work has gone on as well, and in some cases better, in their absence than when they were on the job. They can also afford to keep their engines in a miserably bad state of repair, which causes them to use double the quantity of coal than they would otherwise. Consequently their excuse of cannot afford better conditions to their men will not hold water. Let the directors economise in the right direction. Let them get practical men to manage the various departments. Let them do away with parsons' and managers' sons who have been pitchforked into snug positions through favouritism, and who have to

keep an army of inspectors and clerks to do slave-driving work for them on account of their utter ignorance of the work they have been appointed to do.

So, fellow footplate men, complete your organisation, push forward the movement, show the companies that you know how to manage your business and safeguard your labour.—Yours, etc.,

DRIVER.

The Trades Disputes Bill.

A meeting convened by the Trades Council in support of the Trades Disputes Bill was held on the 17th inst. at the Park Hall, Cardiff, and was well attended.

The Chairman explained that this was one of a series of meetings arranged by the Parliamentary Committee of the Trade Union Congress with the object of endeavouring to bring into unity all sections of Labour in order to place their organisations where they were prior to the Taff Vale judgment. He believed the persecution they had suffered had made Trade Unions healthier, purer, and stronger today than they had ever been. (Applause.) When they asked for support to the Trades Disputes Bill they simply asked to be put in a position of equity before the law. They asked for simple justice. (Applause.)

Mr. J. Graham expressed the opinion that the Taff Vale judgment had done good to Trade Unionism, because it had supplied the necessary incentive to push Trade Unionism in the right direction. Their friend Mr. Beasley some time ago informed his guests that he had a photograph of the vote that had been passed to him from the Labour organisations. If Trade Unionists were true to themselves they would be able to give Mr. Beasley a companion picture to the one he already possessed. (Applause.) He had pleasure in moving the following resolution: "That this meeting calls upon the Government to afford facilities for passing the Trade Union and Trades Disputes Bill, the second reading of which has secured a substantial majority in the House of Commons, and pledges itself not to support any candidate who fails to declare his intention of voting for the bill."

Mr. Richard Bell, M. P., speaking in support of the resolution, said they were told that if Trade Unions had the power they possessed prior to the Taff Vale judgment, the industries of the country would be ruined. If that were so it was remarkable the industries of the country were not ruined during the labour troubles for 30 years prior to that decision. No workman or Trade Union official wanted to strike if it could be avoided, but they did demand the power to strike and strike hard if they found it absolutely necessary.

(Applause.) Nothing more than that did they seek, nothing less than that would they be content with. (Applause.) The Taff Vale decision was in the opinion of many of them a premeditated decision. In support of this view the speaker read from a document dated the 20th September, 1898, two years before the Taff Vale strike. This document was from the Engineering Employers' Federation to Lord Wemyss and the Free Labour Association, inviting the latter to attend a conference at the Hotel Metropole to consider the new rules under which the Federation would in future be conducted. The conference would also consider a proposal to accept into the Federation other allied trades having pressing and immediate grievances with "tyrannical Trade Unions." This communication was to be considered as strictly private, and to be destroyed if not recognized. One of the objects of the Federation was to protect British trade and manufactures at home and abroad by maintaining and defending absolute freedom of contract between employers and employed, and exercising the right of conducting and maintaining their individual businesses without interference from Trade Unions either inside or outside of their works. The Federation guaranteed to provide to every firm in a dispute with a Trade Union the full average profits on a year's turnover so long as the dispute lasted. The Federation reserved to itself the right to stop the dispute at any time, and no firm engaged in a dispute must under any circumstances enter into negotiations with or acknowledge in any way negotiations from the Trade Union under the penalty of instant dismissal from the Federation. (Laughter.) That was the rule under which the management of the Taff Vale acted during the strike. In addition this conference formed a Parliamentary Committee for active work, which the speaker added, showed its real purpose, to thwart and counteract the Parliamentary efforts of the Trade Unions. Thirty-five thousand pounds were guaranteed for Parliamentary and propaganda work by Vickers, Son and Maxim. This, said Mr. Bell, showed what was in the air before the Taff Vale strike and before the House of Lords' decision. The employers were determined to bring about legislation which would cripple Trade Unions. The employers were satisfied with the Taff Vale decision, and they were using their power and influence to maintain it. Proceeding, Mr. Bell denied that there had ever been a Trade Union leader who had endeavoured or desired to interfere with the management of any concern. They did not care how the concerns were managed. What they wanted were fair conditions as

regards hours and wages and safety for those employed. (Applause.) Supposing there was a strike, and one of the strikers happened to hit another man in the eye in the street. What had the union to do with that? The union was not responsible for the control or conduct of an individual in the street, and the union should not be liable for any damages for any such conduct. The law protected the individual and punished the man who committed an assault. During the Taff strike a number of men were summoned for breaking their contracts, and were mulcted in damages to the extent of £4 and costs. There the law protected the employer. They did not desire now in the

personally and individually he had no knowledge as to this. Further, dealing with the membership of the union, Mr. Beasley said that notwithstanding the persistent efforts to force men into the union railwaymen, as a rule, did not join it, being, as he maintained, content with the terms of their service. (Laughter.) Moreover he emphasised the fact that in the case of the A. S. R. S. more than half of its funds for benevolent purposes were obtained from the public. The speaker only wished Mr. Beasley was correct in this latter statement, and went on to ask the Taff Vale manager to explain if he held it wrong in the men to endeavour to get their fellow workers to join the union,

MERRY-GO-ROUND IN GEORGIA, BROS. C. J. KEPLER, OF 493, AND W. E. CHAMBERS, OF 167, PROPRIETORS.—COURTESY K. & C.

Bill to be relieved of this part of the law. So long as the offender paid the penalty what had the union to do with it? If a member of a friendly society assaulted another man in the street the friendly society was not responsible for paying the damages. It was unjust to make unions responsible for the acts of individual members when the law already provided sufficient protection for the individual injured. (Applause.) Referring next to the evidence of Mr. Beasley before the Commission, Mr. Beasley had said he understood certain grades of his railway servants belonged to the A. S. R. S., but

how it was that his own management could be right in refusing to permit men to enter its employ unless they first signed on through the Free Labour Association. He (Mr. Bell) failed to see where the wrong was on the one side and the right on the other. He next ridiculed Mr. Beasley's statement that he did not know those among his workmen who were members of the A. S. R. S. and those who were not. It was, he added, a most singular fact that it was always the members of the A. S. R. S. who were mulcted in penalties, such as dismissal, whilst men who had been imported never seemed to be in

any trouble. A short time ago there was an accident at Abercynon. There were two engines on the train. The driver of the leading engine and the guard of the train were members of the A. S. R. S. Both had been dismissed. The driver of the second engine and the brakeman were imported men, and they had not been interfered with. That was a rather singular coincidence. Of course, Mr. Beasley did not know these men were imported and the others members of the A. S. R. S. During the current year one of the Taff men was on the Executive of the A. S. R. S. and had to attend four meetings during the year. For the first meeting he was allowed leave of absence. For the second he was given one day. When he came to the Executive and reported this the Executive communicated with the manager, and the latter replied, "Well, we will extend the leave, but he must be prepared to return when we require him." On the Wednesday he was sent for and had to go back, when really it was not at all necessary. For the third meeting he was refused leave, but at the latter end of the week was allowed two or three days. Last week, when they met for the fourth time, he was refused leave altogether, and was not at the Executive meeting. Now, Mr. Beasley could not say that that was fair treatment. There were other little straws which showed how the wind blew.

National Movement for Locomotive Men.

From the Locomotive Journal, Leeds, England, Representing Engineers and Firemen.

There was a large attendance of locomotive men at the Shepherd's Hall, Bristol, on Sunday afternoon, November 20th, on the occasion of a meeting held under the auspices of the A. S. L. E. & F. and A. S. R. S. This was arranged for the purpose of discussing the National Programme for locomotive men. Alderman J. Curle, J. P. (secretary of the Bristol Trades Council), presided. The chairman remarked that that was a unique gathering, because so far as his recollection went it was the first occasion on which they had had the two societies meeting together to consider questions of vital character. It augured well for the success of the movement that the men had turned out in such numbers. He understood meetings of that description were being held all over the country, and the one question in the forefront of their programme was an eight hours' day. That could only be done by working upon a national basis. The majority of railway directors were not very sympathetic with a movement of that kind, and railwaymen, above every other class, needed organization. (Ap-

plause.) They had only to show sufficient determination and they would achieve their ends. (Applause.) When the directors saw that the men were in earnest in this movement they would begin to listen to them. If there appeared to be division in their ranks the directors would take advantage of it and ignore their claims. (Hear! hear!) The hymn, "Now courage, working brothers," was then sung. Mr. A. Fox (General Secretary) then addressed the meeting on the National Programme. They had gone backward, he said, considerably, so far as wages and conditions of employment were concerned. They could not allow the companies to go on with a one-sided movement, which was depriving the men of the wherewithal to live, by the conditions they were imposing upon them. Each company trotted out some tit-bit of service which was better than another company gave. The apathy of the men, too, was largely responsible for the state of affairs existing. He then spoke of the eight hours' day, stating that it would mean finding employment for 12,000 more locomotive men, and owing to the increased mileage and the increased loads put behind the engines, men today were putting in as much work in eight hours as they used to in 12, and that the men were worried to death years and years before their time. He then dwelt to some extent on the long runs, quoting the one from London to Plymouth without a stop, and those who knew what engine driving meant would agree that the wonder was that they did not lose their reason before getting to the end of the journey, and he contended that the work our men were called upon to perform nowadays could not be accomplished with safety to the public. He contended that a man must not receive less than a day for each time he signed on duty, that each day must be treated separately, and that we must have a guaranteed week. (Applause.) He urged the men who were not organized to let that be their last Sabbath as non-unionists. (Applause.) Mr. J. H. Thomas, A. S. R. S., also spoke, urging that nothing would solve the unemployed question so effectively as an eight hours' day. The greatest difficulty they had to contend with was classification. On the Great Western Railway they had practically four classes of men. He would like to see classification abolished on every railway throughout the Kingdom. (Applause.) He emphasised the importance of the men being thoroughly organized. Mr. H. J. Washbourne moved the following resolution: "That we, the locomotive men of Bristol and district, hereby record our convictions that an eight hours' day is a reason-

able and just requisition, and having regard to the fact that through recent developments our work has been greatly intensified, and the prospects of promotion reduced to a minimum, we will help to work up and support the National Programme for an eight hours' day and better conditions of service generally, and we, the organized section of locomotive men, also strongly urge the unorganized to consider their position as single and hapless individuals, and to ask themselves whether they intend to join the band which has determined to raise the workers or remain in the slough of despond." Mr. H. Norman, A. S. R. S., seconded. The resolution, on being put to the meeting, was carried unanimously. "Toilers of the nation" was then sung. Mr. H. Cooke moved, and Mr. F. Price seconded, a vote of thanks to the chairman

rions kinds, I have come across several which are of a peculiar character, and a few notes concerning some of these will be interesting, not only because of the extraordinary proceedings indulged in by railway officials concerned, but also as showing how circumstances and human beings can combine to cause results which, were they not facts, would be considered by the most broadminded and experienced individuals to be absolutely impossible.

At least two accidents have occurred in which the engine and train has been travelling backwards for some distance while the enginemen where under the impression that they were travelling forwards.

About 20 years ago the driver of a Midland night express, finding that one of the big ends of the engine was "knocking," stopped to examine and tighten up near Kibworth. After the stoppage he started

ENGINE 209, BOSTON & MAINE.—BRO. LEO AUBRAY, ST. JOHNSBURY, VT., MEMBER OF DIV. 572, ON GANGWAY, AND MRS. AUBRAY IN CAB WINDOW.

for presiding, and to the speakers. Those gentlemen having responded, the largest meeting of locomotive men ever held in Bristol was brought to a close.

O, Brothers be united
And hold together close,
There's strength to us in Union,
There's weakness for our foes.
Then let us not divide, men,
But all one body be;
As one in toil and wrong, men,
So one in Liberty.

SECRETARY.

Locomotive and Railway Notes.

BY "INDICATOR."

In the course of recent researches I have made regarding railway accidents of va-

again, and then went out on the frame to watch the motion. He was so intent on this that he did not notice that he was travelling backwards, the engine having been reversed during the stop or for starting, and the fireman, concerned with his fire, seems to have been oblivious of the reversal also. The front guard thought that the backward movement was caused by setting back for starting, and then that the driver was going back a little way. His unconcern was severely censured and apparently rightly so.

The rear guard seems to have been the only one who grasped the situation, and he, although he did what he thought best, did not act as he should have done, for being on the ground halfway along the train he ran to get to his brake, and fail-

ing to do this, clambered on to the train and along to the van to put on the brakes, whereas the proper course should have been to wait for, or go to the engine and call to the driver.

The train travelled backwards on a falling gradient for more than half a mile and finished, with its speed slightly reduced by the rear guard's application of the brakes, by colliding with a coal train stopping at the station behind. The coal train driver, seeing what was happening, had got his train into motion backwards, but only sufficient to lessen the force of collision.

How the driver could be unaware that he was travelling backwards is one of those questions which probably even the ablest student of human nature would be unable to explain.

On another occasion (about 15 years ago), and for this there is some explanation, a Metropolitan engine and brake stopped by signal at Marlborough Road Station, and when started again travelled backwards and collided in St. John's Wood Station with a following train. In this case the line is in tunnel and the tunnel is divided into two, so that the up and down lines are separated; consequently the presence of the up line would be no indication to the driver, but not one of the three men with the train seems to have realised the position until they emerged into the light of the station behind, and it was then too late to prevent the collision.

A curious occurrence is recorded in connection with the Tottenham and Hampstead Railway. A Great Eastern light engine from Tufnell Park goods yard travelled to Harringay Park Station on the wrong line and collided with a Midland train. In this case two stations were passed—the platforms ought to have been sufficient indication—many bridges, and several signal boxes, yet the fact that it was on the wrong line, but signalled all the way on the right line, was not discovered until too late to prevent the collision.

A further curious accident occurred about 20 years ago at Rochdale. Owing to a large number of special trains it was decided to use the up line as a siding between two stations for the empty trains, and to work all traffic on the down line. A pilot man and pilot engine were appointed to govern single-line working. For the first trip the pilotman decided to go to the other end of the section to bring an up passenger train through before a down goods train. When hooking on to the passenger train, however, he seems to have considered that, although he had started work as pilotman, single-line working had not commenced, notwithstanding that the coal train was waiting

at the other end, and he, therefore, instructed the signalman to send him and the train he was piloting through on the proper line. The result was the natural one, for they ended by colliding with the first lot of empty vehicles shunted on to the up line for storage purposes. Thus all the safeguards of the presence of the pilotman were deliberately disregarded by the pilotman himself in a most extraordinary manner.

Meerschaum Mining in Turkey.

At present there are four districts in Turkey in which any one who so desires may enter into the business of meerschaum mining simply by paying the Ottoman government the sum demanded for a license—namely, five piasters. These districts, as described by the *Revue Scientifique*, are Sari-Sou, Sepetdji, Geikli and Menlon. The 5,000 miners already engaged in this industry are Kurds and Persians, and all of them work according to the most primitive methods. The work is carried on night and day by means of petroleum lamps, the blocks of meerschaum being brought to the surface still imbedded in their matrix. On the weekly saleday the workmen meet and sell their goods to the "luledjis" or pipe manufacturers of Eskichehir. The blocks are then taken to the town and washed, after which they are cut into suitable pieces while the matter is still very soft. Sorting and classing is then proceeded with, and the "luledjis" in their turn sell their purchases to the larger dealers, who export the meerschaum, carefully enveloped in cotton wadding. Meerschaum is composed of about 70 per cent of carbonate of magnesia, 0.25 of selix and 0.05 of aluminum.

The Fearful Price.

Dividends—profits—conquest of markets—these and similar phrases are the sacred passwords nowadays. In the minds of too many any course that tends or seems to tend to the production of material wealth is not only excusable but actually right. Cutting wages, employing children who should be at school, unsanitary factories and stores, defiance of law, bribery and corruption—anything and everything, provided only that wealth is produced.

What a miserable bestial blindness! What a loathsome confusing of means and end! What a repulsive forgetfulness that wealth is only valuable, only desirable, only tolerable, in so far as it produces and tends to produce men and women clothed in the full dignity of the human race!—*Saturday Even'g Post, Philadelphia.*

Supreme Court Decision in the Johnson Case.

Johnson was a freight brakeman, and at a little station in Utah had his arm smashed while trying to couple a locomotive to a dining car. He brought suit and lost in the lower courts, but won in the Supreme Court. Chief Justice Fuller delivered the opinion of the court.

Case determined on the merits without determining the question of jurisdiction, as between the writ of error or the writ of certiorari. Pullman Car Co. vs. Transportation Co., 171 U. S. 138, 145. Quotes sections 1, 2, 6 and 8. Cites in substance the opinion of Sauborn and Lockwood and also the dissenting opinion of Thayer: "We are unable to accept these conclusions which appear to us to disregard the plain intention of Congress to defeat the object of legislation and to be arrived at by an inadmissible narrowness of construction."

The preliminary question is whether locomotives are required to be equipped with automatic couplers, "and it is not to be successfully denied that they are so required if the words 'any car' of the second section were intended to embrace and do embrace locomotives." But it is said that this cannot be so because locomotives were elsewhere in terms required to be equipped with power-driving wheel brakes, and that the rule that the expression of one thing excludes others, applies. That, however, is a question of intention and as there was special reason for requiring locomotives to be equipped with power-driving wheel brakes, if it were also necessary that locomotives should be equipped with automatic couplers, the word car would cover locomotives, then the intention to limit the equipment of locomotives to power-driving wheel brakes because they were separately mentioned could not be imputed. Now it was as necessary for the safety of employees in coupling and uncoupling that locomotives should be equipped with automatic couplers as it was that freight and passenger and dining cars should be, perhaps more so, as Judge Thayer suggests, "Since engines have occasion to make couplings more frequently."

Tested by context, subject matter and object, 'any car' meant all kinds of cars running on the rails, including locomotives, and this view is supported by the dictionary definitions and by many judicial decisions, some of them having been rendered in construction of this act. (Citing Winkler's case, 53 Am. Repts. 70; Fleming's case, 131 Nor. Car. 476, etc.) "The result is that if the locomotive in question was not equipped with automatic couplers the company failed to comply with the provisions of the act. It appears, however, that this locomotive was in fact equipped with automatic couplers, as well as the dining car, but that the couplers on each, which were of different types, would not couple automatically by impact

so as to render it unnecessary for men to go between the cars to couple and uncouple.

"Nevertheless the Circuit Court of Appeals was of opinion that it would be an unwarranted extension of the terms of the law to hold that where the couplers would couple automatically with couplers of their own kind that couplers must so couple with couplers of different kinds. But we think that what the act plainly forbade was the use of cars which could not be coupled together automatically by impact by means of the couplers actually used on the cars to be coupled. The object was to protect the lives and limbs of railroad employees by rendering it unnecessary for a man operating the couplers to go between the ends of the cars, and that the object would be defeated not by the mere use of automatic couplers of different kinds, but if those different kinds would not automatically couple with each other. The point was that the railroad companies should be compelled respectively to adopt devices whatever they were which would act so far uniformly as to eliminate the danger consequent on a man going between the cars."

If the language used were open to construction we are constrained to say that the construction put on the Act by the Circuit Court of Appeals was all gether too narrow. The primary object of the act was to promote the public welfare by securing the safety of employees and travelers and it was in that aspect remedial; while for violation a penalty of \$100, recoverable in a civil action was provided for, and in that aspect it was penal. But the design to give relief was more dominant than to inflict punishment, and the act might well be held to fall within the rule applicable to statutes to prevent fraud upon the revenue and for the collection of customs. That rule not requiring absolute strictness of construction. Citing Taylor's case, 3 Howard 197. The Court referred to Lacher's case, 134 U. S. 624, in which case the Court quoted from U. S. vs. Winn, 3 Sumner 209, quoting Justice Story referring to the rule that penal statutes are to be construed strictly:

"I agree to that rule * * * the apparent policy and objects of the legislature."

Tested by these principles we think the view of the Circuit Court of Appeals, which limits the second section to merely providing automatic couplers and ignores the words "coupling automatically by impact and which can be uncoupled without the necessity of men going between the cars," cannot be sustained.

We dismiss as without merit the suggestion that the words "without the necessity of men going between the ends of cars," which are the test of compliance with section 2, apply only to the act of uncoupling. The phrase literally covers both coupling and uncoupling, and if read as it should be with a comma after the word "uncoupled," this becomes entirely clear. Citing Chicago, Milwaukee & St. Paul vs. Voelker, 129 Fed. Rep. 522; U. S. vs. Lacher, *supra*.

The risk in coupling and uncoupling was the evil sought to be remedied and that risk was to be obviated by the use of couplers actually coupling

automatically. True, no particular design was required, but whatever the devices used they were to be effectively interchangeable. Congress was not paltering in a double sense, and its intention is found in "the language actually used, interpreted according to its fair and obvious meaning." Citing *U. S. vs. Harris*, 177 U. S. 309.

That this was the scope of the statute is confirmed by the circumstances surrounding its enactment as exhibited in public documents to which we are at liberty to refer. *Binns vs. U. S.* 194, U. S. 486-495. *Holy Trinity Church vs. U. S.* 143, U. S. 457-463. (The Court in the opinion refers to Harrison's messages of 1889, 1890, 1891 and 1892. Senate Report 1st Session of the 51st Congress, and the House Report of the same session, are referred to.)

"The diligence of counsel has called our attention to changes made in the bill in the course of its passage and to the debates in the Senate on the report of its committee. (24 Cong. Rec., Part 2, pp. 1246-1273, and following pp.) These demonstrate that the difficulty as to interchangeability was fully in the mind of Congress and was assumed to be met by the language which was used. The essential degree of uniformity was secured by providing that the couplings must couple automatically by impact without the necessity of men going between the cars.

In the present case they did not work together. Johnson was obliged to go between the cars and the law was violated. March 2, 1903, an act, an amendment of the act of 1893, was approved, which provided among other things that the provisions and requirements of the former act "shall be held to apply to common carriers by railroads in the territories and the District of Columbia, and shall apply in all cases whether or not the couplers brought together are of the same kind, make or type;" and "shall be held to apply to all trains, locomotives, tenders, cars and similar vehicles, used on any railroad engaged in interstate commerce." This act was to take effect September 1st, 1903, and nothing in it was to be held or construed to relieve any common carrier "from any of the provisions, powers, duties, liabilities or requirements," of the act of 1893, all should apply, except as specifically amended.

As we have no doubt of the meaning of the prior law the subsequent legislation cannot be regarded as intended to operate to destroy it. Indeed the latter act is affirmative and declaratory and in effect only construed and applied to the former act. (Citing *Bailey's case*, 21 Wall. 284; *U. S. vs. Freeman*, 3 How. 556; and *Copp's case*, 137 U. S. 682.) This legislative recognition of the scope of the prior law fortifies and does not weaken the conclusion at which we have arrived.

Another ground on which the decision of the Circuit Court of Appeals was rested remains to be noticed. That court held by a majority that if the dining car was "empty" as the court said, and had not actually entered upon its trip, it was not used in moving interstate traffic and hence not within the act. The dining car had been constantly used to furnish meals to passengers between San Francisco and Ogden, and for no other

purpose. On the day of the accident the east-bound train was so late that it was found that the car could not reach Ogden in time to return on the next westbound train, as intended; and it was therefore dropped off at Promontory to be picked up by that train as it came along that evening.

The presumption is that it was stopped for the return, and as it was not a new car or a car just from the repair shop on its way to its field of labor, was not an "empty" as that term is sometimes used. Besides, whether cars are empty or loaded the danger to employees is the same, and we agree with the observation of District Judge Shias in *Voelker vs. Railway Co.*, 116 Fed. Rep. 867, that "it cannot be true that on the eastern trip the provisions of the act of Congress would be binding upon the company because the cars were loaded, but would not be binding upon the return trip because the cars were empty." Counsel urges that the character of the dining car at the time and place of the injury was local only and could not be changed until the car was actually engaged in interstate movement, or being put into a train for such use, and *Coe vs. Errol*, 116 U. S. 517, is cited as supporting that contention. In *Coe vs. Errol* it was held that certain logs cut in New Hampshire and hauled to a river in order that they might be transported to Maine, were subject to taxation in the former state before transportation had begun.

The obvious distinction between merchandise which may become an object of interstate commerce or may not, and an instrument regularly used in moving interstate commerce which has stopped temporarily in making its trip between two points in different states, renders this and like cases inapplicable.

Concededly this dining car was under the control of Congress while in the act of making its interstate journey, and in our judgment it was equally so when waiting for the train to be made up for the next trip. It was being regularly used in the movement of interstate traffic and within the law.

Finally, it is argued that Johnson is guilty of such contributory negligence as to defeat recovery, and that therefore the judgment should be affirmed. But the Circuit Court of Appeals did not consider this question, nor, apparently, did the Circuit Court, and we do not feel constrained to determine whether it was properly involved, or if so whether it should have been left to the jury under proper instructions.

The judgment of the Circuit Court of Appeals is reversed; the judgment of the Circuit Court is also reversed and the cause remanded to that court with instruction to set aside the verdict by ordering a new trial.

Personal Injuries.

BY H. O. LEDGERWOOD.

Until there is government or state ownership of railways, with its humanitarian way of considering injuries received in its service, and until such ownership shall become an accomplished fact, the subject of personal injuries and compensation

therefor must be one of continuing and very great importance to railroad men, their families, and society at large. To society, for it has a direct interest in the subject, there being a duty (not well defined at present) upon it to see that one who causes loss of life, limb, health or reputation to another of its members fully compensates that other for such loss. A duty this is, and not a mere passing interest it has, or a privilege it grants, and in the future such it will be recognized. It is therefore, perhaps, permissible to say a few words upon this important subject, too much neglected in the different orders and their journals, and almost never touched upon in schedules and contracts.

One of the saddest of sights to a man able to appreciate the strong, manly and self-reliant feeling of the average railroad man in good health, is that of a maimed ex-railroad man, with his crutches, crouching in a helpless, dependent attitude upon our streets begging alms of the passer-by. The sight is one calculated to make a man who is at all thoughtful weep for sympathy for a people who labor under such a social system as makes this necessary or possible. God speed the day when we shall have left such conditions in the past.

And yet, the report of our Interstate Commerce Commission, recently issued, gives us no hope of a remedy for this condition from the railroads themselves. The charges it contains of criminal neglect on the part of railway managements in the construction, maintenance and operation of their railways, and its information as to the alarmingly large number of deaths and of injuries to railroad men each month, make one feel the justice of its statement that "the mere continuance of the record, though it be no worse than in former years, is a disgrace to the American people, painful to any careful observer."

The average of intelligence, sobriety, painstaking care and loyalty among the employees is higher now than at any time in the past, so that the increase in the number of injuries cannot fairly be said to be due to the negligence of the men engaged in the work of operating the roads. It may, however, be accounted for by the reckless determination of the managements to make a show of profitable operation, better than that of their predecessors in authority, for the year, regardless of how many cripples, widows and orphans are made in order to do it. Of all the abominable features of private management of railroads, the one of judging the head of a department each month by the paper record he keeps in miles, dollars and cents is, we think, the most far-reaching and insidious, yet disastrous in its effects upon the head of the department as well as upon all of the men under him. This determination characterizes all private managements of today, and is behind every one of the acts and neglects to which most of the more serious accidents on railroads are traceable as efficient causes. Of course, so long as our public utilities are operated primarily for profit this will (we do not say must needs) be so.

Enough here for the causes. A word or two

now as to the results. Each month in our country are made hundreds of widows and orphans and thousands of serious cripples. These, without any warning or preparation, are turned out upon the world (not so cold and heartless as it is often pictured, or as are the causes of their misfortunes) to battle with it, and to sink or swim, to starve or to survive, as may be; what care the managements. Under stress of dire necessity the most virtuous man or woman is not so strong in his effort for the right, and how many of these unfortunate ones fall! How many of the tender women and sweet little children, whose lives should be filled with something of the sunlight, grope about in the darkness and in squalor and misery because of these misfortunes! The society which makes it possible is in radical need of reformation.

One other result of this thing is the large and expensive litigation arising out of it; the greater part of it, the country over, necessitated by the determination on the part of the heads of the law and claim departments of the railway to keep their expense for the year down to a minimum, to fix a low price on legs and arms and lives, and to make personal records. This litigation is too often favorable to the railroad in its results, by reason of undue influence, unfair methods, and an erroneous idea of what strict justice demands upon the part of legislatures and courts, though this is, happily, not universal. Too often a deserved success leads those in authority to deny or to crush out a meritorious claim or suit, as well as to use the example of a fraudulent claim or suit to create an erroneous idea in the minds of jurors as to the general character of suits and claims against railroads, a most unfair and unmanly proceeding. The bribery, perjury and subornation inspired and provoked by this litigation are so disastrous in their effects upon society, that it should turn readily to any expedient promising relief.

As to the remedies for this condition of affairs, which no one man can remedy, let us suggest that they must come through united and not individual effort. Therefore, each railroad man, no matter in what branch of the service, should at once ally himself closely with, and work for, the success of the organization representing his line of work. He should preserve his faculties unimpaired, and work with energy, judgment and fearlessness. For the loved ones who look to him, he should provide by being watchful, carrying some insurance for emergency use by himself or by them, saving his earnings, and instructing them in advance as to just what action to take in case of his death or disability.

So long as he can do so, having regard to strict justice as between his employer and himself and family, he should consult and work to its best interest; but when this results in injury to him, it then becomes his duty to himself and family to protect them. If the injury be slight, he should address himself to resuming work as soon as is consistent with his own physical good, and should accept the terms of the company on which he may resume work without incurring its enmity.

If the injury be serious, and such as to make it

probable that his services will no longer be profitable to his employer, then it becomes his plain duty to act at once upon the assumption that his bodily misfortune is added to by the further one of having had his connection with his employer severed. In order to protect himself against the rapid and radical changes on railroads, in men, material and machinery, he should, if possible, get possession of the defective part or appliance responsible for his injury, and should see that all of the facts with any bearing upon the cause of his injury are fixed in some mind upon which he can rely in case of need for them. In view of the abuses of statements made by an injured person, always construed most strongly against him, it is unwise to make any, even to fellow-employees, who, guided by an erroneous idea of what their self-interest dictates, may misinterpret or misquote them. In case of injury at all serious, medical attention which is withheld until the suffering man has signed a written statement, not as to the extent of his injury and suffering, but as to the liability of his employer, should be refused.

While the talent of the company is busily engaged in determining, protecting and fortifying its rights and interests, good business judgment dictates that he should ascertain, protect and fortify his own. And when special skill, knowledge or ability is needed, the company seeks it; so should the employee. In the spirit which pervades the action of the employee and that of the company, nothing even approaching unfairness should enter into the effort of either to protect himself; but that self-interest and zeal for the employer often lead employer as well as employee from the path of strict moral rectitude is so well known a fact that to ignore it, and to fail to protect one's self against its possibility, would be remissness of duty to one's self.

When once his rights are determined, protected and fortified, the law, which is said to be the perfection of human reason, will protect and enforce them even though the employer does not recognize them. Each railroad man owes it to himself, to his family, and to society that he should preserve and use all of his faculties and members. To his family, especially, he owes the duty of collecting compensation for a deprivation of these faculties or members. Organized society provides for this, and the one guilty of this deprivation, the wrongdoer, should not be allowed to determine whether the duty will be performed or the right exercised.

Lastly, one of the most important and yet the most neglected duty owed by railroad men, is that to themselves, their families, their orders and society at large, of seeing to it that no dishonest or fraudulent claim or suit for damages by a fellow railroad man is successfully prosecuted. Those men whose selfish interests would lead them to sacrifice their names, their organizations, their families and friends, and make their very occupation one to be sneered at, by fraud and perjury, are not worthy of membership in any railroad men's organization, or of fellowship with honest people, and should be weeded out as quickly as possible and kept out. But to the

widow, orphan or cripple with a meritorious claim, each man owes his active support and assistance in their suits and claims, at least so far as is consistent with the duty of the employee to himself and family.

Lawyer's Abusive Argument Loses Case.

The Supreme Court of Illinois has just reversed a personal injury case on the ground of an attorney's abuse of his privilege of argument to the jury. In this case (*Wabash R. Co. vs. Billings*, 72 Northeastern Rep. 2), the attorney used this language: "These powerful railroad corporations ignore the rights of citizens, maim or kill them at pleasure, and then bring in their employees to swear them through; most of the witnesses for the defense were employees of the defendant and had to swear the way they did or lose their jobs, and they ought not to be believed for that reason." It was held that the evil of these remarks was not cured by the admonition of the Court to disregard them. The conduct of the attorney was characterized as "wholly indefensible."—*Railway World*.

Railroad Men Imprisoned in France.

The Criminal Court of the Seine, at Paris, France, on December 17, convicted the four trainmen who were responsible for the catastrophe on the Metropolitan Electric Underground Railroad in August, 1903, resulting in the loss of sixty-five lives.

Conductor Joffroy, who was in charge of the train, was sentenced to a month in prison and \$400 fine. Renaud, superintendent of the-depot, whose lack of calmness precipitated the panic, was sentenced to a month's imprisonment and \$400 fine. Chauvin and Cavayle, motormen, were let off with fines of \$600 and \$400, respectively, as they suffered permanent injuries.

A Duty for the Legislative Board.

ST. JOSEPH, MO., Jan. 8, 1905.

EDITOR JOURNAL: I herewith quote part of statutes of Missouri, which I wish would appear in the JOURNAL, so our brothers, sisters and mothers will know about it:

"If an unmarried man over 21 years of age is killed by the negligence of his employer, or fellow-workman, in the state of Missouri, there is no one who may sue such employer for damages on account of such death. See R. S. of M., 1899. Sections 2864, 2865, 2866. Present law."

This leaves the aged father or mother who may be depending upon such a son for support without redress, in court.

This should be remedied by appropriate legislation, authorizing the dependent relatives to seek redress in such cases. Such a case under this law has just been tested by the death of a fireman.

Hoping our Brothers will give this their immediate attention I remain,

A BROTHERHOOD ENGINEER.

Correspondence.

All contributions to our Correspondence and Technical columns must be in not later than the 10th of the month to insure insertion.

Articles must be written on one side of the paper only. Noms de plume may be used, but every article must be signed with full name and address of the writer to insure insertion.

We shall be glad to receive articles on any subject of general interest to the fraternity.

All communications are subject to revision or rejection, as the Editor may deem proper.

The Editor does not assume responsibility for the opinions expressed by contributors in this department. C. H. SALMONS, Editor and Manager.

Sighs for Southern California

I sigh for Pasadena,
Where flowers are aglow,
I long for Catalina,
Away from frost and snow;
I'd like to view the roses
Profusely growing round,
Where frozen ears and noses
Are nowhere to be found!

The zephyrs tripping lightly
In orange groves along,
And sirocco so sprightly,
Are musical with song;
While here the roaring blizzards,
With devil's-fury rife,
Come tearing round our gizzards,
And cut us like a knife.

Grand lemon trees in blossom
I dream of every night,
I press them to my bosom,
In darling rapture tight;
But briefly I enjoy them,
The pelting of the gale,
Abruptly makes me fly them,
To fight the wintry rail.

In Redlands—holy father!
'Tis there I'd like to be,
Than Heaven I would rather
That glorious place to see!
But hummocks round me growing
And cold chills in the air,
And frost and constant snowing
Denote I'm far from there.

Oh, land divinely blooming
With flowers rich in hue!
Oh, skies that know no glooming
To shade their deepest hue!
Oh, mountain peaks sky kissing!
Oh vales of Paradise—
Alas, such sights I'm missing.
Here 'mid the snow and ice.

I sigh for Pasadena,
Where flowers are aglow;

I long for Catalina,
Away from frost and snow.
But what's the use in sighing
For God's most favored clime,
While here with cold I'm crying,
And crooning out this rhyme?

—SHANDY MAGUIRE.

Trouble and Triumphs of Travel.

BY SHANDY MAGUIRE.

[Continued from January JOURNAL.]

The delegates from this section of the country had their grips in their hands and across-the-continent gaits on them on the day I got Kelly's letter. I also got several letters of inquiry to know the route I intended taking, notably so from Mrs. Ben Evans, which came near getting me "snug up in a corner," as the song says. This letter expressed the hope that we would all go by the same route, and it forecast a delightful time, not only in transit, but in taking in the California sights in each other's company; that is, Mrs. Evans and my beloved.

When I arrived home I was asked: "How is it that Mrs. Evans is not afraid of the Desert and its terrors, held up in such a fearful light to me?"

That question required an answer without one moment's hesitancy, and if I failed to reply properly I was lost.

I said: "The atmosphere around Rensselaer is pretty much like it is out in Arizona and New Mexico, owing to the old abattoirs, gas houses and oil refineries on that side of the Hudson River, and she is case-hardened to anything in the shape of a forty-mile-an-hour sand blast on that account, and the Desert has no terrors for her."

The matter was discussed no more just then. I don't know whether she believed me or not. I had my doubts, from signs I saw, the same as on other occasions, mantling the bloom of her lips, when I considered myself closely cornered.

About those days I used to take my troubled mind to bed with me, and hug it as closely into my breast as if it were a blooming bride. I had the route by the various roads all studied out, and about the time that the trains were in trans-

mountain states, rattling along towards the coast, I was almost sick thinking of the blasted anti-pass agreement between railway officials that held me captive behind. I would not pay our fare to go, owing more to the life-long prejudice I held against buying stock in the passenger department of roads than a miserly feeling of self-denial. My better half had no such scruples, and would insist on going at any cost, only that I worked the Desert racket all it would stand.

On the 5th of May, six days before the public opening of the sixth biennial in Los Angeles, Bro. Frank Townsend, a passenger engineer on the Lackawanna, running between Binghamton and Oswego, N. Y., came into the Oswego yard with his train, and as he always can give a man intelligent answers to any questions he is asked, I went up to him as he was standing at the water tub and said:

"Frank, on what conditions did the delegates from our road go to the convention as regards transportation?"

"They went on passes for themselves and wives."

"What?" said I, in a voice he very distinctly heard above the popping of his engine, which was sufficiently loud to blow the clouds off the sky.

"I told you, and you heard me."

"Who furnished the passes?"

"General Superintendent Clarke."

I was knocked galley west with the news. It was entirely unexpected. I was shaping my actions regarding going by the news given me by New York Central men, and never gave any thought to home folks at all.

I sat at my desk and wrote our General Superintendent inside ten minutes after talking with Townsend, requesting a pass for myself and wife to Los Angeles and return. Inside twenty-four hours I got this reply:

"Your letter received. I have requested passes in favor of yourself and wife to California and return, but fear it will be some time before they are received, as some of the passes have to be obtained from a considerable distance.

Yours truly, T. E. CLARKE, G. Sup't."

When I read that brief note, I became frenzied about the head and wanted to jump skyward to exhaust some of my suddenly generated enthusiasm. I was like some poet's description of how he felt when he got his first kiss from his heartache:

"I felt the pressure of her timid kiss;

What then to me were groans or pains or death?
Earth was a round of bliss;

I seemed to walk on thrones."

On this occasion I ran, yes, as swiftly as my legs could carry me, to my humble domicile and darted in through the open door. My eyes no sooner beheld my old girl than I screamed out, utterly regardless of her alarmed look at my excited appearance: "Get ready for California!"

I had a nervous collapse on my hands in short order, and I began to think I was a close relation to the quarryman who was selected by the boss to break the sad tidings in a gentle manner to a woman whose husband had been killed. He did it this way:

He knocked at the door. A lady opened it.

"Are you the Widow Nolan?" said he.

She replied: "My name is Nolan, sir, but I am not a widow."

"Indeed you are, ma'am; here comes Larry home on a door to you."

In a little while I was asked: "What do you mean about getting ready for California?"

"Listen." Then I read Mr. Clarke's letter, and at its conclusion I was asked:

"And what about the Desert?"

"Oh, blast the Desert! Don't let that bother you. I have learned today that it is only in September that there is any inconvenience crossing it."

"Are you deceiving me?"

"That's a thing I never did since I paid his reverence 10 dollars to couple you on to me, and it is too late to do it now."

"When do we start?"

"It will take about ten days to get the passes here. The convention will be but about as many days old when we shall arrive there, and it will be about the right time to reach there as the crowd of visitors will be all fairly well scattered to other places sightseeing by that time."

Life had assumed a more genial enjoyment for me when I found it possible to get to the coast; and in the evenings of beautiful May, when the trees were burgeoning out in leafy bloom after a severe winter's nakedness, we used to sit in the gloaming, talking of the coming trip with sincere pleasure. I brushed up my geography, and related the experience I had of mountain climbing at the time of the Denver Convention, when the Union Pacific gave us an excursion to Silver Plume, up the celebrated loop route, where the altitude was such that it was distressing to even think laboriously. I did not know of the route we were to take from Chicago, as I could not look a gift horse in the mouth. I was satisfied to get there going any old way, but I presumed on going by the way of Marshall Pass or the Royal Gorge, and I used to be fluent telling of the ascent of the trains crossing the mountains, going up from the green of the fields to timber line and above it, yet ascending towards perpetual snow line, reaching the summit, and then going down the other side, every mile taking us nearer to that beautiful clime of perpetual summer and verdure and the Pacific Ocean, and impatiently awaiting Mr. Clarke's passes.

On the evening of the 10th, as usual, we were at the same subject without the slightest diminution of interest, I leading:

"About now there is a mighty throng in the rotunda of the Hollenbeck hand-shaking, kissing and hellingo. How I wish we were there!"

"Yes, indeed," she replied, "And if you only made an effort to get there on time you might have been one of the crowd, and I another. You think you are smart, but you have lots to learn, and the quicker you begin to remember that 'God helps those that help themselves' the better off you will be."

That was a dig in the ribs, and I knew why I got it. I was preparing to get back when ting-a-ling-a-ling went the 'phone bell. I put the receiver to my ear and was asked, "Is this 24?"

"Yes."

"This is the Postal Telegraph office. I

have a message for you. Do you desire it sent up or will you take it now?"

"I didn't attach much importance to it so I replied, 'Fire away.'"

"Your letter to R. W. Kelly. Call at Railway Exchange Building, Chicago, where you will find pass for yourself and wife from there to Los Angeles and return. (Signed) A. G. WELLS."

I hung up the receiver and said: "Did you hear that?" My face, nerves and voice being in about the same condition they were when I got Mr. Clarke's letter.

"Oh, yes; don't talk so terribly loud. If I were dead I could hear you. What does it mean?"

"It means that we go to California by the Santa Fe. That a pass for us has been wired me from Los Angeles by Mr. A. G. Wells, the General Manager; and it means furthermore that you have just two days to get ready, as I will have my arrangements made by that time.

(To be continued.)

A Noted Excursion.

DETROIT, MICH., JAN. 3, 1905.

EDITOR JOURNAL: Owing to the fact that the B. of L. E. was organized by engineers on the M. C. R. R. at the time Mr. A. S. Sweete was Superintendent of Motive Power, some of your readers may imagine him a tyrant without an equal, which is decidedly wrong. There is no doubt that when he first came to Detroit some good men lost their jobs, just as they did on every road when there was a change of officers; but as a man, I guess he would stand equal with the best officials of his time. The writer first came directly under Mr. Sweete's supervision in 1869, having been transferred from Marshall to Detroit, and continued to serve under him until he died in 1873, and knows of many acts of kindness and charity of his, for few engineers went to him with a hard-luck story and were turned away; but they never had to ask their neighbors what the "old man" thought of them, as they were informed before the interview closed. His advice to young

ENGINE RUBY, DECORATED FOR THE BOSTON BOARD OF TRADE TRAIN, 1870.

men was, don't drink; just so much as you do, just so much it will drag you down.

Mr. Sweete was devoted to his family and an active member of Detroit Commandery, K. P., and a vestryman of St. Paul's P. E. Church, in which he took much interest, and to show that he swore from habit, not because he was vindictive towards his men, I will relate the following:

With the late Bishop McCloskey, he was superintending the trimming of St. Paul's for Easter service, and he caused ladders to be spliced to reach the high Gothic ceiling; but when raised, they were too short to reach the point he desired, which vexed him, and turning to the Bishop he said, "I didn't think the G-d d-n church was so high!"

On another occasion after one of the usual stormy interviews with a young engineer, he asked what he had to say, to which the poor fellow replied: "Mr. Sweete, you have abused me the meanest and used the best language I ever heard," and he went right back to work; and of eight locomotive superintendents that the writer has served under, Mr. Sweete was quite up to the average from the employees' point of view, and when he died there was not a man in his employ who did not feel that he had lost a personal friend. The picture was taken shortly before that sad event.

In my mind, his greatest fault was in not investigating a case more thoroughly before passing judgment. But he was in service as an official when all of his class presumed to have a right to run his business in his own way, and to hire and discharge whom and when he pleased. The practice of all officials in that period was of a character to make men desire some means of guarding their personal interests, make their places more secure as employees, and conditions of service better in all respects, and they joined together for this purpose, and the B. of L. E. is the result; but it does not necessarily cast any reflection upon Mr. Sweete, who was serving during the constructive period, when all men con-

nected with railroads were in school, and the one who was a dull student was superseded by others with better talents. But Mr. Sweete remained, while he lived, and during the time of his service saw great advances in all direction, and when the time came for the wonderful feat of going by rail from Boston to San Francisco, none were more interested than Mr. Sweete, who supervised the decoration of the engine "Ruby," which pulled the Boston Board of Trade train from Detroit to Chicago, and I believe this was the first solid train from Boston to San Francisco. The decorations on the engine were such as the best decorating artist could bring out. The stack was painted so as to represent a crimson drape with gold fringe and looped up with cord and tassel. The picture of Mr. Jas. F. Joy, President of the M. C. R. R., was in the head lamp. The false front end was a picture of the landing of the Pilgrims on Plymouth Rock. The shields between the drivers were a copy of the great seals of the States of Massachusetts and California. The side of the tank was a picture of Eagle Rock on the line of the U. P. R., and on the four lower corners of the tank a birdseye view of the cities Detroit, Boston, Chicago and San Francisco. Owing to the train being heavy, a double-header had to be used.

Engineer George Roby had charge of the "Ruby;" he stands at right of pilot, and Thomas Kent, who ran the engine "Persian," at the left. They were both members of Div. No. 1. At one time Mr. Sweete rode with the engineer to Chicago.

The "Ruby" was a Manchester engine and of course without lubricator, air brake and other later improvements.

I recall a poem that appeared in the B. of L. E. JOURNAL on this occasion, composed of eleven verses, by the C. E. of Div. 18, the last four reading, viz.:

"From proud New England's boasted Hub,
By you, on iron bands;
The Board of Trade in one short week,
In San Francisco lands.

"Then honor them who guide and guard,
As well as them who feed;
And labor faithful night and day,
On this metallic steed.

" Their watchful eyes and steady nerves
Guard well the rushing train ;
Which brings to fond and anxious ones,
The loved one home again.

" Then recognize and treat them well,
And assist them in their course ;
That they may be the best of men,
Who guide the iron horse."

C. A. HARKINS, Div. 1.

Why These Seventy-Six Names?

ROCHESTER, N. Y., Jan. 12, 1905.

EDITOR JOURNAL: Why do so many allow themselves to get in arrears for dues or assessments? Seventy-six names in the January JOURNAL as expelled or suspended for non-payment of dues or assessments, and I would be willing to wager that the majority of those seventy-six Brothers will be scrambling to get back into good standing again. Why, then, allow yourselves to become delinquent?

The railroad company pays you promptly for your services, why not pay your dues and assessments just as promptly? If paid monthly, when you receive your pay check, the expense is hardly noticed, but when you pay for several months at one payment, it "pulls."

Remember that it takes money to keep the Division going. It takes money to pay the Grievance Committee and they earn every cent they get.

Remember the B. of L. E. makes it possible for you to get the wages you are getting. Without the B. of L. E. you would only have been able to earn laborer's pay, \$1.50 per day. To the B. of L. E. you are indebted for all you get over and above \$1.50 per day, and it took money to do it.

Do you begrudge the small amount it costs each month to keep the ball a-rolling? If you do, you should have no place in the organization and by rights should be obliged to work for the \$1.50 per day.

Did you ever stop to think how much it costs to get a schedule? You will be surprised if you have not thought about it and will wonder how it was done at so little expense to each member. If the dues and assessments are not paid, it

means no Division, and that means no schedule, and no schedule means take what they choose to give you and say nothing, and that means, "Each one for himself, and the devil take the hindmost."

Go to the Division meetings and take an interest in what business comes up. It is your affair; why do you leave it for some one else to look after? It has been said that nine out of ten railroad men are incompetent to attend to their own business affairs. The Division is a mighty important business affair of yours, if you only know it. Why not look after it? It means dollars and cents to you. The Division makes it possible for you to pay the grocer and the baker and the candlestick maker. It makes it possible for you to provide a good and comfortable home for your family and to enjoy many luxuries. If that is not important affairs of yours, what is? And remember, the dues and assessments are the price you pay for the privilege of being able to do these things. It takes money "to make the mare go," and to keep the Division going, and the Division makes it possible for you to pay your dues and assessments to the Division.

"When a fellow has spent his last red cent,
The world looks blue, you bet!
But give him a dollar and you'll hear him holler,
There's life in the old world yet!
For money's the comforts afte'-all,
No matter what the cynics say;
And the world will stick to you when you fall,
If it finds you can pay your way."

The Division will stick to you, too, when you fall by the wayside, if you will only keep square on the books.

Pay up, Brothers, and don't let your name go into the list of expelled for non-payment of dues. Remember the 47,000 members in good standing, each and every one of them will have a JOURNAL with your name in the expelled list. How pleasant to have some acquaintance meet you and greet you with, "Hello, Tom! I see your name in the JOURNAL as being expelled for non-payment of dues. What's the matter with you? You are working every day. Can't you pay your just debts?"

Don't go to making excuses then, for anything you can offer will sound untrue, but walk up to the captain's office and settle and be a man among men and pay up promptly in the future for the benefits you have received and are receiving daily.

Fraternally yours, B.

The Embryo Engineer.

My father he's an engineer,
'N' so am I, or pretty near.
That's the railroad yards, right over there,—
You kin see the roun'house from the stair.
Ma's allus got an eye on me—
She's just as skeery as kin be.
Why, 'f I so much as *teck* the gate
She hollers: "George, you come back, straight!"
If ever I c'd reach that track
I wouldn't hurry ter come back.
Ma's so 'fraid—but that's all truck!
Even my school—it's just my luck—
Lies east of here, instead of west—
Where the railroad runs. [You kin guess the rest.]
My mother's pretty smart, you know,
An' when it's time fer me ter go
Ter school she stands right at the gate
'N' says, "Look out you aren't late.
You come straight home, don't stop to play;
Don't be kept after school today."
I'd almost dareter, anyway,
Go down there in the yards 'n' play;
But then, you see, I had a fight
With another boy—his name is White;
'N' he'd just die ter tell on me.
(That's what I call as mean kin be.)
Sometimes when father's home, sez he:
"Say, son, you want to come with me?"
"You bet," I yell when I hear that,
'N' hardly wait to grab my hat.
'N' mother allus has ter say:
"I'm 'fraid that he'll be in the way."
But I tell you I think *my* dad
The finest thet I ever had.
Oh, yes, I like the roun'house best.
M' father never gets no rest
Until he boosts me in a 'gine
Thet's movin' up along the line
Afore it's coupled to the train.
'N' then I want ter go again
Back ter the roun'house—why, I c'd stay
'N' watch the doin's all the day.
'N' pa explains things pretty nice,
'N' I never ask a question twice.
Why, I jus' think it's something GRAND
To have a pa thet understands.
But when I say thet some day I
Am goin' ter make them engines fly,
Pa turns aroun' as mad to nie
An' sez, "Young man, 'twill never be.
You kin follow any other plan
I won't have my son a railroad man."
Now, I would like to know right flat
Jus' what my father means by that!

If it's so bad a place to go
Why's he there, I'd like ter know!
Of course, ma's only brother he
Was killed 'way down in Tennessee.
He was firin' an' his train
Went in the river in a rain.
'N' mother cried 'n' cried 'n' cried,
'N' gran'ma, why, she nearly died.
An' after all it was too bad—
He was all the uncle thet I had.
But someone's got ter work, you know,
Or else the trains they couldn't go.
I'd ruther go the railroad way
Than be a cowboy any day.
I made an engine—wanner see? ·
'Tisn't stylish, but it suits me.
I thought it sure wuz pretty good
Ter take a little block of wood,
A piece of stovepipe 'n some twine,
Some coaster wheels 'n make a 'gine.
Pa sez: "Go, chuck it in the lot,"
But I don't care, it's all I got.
I like to pull it 'roun' the yard,
But, then, the puffing's pretty hard.
It nearly uses up my breath,
But it tickles pa most half ter death.
I like to whistle an' ring the bell.
I know the signals pretty well.
Toot, toot, toot, toot,—thet's, "Signal me;"
Toot, toot,— "I saw your signal!"—See?
Too-too-tootoot,— "I'm comin' inter town"—
[Bet I kin do the thing up brown.]
You wait till I am older, say—
I'll run an engine night 'n day.
First I'll fire awhile for pop
Until I'm way up at the top.
Then a-dang-a-lang an' toot, toot, toot—
I'll simply make them engines scoot!
Oh, just you wait—I'll make things hum—
I gotter go now—father's come.

GRACE ESTELLE WARD.

Success of Div. 170.

CLEVELAND, O., Jan. 10, 1905.

EDITOR JOURNAL: It gives me much pleasure to read the letters of others in the JOURNAL, and as space is valuable I have left the most of it for others, but if you can spare me a little corner I will tell the boys about our Division and the work we are doing.

In one year we have increased our membership from 68 to 128. We now represent 98 per cent of the eligible engineers of the Division. I believe that we hold the banner for increase in membership during the year. This is the way we did it:

A special meeting was called, all the enginemen of the Division were invited,

speeches were made, and as far as possible the benefits that they would derive by becoming members were explained to them, winding up with a cordial invitation to enroll their names among men. The result has been very gratifying. Each member appointed himself a committee of one for the purpose of building up and strengthening the Division, and we have succeeded in building up one of the strongest Divisions of the order.

It is through this individual activity and desire to further the cause represented by the B. of L. E. that great things

accepted a run with headquarters in Ravenna, resigned his position as Chief. We are very sorry that Brother Ryan is so situated that he cannot continue to hold the office, for he has filled the position in a very creditable manner and has the respect and confidence of the whole Division.

Bro. Thomas Ryan has been elected to succeed his brother as Chief, and Brother Armstrong succeeds Brother Cable (resigned) as Secretary. We are taking a very optimistic view of the new year, and expect to accomplish more than we did in the old.

CLEVELAND & PITTSBURG (PENN. RY.) ENGINE NO. 7235.

may be expected. By being conservative and willing to co-operate with our officials in bringing about better conditions, we have gained some very valuable concessions, and others of a grievous nature have been eliminated.

We do not expect to make railroading on the C. & P. a bed of roses, but we do expect to extract a few of the thorns, and realize as far as possible the best conditions that can exist on a twentieth century up-to-date railroad.

Our ex-Chief, Bro. John Ryan, having

There are a great many things that will necessarily occupy our time and attention during the next year, and it will be necessary for each one of us to decide matters of importance to the B. of L. E.

Let us wake up to our individual possibilities and all work together for the advancement of the order, and we shall soon realize a result which will be satisfactory to all.

I herewith present you with a picture of one of our engines and full Brother-

hood crew. Reading from left to right, they are:

C. F. Lockhart, B. of L. E., Wellsville, Div. 170.

M. C. Mumaw, B. of L. F., Wellsville, Div. 96.

J. C. George, B. of R. T., Goodwill Lodge, 107.

O. W. Dennison, B. of R. T., Wellsville, Lodge 286.

J. A. Briceland, O. R. C., Wellsville, Div. 289.

Fraternally yours,

C. F. LOCKHART, Div. 170.

A Brother in Cuba.

CAMAGUEY, CUBA, Oct. 24, 1904.

EDITOR JOURNAL: Briefly, being on leave of absence from the States, I left Punta Gorda, Fla., August 3rd in search of the filthy lucre called money. Had a pleasant voyage and did not get seasick. Being out of sight of land for the first time at sea, was enraptured with the grandeur of the "Mighty Deep." Stopped at Key West and "rubber-necked" there three hours. Approaching Havana I saw Morro Castle and the hulk of the historic *Maine*. Spent a day sightseeing in the famous city.

August 6th I was at the throttle of a locomotive for the Cuba Co., which runs from Santa Clara to Santiago, with various branches. The main line is equipped with steel rails and rock ballast and Rhode Island engines. To the credit of the Cuba Co., they give the members of the B. of L. E. preference for employment as enginemen. The compensation is \$135 per month in American gold with a four days' layoff every sixteen days.

The scenery along the road is both beautiful and sublime. From the observation car you can see picturesque hills and high mountains and great plains of high grass seven feet high and herds of fine cattle. There are also lots of deer, turkey, quail and grouse. We often kill them with our engines. They seem to be too lazy or tame to get out of the way. This is a great place for sportsmen.

The road runs through great forests of cedar, mahogany, and lots of other fine timbers that I don't know the names of.

The royal and many other kinds of palms are beautiful. Here Nature must have loved to experiment. There are wild roses without thorns and without odor. There are also sweet pansy blossoms that grow wild in among the grass. There are gentlemen as gallant as the plumed knights of old. There are women here with forms as perfect as a Grecian statue, beautiful as Cleopatra and as pure as a dew drop from the hills of old Tennessee. But there are also men and women without beauty, principle or honor.

Camaguey, my postoffice for the present, is nearly six centuries old and has a population of 20,000. So much was written about Cuba during the war, I take it for granted most of the Brothers are posted about the customs of the people here.

Spain "pressed down her crown of thorns and crucified Cuba upon crosses of gold" for five centuries, but when the Spanish army surrendered to General Shafter under the famous peace treaty, then "Cuba libre," the infant nation, was born and white peace was a reality and came to stay.

That the Cubans are competent for self-government, I have not the slightest doubt. Much of the land is being purchased by Americans and all kinds of industries are being rapidly developed. The climate is fine and healthy, average temperature about 80. No winter at all; vegetables, fruits and flowers the entire year.

Let all the Brothers who can take a lay off bring their families and come over here and spend a month sightseeing. The sea voyage would do you good and you would see enough here to talk about the rest of your life. The fare from New York to Havana is \$40, New Orleans, \$20, Port Tampa, Fla., \$24.

I am learning to speak Spanish and the first words I learned to say were "bonita seniorita."

Fraternally yours,

P. O. RICKMAN, Div. 495.

Lukewarm Members.

PORTSMOUTH, O., Jan. 6, 1905.

EDITOR JOURNAL: "B" in January JOURNAL, or "Lukewarm Members,"

expresses one weakness which the B. of L. E. and all other fraternal and labor organizations are afflicted with, a weakness that is dangerous if fostered.

This is a question that confronts all labor organizations, and how to overcome it is of vital importance. Our order, like all others, is composed of all classes of men; there are men who naturally understand the obligations they are under to the B. of L. E. and are always ready to do their duty by the order. Such men are blessed with the cardinal virtues, also strong-willed, independent, etc., and upon them devolves the life and success of the subordinate Divisions of which they are members.

Then we have men who join the order as a matter of personal gain in the way of influence and any benefits to be derived; a majority of these men are of a selfish disposition, and unless treated in the proper manner do a great deal of harm.

Again, we admit into the order the younger generation, the promoted engineer; and unless the Divisions of which this element become members are conducted in the manner they should be they will not have the interest they should to be beneficial both to themselves and the order.

Subordinate Divisions that have a quantity of lukewarm members can attribute it to many causes, but the principal cause is a failure to enforce the Constitution and By-Laws, by neglecting to live within the pale of our laws. We are bound to deteriorate; our laws do not show partiality, and privileges allowed one must be allowed all; hence, the necessity of enforcing the laws is paramount to maintain a loyal Brotherhood.

Roads upon which the Brown system of discipline is in force, is indirectly, or I may say directly, a cause, for the fact that records of engineers are recorded at the general offices, engineers are sometimes unjustly disciplined either by demerits or dismissal, and much delay, a great loss of time in an effort to adjust the same is certainly discouraging to men unfortunate enough to be punished

whether merited or not. Again, where the Brown system is employed the duties and responsibilities of General Chairmen are increased manifold and does not give him the opportunity to look after the rank and file to investigate the standing of Divisions and attend their meetings as regularly and as often as is necessary to keep them in good working order.

There are many other causes of which I will not make mention, but suggest that Division officers closely observe the conditions that surround them and anything that is conducive to leading members away from the Division should be removed, and the surest way of removing them is a strict enforcement of Constitution and By-Laws, and an adherence to your agreements.

Our laws now cover everything pertaining to good government and the making of loyal and active members and this will surely come about when we can all realize that the B. of L. E. is a business proposition and should be conducted upon business principles and not to allow selfishness or self-interest to become too firmly rooted, or allow any factionalism to exist, but remove all such features and the members will soon realize that to be a Brotherhood man they must learn to bear and forbear, to share equally and not to profit in *anything* at the expense of a Brother.

I say enforce the Constitution and see if the lukewarm membership does not decrease with great rapidity. It certainly will, for unless they throw off the mantle of indifference, selfishness, and self-interest, you must necessarily throw them out.

It is, in my opinion, far better to have a Division of 25 loyal members in whom you can place every confidence, than to have a Division of 50, among whom there is one to distrust. Yours fraternally,

"REUBEN."

The Employment of Children.

LITTLE ROCK, ARK., Jan. 6, 1905.

EDITOR JOURNAL: With all the misery and suffering in the world to-day caused by man's inhumanity to man through a

false economic system in the distribution of wealth, there never has been a time when greater philanthropic effort was put forward by humanely disposed persons and various associations, especially those composed of women, than the present in an effort to uplift humanity and make life more worth the living.

It makes little difference that much of the effort is in the very nature of things ineffectual on account of not being of a fundamental nature, or in other words, calculated to remove the cause; yet the disposition to benefit mankind leads to higher ideals, and even if mistakes as to method are at first made, much good will surely follow.

That we have in this country societies for the prevention of cruelty to animals, I think is a great honor and something that every one here should be proud of; but why not make the effort to organize like societies for the prevention of cruelty to children all over the land?

One form of cruelty to children that should be condemned is their working in factories under certain prescribed ages. While many of the organized bodies of women, North and South, have been fighting this evil, it seems that it is a question that not only appeals to the finer instincts of womanhood, but is an issue that all classes can stand for and sympathize with in an effort to protect the welfare of the future men and women of the nation, and thus protect the race.

However, laws regulating the working of children in factories have done great good in the North, and no doubt will do the same in the South when enacted, though I believe Tennessee has such a law at present.

What suggested my writing these lines to the JOURNAL was an eloquent plea for the children by Miss Mina Price in the Detroit *Commonwealth*, copied from the Minneapolis *Journal*, in which Miss Price claims that "poverty compels 5,000,000 children to work in factories in the United States." She speaks of the hard condition of the child working in Chicago and New York and in the mills of the South, where little tots work twelve hours at

night for a few cents. Hideous accidents are the order of the day. In one mill town in the South a doctor told a friend that he had personally amputated over one hundred baby fingers mangled in the cruel machinery. He dared not speak of it, he said, for the mill management preferred doctors who could keep their mouths shut.

The same sad story of child slavery is true throughout the land from the Gulf to the Lakes, from ocean to ocean, wherever the big machines have been. In no parts of the South can conditions be worse than in some parts of New Jersey and Chicago.

In the opening part of the article quoted is this beautiful tribute to childhood:

"Childhood is a bright and beautiful thing. The tint of health on its dimpled cheek, the light of its eyes, the soft round limbs delighting in ceaseless activity, its play, the music of its laughter, its joy in the sunshine and fresh wind, its kinship with the flowers, the birds and butterflies, and all the wild free things—these are its charms, but it is more, it is the future of the human race.

"In its young innocence it dreams of the mighty things it will do by and by when it has left the flowery meadows of youth behind it—when on the highway of life it has triumphantly arrived at man's estate. It will design, build and adorn beautifully; it will paint master works and invent marvelous pieces of mechanism; it will sing such melodies as never before delighted the air; it will write noble truths and live forever in the gratitude of humanity; this dream, this hope, this faith, this courage, born of high resolve—these are the graces of childhood, and if by any misfortune childhood is denied these, its rights, what then?

"Deprived of its playtime, imprisoned in a factory, kept from all intercourse with nature, even to the sunshine and fresh air, and labor demanded of the tender hands, then childhood is enslaved, the tender body is maimed, the mind is starved, the soul shrinks, a gifted being, it becomes a clod, a withered leaf, a dying flower." ROBERT HERIOT, Div. 678.

Have We All Hibernated?

HOQUIAM, WASH., Dec. 18, 1904.

EDITOR JOURNAL: From the tranquillity of everything pertaining to an endowment insurance, or some means of caring for our Brothers, who, though not entitled to their insurance money under the present rules, still are really in need and worthy of assistance, through some combination of circumstances wholly beyond their control, would tend to indicate that Brother Freenor, Div. 372, was "calling the turn" when he asserted that the membership would all come out "like angle worms about a month prior to our next convention." I believe that the proper time to discuss this really vital matter is *right now*, while we have ample time to adjust differences of opinion and finally to arrive at some practical resolution to be brought before our next convention. There can be no plausible excuse for our membership drifting along in the old channel,—no improvements agitated, no reform in insurance matters broached or discussed until "just before convention," when every one tries to raise some question of moment, well knowing that under no circumstances is there adequate time to bring the matter to an intelligible or agreed condition until the convention is over. How like a shower we were visited with all kinds of vague suggestions, etc., just before "Los Angeles" this year. What came of it? It occurs to me that we are in a great measure similar to the old colored man who was trying to persuade a young and cantankerous calf through the streets of a village by means of a rope. After many entanglements and erratic movements he was interrogated by a by-stander: "Uncle Jeff, where are you taking that calf, anyway?" The old darky scratched his woolly pate in a perplexed manner and replied: "Well, boss, I don't t'ink de calf hab *quite made up his mind*." Now, we all know and feel that *something* should be done in this insurance matter, but, like the old darky, we are *waiting for some factor to define* just where we are going to "head in." Let us all take in-

spiration from Brother Freenor, who, I know, feels the truth of his convictions, get at it and formulate our ideas into a short article for the JOURNAL; then we can begin the elimination process, sort out the best ones of the lot, submit them to a popular vote, and find ourselves in position to amply provide for the worthy needy without oppressing any individual member, and *entirely eliminating* the word "charity" from our list of members financially assisted. I submitted my personal idea on this matter some months ago, and prefer at this time to await suggestions from some of our more worthy members before entering into a discussion. Not a Division of this great Brotherhood but what includes among its membership men who are intellectually brilliant and qualified to discuss such matters in a forceful and convincing manner. Why not rout them out? You know who in your own Division can make a "good spiel" and keep a crowd of roundhouse "greasies" laughing or soberly contemplating his remarks, be the subject what it may. I'm going to make personal mention of a few—just a few, mind you,—members of my home Division who should come out frequently in the JOURNAL, especially on such topics as tend to enhance the welfare of the Brotherhood, not to mention the anecdotes and other matter they could easily offer, and which would be greatly appreciated by the reading members. There's Brother Henson, our F. A. E., a man who can "keep 'em humming" anywhere. We won't scold him too much, through reason of his manifold duties. Then there are Bros. Frates, Jackson, Hanson (C. E.), Pike, Tyson, Thompson and Oliver. Well, well, boys, I've got you dead to rights, and if we don't hear your gentle voices soon there'll be another list of names submitted that won't stop at a *few*. Some member of each Division please "follow my smoke"; send in some names of your Division Brothers and see if they won't "come out of their shell and look 'round." There are two Divisions at Spokane, one at Kalispell and one at Portland (136), and the writer has "met and known them all," so I won't

promise to stop with an exposé of my home Division, 362, but may take a fool notion to name some from the foregoing Divisions who are lax in their duties as to correspondence for our mutual welfare. You don't necessarily have to be "edicated" to convey your ideas through the JOURNAL. We like to hear a man speak *naturally*. Just stick it on paper the way it "gives 'em a kick through your brain," and if there is some of it that won't stand the language of our realm, Brother Salmons can fix it in a jiffy and the end is attained. Come on, boys, wake up; we've got a train that is heavy and the grade stiff, but the "wind" is in good shape, plenty of sand, a good steaming fireman and lots of time to make the next meeting point. Let's start 'em rollin', get the Johnson bar up where it belongs, throttle back in the tank and we're there before we know it.

SAM L. WINTER, Div. 362.

To the Brothers of La Grande, Ore.

HENDERSON, ME., Jan. 10, 1905.

EDITOR JOURNAL: Don't think for a moment that Brother McGibbon lost his hair from lifting his hat so many times or through natural embarrassment on the day of the excursion, as mentioned in the January JOURNAL, page 85, for I believe I was well acquainted with Tom some fifteen years ago, when he ran an engine out of McAdam Junction, New Brunswick, for the Canadian Pacific Railway, and there, as in the picture, his head was smooth, and I remember, he at that time laid it to carrying prayer books in his hat during his early days. So you see there is no reason whatsoever for the Brothers and Sisters of La Grande to feel responsible for his appearance on arrival home that day. Although, as our Brother says, he is young and he may raise some more, yet when one gets to be 40—excuse me, 29—still 29 (did you say 29, Tom?) it's rather a hard proposition; but if he intends to try, would suggest that he use "Mother Kies" restorer, a McAdam, N. B., product. It's the only thing that will do it, Tom.

I see by the sketch that Brother McGibbon is still up to his old tricks, posing

as a ladies' man. It was so in the old days; but what surprises me most is how the Brothers ever got him back home with only two cabooses between him and the painted cars containing the ladies. Did they have a guard over him? Once this would have been necessary surely; especially on the Grand Lake excursion.

I was glad to learn through the JOURNAL where Brother McGibbon was located, and that he was still working for the interests of the B. of L. E., as we had been informed that Tom had turned Mormon while in Utah. F. A. E. Div. 440.

The Locomotive.

As along the Cresson hills you roam
And feast on the wondrous view,
A chorus of voices fills the dome
And comes rolling up to you.

They seem imbued with human life,
Though they issue from breasts of steel;
You can hear the sighs of toil and strife,
Which men and women feel.

Two long shrill cries make the air resound—
They come from a spot out of sight—
But an echoing answer proves there's found
A helper, who says, "All—right!"

A belching snort, the driver slips,
And, if ever an engine doth swear,
It is now that a volley escapes her lips
As black as the enfolding air.

But her mate puffs, too, and they seem to say,
As the wheels begin to roll
So slowly around on the iron way
With their tons upon tons of coal:

"Though it's heavy, awful heavy,
I can pull it! I can push it!
Now it's moving, slowly moving;
We can do it! We can do it!"

Methinks there is many a sturdy soul
In this struggling world of ours,
Whose burden is just as hard to roll
And calls for as mighty powers.

And often, too, the driver slips,
And a cry goes up for aid:
But, the sand applied, once more it grips
And bravely climbs the grade.

EUDORUS C. KENNEY.

Washington, D. C.

Division Addresses Twice a Year.

MIDDLETOWN, N. Y.

EDITOR JOURNAL: The delegates that assembled in convention at Los Angeles, Cal., composed of intelligent men, who

were given authority to make laws for the benefit of their constituents, realized that more space was required in the JOURNAL for contributors, and in their wisdom excluded the Division Addresses, with the exception of twice a year; therefore, let the will of the majority be cheerfully accepted.

As I turn the pages of the January number of the JOURNAL, I am pleased to note the expressions of different Brothers from all parts of the United States, Canada and Mexico. To me it seems very pleasant and helpful—this exchange of thought among the Brothers—and fully repays for the sacrifice made. In making sacrifice we often receive benefit thereby, and I sincerely hope this may be one of the times, and that the Brothers will wake up and put forth their best efforts to make our JOURNAL one of the brightest and best magazines of the day. Let each one put on his "thinking cap"; he will be surprised at what he may evolve in the way of some short story, which will interest and encourage his Brother and spur him on to do likewise. Do not let modesty deter you from sending in your contribution, for has not our Brother Editor accepted my poor efforts, and does not Brother "Shandy" tell you what he (the Editor) will also do for you? So just brace up and do your prettiest. Let us hear from you soon.

This change will be the means of two copies of the JOURNAL during the year being preserved for address reference, where otherwise they might be carelessly thrown aside.

J. PUFFENBERGER.

A Run for Life by an Old Engineer.

TEXARKANA, TEX., Dec. 16, 1904.

EDITOR JOURNAL: The following story is about a run for life by an old engineer on the Texas Pacific Railroad 23 years ago:

I was signaled ahead by Captain Joe Barber, with Will James baggageman, with a good brakeman and fireman, and as I thought, as good and jolly a crew as ever sailed out of Ft. Worth. We left the city limits a little after daylight and

everything went well, passing all stations on time, until we hove in sight of Roanoke. We were traveling east, and just west of the station we were flagged, and just ahead of us were several freight cars in the ditch. We stopped and saw at a glance that we would be detained several hours, and it being the custom in this thinly settled country at that time to look out for a boarding house first thing, and they were very scarce in this part of Texas at that time, I was getting my engine ready to stay there some time, as Captain Barber, Will James and all the passengers came walking by the engine. The captain looked up and said, "Lyman, looks like we will be here several hours. I will go down to the station and report." I said, "Joe, where will we eat?" and he looked across the prairie and pointed to a house over a quarter of a mile away, and said, "There is the only place we can eat here," and he and the passengers walked on and my fireman joined in the procession, saying they would go over and order whatever we could get to eat. So when we got ready to start I took a good look at the house where we were to dine. I noticed several horses hitched to the fence surrounding the house. Captain Barber, passengers and all were just rounding up on the porch and it being nearer for me to cut across the prairie, I accordingly cut and was walking jauntily along when I noticed directly in my front a red cow with a young calf not over 100 yards away. Now, everyone who knows anything about a wild Texas cow on a prairie with or without a calf knows she is a very dangerous animal to a man on foot. They seem to pay no attention to a man in the saddle—how I longed for a saddle—this I knew as well as any cowboy on the plains. I took in the situation at a glance, and having been an old soldier, Lyme left oblique march. I was trying my level best to keep from attracting the red cow's attention. I sized up the distance from where I was to the boarding house and looked over my shoulder to my engine. I was by this time nearer the house than the engine, and I kept making a gradual circle

around the cow and keeping an eye on every move she made. I took one more look at the house and Barber, the passengers and cowboys were on the porch watching me and frantically waving me ahead. Just then I heard a bawl and looked for the cow and she had started for the big engineer. I flew into the air like a thing with wings, for I knew up to date there was no way known to modern science of calculating the speed of a mad red cow. Now, I being a born jig-dancer and a big, strong, athletic man (Barber and James told me afterwards that they were confident that I could outrun a little old red cow) I made a wild dash for the house and the cow was making a wild dash for me, and I could tell by the sound of her hoofs on the ground behind me that she was gaining on me rapidly. My breath was giving out, but I was nearing the picket fence as fast as possible. We were both doing our best. I took a quick glance at the group on the porch and saw a cowboy cut a pony loose and mount and was on a dead run to meet us. That encouraged me greatly. Then was the effort of my life put forth; I could almost feel those long horns penetrating my anatomy, but now the cowboy with his pony was running with us, and in a shorter time than it takes to write it I was within a jump of the fence. Then came the superhuman. I caught my breath and gathered for the last spring, and as I left the earth I felt the hot breath of the wild cow against me. I cleared the fence, fell into the yard and the last thing I remember was the cow tumbling against the fence immediately after me, and the growl and bark of some ferocious dogs that had been under the porch, and of course, thought I was some wild animal coming in so abruptly and proceeded to chew me. The next thing I remember I was lying on the porch and Barber and James holding my head up and bathing my face with cold water, and I heard the cowboy say, "If I had had my gun I could have stopped him sooner, but I had to rely on my lasso." He had rode out to meet us, turned and ran with us, dropped the lasso over the cow's horns

and gradually drew her in until she fell against the fence and broke the palings.

I soon gained strength and was able to finish the trip on my engine, and now I raise my hat to a cowboy wherever I meet him; and to this day I get as light as a feather at the sound of the lowing of a cow.

My friend, Joe Barber, passed away at his home in Ft. Worth the next year after this great trial of speed that is not down on the train sheet, and the noble young man whom everybody loved, Will James, the baggageman, has too made his final settlement and passed peacefully to the Great Beyond a few years ago in the city of Ft. Worth. My old fireman, I have forgotten his name, but the last I heard of him he was running in Mexico, and will, no doubt, recognize his old friend, if this meets his eye. Fraternally,

LYMAN S. ROACH, Div. 496.

Reduce Representation, Etc.

PHILADELPHIA, PA., Dec. 17, 1904.

EDITOR JOURNAL: Winter is here—snow is on the ground, and a dreary night, and as I look over the pages of the proceedings of our long ago conventions I wonder to myself as an organization do we go ahead or are we going behind—does time give us wisdom or as we grow old do we show our dotage?

I take the records of the year 1869. Would you believe it, Brothers, when I tell you that it took eight days to do your convention work with eighty-four delegates. But you must remember that at that time we were endeavoring to create an interest in our profession as engineers, and now with nearly or about 600 delegates methinks we have done so, but do we grow any wiser? I do not believe so, for convention after convention since that time, article after article in our JOURNAL has said, "Equal taxation for members for all delegates," and on the other side they say, "Give us equal representation then will we agree to equal taxation." That was fought out in 1886 at the New York Convention, but to no account, and at the last convention it seems the

divine vision has got to be fulfilled that *many shall run to and fro and knowledge shall be increased* and so, personally, in patience I wait and hope that if we as an organization have been slow in knowledge that in time we may in wisdom be able to get out of the old 19th century idea and become progressive 20th century. To do so let me call your attention to two things. First, let us reduce our convention membership down to one hundred members, each Division to pay her pro-rata cost and each delegate to have a voting capacity of one vote for each 100 members, one-half vote for fifty, three-quarters for seventy-five and one-quarter for twenty-five; that will represent them all on any system and set a good example to our General Committee of Adjustment, and possibly the time will come when one man can represent the Brothers of any system at our annual convention and the great cost be reduced so that other objects of interest can be maintained with the balance of the cost of our convention now, whereby we may be able to assist in relieving many of our old members in distress.

I read in the Grand Chief's address in the year 1869 these words: "I recommend that the trustees of the Widows and Orphans and Disabled Members' Fund be authorized to invest the same in a building suitable for the transaction of the business of the Grand International Division, etc., and the rents and income to be paid into the fund." Why was this not done? Can you imagine what the B. of L. E. would have saved had it been done? Many things good we have neglected and many things which we should change we neglect to do, and like sheep, follow after custom, even if it leads to destruction.

Our conventions have grown too large and expensive and following after the example set by them come our laws relative to our G. C. of A., in which we take the convention membership as an example of what the committees shall be. As I understand the intention of our G. C. of A., it is to prevent trouble between the members of the B. of L. E. and the officials of the road and at the same time to

settle all differences between the same when the local committees are unable to do so. If I am right let me ask fair and square, is it just and right that upon a large system it should take fifty to sixty delegates to represent less than 3,500 engineers at a cost of about seven to ten dollars per day? Do you not think that twenty men could do this better and at so much less cost? I am not opposed to the G. C. of A. or to the members that compose the same, but I am dead down opposed to a continuation of a law that has followed the Brotherhood ever since I joined it—a law that prevents twelve men on the same system to having the representative, that shall be paid by the others, who are not so fortunate as to have a small representation, for all being on the same system all will or could be looked after the same by a representative body of twenty men, these men elected by the men on the system, regardless of what Division they belonged to and then and only then the men on the system taxed alike for the cost.

I may have more to say on this subject, but let us reason together. Let each and every member read the proceedings of the last meeting of their respective G. C. of A. Count the membership represented—count the number of members each Division has that it takes one man to represent—count the time consumed and the cost for this meeting and what it would cost if they were in session five weeks. Add to that the cost to each Division for their local committee work and then if you don't come to the conclusion that first, we should have a paid or salaried chairman; second, that all our grievances are local and that if the local committee cannot settle them they might as well be dropped; third, decide for yourself that if our following after the ways of the Grand International Convention isn't foolishness on our part; fourth, is there any good reason why the G. C. of A. business cannot be done by twenty good men, or not; and above all remember that the cost of all this comes out of your pockets and be willing to pay it be it 28 cents or 28 dollars. As for me, I person-

ally say that I would pay it, but under protest, so long as we are compelled to not have the privilege of saying ourselves as a system how many men it shall require to do our work, and I feel sure that anyone on the G. C. of A. can represent any city, town or division of road composed of the same men just as well as from the same place four or five can.

Fraternally yours,
C. B. NIXON.

Live and Act the Principles of the Order.

RALEIGH, N. C., Jan. 8, 1905.

EDITOR JOURNAL: Having read the article of Bro. Henry Reece in the January number of the JOURNAL, also the article in November *Review of Reviews*, I heartily indorse all that Brother Reece has said; and in continuance, as we are entering on another New Year (which may possibly be the last mile post for some of us) let us try in the future more than in the past, to live and act the grand principles of our noble Brotherhood, remembering that a kind word spoken, or an act of kindness, especially to the strange Brother who comes to work and resides amongst us, will help to make us all better, spiritually, socially and better every other way, and make us all feel doubly proud that we belong to an organization that treats all as Brothers.

Those who have never had the experience of going among strangers and learning a new road do not know the troubles and discouragements that a new man has to contend with or how friendless he thinks he is, or how much he appreciates a word of advice if spoken in kindness instead of unjust criticism from some man older in the service.

Now, a word to the strange Brother. When you apply for a position, you should expect to conform to all the rules and regulations of the system applied to, and not expect to have them changed to suit your own individual taste, or to what you had been accustomed to before applying for a job; and when you go out with a man to learn the road do not start the trip by telling him how much better a job you had, or how much better the other road was

managed than the one you are about to learn, for right there you ignite a little spark of enmity in the breast of that engineer, especially if he is satisfied with and knows that he has a good position; and then you call him all kinds of names that are not sweet, because he does not care to talk about things that are distasteful to him, and you tell other brethren how stuck-up and distant he is, when possibly he is the most sociable man on the road, if you had started in the right way.

Now, Brethren, let us all strive to pull together and try as near as we can to live up to the Golden Rule: "Do unto others as we would they should do unto us," and we will all profit thereby.

Fraternally yours,
J. H. GRIFFITH, Div. 331.

Treating a Subject Without Knowledge.

ALTOONA, PA., Dec. 21, 1904.

EDITOR JOURNAL: Inclosed please find an item which appeared in the *Wall Street Journal*, and I ask you to publish this in the JOURNAL that every reader may see for himself how ridiculous a matter of this kind sounds when taken up by inexperienced parties and discussed, and their views thrown broadcast throughout the land, especially when they are trying to talk about some subject that they know nothing about.

In dealing with the subject of railway accidents and their causes, the *Wall Street Journal* attributes much of it to divided authority, "the labor unions creating a bond of sympathy that is stronger than loyalty to the spirit and letter of discipline."

"The automatic block signal is very well if the locomotive engineer will obey it, but if he disregards it and if other railway employees are lacking in discipline, mechanical appliances to insure the safety of trains are in vain. 'At this time,' says the *Journal*, 'there is a pronounced tendency to demoralization among working forces. Managers cautiously express themselves, but the plain implication is that there is an influence which is weakening their authority to enforce their orders with the severity of

army discipline, as was formerly their wont. The extraordinary authority of the general of the army or the captain of the ship was not without its reason. The superintendent who assumes the responsibility of life and limb within the bounds of his division should have absolute control conceded to him, not only by the regulations that are in force, but by the spirit of the service and the cordial consent of every individual in the service.' The principle involved, it is contended, is the same that gives the captain of a ship absolute authority. The railway superintendent has the lives, not only of his crew, but also of hundreds of passengers, in his charge, so that during each run obedience to his regulations and orders should be enforced most rigidly."

Now, it is very plainly seen that this *Journal* is a foe to labor organizations, but why should they try to put a dagger into railway organizations? Why don't they leave these complex matters for railway officials to work out, which strictly pertains to their business? We feel sure we have some of the best brains at the heads of our railroads that can be produced. So let them give a solution to matters of this kind, and if they fail to work them out you may depend that the *Wall Street Journal* cannot show them a way out.

I think the motive of the party who wrote this was simply to create an antagonistic feeling between employer and employee, or in other words, our officials and the Brotherhood. I feel sure we have the respect of our officials as a Brotherhood.

Where is there a man who will willfully destroy company property? If the company for which he is working does not prosper he cannot prosper. We positively do not want to take away from our officials one bit of authority that they should exercise to run a well kept road, nor do we ask them to retain unfit or incompetent employees; but, on the contrary, if the officials were to enforce severe army discipline, as this party advocates, it would be but a short time until they would have at least half their employees discharged, and some of their very best men at that.

Where is there a position that a little forgetfulness or a spark of poor judgment will tell as quickly on the man that uses it as a man running an engine at the present day, and if an engineer was to make as great a mistake on the road as the party who wrote that piece in the *Wall Street Journal*, "Divided Authority on Trains," he would have a large wreck on hand.

But we feel glad to say that our officials are fair enough in a great majority of cases, to consider all of these things from a fair standpoint, and further, where are there any teachings of the Brotherhood that are demoralizing in their effects? On the contrary, its teachings are elevating if lived up to and are sure to make a better man of the man who belongs.

Fraternally yours,

MEMBER DIV. 287.

Relation Between Engineer and Fireman.

SOMERVILLE, MASS., Dec. 19, 1904.

EDITOR JOURNAL: Upon most of the railroads today an agreement exists between the enginemen and the management, so that each knows on certain lines what ought to be done and what is expected.

This is as it should be. It not only saves a lot of unnecessary talk between enginemen and master mechanic, but it also saves many hard feelings between engineer and fireman.

How well do I remember the last words my father spoke to me as I was about to leave home to learn the machinist's trade in a distant city.

"Always do as you are told," he said, "when the foreman gives you a mean job; and do it just as cheerfully as you would do a good one; it is the best way to get along."

Now, I never was worth much at taking advice, but I knew my father had been all through what I was about to begin, and for once after entering the shop I followed his advice; and I will add that I have been following his advice on this line ever since, and I have gained ever so much by so doing.

We have all learned that character is everything; also that "a good name is to

be chosen rather than great riches"; but experience has taught me that reputation is something to be reckoned with. I have seen good passenger trains that had been advertised fall to very young firemen, simply because the engineer's reputation was bad. The engineers were not bad; they simply had bad names among the firemen.

"Herbert Arthur is a good engineer," said a fireman, "but I would not fire for him. He is so disagreeable that it is almost impossible to please him. He comes around in the morning so ugly that if the least thing goes wrong he swears and tears around. Never mind whether the fireman is to blame or not, he must take the wrath.

"Andy Losson fired for Arthur three years, and when he bid off the Limited, Tommy Monblo wanted to bid off Andy's run, but Andy happened to drop a remark one day about being thankful he was going to have a change. Explanations were in order, and Tommy would not bid on the run.

"Henry Peck is a good fellow; always has a pleasant word for everybody, but Henry should be pumping salt water somewhere instead of running a locomotive. Henry began on a freight. It was a night freight, and Henry could not see the notches; he went entirely by sound, and as his engines always pounded badly it was necessary to have the lever lean a good deal in order that he might hear the exhausts. When old Bob died Henry got his run. It was a local passenger, only hauled three cars, but Henry didn't mind a little thing like that. It was a daylight job and the notches were revealed to him, but he thought they were only cut in to make the quadrant look fancy.

"Amos Bradford lived in Conlex, where Henry's train put up over night, and he would have liked to bid it off. He had been away from home four years, but he would not fire for a man that worked an engine so unnecessarily hard.

"Every fireman who had worked on the division one year knew Henry's reputation, and the result was a very young man got the train.

"This is where Henry's troubles began. The fireman had just left a night shifter. Was a night fireman ever guilty of cleaning an engine? It was necessary for Henry to teach him everything. It was hard work for the engineer, but it was harder for the fireman. He could not keep up steam. Henry could not make time at first. He did nothing either to help himself or his fireman. He might have shut the water off when he was leaving a station, but Henry had not learned that yet. He could have also let her drift more into the stations and given the blower a chance; but, no, he paddled along anywhere from three to five minutes late on each trip, with the simple excuse of a 'new fireman.' The fireman would always have remained 'new' had not Henry been taken sick and a spare man put on the run.

"The fireman began to learn rapidly. Boyle, the spare man, was a good engineer. There was no trouble in making time. The engine was kept cleaner because the fireman took more interest in his work. He learned so rapidly that when a night freight was vacant for a fireman he bid it off.

"The 'new' fireman's troubles ended there, but Henry's began to multiply.

"His next victim was a fireman from the east end, who had been transferred on account of his convincing his engineer of something with his gloved hand. He was an excellent fireman, and rather than discharge him they transferred him.

"His experience helped him the first day he fired for Henry; but it was hard work. On the second day, Mr. Fireman from the east end began to ask Henry a few questions. Now, Henry was a clever soul, but he never could stand interference with his business. In the first place, he was not used to it, and to think that a fireman should undertake to dictate to him! He did not swear, but he got so rattled that he made a poor stop at the next station.

"On the completion of the first trip the fireman was wiping out the cab. The engineer was looking over the morning paper.

" 'Mr. Peck,' said the fireman, 'I suppose you know I have been transferred on account of some trouble I had with my engineer? I have learned my lesson, but there are a few things I want to say.'

" 'I always intend to get along with everybody. I have a wife and two children to support. But I punched that engineer's head because he carried too much water and daubed the engine all over after I had polished her up. I had spoken to him many times pleasantly about carrying the water so high, and when the black rain struck the windows I said: "There she goes again." Of course, you know Bill was turned out of the Brotherhood for not paying his dues, and when he answered me that if we had one more schedule the firemen would wear silk hats, I punched him; but I do not propose to punch anybody else. You and I are good Brotherhood men, even if we do not belong to the same order, and I, for one, do not want to have any trouble. I do not mean to advertise trouble, but I would like to get along peaceably and pleasantly. I will tell you now confidentially that I am going to be put back on my old division and given my rating at the end of a year. I have got to fire this train a year, but I do not propose to work as hard as I did yesterday. I know that this engine is a good steamer, and if worked all right will make the time easily. If you will do your part I will do mine.'

" 'Now, I don't wish to run the engine, but when the company counts out the valve oil in drops, it is a shame to ballast the road with coal when gravel is so much cheaper. You have ideas that you learned twenty years ago, and what passed then cannot even enter now, as you must be well aware of since this examination era is upon us. Now, it remains with you how we get along.'

" 'This talk was something new to Henry. He made no reply; in fact, neither spoke for the rest of the day, but that night after he reached home he did a great deal of thinking. Before he retired he had made up his mind to work the engine differently the next day; and he did.

Everything went along smoothly; the time was made easily, and even the baggage master on the train wanted to learn the cause of the absence of the usual number of sparks.

" 'The fireman was happy and Henry was well paid. When a water glass broke on the road, the fireman slipped in another. The fireman had to watch in the engine house every alternate Sunday, and to pass away the time he would reduce the steam pressure and pack the valves in the cab.

" 'Many things the fireman did to lighten the burden of the engineer. We all know what the result would have been had they not tried to make things agreeable.'

Compared with many other lines of business, railroading is a hard life. We who are now running a regular train do not fully realize what hardships we have passed. When we look back we wonder how we ever stood it and lived. Ordered out in all kinds of weather; taking all kinds of chances with different engines; trying to reach side tracks with leaky engines; having our patience tried with poor working injectors, and standing in a foot of snow trying to take down or put up a hose when the water gate would not shut off and the cold water running up your sleeve.

How nice it is to be riding along, thinking in a short time you will have completed your run, when, without warning, a side rod breaks.

You are six miles from a telegraph office and the thermomometer registers 10° above. Is it not fun to get down in the snow and try to disconnect?

These, and many more things of a like character, make the life of an engineer a hard one, and not envied by them who are familiar with the profession.

How much more, then, should the efforts of engineers and firemen be greater to stimulate a bond of good feeling and fellowship—one that will not only endure during the time on the engine together, but through life. Today a fireman, tomorrow an engineer. If the Brotherhood means anything, it means this.

Results cannot be accomplished without some effort. A fireman should study the character of the engineer and try in some measure to please him. If he is not interested in baseball, it is poor taste for the fireman to keep talking on that subject. A little close observation on the fireman's part for a few days will enable him to learn what the engineer's requirements are.

It takes a number of years of experience to make a successful engineer. It does not matter if the fireman has passed successfully all of the examinations, and can talk fluently and instructively on the air brake, and his engineer, without early advantages, cannot spell "reservoir" on the repair book, or does not know spring No. 22 from an automatic can opener, but he is still the superior engineer; but he will not be after the fireman has gained practical experience.

If we would only remember that we are both students, each working on different lines toward the same result, our burdens would be made lighter and our lives filled with more sunshine. BLOOMFIELD.

Washington, D. C., for Headquarters.

WASHINGTON, D. C., Jan. 2, 1905.

EDITOR JOURNAL: I noticed what you said of the lack of interest in contributing to the JOURNAL, on page 774 of the October issue, under the caption, "Contributors and the Lack of Them." In it you say the Convention voted the Division Addresses out of the JOURNAL, and I am one of many who condemn the Convention's action. Such an important question should have been left to a referendum vote of all the Divisions. I am glad Brother Conrad touched up the Brothers on that subject.

There have been many complaints that the Grand Officers do not visit the Subdivisions, and out of this have grown three Assistant Grand Chiefs, so they can visit the Subdivisions; and when they do visit them, they should commend them, or at least mention their presence.

As near as I can learn, there was too much tomfoolery in the Los Angeles Convention. Our laws should be changed so that all Brothers in good standing could

be eligible to any office the Brothers chose to elect them to. As they are now, they leave out many who should be delegates to our conventions; and too many are sent who know nothing about legislation.

Why is it so many Brothers drop out by not paying their insurance? I never thought it policy to compel Brothers to join the Insurance; that should have been left optional with each Brother.

Many Brothers inquire of me if Washington, D. C., is the place for the headquarters of the Brotherhood. I emphatically answer, No. First, it should be located in the Mississippi Valley, and all our National Conventions should be held in the Mississippi Valley.

Washington is the most expensive city to live in in the United States. It is an unhealthy place because of its bad water. It is a wicked city; it cannot be healthy with so many saloons.

We think there should be a national law compelling railway companies to put on the third man (especially single-track railways) to keep the trainmen from forgetting about their meeting points when running by telegraph orders. I had a little talk with Secretary Moseley, of the Interstate Commerce Commission, on this proposition. He says the railway companies will oppose it, and to bring it about it must be agitated in the public press. I said: "Never mind the public press of it. What should be done is to have Congress enact a law. It is time that Congress should not be owned by these big corporations."

It is my intention to interview all members of Congress that I can to urge them to pass some law, if it can be done, to prevent so many lives being sacrificed by railway collisions. If nothing can be done to avoid so many accidents, we should run trains by card-time rules only. That I know is a safe way, because I pulled passenger trains several years before trains were run by telegraph orders. It is awful to think of so many killed by head-end collisions.

In hope you will be prosperous in your labors on the JOURNAL, I remain,

J. S. HITCHOCK, Div. 164.

Endowment Insurance.

ALBANY, N. Y., Dec. 26, 1904.

EDITOR JOURNAL: Having often thought of writing to the JOURNAL for some information relative to several articles on endowment insurance, as I think that it is something we need, but none of the Brothers seem to explain their plans so that we can get at just how they want to do it.

Why don't Bro. J. F. Freenor and others give us the particulars of their plans and then probably some more plans would come to light and we might get a good one, which I think we need, and which some of the large roads are trying to get their employees to do on their roads. I think it would be better for our order to handle these matters for us instead of the companies.

I think that the Editor's reply to Bro. J. J. Conrad in regard to the Division Addresses should be satisfactory to all, but I see two ads in back pages that I do not think should be advertised in our JOURNAL at any price, as I do not think that we have as many men in our order or other railroad orders that need their goods, and that they cast reflections upon us, and they think it is a good field to work in or they would not have hired our space. I think we have not many that need to be cured of drunken habits as the advertiser would have readers think there is in the railroad employees in general; and would rather see the Division Addresses every month than to see such advertisements. Yours fraternally,

W. ONDERKIRK, Div. 46.

Brother Onderkirk is laboring under a mistaken idea when he asserts that the ad alluded to casts a reflection upon any number of members of this organization, nor does it carry with it any insinuation that there are a large number who indulge in strong drink to excess. Father Coffin, of Iowa, who is widely known among the members of this order, thought enough of this remedy and its good results to allow his picture to accompany it as a commendation for it, and I am free to say that I would willingly pay for

the space it occupies myself if I thought even one of the five names which appear in the expulsion list in the January JOURNAL could have been left out. No one would be better pleased than the Editor if every member of this order would remember that they owe an obligation to themselves, to their dependents, to every member of this order, and to their employer as well, to lead sober, upright lives, and that drink is a sin against all of these. Then there would be no necessity for a remedy for this evil, and no remedy would be advertised; but so long as some forget, however few, we should not put out of reach of wife or mother any means that has any hope for the better things in it.

EDITOR.

Correspondence School.

GALION, O., Jan. 7, 1905.

EDITOR JOURNAL: For the benefit of the order why could there not be a correspondence school started in the JOURNAL? The Brothers are paying thousands of dollars yearly into institutions which could be saved to them if there was such a department in our JOURNAL. Of course, old men have gone by that period in life where such a thing would be of no benefit to them; and again, there are others who would be indifferent to such a thing or take little or no interest in the matter. But when it is claimed we have 47,000 members and others coming in every month I believe, and others will coincide with me, that there should be an effort in helping the young men who are entering our order.

I see a discussion arising in regard to the directory being removed from the pages of the JOURNAL. The space might as well be occupied by the directory unless it is occupied by some useful matter that will be of some benefit to the members. Twice a year is enough for the directory to appear in the JOURNAL, providing there is useful matter inserted in its place.

Start a department in the JOURNAL with a systematic study of problems that confront the members each day in their work and there is no doubt but it will meet with the approbation of a large number.

Hoping to see something done in this line, I am
Yours fraternally,
EDW. KAVANAUGH.

The Pen Mightier than the Sword.

JERSEY CITY, N. J.

EDITOR JOURNAL: I hope the appeal of our Editor will be heeded in regard to "contributors and the lack of them." I heartily indorse the stand he has taken in making this appeal.

Brothers, read your JOURNAL,—every one of us has a few spare moments,—and come out to our meetings. Div. 53 has had some very interesting meetings lately. Bro. W. P. Garabrant is devoting about one-half hour on the quick-action triple and air brake instructions in general every meeting Sunday. We had Bro. James Currie with us Sunday, November 27, and it was a pleasure to see his smiling countenance, and we all appreciated his visit.

We had our charter draped in mourning for our deceased Brothers, Peter Logan and Edward Johnson, and the thought came to me, Who is next?—just one a little ahead of the other, for this is the only certainty we have in this life, therefore, let us strive for a good name and live for something, so we may not be forgotten when it comes our turn.

Although riches and high positions are within the reach of but a few, learning and a good character may be obtained by every person; a good name is better than all. Without a character that commands respect, our influence in society is not felt, and while tolerated is never emulated.

Write your name in kindness, love and mercy on the hearts of those you come in contact with day by day. You will then become entwined in the hearts you leave behind when the Great Master Mechanic makes the last call and our train bears us over the Mystic River. Good deeds will shine as the stars in heaven.

Fraternally yours,
S. SCHLEGAL, C. E., Div. 53.

Tobacco Tags and the Home.

CHICAGO, ILL., Dec. 26, 1904.

EDITOR JOURNAL: I beg to thank you for the assistance you gave through the JOURNAL to my plan for furnishing the reception room at the Railroad Men's Home, and I inclose a list of the tags and coupons redeemed, donated by the Brothers of the different organizations.

There were 21,200 tags and coupons redeemed, with which we obtained a—

- Royal Wilton rug for 4,000 tags.
- Library table " 3,800 "
- Couch " 4,800 "
- Morris chair " 2,800 "
- Rocking chair " 2,800 "
- Writing desk " 2,300 "
- Chair for desk " 700 "

a very nice addition to the furnishings of the Home, but not by any means what it should have been, for not more than one per cent of the members of the four organizations sent in tags, evidently because so few of the Brothers look into their official publication. Over half of the 250,000 composing the four orders use tobacco in some form, and if each one had sent one whole tag we would have obtained twice as many as we did; and if each had sent or would send in 100, as some of the Brothers did, it would build a new \$125,000 Home. But we are thankful for the contributions that came to us and the result. Respectfully yours,

MRS. & MR. M. E. MURRAY,
972 76th Place.

Railroad Employees' Home.

HIGHLAND PARK, ILL., Jan. 1, 1905.

Communications for publication must be written on one side of the paper. Noms de plume are always permissible, but to receive consideration must be signed by the full name and address of the author, and addressed to the Editress, Mrs. M. E. CASSELL, 922 Dennison Av., Columbus, Ohio, not later than the 8th of the month.

The Editress reserves the right to revise, reject or use matter sent in, governed entirely on its merits.

A Valentine.

E. A. H.

Jack's grandpapa to grandmamma
Once sent a piece of folly—
'Twas long ago, when he was "Jack,"
And she, of course, was "Dolly."
St. Valentine inspired the rhyme
He put within the letter,
And even helped him choose the seal,
Two hearts bound with a fetter.
'The rose is red, the violet's blue,
Sugar is sweet, and so are you."

And Jack's papa sent to mamma,
When he was just eleven,
The same rhyme for a valentine,
She being aged seven.
The envelope was tinted pink,
And up within one corner,
With bow and arrows, wings and all,
Sat Cupid, little scorners.
'The rose is red, the violet blue,
Sugar is sweet, and so are you."

And Master Jack shot out last night,
As swift as any rocket,
But not before I caught a glimpse
Of something in his pocket.
It was a letter—bless the boy!—
And I knew in a minute,

The next day was St. Valentine's,
And so, just what was in it:
'The rose is red, the violet blue,
Sugar is sweet, and so are you."

A Chat About Valentines.

What a stir and flutter that sly little elf, Master Cupid, creates among the young folks as the 14th of February draws near!

On no other day in the year do bright eyes watch so anxiously for the postman; while in country towns the small post-office is thronged as soon as school is over with merry, chattering groups of laughing boys and girls, eagerly awaiting their share of glittering "hearts and darts and true lovers' knots"—the effort to discover the senders making no end of fun and mystery.

St. Valentine, whose name, at least, is remembered in these gay, foolish mis-sives, was no doubt a very good old person, for we are told that he "was a man of most admirable parts, famous for his love and charity," and that he suffered martyrdom in the third century; but we can find nothing in his life to suggest his festival being kept as it now is, and has been for four or five hundred years.

The children, however, will not regret that these fascinating paper souvenirs have become a part of St. Valentine's Day; only the poor letter-carriers, as they toil along with their unusually heavy burdens, having reason to grumble at the worthy saint. As some wag writes:

"Oh, Love! how potent is thy sway!
Thou'rt terrible, indeed, to most men;
But once a year there comes a day
When thou tormentest chiefly postmen.
Oh, hard, indeed, the lot must be
Of him who wears thy galling fetters!
But e'en most miserable he
Who must go round with all thy letters."

The mode of celebrating the day differs in various countries, but to see St. Valentine at his best one must go to the old English city of Norwich.

There it is the great festival of the year, to which all look forward, and for which shopkeepers prepare for weeks beforehand; for their valentines are no paper affairs,

but of some intrinsic value, as toys, jewelry and sweetmeats.

St. Valentine's Eve is the time of celebration, and it is said that furious rapping at the knockers, all over the town, sounds like the clattering of ten thousand castanets.

In no country are so many so-called comic valentines sold and sent as in the United States. Is it possible that we, who pride ourselves upon being a people progressive and one of the foremost nations of the world, are lacking in natural refinement, and can find pleasure in anything so low as the sending of comic valentines?

There is no excuse for wounding the feelings of a fellow-creature by making sport of his infirmities or his position in life, even on St. Valentine's Day, and to a sensitive person nothing can be more cruel than to receive one of these exaggerated caricatures.

The day should be one to look forward to with joy, bringing sweets and leaving pleasant memories, if we would rightly honor good St. Valentine, and as they seem to know how to keep the 14th day of February in Norwich, I will close this chat with the couplet that always ends the valentines there:

"If you'll be mine, I'll be thine,
And so, good-morrow, Valentine."

M. E. C.

Greetings from Div. 1.

DEAR SISTERS: We come to you with New Year's greetings and sincerely hope that the new year may be productive of much good in the work we are striving to do.

May we see our duty clearly and do it not only for duty's sake, but because we love to help each other in every way we can.

May we always be alert for opportunities to do the right things, and encourage our Sisters by all working together in harmony. This we will do if we keep our motives pure and really "Do unto others as we would have them do unto us."

We have a very flourishing Division and a constantly increasing membership of willing, cheerful workers. We had a number of very pleasant social gatherings last year, notably our picnic at the Railway Men's Home, Highland Park, Ill., which we gave August 25, and which was attended by a large number of Brothers and Sisters and their friends. The C. & N. W. Ry. Co. again, as before, generously furnished us with free transportation for the round trip.

To those who have never attended one of these picnics, I would say that you have certainly missed a good time, and the inmates of the Home always seem to enjoy them as much as we do. These picnics are given as a benefit for the Home, and all our friends have responded so liberally that we have been enabled to clear a nice sum for it every year.

Our latest social event was a ball given on the evening of December 22nd, and judging from the happy crowd who attended it, it was at least a social success. As we have had no meeting since, at this writing it is impossible to say what the financial gains are, but any way the evening was spent most enjoyably and the refreshments served were all that could be desired.

We would say to our Sisters that we are always pleased to have you visit us, and believe that it promotes a general good feeling to visit each other, and so you may always be sure of a cordial welcome whenever you call on Crescent Div. No. 1.

I take the liberty to copy the following verses clipped from *The Home Monthly*, entitled "Nobility: "

" True worth is being, not seeming,
In doing each day that goes by
Some little good, not in the dreaming
Of great things to do by and by;
For whatever men say in blindness
And spite of the fancies of youth,
There's nothing so kingly as kindness,
And nothing so royal as truth.

" We get back our mete as we measure—
We cannot do wrong and feel right,
Nor can we give pain and feel pleasure,
For justice avenges each slight.

The air for the wing of the sparrow,
The bush for the robin and wren,
But always the path that is narrow
And straight for the children of men.

"We cannot make bargains for blisses,
Nor catch them like fishes, in nets,
And sometimes the thing our life misses
Helps more than the thing which it gets;
For good lieth not in pursuing,
Nor gaining of great nor of small,
But just in the doing, and doing,
As we would be done by, that's all."

Fraternally yours,
MRS. W. W. HAMILTON.

Little Acts of Kindness.

MOBERLY, MO., Dec. 19, 1904.

DEAR EDITRESS: May I write a few words on the value of the little acts of kindness which make up the "sum of happiness below?" It has been my good, or ill, fortune to have been Corresponding Secretary for several organizations during the past few years. It is one of my few good traits to be "faithful to my obligations," and whenever requested to write a letter or an article it may be considered as done. I have noticed that if I write nine articles correctly they are taken without comment and as a matter of course. Perhaps I should be flattered by the silence which may be a compliment, but I am not. I like to talk, and like others to talk too. But, if in the 10th article I inadvertently make an error or incorrect statement, the telephone bell is sure to ring, and I am called to account. It is an old adage "serving the public is a thankless job," and I have proved it so in most instances. The few exceptions form the oases in the desert which make it "blossom as the rose." I did not write this article to obtain sympathy or ask praise, but simply "To point a moral and adorn a tale." Having had the above experience it may not be necessary to tell you how pleasant it was to receive so kind a letter recently from our Editress in acknowledgment of an article. When she closed with the expression, "Come again, Sister, you are always welcome as the flowers in May," you may imagine what a warm glow it sent to my heart, and it inspired me to write this, which may

prove "a word in season." I thought how little it cost her, only the writing of that sweet note, but its memory lingers in my heart and warms it still. May I not tell the Sisters the train of thought this note aroused? Doubtless no Division which has been in existence any length of time is lacking in the class we style "reliable;" officers or members who never fail in attendance or duty. Does it ever occur to you to tell them you appreciate it? I know a lady who is neither witty, brilliant, handsome nor wealthy, and whose taste in dress rather approaches the ridiculous, yet she is welcomed in every social circle and beloved by young and old, because she has such a kind heart. She is always saying pleasant things, and in fifteen years' acquaintance I have never heard her say an unkind word of any one. Must we always wait to bring flowers until we can strew them over graves? Must we close so tightly in our minds the appreciation we feel for others, gifts that not one little ray can escape to brighten their pathway? Must we wait to say the pleasant word or do the kindly act until life's pulses are stilled or the heart grown weary and unresponsive to our touch! Mayhap the time never comes when we fail to love the bright, sweet notes of appreciation, but the waiting is weary and the road is long, unlighted by the lamps of kindly words and kindly thoughts. No one can delve into our minds and bring our feelings to the light and this is well; but, if they are good thoughts, give them expression; if harsh, hide them so deep down they shall not escape. If your friends are welcome and dear say so in unmistakable accents, and not with the air of a society dame. If your friend's new dress is infinitely becoming tell her so, it will not make her vain. If she writes well let her know you think so. It is not praise but justice to the heaven-sent gift which she has not hidden in a napkin but cherished and cultivated. Try praise. It may bring to some other heart the happiness thus brought to mine, and cause it to sing as mine has done over the bright little greeting, "you are welcome as the flowers in May."

-COR. SEC. 33.

Bright Hopes for the Future.

DEAR SISTER EDITRESS: Your request for an offering in January number reached me too late, as it went to California, then followed me to Iowa, where I had been sojourning for two months, called hence by the severe illness of one of my kin.

While there I received many invitations from Grand Officers and surrounding Divisions to visit them, but felt obliged to sacrifice pleasure for duty. My home coming happened to be in the worst storm of the season, a real blizzard, and as I had wanted to see plenty of snow I saw it to my heart's content. Trains were delayed which caused anxiety to my friends, and I had a chance to see all along the way the brave daring of our noble and trustworthy engineers.

As soon as I could, after the storm had sufficiently subsided, and the train stopped long enough, I walked forward with some traveling companions to see the man in the cab. It was stinging cold in the wind and sleet, but we found him looking closely after the engine with his helpers, icicles frozen to his whiskers, but looking as if he intended to brave the storm and do all in his power to reach his destination outlined. I know how hard it was to make any headway, and often we were behind time, how easy it was to make some slight mistake or catch the wrong signal, which would end in wreck or disaster. But I had perfect confidence in the man at the throttle, who landed us safely at last through all those trying scenes, and I have been congratulating the Brothers of California since my return, that they work in a milder climate, "the land of sunshine and flowers."

I returned home just in time for New Year's day, and I would extend to all the Sisters of the G. I. A. a most hearty greeting. Best wishes to the Grand Officers and the newly installed Division officers, not forgetting those who have laid down their badge of office after a successful year. We have certainly been prospered and blessed in our Order during the past year, and have bright hopes for the future.

The Pacific Coast joins in new interest with another Division recently organized. Mrs. Leland Stanford Div. 106, held its installation on Tuesday, Jan. 10th, with the Sisters of Div. 104, as guests, and Sister Armstrong, Grand Inspector, acting as installing officer. After the installation service a sumptuous banquet was served, to which the Brothers were made welcome. Several of the retiring officers, among them the Grand Chaplain, were presented with elaborate and handsome gifts. Much credit was reflected upon the impressive work of the installing officer, and the committee in charge, it being a happy and most successful affair.

GRAND CHAPLAIN.

Feminine Wisdom.

When a man's wife has gone away to visit, he wonders how he ever managed to get along as a bachelor.

There are lots of girls who are afraid of mice who wear a "rat" in their hair all the time.

Every time I see a woman kiss her worst enemy and call her "dear," I think what a great career would have been hers had she been a man and in politics.

It is usually after a woman loses her good looks that she takes up mission work and joins a club.

A man can give more valid reasons for making a mistake than a woman can for doing right.

There is a soul mate for each man and woman in the world, and once in awhile they marry.

When a woman admits that she is jealous, she is, and when she denies it, she is.

More men commit crime, go crazy, and kill themselves than women, yet we speak of women as the "emotional sex!"

Study Club Program for February.

"A mighty hand from an exhaustless urn
Pours forth the flood of years."

1. Paper—Current events of 1904.
2. Reading—"Is the World Growing Better?"
Everybody's Magazine, December, 1904.
Discussion.

3. Let each member bring a clipping of some heroic or unselfish action which occurred during the year.
4. Book Review—The Simple Life. Charles Wagner. Is it possible, with our complex civilization, to live such a life?
5. "A Waste of Human Life." By Ray Stannard Baker, in McClure's for December, 1904.

Silently, like the blessings of God, the years descend upon us; come with a glory and a promise, bringing to us treasures and trials unknown; bearing with them something of the radiance of the Throne, of the gleam and glimmer of the far-off "Jasper Sea."

And as silently they go, out beyond our reach, bearing with them all the sweetness, the gladness, the sorrows, regrets and mistakes.

Down their tide dear faces have vanished, leaving us behind; but life and love are eternal, and God will surely give us our own again.

What are we going to accomplish in the year which has just begun? Shall we progress or be willing to simply drift with the tide. Shall we sit calmly down, satisfied with ourselves and our past achievements, saying, "Let well enough alone"? No! a thousand times No. We want to rise; to live up to what is highest and best within us, and make our beloved order more potent for good. Our Grand Officers are constantly urging us, by tongue and pen, to greater activity. Let us respond with our best efforts helping them, ourselves and the world.

May happiness and prosperity attend all our Sisters, and let us all strive to so live that we may finally enter into that larger and better life, "where time shall be no longer."

STUDY CLUB COMMITTEE.

Some Thoughts on Insurance.

With the January JOURNAL as an incentive, I venture to air some of my views on the subject of insurance, and I hope for the next eighteen months many of our Sisters will do the same, in order that our delegates may be able to legislate for us wisely and well at Memphis in 1906.

I believe, with many others, that our system of insurance needs a remodeling or making over; for, though it has fulfilled its mission completely in the past and always reflects unlimited credit on its originators, our V. R. A. has grown so wonderfully that the time has come when a change is absolutely necessary.

Now, will "rating of assessments according to age" give the change that will do the most good? Well, for reasons which I will not discuss in this article, I fear not.

I believe that insuring on the "Expectancy plan" is far better. What is the Expectancy plan? Well, I will try to explain as briefly as possible.

There are tables already, or we could formulate one of our own, showing how long a Sister is expected to live after she has reached a certain age, and her assessments can be levied accordingly. Then, if through something unforeseen she should die before reaching the expected age, the amount of assessments still due the V. R. A. may be deducted from the amount of the policy, and then each one would be paying for what she got and no one be getting something for nothing, and the young stand an equal show with the old.

Now, the idea of deducting from the policy shocks you! Well, it need not, for you would be surprised at the very small amount it would take out—in many cases less than one dollar.

Do not say we are turning fortune-tellers in presuming to say how long each one shall live. No, we are not. God, and He alone, knows "the day and the hour." But thinking ones can, and do, figure out how long a person is expected to live after she reaches a certain age, be that age twelve, twenty or sixty.

Now, Sisters, here are some views with which you do or do not agree. Well, say so through the JOURNAL. Do not say, "I cannot spell," or "I am no grammarian." Not all of us are college-bred, I can tell you; but if you are too timid to come as you are, write your thoughts to our dear Editress, and I know she will be only too happy to clothe them properly and present them for you, and you can have your say just the same.

With good wishes for all, I am,

Yours fraternally,

MRS. M. E. FITZPATRICK, Div. 150.

Woman at Home.

There is no place where the graces of true womankind shine out more conspicuously than in the common daily intercourse of the family. Patience, gentleness, tender sympathy, love and forbearance here come into play with a force and

influence felt in no other place. Here those virtues, which have their source in the Divine nature, find their most congenial atmosphere. Let them be lacking, or any of them, and the harmony is broken, and peace and joy depart. It is not to be understood that the happiness of the family relation does not also depend in a large measure upon the character of the husband and the father, but we insist only that the influence of the wife and mother here is the chief and most essential thing. The home is, primarily, what she makes it. It is her domain, her throne of power. If she chooses to neglect her duties at the behest of society, or because of other outside interests, the home suffers from her absence, and the family loses all that charm and brightness which her presence should infuse. There is danger, we apprehend, in these days of progress and "reform," particularly in the matter of "woman's rights," of undervaluing the influence and character of the family life. It is sometimes talked of as a matter of small consequence in comparison with that so-called wider sphere outside of home duties, to which many are aspiring. But let the truth be emphasized, that the mothers of today hold the levers of the world's tomorrow. Let impurity, discord and dissension enter the homes of the people, let the family life be corrupted, and disease and death will fasten itself upon the vitals of the republic, and its days will be numbered. Domestic happiness underlies national strength and prosperity, and the nearer we approach to the ideal home the less we shall have to fear for the future.—*Leslie's Weekly.*

A Deed and a Word.

A little stream had lost its way
Amid the grass and fern;
A passing stranger scooped a well,
Where weary men might turn;
He walled it in, and hung with care
A ladle at the brink;
He thought not of the deed he did,
But judged that all might drink.
He passed again, and, lo! the well,
By summer never dried,
Had cooled ten thousand parching tongues
And saved a life beside.

A nameless man, amid a crowd
That thronged the daily mart,
Let fall a word of hope and love,
Unstudied, from the heart;
A whisper on the tumult thrown,
A transitory breath—
It raised a brother from the dust,
It saved a soul from death.
O germ! O fount! O word of love!
O thought at random cast!
Ye were but little at the first,
But mighty at the last.

—*Charles Mackay.*

New Divisions.

ANOTHER IN TEXAS.

Our Grand President assigned to me the pleasant duty of organizing a G. I. A. to W. H. Reilly Div. 427, B. of L. E., at Yoakum, Texas. I was notified that they would be ready to organize on Nov. 28, and accompanied by Sisters J. W. Smart and W. D. Oland of Mistletoe Div. 181, arrived at Yoakum on the afternoon of Nov. 27. We were met at the depot by several of the prospective Sisters, who gave us such a royal welcome that the discomforts of the trip—which among other things was a "lay over" of about nine hours at West Point Junction—were forgotten.

The Sisters had carriages in waiting, and we were taken to pleasant homes. Sisters Smart and Oland were entertained at the beautiful home of Sister Martin, while I had a delightful visit with an old school friend, Sister Marsters. On the morning of the 28th we met at the Red Men's Hall, at 9:30, and with Sister Oland as Secretary and Sister Smart as Marshal, Yoakum Div. 336 was organized, with twenty-four charter members. Officers were then elected, after which we adjourned for dinner at the pleasant home of Brother and Sister Conlon, and needless to say we did ample justice to the turkey and other delicious eatables served. The afternoon was given to installation of officers and exemplification of the ritual work. The appointed offices were all filled, and each seemed especially suited for the station to which she was chosen. Sister Conlon, who was elected President, joined the G. I. A. at the late Convention at Los Angeles, and it was largely through

her efforts that the new Division was organized.

Tuesday morning we met at 10 o'clock, holding an all day session. The new officers were all in their stations, opened in regular form and went through all the forms of ritual work. One could hardly believe that they were not "old-timers," especially in the officers' drill and burial service. The new Auxiliary deserves much praise for the manner in which they took hold of the work, and the success and prosperity of Yoakum Div. 336 is assured, because of such earnest and diligent workers.

I must not forget to mention that Red Men's Hall is in possession of a fine, large goat, the use of which made the initiation of candidates much more impressive, especially when the new members were ready to be conducted to seats near the Vice President. His goatship was in fine spirits, and under the capable management of Sister Russell, he displayed many accomplishments, to the great enjoyment of all, the victims not excepted. After the close of the meeting a photographer came in and took a picture of us all, and I felt disappointed that the goat was not given a place in the group. We were then driven to the home of Brother and Sister Martin, where we enjoyed a dainty supper.

In the evening a reception was given at the hospitable home of Brother and Sister Russell, to which the Brothers and their families were invited, and a large number were present. A delightful musical program was rendered, which added much to the pleasure of the evening, and a most enjoyable social time was had by all who were fortunate enough to be present. Delicious refreshments were served, and the dining-room with its beautiful decorations and attractive table, made a scene long to be remembered.

The next day quite a number of the Brothers and Sisters were at the depot to bid us good-by, and we started on our homeward journey, carrying with us most pleasant memories of Yoakum and her people.

MRS. R. W. MAYS.

AT BURLINGTON, IA.

In response to our Grand President

Mrs. W. A. Murdock's call, I secured transportation for Burlington, Iowa, to organize a Division there on December 12th.

I was well cared for by Bro. J. A. Richards, F. A. E., and wife in their comfortable home. At 10 o'clock on the morning of the 12th the ladies were at the hall ready to assume their responsibilities. We organized in the morning, elected and installed officers, and by 2:30 were ready to hold meeting. As the second and fourth Mondays were to be their regular meeting days we started in with the work in regular form. I was pleased, as well as agreeably surprised, to see how well the ladies started out with the work, it being so new to them. After we had drilled in the work during the greater part of the day we were ready for the fine five-course dinner served us at one of the leading hotels in Burlington. The charter was held open for a short time as there were some of the ladies who could not be present that day. The ladies were very enthusiastic over their new Division, No. 348, and gave it the name of "The Burlington."

Too soon the hour came to say farewell, for we met as friends and we parted as Sisters.

MRS. W. H. McBRIDE,
Grand Organizer and Inspector, Valley Junction, Iowa.

AT CRESTON, IA.

On December 9, 1904, Highland Division 341, G. I. A. to the B. of L. E., was organized by Mrs. W. A. Murdock, Grand President. There were fifteen charter members. After the meeting at the hall the Division adjourned to the home of Sister Frank Heflin, where in the evening a banquet was served, and an evening spent long to be remembered by all present.

MRS. GEO. WATERMAN,
Sec., Div. 341.

ANOTHER FOR MONTANA.

Our Grand President, Sister Murdock, appointed Mrs. J. C. Anderson, Past President of Div. 101, to go to Great Falls, Mont., to organize a Division there. She was assisted by Sisters G. W. Valentine and W. L. Brewer. Sister Valentine acting as musician and secretary, and Sister

Brewer, as Marshal. We were met at the depot by Brothers and their wives and taken to the hotel. The day following, on December 11th, we were escorted to the Odd Fellows' Hall where the organization was to take place.

After arriving at the hall the Brothers of Div. 504 presented members with the charter, seal, ritual and by-laws, for which the ladies were truly grateful. Electric City Div. 325, was duly organized with nineteen charter members. While the Division was being organized and officers installed the Brothers were busily engaged in the annex preparing an elaborate luncheon. And when the doors were thrown open they were greeted with a pleasing sight. Brother Fisher, M. M. at Great Falls, and Brothers Stoddard and Houle served the ladies at the luncheon. Brother Fisher with a long white apron, with long white streamers, made a very graceful and accommodating waiter.

When all had been served, fifty in number, Brothers, Sisters and friends were given a theater party, which all thoroughly enjoyed. Not enough praise can be given Brothers of Division 504, who so ably assisted in making this event a grand success, of which the organizer and members are very proud. We left the Division in charge of an intelligent and industrious lot of ladies, and our trip to Great Falls will long be remembered with pleasure. We feel assured that our good and noble Order will find a permanent home in Electric City Div. 325. God bless our noble Order, the G. I. A. to the B. of L. E.

MRS. J. C. ANDERSON.

Notice.

A union meeting of the G. I. A. will be held in I. O. O. F. Hall, in Columbus, O., on March 14, under the auspices of Div. 52. The ritual work will be exemplified and fancy drills given, including the Installation Drill. Sister Murdock and other Grand officers will be present. All members of the G. I. A. are invited, and the Ohio Sisters especially urged to come to this meeting.

EDITRESS.

Division News.

THE first anniversary of Div. 307, Reading, Pa., was celebrated in a fitting manner on the evening of December 10, to which celebration the members of Div. 75, B. of L. E., were invited, and responded by being present. The C. E. of Div. 75 introduced Bro. Joseph Williams, who delivered an address full of inspiration, after which all present were seated at the table, which was made beautiful by decoration and loaded down with eatables representing the culinary art of the Sisters. Many were the words of praise bestowed upon the different viands, and the coffee as made by Sister McGovern was pronounced excellent by the Brothers, who proved their assertions by calling time and again for "one more cup of that good coffee." After spending an evening full of enjoyment we returned to our homes, hoping for many such evenings with the same spirit of harmony.

MRS. MATTIE BRADFORD.

GOLDEN SEAL Div. 30, of the G. I. A., Parsons, Kans., has been silent for a long time, and now comes forward and sends greetings to all Sister Divisions, wishing them a prosperous and Happy New Year. We have started the new year with a rich treasury, the fruits of hard labor the past year, and hope it may continue so through out the lifetime of our beloved Division.

We have a splendid membership, and our lodge is growing and the prospects are very bright for a more rapid growth, as a prize of \$2 is offered by the Division to the Sister securing the most members this year. We all expect to work for the prize, and in so doing we also work for the good of our Order. We love our noble Division and its good works and are like a great family, very dear to each other.

On the evening of January 4th, at B. of L. E. Hall, at the close of a meeting of Div. 179, B. of L. E., we served a farewell banquet to our dear Brother and Sister Mr. and Mrs. Wm. Boucher, who were leaving for their new home in Alliance, Nebr. A large crowd of the Brothers and Sisters were present, and the evening was indeed a most enjoyable one.

We deeply regret the departure of our Brother and Sister from our midst, and all unite in wishing them happiness and prosperity in their new home. At our regular meeting on the afternoon of January 5th, we presented our Sister with a handsome solid gold thimble, initial engraved, as a token of our sisterly love for her. We know she will often think of us when far away, but our little gift will cause her to think even oftener of us, as each time it is placed in use on her finger it will bring back to her memory the many pleasant times we have spent together.

At the same meeting of our Division we also presented our worthy Past President, Mrs. Frank Trago, with a beautiful hand painted vase (the work of our Sister Mrs. Glenn Ewing), as a token of our appreciation of her faithful service rendered the past year. Sister Trago has worked very hard for the welfare of our Division, and much credit is due her for its prosperous condition. Our rummage sale in December, conducted by our Sister, was a grand success. We have a splendid corps of officers for the ensuing term, and trust we may continue the good work already begun. Success to all our Sister Divisions. Thanking you for a share of space in your popular magazine and hoping we may appear again in the future,

I am sincerely yours in F. L. and P.

MRS. FREDERICK H. KREGER,
Treas. Div. 30, G. I. A.

I WOULD like enough space in the columns of the JOURNAL to let you know that Silver Star Div., 22, Grand Rapids, Mich., is not dead. We are alive and working. Our Division is small, only 45 members, and six of them do not live in our city, and ten of them we added in the past year. Our readers must not forget that this was convention year. We sent a delegate and our finances are still good, having something like \$150 in our treasury now, so you see we have been working some.

We installed our new officers the third Thursday in December, after which we presented our Past-President, Mrs. Mary C. Gage, with a very nice chocolate set;

then served coffee, doughnuts and sandwiches. All had a very nice time.

We have a fine set of officers, and with our headlight bright and clear, we think we have a prosperous year before us.

C. S., Div. 22.

G. I. A. Voluntary Relief Association.

TOLEDO, O., Feb. 1, 1905.

To Division Insurance Secretaries, V. R. A.:

You are hereby notified of the death of the following members of the Association, and for the payment of these claims you will collect 50 cents from each member carrying one certificate, and \$1.00 from each one carrying two; providing, however, that no one be assessed on a certificate, if the application for same was dated later than December 31, 1904.

ASSESSMENT NO. 194.

Died Dec. 13, 1904. Sister Anna B. Smith, aged 62, of Div. 111, Martinsburg, W. Va. Cause of death, cerebral hemorrhage. Carried two certificates, dated March and June, 1900, payable to William M. Smith, husband, and Anna B. Smith, daughter.

ASSESSMENT NO. 195.

Died Dec. 22, 1904. Sister Tena E. Barnes, aged 59, of Div. 62, of Collinwood, O. Cause of death chronic nephritis. Carried two certificates, dated March, 1894, payable to T. J. Barnes, husband, and Nina J. Barnes, daughter.

ASSESSMENT NO. 196.

Died Dec. 13, 1904. Sister Nora E. Brown, aged 50, of Div. 99, Boston, Mass. Cause of death, pneumonia. Held two certificates, dated April, 1894, payable to C. E. Brown, husband, and Nancy M. Moriarty, sister.

ASSESSMENT NO. 197.

Died Dec. 24, 1904. Sister Carrie Smith, aged 58, of Div. 80, Mauch Chunk, Pa. Cause of death, paralysis. Carried one certificate, dated September, 1891, payable to children, Annie, Lobien, Frank, Dan and Stroud Smith.

Members will pay their Insurance Secretaries on or before February 28, or be marked delinquent; and in order to reinstate must pay a fine of 10 cents on each certificate besides the delinquency. Insurance Secretaries must forward to General Secretary and Treasurer not later than March 10, 1905, or stand delinquent till remittance is made.

Assessments Nos. 196 and 197 will be paid from the Assessment Fund.

Members in good standing Dec. 31, 1904, forty-eight hundred and thirty-one in the first class; and two thousand and seven in the second class.

There has been much confusion about transferred members, because the new law is not followed. If the General Secretary is properly and promptly notified, she will instruct Insurance Secretaries. Please study Section 7, page 87.

MRS. GEO. WILSON, Pres. V. R. A.

MARY L. ROBERTSON, Gen'l Sec'y and Treas.

Automatic Air and Steam Coupler.

BY R. H. BLACKALL.

Laws are being gradually introduced which tend to give the greatest protection to all men who are engaged in the different branches of railroad service. The replacement of the link and pin with the automatic coupler has done away, to a large extent, with the necessity for trainmen going between cars to make couplings. The new equipment, combined with laws which compel their use, has made great strides toward accomplishing safety, especially for the trainmen. The introduction of the air brake has been of inestimable value as a protection to life and property, but its use still makes it necessary for the trainmen to go between cars in the performance of their duties. Devices are now on the market which will not only couple the air pipes on freight cars, but in passenger service it will couple up the air brake, air signal and steam heat connections, so that it will not be necessary for the trainmen to perform this work, the operation being made automatic by the coupling of the cars.

Aside from the danger involved in going between the cars for the purpose of coupling the hose, a saving is made in time as well as in the less frequent renewal of parts.

The sale of the Forsyth Automatic Air and Steam Coupler is now controlled by the New York Air Brake Company, and this device is illustrated in Figs. 1, 2 and 3 in Plate 1. Fig. 1 is a plan or top view. This shows the various train-pipe connections, the location of the train pipes with respect to the center line of the car and the proper length for the short lengths of pipe connected to the coupler.

Fig. 2 is a side elevation of the coupler, in which the method of attaching the brace and length from the coupler is

shown, also the proper length between the center line of the coupler and the center line of the draw bar.

Fig. 3 is an end elevation of the coupler, and shows the lengths of the center line of the various pipes above the center line of the automatic coupler head.

It will be seen that the use of the automatic coupler in freight service requires but one connection to the coupler head. This simplifies the coupler very much for freight service, and makes its application practically as simple as that of the familiar air hose.

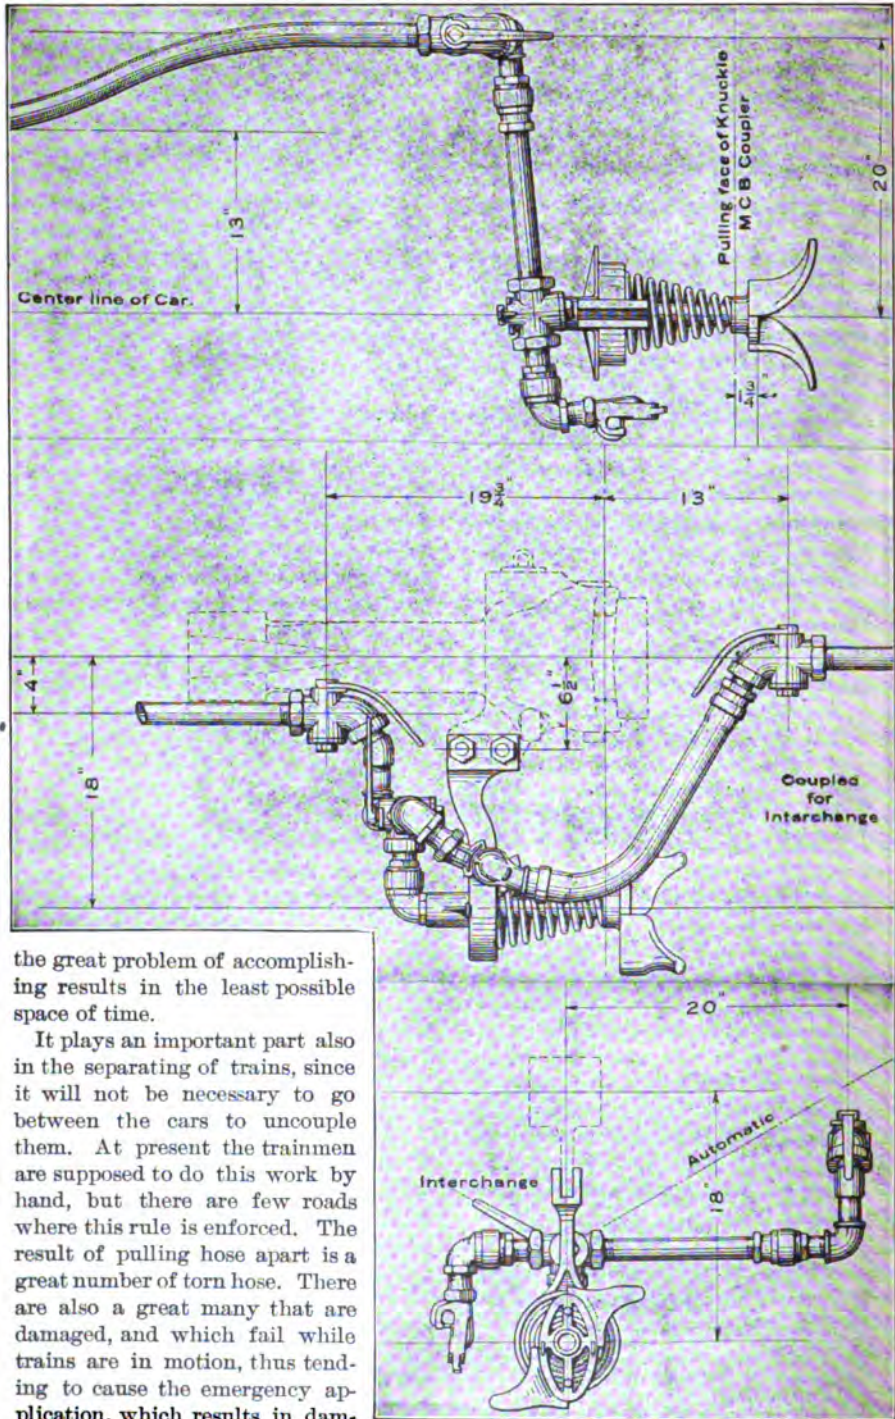

By means of the improved method of piping and the flexible joints which the coupler has, the head can adjust itself to the varying heights of cars and the varying degrees of curvature upon which they may be run. The gaskets are forced together face to face, and are held together, air-tight, by the pressure of the air and by the tension of the conical springs behind them.

The coupler is attached to the draw bar by a brace which holds it in the proper position, while the springs and flexibility in the pipes and couplings allow the necessary play.

In coupling cars together the automatic coupler comes together face to face, and in uncoupling draw away from each other without the amount of rubbing action that ensues on the gasket with the ordinary hose coupling.

By the elimination of the rubber hose, this device is expected to greatly reduce the cost of maintenance. The coupler is also expected to make a great saving in gasket renewals, owing to the way in which the gaskets are brought together and separated.

There seems to be little doubt but that there is an urgent call for a device which will automatically couple the air and steam when the cars are coupled. This is not only a necessity from the standpoint of safety to the train crews, but, as it will do away with the necessity of going between the cars to couple the hose, it will serve to reduce the time necessary in which to get a train ready for the road. All such questions are part of

the great problem of accomplishing results in the least possible space of time.

It plays an important part also in the separating of trains, since it will not be necessary to go between the cars to uncouple them. At present the trainmen are supposed to do this work by hand, but there are few roads where this rule is enforced. The result of pulling hose apart is a great number of torn hose. There are also a great many that are damaged, and which fail while trains are in motion, thus tending to cause the emergency application, which results in dam-

PLATE I.

age to cars and lading, and in many delays, to say nothing of the injuries which the members of the crew in the caboose are likely to sustain.

Frequently when hose are pulled apart

of which is the same as that for the passenger cars. It will be noted, however, that on this coupler a provision has been made so that a car not equipped with an automatic coupler can be con-

a severe strain is placed upon the train pipe, and this results in leakage, which, if not eliminated, puts a great amount of labor on the pump, besides affecting the handling of the train to a large degree. If any change in the equipment can be made that will reduce train-pipe leakage, it will not only increase the safety, but it will also mean a longer life of air pump and better results in general.

Illustrations, Plate 2, Figs. 4, 5 and 6, cover the coupler as applied to freight cars, the operation

PLATE 2.

nected to the present coupler in use today. All that is necessary is to connect the two hose couplings and turn the two-way cock, shown. The movement of this valve turns the passage of the air to the automatic or the hand coupling as desired.

PRESSURE RETAINING DEVICE FOR AIR BRAKES.

In the December number of *Railway Machinery* is given an article on a new type of retaining valve, which is entirely in the hands of the engineer. Attention is called to the necessity for a device of this kind, and it is contended that it is most essential that the control of the train should be entirely in the hands of the engineer, rather than a partnership affair between the train crew and the engineer.

The valve consists of a mechanism placed between the triple valve exhaust port and the train pipe, a piston in it being subjected to train-pipe pressure on one side and the tension of a spring on the other, the spring acting to prevent the piston from being forced over to close the exhaust port as long as the pressure in the train pipe is less than 85 pounds. Upon reaching a grade where it is desired to use the retaining-valve feature, the train-pipe pressure is raised to 85 pounds, at which time the spring back of the piston is compressed and the piston is forced over so as to close the exhaust port. The exhaust port now remains closed until the train-pipe pressure is reduced to 80 pounds, at which time the spring asserts its power and forces the piston over so that the exhaust port will again be opened, when the brakes can be released.

One of the peculiar features contained in many of the air-brake patents is that the mechanism in question will not work satisfactorily with the equipment that is now in use, and so many inventors seem to forget that it is impossible for all roads, even if the device is of sufficient importance to warrant it, to make a complete change of existing equipment. Many devices are also patented that may operate satisfactorily with some given pressure, but will not operate in case the pressure

is increased to 90 pounds, that employed with the High-Pressure Control Apparatus used in grade and fast freight service.

Any device which maintains all of the brake-cylinder pressure when a train is being controlled on a grade will always be objectionable, since the packing leathers which are in first-class condition will hold practically all of the air that is put into the brake cylinder. As a result, the cylinder pressure gradually builds up on these cars, with the final result that these cars do much more than their share of work and the wheels on these cars are very likely to be overheated. This would be especially true in case this device were on but a few cars of the train.

Such a device would also be objectionable if the brakes were applied too hard in descending a grade, in which case they could not be released without reducing the train-pipe pressure to 80 pounds.

A practical railroad man can readily see that it would not be good practice to reduce the train-pipe pressure to 80 pounds and then release all of the air from the brake cylinders on a heavy grade.

One of the essentials in order that an invention may be a success requires that the device will operate with the present equipment when different pressures are employed, and it must be of such a nature that it will operate with cars in interchange service.

REGULATIONS FOR RAILROAD EMPLOYEES.

The following gives an idea of some of the laws in different states in regard to the number of hours of rest that must follow a certain number of working hours, as set forth in a paper presented to the International Railway Congress by G. L. Potter, V. P. of the B. & O.:

One state provides for eight hours' rest after thirteen hours' work, one after fifteen hours' work, three after sixteen hours, one after eighteen, one after twenty and two after twenty-four; one state provides for nine hours' rest after sixteen hours' work, one for ten hours' rest after thirteen hours' work, and one after sixteen hours' work.

These laws in most cases conform with the practice established on railroads.

From this it can be concluded that the railroads practically establish their own regulations with regard to these questions, conforming to general laws regulating labor in all industries.

Fifty per cent of the companies replying to Mr. Potter's questions have so-called agreements with organizations of various classes of employees. In these agreements, which are primarily schedules of wages, conditions of service are enumerated in more or less minute detail. They are generally signed by the general manager of the railway company and by representatives of the employees; at other times by general officers of their unions, and sometimes by the railway officers only. Some railways, having no agreements, issue printed bulletins covering these questions, signed by an operating officer of the railway; and others, while there are no published regulations, are governed by customs which have been crystallized by conferences and precedents, and though unwritten are about as firmly established as the printed and signed agreements. The above-named agreements and tacit understandings primarily define rates of pay, pay for overtime, periods of rest for meals, and usually specify the number of hours of rest allowed after a certain number of hours of work.

In some instances, when men are under monthly pay and their work is continuous and unusually arduous, one or two days a month of vacation is allowed, and in other cases one or two weeks a year. These cases, however, are rare, and the matter is usually equalized by a corresponding adjustment of pay, the general principle governing the rate of pay being that an employee is paid for the actual work done.

MOLASSES FOR LOCOMOTIVE FEED WATER.

A curious accident happened recently on the Baltimore & Ohio Railroad at Freeport, W. Va. A gang of Italians while emptying big tanks of water from a water crane into a tank got a tank of molasses mixed with the water, and the fact was not discovered till half the engines had taken their supply. The re-

porter is authority for the statement that "the heat literally made taffy in the boilers and the engines affected were tied up in the yard until the boilers were scrapped out."

We will not vouch for it, but it is also asserted that the engineers and firemen dealt out an unusual amount of taffy while the molasses lasted.

QUESTIONS AND ANSWERS.

Q.—N. L. G.—I saw an engine the other day that was equipped with the high-speed brake, but it was piped up different than our engines. Instead of having the pump governor pipe from the low-pressure head connect into a tee in the pipe connected to the high-pressure head, it was connected to the top of the reversing cock. The small cock was also left out of the pipe to the low-pressure head. Was this outfit coupled up wrong or is that the way it is done now?

A.—What you saw is a new method of coupling up this device. This is the method that will be recommended in the future and is better for the following reasons:

The one-quarter-inch cock is done away with; this method makes the same plan the same for either the high-pressure control for freight service or the high-speed brake for passenger service, the only difference being that train pipe governors are adjusted differently for the two systems, and high-speed reducing valves are used with the latter and safety valves for the former equipments; so piped with the high-speed system the advantage of a high main reservoir pressure is obtained with which to release when the low train-pipe pressure is cut in. In connection with this method of piping it might be well to remind you of the fact that the low-pressure governor is cut out by turning the cock handle of the reversing cock so as to cut in the high-pressure train pipe feed valve.

Q.—B. R. P.—I would like to know what the JOURNAL thinks about taking the conductor's valve to stop a train with. I had it used on me the other day and it made me wonder if a train could be stopped with this valve, when the engine

was working, and not break the train in two. I was pulling a train of twelve or thirteen cars at the time and we pulled in two just back of the engine.

A.—There is no doubt but that the train can be brought to a standstill by the use of the conductor's valve if handled properly. In case of actual danger, of course, we are not as particular whether we break in two or not, the main point being to stop as soon as possible. If it is desired to stop and the signal fails to reach the engineer a stop can be made by opening the valve, but this should be done cautiously so as to produce a service application of the brake. Especial care should be taken in opening the valve at such times as the speed of the train is slow, as when just starting, or when using considerable steam in grade work.

The service application of the brake properly applied on a passenger train should bring the train to a stop without accident, but it should always be borne in mind by the train crew that the conductor's valve is primarily an emergency valve and should, as a rule, only be used then. Where practical the train should be brought to rest by signaling the engineer.

Q.—R. G.—In my experience I have noticed that I have seen more cases of flat wheels on light cars than I have on heavy ones. This may be imagination, but I don't think it is, and would like you to give me a reason for this fact if it is one, and set me right if I am wrong. It seems as if this was a fact and yet I know that the cars were all braked at practically the same per cent of the weight. Of course I know that there are special cases like short piston travel and stuck brakes, but I don't refer to any of these defects, for these happen to light and heavy cars alike.

A.—There is certainly a reason and a very good one why cars which are light should tend to slide more frequently than those which are heavier. If you follow this matter down to the actual weight on the wheels in the two types of cars you will readily see how the facts bear out your observations.

Suppose you have a car that weighs 80,000 pounds empty and another that weighs 45,000 pounds when empty and that they both are braked at 70 per cent of their light weight. In the first case the total pressure of the shoes against the wheels would be 21,000 pounds and in the second case the total pressure of the shoes against the wheels would be 31,500 pounds. In the first case the weight on each axle would be 7,500 pounds and the braking power per axle would be 5,250 pounds; the difference between the two would be 2,250 pounds which may be considered as a protective weight to keep the wheels from sliding.

In the second case, or that of the heavy car, the weight on each axle would be 11,250 pounds and the braking power on each would be 7,875 pounds; the protecting weight would be 3,475 pounds, or about 50 per cent more protection than is afforded with the lighter car which has the same percentage of braking power. This being true there is no doubt but that there is more likelihood of wheels being slid more frequently on light than on heavy cars if they both have the same percentage of braking power.

Q.—D. S. M.—The other day we had a long train of empties and had some trouble with the wheels sliding on one of the cars. It didn't seem to make any difference if I did only make a light reduction of train-pipe pressure. We looked at the piston travel after we noticed it was sliding and found it like the rest, somewhere around seven or eight inches. I let it out a couple of inches and it kept right on sliding just the same; there didn't seem to be any trouble in getting the triple to go to release position when the others did. We couldn't figure out what was the matter and would like to have an explanation of the queer action of sliding?

A.—The action of the wheels pointed to a high braking power and indicated that pressure was reaching the brake cylinder in some way. In all probability the train-pipe pressure was connected with the brake cylinder on account of leakage by the rubber-seated or emergency valve.

This leakage passed to the brake cylinder and out to the atmosphere when the triple valve was in release position, but the exhaust port being closed after the triple slide valve had moved to service position, the pressure in the train pipe and that in the brake cylinder equalized and this high pressure caused the wheels to slide. The reason for the pressure equalizing at a high pressure was because there was a considerable number of cars coupled up and this meant that there was a large volume in the train pipe compared with that in the brake cylinder; hence, the pressure in the cylinder raised considerably for a very slight reduction of pressure in the train pipe.

Q.—G. B.—Can you tell me what is the general thing to be out of order when the signal doesn't respond right; that is, when it don't sound right when the crew pulls it back in the train?

A.—On the supposition that the crew pulls the cord properly, that is, pulls it for the duration of a second and then waits two or three seconds to get the pipe recharged, the trouble is usually in having the signal pipe overcharged, due to dirt in the reducing valve, or to an improper fit of the stem in the signal valve.

Electricity — Magnetism.

BY ELWOOD A. GRESSINGER, E. E.

When a piece of steel is rubbed with loadstone it becomes magnetized. If the same is suspended by means of thread or upon pivotal centers and then allowed to assume its chosen position, it will be found to point north and south. The position may not be due north and south, but will be very nearly so. Any deviation from the true north will be caused by the earth's magnetism, which effect is of much greater consequence in some localities than in others. When a piece of iron or steel is thus influenced, it is called a magnet. The fact that when it is suspended it will be selective as to position, enables us to say that a magnet has a north pole which will always point toward the terrestrial north pole, and a south pole which will point in a diametrically opposite di-

rection. Upon this principle the mariner's compass was devised.

Cast iron, wrought iron and steel are magnetic substances; but of the three the latter is the only one that will retain magnetism, the others giving up the influence as fast as it is imparted. The softer the metal the more rapidly it will acquire full magnetization and the more rapidly it will demagnetize. Every true magnet has two poles. Its magnetism is the strongest at its poles. This strength diminishes rapidly at first and then gradually, until at the half-way point between the poles there should be no magnetism present. This point is called the neutral point or equator of the magnet. Sometimes it may be found, upon examination, that a magnet has more than two poles. Such are called consequent poles, and arise from different causes.

It has been assumed that magnetism is electricity in rotation. At any rate, it is known that a magnet can be imitated by an electric whirl. A magnet is not magnetized as a whole; but each molecule of it is separately magnetized—the magnet being an aggregation of polarized atoms or molecules. The fact that a magnet is made of such polarized particles is easily proved by breaking a magnet in two. Each part will be found a perfect magnet. This will be true of every portion, no matter how often subdivision may take place. From a previous remark, it is not meant that a permanent steel magnet (as distinguished from an electromagnet) has a current of electricity circulating round and round it, but each molecule of the magnet has its own current circulating round it; and from what has just been said about the subdivision of a magnet, the individuality of atoms or molecules with their own circulating currents explains the properties of the whole. It may be asked how such currents are maintained. The answer is in some respects simple and in some complex. A full discussion of it would carry us beyond the confines of this paper, but owing to the great importance attached to it some reference should be made to the theory.

A current of electricity will flow so long as there is no resistance to its passage, i. e., if there were not resistance its motion would be perpetual. The resistance to the passage of a current stops its flow, and the energy of it is dissipated in heat. In a copper or other metallic wire, a current must pass from one molecule to another, meeting a certain resistance in so doing, which resistance depends upon the nature of the metal. The passage of the current from one atom to another may be the real resistance, while the atoms may be the perfect conductor—may, in fact, conduct electricity infinitely, so to speak. If such were the case there would be no dissipation of energy, and a current once begun would be maintained. As far as is known, atoms are infinitely elastic, and there is every reason to believe they are likewise infinitely conducting. We do not know of any reason why there should be any dissipation of energy when a current circulates within an atom. It is not known how such currents originate, nor is it known how any of the inherent properties of atoms originated. We are unable to explain them, but we know they have motion and possess certain properties. Among these properties is that of an electric whirl of certain strength traversing every atom of a piece of iron or steel. This is a physical property. Magnetizing a piece of steel does not mean that there is a current of electricity excited in each and every atom or molecule. They possessed such a current in the first place, and having such were individually magnetized. What we do when magnetizing a bar of steel is simply to bring about a re-arrangement of the molecules, so they will all face in the same direction. When this is accomplished, the north poles of each atom will point in one and the same direction, while the south poles will point diametrically opposite. In the case of steel such position is maintained, but with soft grades of iron it is not the case. Exhaustive and interesting explanations of magnetism can be found in Vol. II., Chap. 6, of Maxwell.

When a bar magnet is dipped into iron filings, the latter arrange themselves with

their longest axis perpendicular to the point of contact, adhering to one another and forming a great mass, which is supported by the magnet. These will hang onto one another end to end and become interlaced so as to present almost a continuous surface. For the time being, each filing is a magnet; but when taken from the bar, are at once restored to their normal condition. Analogous to the facts laid down in the article on frictional electricity, the particles of iron are first magnetized by induction when a magnet is brought near. If a north pole is brought near a lot of filings, each of the latter becomes magnetized by induction, and end-on present a south pole, which is at once attracted. In other words, two north poles will repel one another, whilst unlike poles attract one another.

A magnet is always strongest at its end, and this strength varies inversely as the square of the distance. If a magnet be brought near a piece of iron of light weight, a point will be reached when the small piece will be drawn to the magnet very quickly. This is because the influence of the magnetism extends beyond the confines of the metal. The space immediately about the magnet, and within which we are able to show a magnetic effect, is called the *field* of the magnet, and the force traversing this field has been termed *lines of force*. It is the summation of the lines of force of all the atoms or molecules. These atoms have no more lines of force than they had at any time previous to magnetization, but they have now become so arranged that their effect is a summation. Previous to magnetization, the lines of force of one atom would neutralize those of its neighbor and there could be no external evidence of magnetization. In a perfect magnet, the north and south poles should have equal strength. A magnet will attract a piece of iron or steel, and conversely both these metals will attract a magnet. This is readily proved by floating a small bar magnet on water, when, if a piece of iron be held near, the magnet can be drawn through the water.

The lines of force of a magnet will pass

through all known substances—nothing will screen them. At the same time they, like a current of electricity, will seek the path of least resistance, but unlike a current, there is no substance through which they will not act. They will pass through a piece of glass as easily as through copper; across a vacuum as readily as through a solid. It has been found, however, that a magnet suspended within a hollow iron sphere is not influenced in any way by the movement of a magnetic substance about the exterior of the sphere. It seems that the sphere absorbs the lines of force from without and they circulate within the shell, forming a closed circuit, as it were. This feature has been taken advantage of in the mariner's compass. Such are now placed in the bottom of a shallow iron cylinder, and when so placed are uninfluenced by any other magnets or metallic substances on board. Without such provision, a mariner's compass would be very liable to show a large error on account of the disturbing influences of magnetic substances always aboard ship, which error would prove of serious consequence.

To illustrate the field and paths which lines of force traverse, I have prepared several cuts which are reproduced herewith. The method is very simple, and will afford interesting and instructive experiments for anyone. Take an ordinary bar magnet, and if none be at hand select a piece of steel of rectangular cross section, taking it to an electric light station where an attendant can magnetize it in a few minutes by placing upon the pole of a dynamo. This done, secure a piece of window glass about a foot square and lay it on top of the magnet. Next, place a piece of white paper upon the glass. Then sprinkle fine iron filings upon the paper just above the magnet, and you will find that the filings will arrange themselves in a certain position, which will correspond to the direction of the lines of force. Tapping the glass gently with a lead pencil will greatly facilitate the arrangement of the filings. It will be seen that they arrange themselves in graceful curves—that these curves diverge and close in

upon one another—at least many of them do, as you can see. Some may not as the eye sees them, but they return and join the others somewhere, though it be at infinity. To make such a record permanent it is only necessary before beginning the experiment to dip one side of the paper in wax, and after the filings have been placed upon the waxed side remove the glass and paper carefully and pass over a flame. The wax will liquefy, and its capillary attraction will cause it to creep over the filings. Upon cooling, the latter will be imbedded in the wax and form a record. To show attraction and repulsion of unlike and like poles, more than one magnet is necessary.

In Fig. 1, a single bar magnet was used. The poles of the magnet are shown, and marked N and S respectively. This magnet was about four inches long and an inch wide by three-sixteenths in thickness. You will see that the lines curve from the one pole to the other. From this, it is deduced the force emerges from one pole, passes through the space around the magnet and enters the metal at the other pole, passing to the first pole through the metal. This field of force extends all around the magnet, as shown for one side only. In the case of a round bar magnet, the field would be uniform about the bar, would be large and bulky, so to speak, at the ends, but would decrease toward the center, where it is seen that no lines enter the bar. Some of the lines run from one pole to another, while others spread out fan-like from each pole. These the eye cannot trace, but they all get from one pole to another just the same, though our means of detection are incompetent. It must not be understood that the paths represented by the filings are the only lines of force present. Such is not the case, for there are more of them than a distribution of iron filings will reveal. At the same time, there is a limit to which we can force magnetic lines through a square inch or square centimeter of section. When we have succeeded in passing all the lines through a metal that it is possible to pass, the same is said to be saturated. It is supposed that saturation is

attained when all atoms have been polarized and arranged in the same direction.

Fig. 2 shows the field produced by placing two bar magnets in line with one another, but about an inch apart, with their unlike poles facing one another. This is

field of a horseshoe form of magnet. The poles are marked N and S respectively, and are the ends of the horseshoe, the shape of the magnet outlined by beginning at pole marked N and running to the left, curving back to S. At the poles, it

FIG. 1.

the condition for attraction, and the arrangement of the filings shows that the lines travel from one pole to another—they pass freely and unopposed. To the left of pole marked N and to the right of that marked S the fields would repeat them-

is noticed, the lines curve gracefully from one to the other, and the heavy straight lines running up and down show that the lines of force pass from one side of the magnet to the other just back of the poles.

A great many additional and instructive

FIG. 2.

selves as in Fig. 1, because there are two magnets here instead of one, and consequently twice as many poles. The filings were not disturbed to show them so as to avoid confusion with what follows.

In Fig. 3, it is endeavored to show the

combinations can be made, such as varying the distance between two magnets with their like and unlike poles adjacent, examining the field of any one pole end-on and of a horseshoe magnet in the same position. Also place a piece of iron across

the poles of a horseshoe magnet and note how the field is disposed.

The next paper will begin with a de-

FIG. 3.

scription of electro-magnets, which will be followed by an explanation of the method of generating currents in dynamos.

Shorter Hours—How to Secure Them.

ATLANTA, GA., Jan. 5, 1905.

EDITOR JOURNAL: The question of shorter hours of service has been agitating labor unions and laboring people generally for some time, and rightly it should. It has at least reached the ranks of the B. of L. E., and I note with interest the different views taken by the Brothers.

There is but one side of the question to me. That is the side of equity and justice to both the railway company and the men, and that side is shorter hours of service, and I mean by shorter hours a reasonable number of hours on duty, leaving a reasonable number of hours in the twenty-four for recreation and rest.

What is the usual number of hours an engineer is now required to serve on slow freight (or local freight) as some term it? You can take the country over and you will find it to be 18 to 20 hours. Is not this excessive? Is an engineer, or any of the crew for that matter, capable of taking proper care of the train, avoiding all others, making his schedule, pulling a heavy tonnage train with a heavy tonnage engine and caring for his engine, when required to work 18 to 20 and sometimes 24 to 30 hours? Then if we are all agreed that these are long and excessive hours, why do we continue them? Why do the railway companies continue to allow the men to do

this and in some cases require them to do it?

Is it possible that the Brothers or the company have never sat down and seriously considered this question, or figured the loss by allowing the power to drag over the road, loss by paying overtime checks to have what?—Nothing!

Are the men doing this long hour "stunt" to beat the company or the company to beat the men? If so, who is beating, and who is getting beat? Brothers, neither is winning. Look at these figures—figures don't lie.

You can only work in Georgia from midnight Sunday to 8 A. M. the next Sunday (thank God for that) or 152 hours. You can only make five 20 hour trips per week—this gives you \$32 straight time and \$10 overtime, a total of \$42; handling for the company 4,000 tons, 800 each trip, on duty 100 hours with 68 hours rest; \$42 divided by 100 equals 42c per hour, salary per month \$168.

Suppose we had 12 hours for a minimum day on freight. You could make seven 12 hour trips, \$44.80, no overtime, handle 5,600 tons, on duty 84 hours, 84 hours rest, \$44.80 divided by 84 equals over 53c per hour, salary per month \$179.20. Both these calculations made on a basis of 10 hours rest at the end of each trip. Suppose we cut tonnage to 700 tons, to allow engineers to make good time and not drag, the 12 hour man will then handle 4,900, a gain of 900 tons per week over the long hour system.

This regular engine plan also. Pooling the engine shows up worse than this against the men and the company figures on it.

You will note the company gets 4,000 tons handled in the long hour case in a week, which costs \$42, as against 5,600 at a cost of \$44.80—or the difference—1,600 tons for \$2.80, not counting coal consumed on long hour runs per ton handled. The company gains in short hours also by having a man with a bright, clear brain—a man who has had time also to read and post himself on economy in railway service, air brakes, steam power and its uses, economy in coal consumption, etc., and felt like doing so, and is a bright, intelligent man, worth every dollar they pay him. Right here I want to ask you who is going to pay the long hour man or his family for the 10 or 15 years cut off the latter end of his life by these same long hours?

Long hours are a menace to every moral and physical law; a menace to the traveling public, the health and wealth of the men, good morals, tempting the men to strong drink, tobacco, etc., and finally wrecking the man—a terrible wreck—forgot the other train—killing several others—who will pay them?

Again, it is not a question of dollars only. You owe your family something dollars won't pay. You owe society something, yourself something, your country something, your posterity something, the company a long and useful life and faithful employee.

The social privileges granted to us by our Maker and our constitution are ours for the asking. Let's go to the company with these figures and these facts, and with kindly feelings and mutual agreement try the shorter day. Yours fraternally,

WALTER SIMMONS.

Troubles from Leaky Flues.

LOS ANGELES, CAL., Dec. 29, 1904.

EDITOR JOURNAL: Enclosed please find a poem from the pen of Bro. S. Wood which was sent to Bro. Charles Wright, both members of Orange Grove Div., 5, B. of L. E., and running on the Los Angeles Division of the S. P. R. R. The poem shows that it was written in a spirit of appreciation and brotherly feeling toward a Brother engineer for his prompt assistance, also has a humorous side to it, and appears to me to be worthy of a place in the JOURNAL.

In telling the author of my intention of sending a copy for publication, I was instructed to make it plain that it was not the intention to reflect in the least either on the Vanderbilt fire box or the engines in general on this division, as he believes they are as good as any class, and are kept in as good condition as anywhere in the country. I am of the same opinion, but of course, occasionally one will cause delay or failure on account of flues leaking.

In the case referred to by Brother Wood he was on a stock train from Indio to Los Angeles (129 miles), and when about 15 miles from Los Angeles the engine began failing for steam on account of flues leaking; they were trying to put sawdust in boiler through pipe connected with oil cup hole in injector, the other end of pipe in bucket of water mixed with sawdust, but owing to chips in sawdust were unable to get much in boiler. As they stopped to couple on helper engine, Brother Wright, engineer, saw at a glance that a package of "Quaker Oats" which he had in seat box for similar cases would be just the thing. The oats were

soon inside the boiler; the rest is told by the poem sent in company with a package of oats to Engineer Wright.

In explanation of the "Wrinkle Belly" part of it I will say that it is the name given the Vanderbilt fire box by the railroad boys on account of the corrugations (wrinkles) in the continuous circular inside sheet.

Brother Wood was with the Cleveland & Pittsburg Division of the Pennsylvania Co. for sixteen years prior to his coming here two years ago, also ran on the Chicago Division of the B. & O. temporarily during the years 1900 and 1901, and was a member of Div. 170, at Wellsville, O. No doubt many of the Brothers will remember him, to all of whom he sends his best wishes, as well as to all good Brothers, although they may never have given him any oats. I feel confident they would, should he ever be in need of any.

Yours fraternally,
O. L. SCOVILLE.

When the "Wrinkle Belly" was dying,

And we were on the spot,
Because the flues were leaking,
We could not get her hot;
We were trying to console her
With a feed of old sawdust,
And at the same time telling her,
Los Angeles or bust.

We kept the blower working,
And fed the flames more oil,
But still the flues kept leaking,
And the water would not boil,
And now there crept a feeling
Of racking of the brain,
For we must surely answer for
Delay to that stock train.

Now, while we were thus pondering
Over the next best thing to do,
Along comes a Brother who
We know has been there too;
Says he, "You have my sympathy,
And we have rode the same goats,
But to save the life of your engine,
Just feed her this 'Quaker Oats.'"

This we did, and very shortly,
We were happy on the way,
Arriving in Los Angeles with
Only fifteen minutes' delay.
In talking to my fireman,
It was finally agreed,
That it's a pretty good horse
That will work with just one feed.

Accept this package, Charley,
For I know you are all Wright,
And ready to assist a Brother
In the day time or the night.
Now, should you need assistance and
I could do you any good,
You will always find a helping hand,
Say nothing, but—S. A. W. Wood.

Eccentric Strap Broken.

HAVELOCK, ONT., Jan. 8, 1905.

EDITOR JOURNAL: As I have read quite a number of different ways to uncouple an engine when becoming disabled on the road through eccentric straps or link block or valve rod breaking, and as I had this experience myself not very long ago, will explain the way in which I brought engine forty miles with a right forward gear eccentric strap and pulley broken. Clamped right main valve with front port open a little, took out front cylinder cock on disabled side and left main rod up. This will not allow engine to get on dead center. This is not according to our instruction, but as engines are becoming so large it is almost impossible to take down main rod without the use of shop tools, it is the shortest way and quickest, and impossible to do any harm, as oil can be fed to cylinder and no danger of block in crosshead working out and breaking cylinder head, as when main rod is taken down.

JOHN TOMAN, Div. 658.

We Can All Learn.

PORTSMOUTH, O., Jan. 2, 1905.

EDITOR JOURNAL: It is sure that there is nothing better than the Technical department of our JOURNAL for the education of the members of our Brotherhood, with the new improvements that are coming into service every day, the great improvements made in railroading and in modern high speed engines and in the improved devices that are used for controlling heavy freight trains, and heavy fast passenger train service, has call for men of skill and ability. The time is fast coming when if you cannot make the time, and also keep a watch on your engine and prevent breakdowns, you will have to get down and give your run up to some one that has qualified himself for the service. To do this a technical education is necessary, and to men who will make the effort to better themselves by obtaining this education promotion is sure. If all the members of our Brotherhood would take an interest in the JOURNAL we could have as fine an educational treatise on the air brake and the management of locomotives as could be had, and by so doing we would not only educate ourselves but would help our JOURNAL, for thousands of firemen and others would subscribe for it to learn, thereby helping it. It is self-evident that success is not a matter of "mere luck." True success is only attained by a definite, earnest striving along fixed lines; the only way to get ahead is to study and try, and success is bound to follow. The quickest and only way to gain

this success is to educate yourself so as to be qualified to do your work with skill and economy, and get the necessary power out of your engine with the least expenditure of fuel, oil and repairs. Let's all work for the JOURNAL and to educate ourselves.

E. A. LINDSEY, Div. 584.

Overloaded Engines.

NEW ALBANY, IND., Dec. 13, 1904.

EDITOR JOURNAL: Being an engineer and belonging to Mr. F. W. Quimby's regiment of the C. I. & L. Ry., allow me to emphasize his statement before the annual meeting of the Central Association of Railroad Officers regarding a sufficient reduction of overburdened locomotives: "That it is an evident fact that a moderate reduction of tonnage would more nearly enable train movements to harmonize with train dispatchers' conclusions."

It is absolutely impossible under the present tonnage rating of engines for a train dispatcher to arrange meeting and passing points of trains without causing delays, or the source of overtime, because it is always a doubt if a train will ascend a grade without doubling.

This same doubt affects freight trains ahead, as well as those opposing passenger trains, causing them to lie back to avoid delaying passenger trains by doubling the grades.

And no doubt the delay caused by the freight lying back will cause the train dispatcher to fail to make a meet point with some other train, and the consequence is, when those trains reach their terminals they are all entitled to overtime and overtaxed engines the result.

No train man desires to make overtime, and if a train crew leaves a terminal with the expectation of making four or five hours overtime, they will naturally be inclined to lose interest in any special movements that would promote dispatch in getting over the road, and it seems to me that the standing demand at terminals for power, by a sufficient reduction of tonnage to insure engines handling their trains, would not only expedite business, but extend the life of an engine, and effect a financial gain.

Fraternally yours,
JAS. CONNER, Div. 361.

What Caused the Explosion?

LOUISVILLE, KY., Dec. 19, 1904.

EDITOR JOURNAL: We have a peculiar case here on which we should like to have your opinion. There have been several theories advanced here, but there are points in the case that seem to explode them. Engine 945 on passenger train was standing at station, when an explosion

occurred in the fire box, blowing almost all the fire out through the grates and fire door. Engine had 175 pounds of steam at time of explosion and when smoke and steam cleared away in cab engine had only 50 pounds. There was no damage done to engine and another fire was built and engine proceeded on trip and has been in service ever since. The last fire was put in about one and a half miles from where explosion occurred, blower was working enough to take up smoke, fire door closed, fire was rather heavy but not covered with green coal. Engine has a self-cleaning front end and was not choked with cinders. Engine not equipped with arch pipes, flues were not leaking, result of the explosion was blower broken off in front end, fire blown out of fire box, fire door blown open. The force of the explosion was down and to the left side of engine. Now the question is, what caused the explosion, and what caused this loss of 125 pounds steam pressure when there was no leakage in boiler or fire box and engine did not lose any water, and time was not over three minutes? Yours truly, H. E. SMITH.

Run Extra from Clare to Portsmouth.

PORTSMOUTH, O., Jan. 6, 1905.

EDITOR JOURNAL: Please allow me space to discuss my previous train order, which appeared in the November number. The train order had three separate movements in it, one to run extra from Clare to East Portsmouth, and one to meet extra 354 west at Cohoon, and one to take the siding at Cohoon. Now the second order did not effect but one movement, that was the meet at Cohoon, the second order only gave extra 352 rights to go to Batavia, but must take the siding when arriving at Batavia. Standard rules says that an order containing more than one movement either movement can be annulled or superseded without interfering with the other movement. The second order to extra 352 only superseded the movement of the first order to meet extra 354 west at Cohoon, and the other two movements hold good until fulfilled, superseded or annulled, which has not been done. Brother Anderson says that the word instead supersedes the whole of the first order, then I will have no running orders to get out of Cohoon by his opinion. Brother Gatchings is wrong, for extra 352 has been otherwise directed to take the siding at Batavia by the first order. Brother Preston and Brother Morris, you must come to my aid on this subject as you take sides with me.

Yours fraternally,
E. A. LINDSEY.

Replies to Bros. Hoyt and Lance—Train Rights.

AURORA, ILL., Jan. 8, 1905.

EDITOR JOURNAL: In reply to Bro. C. L. Hoyt, of Div. 468, will say, no doubt it was the intention of the train dispatcher to have No. 32 take siding at B; if he expected No. 32 to hold main track, then the order should read as follows:

No. 32 will take siding and meet first No. 31 at C, No. 32 will meet second No. 31 at B.

Replying to Bro. Geo. W. Lance. He had a right to proceed before 8:30 P. M. without an order. The order he received gave Work Extra 41 right over Extra 898 until 8:30 P. M. between the points named in the order. Work Extra No. 41 arriving at B at 2:55 and not returning between B and C, gave Extra No. 898 the right to proceed without an order.

I do not agree with Brother Hoyt in his reply to Brother Blasdel in regard to waiting at Teton for Extra 517 to arrive. Extras running in opposite directions have equal rights and the train dispatcher must make the meeting points. The order received at Great Falls gave Extra 576 absolute right over Extra 517 to Teton. On arrival at Teton of Extra 576 the rights became equal and it was the duty of the dispatcher to make the meeting point.

JAMES LENAHAN, Div. 82.

SALT LAKE CITY, UTAH, Jan. 10, 1905.

EDITOR JOURNAL: In reply to Brother Hoyt, Div. 468, in the January JOURNAL. 32 being a superior train to 31, that is, direction, Brother Hoyt will hold main line at B.

Fraternally yours,

CHAS. A. STANDROD, Div. 222.

Could Extra No. 17 Run from D to C?

NORFOLK, VA., Jan. 9, 1905.

EDITOR JOURNAL: Will you please give ruling on the following order under Standard Rules:

A, B, C and D represent stations. No. 9 due to leave A at 12:30 P. M., due to leave B at 12:50 P. M., due to leave C at 1:16 P. M. Extra 17 going opposite directions gets order at G like this:

No. 9 will wait at B until 1:20 P. M. for Extra 17. Extra 17 is doing local work and is unable to get away from D before 1:20 P. M. Distance between B and C is 7 miles. Distance between D and C is 1½ miles.

I claim at 1:20 P. M. order Extra 17 received at G has been executed, therefore Extra 17 has no right to proceed to C to meet No. 9. However, Extra 17 could run from D to C and clear No. 9 before No. 9 can run from B to C.

D. E. PURSELL, Div. 466.

● The Journal ●

Published monthly, 307 Society for Savings Bldg.
CLEVELAND, OHIO.

CHARLES H. SALMONS, - Editor and Manager.

Address all matter for publication—Correspondence, Technical and Link Departments, changes in Division Addresses, Special Notices, and address of Outside Subscribers to C. H. SALMONS, S. G. E., Editor JOURNAL.

No reading space will be sold for advertising purposes under any circumstances.

All money matters should be addressed to W. B. PRENTER, F. G. E., 307 Society for Savings Bldg. Send New York or Chicago draft, Express money order or Postal order, but never send personal check. Also send the name and address of all members Initiated, Reinstated, Transferred, Expelled, Suspended, Withdrawn and Deaths to the F. G. E., as per Section 16 of the Statutes.

Changes in Address of the JOURNAL and orders for Division supplies should be addressed to D. EVERETT, T. G. E., 307 Society for Savings Bldg.

Advertising Department matter and all correspondence relating thereto should be addressed to W. N. GATES, 409 Garfield Bldg., Cleveland, O.

FEBRUARY, 1905.

The Scientific Fad in Eye Tests.

At a conference of chairmen of General Committees of Adjustment held in Cleveland in January, this very important subject of eye test was before them in a new phase, because a number of first-class engineers had been displaced through eye tests formulated by oculists, who know little or nothing of the practical side of railroad work, and among these men thrown out of work because their eyes would not stand up to the scientific test in an office, were men who had never had any difficulty in telling colors at any distance or detecting and acting upon any signal that any other man would have seen. Because an engineer or any other in train service cannot read letters 35-100 of an inch in height at a distance of 20 feet is no evidence that his sight is impaired to an extent that he cannot see all that any other is called to see in practice, or that he is dangerous to the service. If he can tell colors and see all signals at the required distance in practice, there is no reason why he should not be kept in service, or if his eyes are defective and can be brought up to the *practically* normal condition, he should be kept in service so long as that condition can be maintained. The objection that the glasses might get broken may be offset by two pairs, and the claim that they might get broken is no better than to say that one might get a cinder in his eye, for in that case the other

eye will water until he can see out of neither. Or the claim that the glass will fog, is more than offset by the fact that in cold weather the eyes will water and sight be impaired.

Experience is too valuable to be thrown away before there is any danger from defective sight, as demonstrated by a common sense test.

The Brotherhood does not desire the retention of men in service whose eyes have failed until they cannot be corrected to a reasonable degree by glasses; that would involve the lives of other members, and surely the risk is now so extreme that no class could desire a change for the better more than the engineers themselves.

Reports of deaths and their causes show that of the 530 deaths among the members of the B. of L. E. in 1904, 180 were killed and 26 lost a leg or an arm, practically 40% of the deaths caused by accidents, and on these deaths by accident the Brotherhood paid an insurance amounting to \$399,250. Were these accidents all caused by the older men with defective eyesight? Let us see. The average age of the 206 killed or maimed was forty-two and one-half years, and every one knows that he who is promoted to an engineer before 30 years of age is in great luck, and Dr. H. B. Young, examiner for the Burlington Road, said in the *March Optical Journal*, that on the old established roads the average man does not get to be an engineer much under 40, and the average of those who lost their lives in wrecks, as we have shown, was but forty-two and one-half years. Investigating farther, I found that men under 50 years of age were in 70% of the wrecks and those of 50 and over were in but 30%; so it is evident that the older men are not creating any extra hazard for the public, the company, or their fellow-workers; in fact, the evidence is quite the contrary, and shows that experience and the staid qualities of men of 50 and up deserve more consideration than they will get under the scientific rules for examination of eyes.

There is no walk in life where experience counts for more than in the train service of our railroads with its hundreds of complications, that require years to become acquainted with the varied complications to be met with, and the Brotherhood desires that these men of long experience and excellent records be retained in service for the safety of the public, the property of the company, and the co-worker in the service, so long as they are physically able to perform the duties and their eyes can be brought up to a *practical* normal condition by the use of glasses, and feel that it is unjust to these men who have served so faithfully, and well, to do otherwise, so long as keeping them in

service creates no extra risk for any factor, the public or the company.

Let there be practical test in the field of the work they have to perform. If an engineer's eyes become in question go out in a clear space, give the engineer whose eyes are in question all the flags used in practice, take another set and go a distance away, then show him a flag, he to answer with a like color, and move away until the limit of his sight has been reached where he can readily tell the colors and all signals given him. If his sight proves not up to the practical standard try him with glasses, and if with them his sight becomes normal, keep him in service and retain his valuable experience which conduces so much to safety.

The contention for classified pay by railway officials has always been made on the ground that there was an extra risk because of inexperience, and that the difference in wage was necessary to meet the extra expense of the new engineer, but there is another phase of this question that should not be overlooked by either the companies or the public. What of the future if these examinations run on the fad lines, and men are crowded out of the service at an age when in all other walks of life they are at their best? Will the intelligent engineer who has rendered excellent service allow his sons to learn a business which has in it from five to eight years of extra hard as well as hazardous work to become an engineer, with a liability of being set aside before he is fifty years of age? Will the educated, intelligent young man enter such a service if he is to be set aside at the first indication of physical defect, as soon as he cannot hear a watch tick at a given distance or his eyes will not stand up to at least $\frac{3}{8}$ in a scientific test without glasses, and he is prohibited from their use to correct the sight and bring it to a practical normal? Is it presumed that these scientific restrictions will bring into the service, and place the locomotive in charge of men of greater intelligence than those now in the service? The hazard and hardships and the liability of discharge for some mistake is too great to appeal to men of large intelligence, if beyond this, they are to be set aside on the slightest pretext, and if reasonable conditions of service are not fixed, of course on the safe side from a practical standpoint, the personnel in train service must deteriorate rather than improve.

Powers of the Interstate Commerce Commission.

Strenuous efforts are being made in Washington to amend the Interstate Commerce law, and to give to the Commission

power to regulate rates on the great railroad systems which run through and into every section of our country, varying in cost of construction, maintenance and transportation, until it becomes one of the greatest and most complex problems in finance with which men are called upon to deal, and which has called into it many of the best managers and financiers who have been unable to produce in the aggregate more than three per cent on the investment of thousands of stockholders, many of whom are in moderate circumstances, and to give such unusual power into the hands of the Commission seems to us not only a dangerous innovation, but in direct opposition to the proposed cure of restricted competition, when they propose to place in the hands of a single Commission full power to regulate rates, which to us would be an astonishing stride in the direction of centralized power and the restriction of competition. Such power vested in the Commission suggests pertinent questions in which both the general public and the great factor of employees must be much interested. If the Commission is given power to make rates, with competition eliminated, what incentive will be left the companies to cater to the public by betterments? If betterments are demanded, with the rate-making out of the companies' hands, how will they estimate future earnings to meet such requirements?

Those who are clamoring for more power for the Commission aver that they do not propose to use their power only to correct unreasonable rates! But having the power, with one of the Commission reported as saying that the country is paying \$40,000,000 more to the railroads than it should; are railroads likely to spend their income on betterments with the future in doubt? If the income of the railroads is reduced \$40,000,000 annually, what of the great factor of employees whose wages are none too good now?

There have been tons of ink used in presenting the horrors of wrecks and the destruction of life on railroads, and demands are made for no grade crossings, gates and watchmen at all grade crossings, the block system applied everywhere, double track everywhere, steel baggage, express, mail and passenger cars. These demands are easily made, for the other fellow is supposed to pay the cost, but with the income part of the business fixed by the Interstate Commerce Commission, are these improvements likely to be made? Hardly. It would seem time enough to make these directly opposite propositions of decreased earnings and increased expenses when this Socialistic proposition is carried to the point of government ownership; when the public of right may

do what it pleases with the rates and incomes of railroads. In this struggle for more power for the Commission great stress is laid upon the President's message, but we do not find any sanction in it for such power as is asked. In fact, the President says: "I am of the opinion that at present it would be undesirable, if it were not impractical, to clothe the Commission with general authority to fix railroad rates," but suggests that they be empowered to fix rates where they have been challenged as unreasonable, and the rate so fixed to be subject to court review. The President places the greatest stress upon the rebate practice, and asks that the Commission be empowered to carry out the law already on the statutes with power added to inflict penalty. This we do not think railroad companies themselves will object to. No one acquainted with the personnel of the Commission but will commend them as men of great honor and intelligence, but it is consistent to question their possession of sufficient knowledge of the intricate problem of transportation to justify the Nation in putting into their hands the control of the earning power of the greatest commercial establishment on the continent.

On page 168 will be found an address delivered by President Tuttle, of the Boston & Maine Ry., at the anniversary of Div. 61. Every member of the order should read it, as everyone else should, who makes demands on these companies and, at the same time demands power to suppress the possibility of their meeting the demands made. He shows that 47-100 of one mill per ton a mile amounted to \$800,000 on that road alone. Freight rates are about half as much in this country as they are in Europe, and with rebates eliminated we believe the people ought to be well enough satisfied, to allow the railroads sufficient earnings for betterments to the service in the interest of safety to the public, and to the employees, and to not only maintain the present wage scale, but to increase where equity demands it. When freight rates are figured in fractions of one-hundredths of a mill per ton a mile, and less than one mill per ton would reduce the income of the Boston & Maine \$1,500,000, and with it bring the best possible excuse for the reduction of wages, every railroad employee should oppose such a dangerous innovation.

Correspondence Department.

This number of the JOURNAL shows conclusively that our members can make an interesting department of it if they try. There is not only a large number of contributions, but they will be found very

interesting, and are exceedingly commendable in both quantity and quality. It is needless to say that we are very much pleased with this interest and its results and we hope for a continuance of these favors.

The Technical Department is also getting fair attention, and we hope for still greater interest in it. No one need be afraid to write because of any feeling that his expressions will be grammatically defective. We will be glad to edit all copy to the best of our ability. Send in your ideas and oblige
THE EDITOR.

LINKS.

THE premium list and address card will be found at the end of Division Addresses. We hope many will try for these splendid premiums, and learn how easy it is to get one if they do try. They are the greatest value ever offered as a premium.

The JOURNAL address card is for the use of any one whose JOURNAL does not reach him. Don't wait for any one else to correct your address; do it yourself on this blank.

Every member who has use for the Division Addresses should put this number in a handy place, and keep it there for reference until the August issue, when the addresses will again be inserted. If this number is properly cared for there will be little cause for complaint because the addresses are left out of the other ten numbers during the year, and the space used for reading matter.

B. of L. E. Div. 598 and G. I. A. Div. 303, Richmond, Ind., will give their second annual ball on Wednesday evening, Feb. 23, 1905. Their first ball, given in 1904, was an unqualified success, and their preparations this year are on a much larger scale, and we predict that those who can attend and do not will have something to regret.

The Grand Officers have been honored with an invitation, but pressure of work here foredooms our desire to share in the festivities on that occasion, and we can only thank the Brothers for remembering us and wish them the greatest possible success on February 22nd.

WE have been favored with a copy of the proceedings of the Traveling Engineers' Association, held at Chicago, in September, 1904. It contains very interesting discussions of matters pertaining to train service. Some of the especially interesting subjects under discussion were: "The Future Engineer," "Progressive Examination of Firemen and

New Men for Employment," "The Water Tube," "Valve Motion, and its Relation to Economy," "The High Speed Brake," "Headlights," "Four Cylinder Compound," etc. Paper, 75 cts.; cloth, \$1.00.

Address, W. O. Thompson, Sec. T. E. Association, Oswego, N. Y.

BRO. WALTER C. GARAGHTY, of Div. 353, has been appointed temporary Air Brake Instructor on the Baltimore & Ohio System. The management has made no mistake in selecting a man like Brother Garaghty who is in every way qualified and fitted to fill the position to the satisfaction of the company and the men, as his advice has often been sought on technical air brake problems, and while we, the members of George W. Childs Div., 353, extend to the management our appreciation for the kindness in promoting one of our number, we also extend our congratulations and unanimous support to Brother Garaghty.

GEORGE W. COYLE, F. A. E.

OUR esteemed Brother, B. F. Crolley, member of Div. 411, has been called from our ranks to join the official list as Assistant Road Foreman of Engines, with headquarters at Akron Junction.

The B. & O. certainly picked out a good man for this position, and we who know him so well are pleased with his good fortune.

G. H. G., Div. 411.

BRO. JOHN Q. MOWRY, member of Div. 11, running an engine on the Vincennes Division of the Pennsylvania Lines, has been promoted to the position of Road Foreman of Engines, which meets with the approval of Brothers on this system. The hearty congratulations of Div. 11 are extended to Brother Mowry.

WM. M. BLYTHE, F. A. E. Div. 11.

BRO. CHAS. W. HYDE, one of our members, has been appointed Traveling Engineer of the St. Elmo and the St. Louis and Gulf Divisions of the Frisco System. For several years Brother Hyde has filled the position of General Foreman of the E. & T. H. Terminal at Terre Haute, Ind., but upon the consolidation of the E. & T. H. and the C. & E. J. Terminals at that point he was appointed to his present position.

The members of Div. 246 feel very proud of Brother Hyde's appointment, as he is one of our most faithful members and the Brothers under his jurisdiction will find him a true Brotherhood man. The members of our Division unite in wishing him success in his new position.

ROB'T SKINNER, F. A. E. Div. 246.

SUNDAY, January 14th, was another "red letter day" in the history of Div. 61, of Boston, Mass., it being their fortieth anniversary, and was fittingly observed in the form of a reception, entertainment and banquet in Odd Fellows' Hall, Charlestown District.

The reception was from 12 M. to 1 P. M., and an excellent entertainment followed, consisting of mandolin and piano duet by Misses Boody and Morrill; solo, Mr. Heald; duet, Misses Baker and Wilcox; reading, Miss Pierie; solo, Miss Goodrich; piano, Mrs. Moore; solo, Mrs. Abbott; reading, Mrs. Douglas; solo, Mrs. Webster; all of which were much enjoyed by all present and liberally enjoyed and all recalled.

Chief Abbott, in well chosen remarks, then introduced President Tuttle of the Boston & Maine R. R., who, after prefacing his address by complimentary remarks for the Brotherhood, read a very able, and comprehensive and convincing argument against the proposed legislative action by Congress, giving into the hands of the Interstate Commerce Commission almost absolute authority in the making of rates for freight on all or any of the railroads of the country.

Mr. Tuttle said:

The subject to which I shall ask your careful and temperate attention is one which is now being widely discussed in the highest official circles, by the newspaper press, and by eminent leaders of thought in political, commercial and economic investigation; a subject of vital interest not only to the customers of railroads, and to every investor in railroad securities, but of paramount importance to the million persons, more or less, who are engaged in railroad work, and who derive the means of their livelihood therefrom. I refer to the specific proposal that railroad rates shall be arbitrarily fixed under congressional supervision and authority. For a better understanding of the sources from which Congress derives its power over this matter, a short historical review will be useful.

From the date of the treaty of peace, September 3, 1783, which separated the thirteen American colonies from the British Empire, to the ratification of the Federal Constitution and the adoption of our present form of national government in 1788, the thirteen states acknowledged only quasi-allegiance to their general government under a loosely constructed agreement called "Articles of Confederation and Perpetual Union." They continued to be in reality thirteen separate commonwealths, and the bonds of their union were so frail and shadowy that there was imminent and constant danger of disruption, and a state of discord and disaffection little short of anarchy prevailed throughout the land. The most prominent cause for these distractions and disagreements between the states was the lack of definite and uniform laws giving freedom of commercial intercourse between the citizens thereof. Some of the states discriminated in port and import charges upon passing goods, as between their own and citizens of adjoining states, and others established retaliatory license charges, and the conditions finally became so chaotic and unbearable that in

1786 the state of Virginia suggested by circular letter the assembling of commissioners from all the states "to take into consideration the trade and commerce of the United States, etc." Under this call commissioners from a few states met at Annapolis, Md., September 11, 1786, but their number was too few to make their proceedings authoritative, and the meeting broke up without attempting anything. General dissatisfaction had, however, become so acute, not only as to interstate commercial relations, but also as to many other governmental functions, that in February, 1787, Congress called for a convention of delegates from all the states to assemble at Philadelphia in May of that year, "for the sole and express purpose of revising the Articles of Confederation." This finally resulted in an abandonment of the "Articles of Confederation," and the making and adoption in their stead, in 1788, of the Constitution of the United States, which, with its subsequent amendments, is now the foundation of our National Government.

Although the basic reason for all this action seems to have been the necessity for adjusting interstate and foreign trade relations, the Constitutional Convention disposed of this important subject in the fewest possible words. In defining the various duties of Congress it gave to it, among other things, the power "to regulate commerce with foreign nations, and among the several states, and with the Indian Tribes." It also created the Supreme Court, and imposed upon it the duty of interpreting the constitutional power of Congress whenever differences of opinion should arise concerning it. I do not think it has been, or can be, shown that the makers of the constitution ever had any other thing in mind in connection with this delegation to Congress of the power to regulate interstate commercial relations than a well-defined intent to forever prevent the erection, by any state, of any customs, tariffs, or other barriers that should be an obstruction to the freest currents of commerce; and there seems to be no evidence that the idea of regulating the market prices, or the methods, of transporting either freight or passengers across state lines, or to foreign countries, was ever, in the remotest way, entertained by any of them. The Supreme Court has since then so broadened, by interpretation, this meagerly stated power of Congress, and so enlarged its authority over interstate intercourse that it can now exercise, with apparently lawful authority, control over its minutest detail. We can, therefore, only accept the situation as it now exists, but each one may, for himself, investigate and form his own opinion as to the extent to which this enormous, and perhaps unprecedented, power ought to be exercised, and in what way individual and general interests are likely to be thereby benefitted or put in jeopardy.

For almost a century—just ninety-nine years, to be exact,—Congress allowed its power to regulate interstate commerce, whether carried on by private enterprise, or by public service corporations, to lie dormant. In the meantime, the steamboat and the steam locomotive had been perfected, and under state charters and authority, and without even a hint from Congress of its interest in, or most remote objection thereto, more than one hundred and forty-seven thousand miles of steam railroad had been constructed and put in operation in the United States, at a cost of upward of nine billions of dollars, furnished by private investors and without government aid, except that in isolated instances, and in a limited way, for the furtherance of the public interest in open-

ing up governmental areas of unoccupied lands for settlement, or to tie with strong and permanent bonds of unity the almost inaccessible Pacific Coast states to their older and more fully developed sister states of the East, the National Government had donated portions of its public lands and had loaned its credit in aid of some railway extension and development, in the then remote West, that would otherwise have been found difficult, if not impossible, of accomplishment.

Then, in 1887, after all this investment of private capital had been made under conditions that there was no reason to suppose to be other than permanent, and after ninety-nine years of non-interference, Congress, through the Interstate Commerce Law, announced its power and determination to thereafter control and regulate all public service corporations that were then engaged, or might thereafter engage, in the business of interstate and, within certain limitations, international commerce.

This special and unprecedented national legislation, which was the first attempt by Congress to substitute, in this connection, unscientific and inelastic statute law for the natural laws of supply and demand, and to abridge the freedom of private contract rights, has now been in force for about eighteen years; and it is perhaps not too much to say of it, that it has in its career thus far occupied relatively more of the attention of Congress, of the law courts, of those engaged in the business of public transportation, and of the newspaper press and the general public, and has caused more hypocrisy and lying, with less production of intended results, than has any other piece of national legislation that has had its birth since the foundation of our government. It is a law that attempts to place, not only the earnings, but the absolute capital privately subscribed and owned and which derives its value wholly from expected earnings, in the hands of a politically selected commission which is endowed not only with the judicial function of passing upon cases that may be submitted by complainants in the usual way, but possesses also a further, and extrajudicial, power of initiating investigations of cases that it believes may be violations of the law, of hearing evidence thereon collected by its own agents upon its own instigation, and then of passing in judgment upon the facts as thus in part ascertained.

In framing the Interstate Commerce Law it was the purpose of Congress to produce, among others, the following definite results: First, the continuance of competition between the railways; second, the prevention of pooling and other combinations that should reduce railway competition, or unduly increase transportation rates; third, to prevent the railways from discriminating between their customers by giving rebates, secret rates or relatively unlike facilities for like or similar service; fourth, to prevent higher rates being charged for short hauls than for long hauls; fifth, to cause uniform, stable and equal rates to be charged for like or similar service.

Later, Congress enacted the so-called "Sherman Anti-Trust Law," about which two interesting facts may be stated: One, that although named after Senator Sherman he had little or nothing to do with the details of its making and took no special part in its enactment by Congress; and the other that when it was under discussion by Congress it was not intended or understood to have any reference to, or control over, transportation companies. A third interesting fact about this law is that its first important use was for

breaking up the useful and beneficial traffic associations which had been formed by the railways to produce the very uniformity and stability in rates that the Interstate Commerce Law was in part framed to accomplish. It is a fourth interesting fact in regard to this so-called Sherman Anti-Trust Law that in its interpretation the Supreme Court has laid down the extraordinary principle that under it all combinations in restraint of trade are unlawful even though they may be in themselves beneficial to many interests and harmful to none.

Now let us see to what extent the Interstate Commerce Law and its complement, the Sherman Anti-Trust Law, have produced their intended results. The railroads having in many instances extended their lines in anticipation and advance of the public demand therefor, and being denied the privilege of arranging an equitable distribution of the existent competitive traffic at remunerative and reasonable rates, at once entered upon a fierce and ruinous competition, which made their rates and service unstable, irregular and discriminatory and, as one of the results of the business panic of 1893, many of the larger as well as smaller systems were forced to take refuge from the claims of their creditors by passing into the hands of receivers; whence most of them have since emerged, and under the processes of natural law, have become component parts of greatly enlarged, consolidated and unified combinations, or systems, under whose combined, but lawful, management the possibility of general competition such as it was one of the purposes of the Interstate Commerce Law to uphold and maintain, has hopelessly and forever vanished. This combination and unification of separately owned and competing roads is still going on at a rate of progress that will, in the not distant future—and still under the working of natural laws—remove whatever rebating, secret rate giving and other forms of favoritism now exist, and for which railroad managers have been so severely censured, but of which the conscience of an outraged public has never yet prevented it from reaping the uttermost advantage.

These facts would not be called to your attention but for the further fact that the Interstate Commerce Commission is again before Congress with its many times iterated and reiterated request, now reinforced by Presidential recommendation, that it be given the absolute power to prescribe the maximum rate that a railway, or line of railways, may make whenever, upon complaint and investigation, the rates currently charged are deemed by it to be unreasonable; and that it be further empowered to put such prescribed maximum rates in immediate effect, to stay until declared by the courts, upon appeal by the defendant railway or railways, to be unlawful.

In support of its claim that it should have the power to fix maximum rates, the statement is put forth in its behalf, that it does not intend to exercise this power except to remedy occasional, and possibly rare, cases of injustice on the part of the railways; and that it does not expect, or desire, to make tariffs for the railways in a wholesale way; one member of the Commission is reported as having said that its proposed methods of correcting existing evils will not be likely to appreciably affect the general average freight rate now received by the railways of the country, or materially reduce their gross or net income. The value of this statement is, however, materially weakened by that of another member of the Commission who is quoted as having recently

said that unless this power of rate-making is given to the Commission, the people of this country will continue to pay at least \$40,000,000 a year more for their railway facilities than they ought to pay. If this latter statement is to be accepted as embodying the true intent and purposes of the Commission, if it is given the power to fix transportation rates, the question naturally arises, how this forty millions of dollars a year in reduced gross and net earnings is to be provided for without correspondingly reducing the at present low average dividend returns of the railways, or relatively reducing the cost of their operation?

As the average return paid to the railway shareholders of the United States in 1903 was less than three per cent upon the par value of their holdings, and as a four per cent annual return upon investment of this nature is not considered an extravagant income, will it not be possibly and naturally necessary for the railways to attempt finding some method of reducing their cost of operating so that the interests of their shareholders shall not be unfairly affected? And if a reduction of forty millions of dollars a year, or any considerable portion of that sum, in operating expenses must be provided for by the railways at large, is it not probable that the payrolls of those in their employ, which now amount in total to nearly one-half the gross income received from railway operation, will be expected to contribute their proportion of this necessary reduction in the cost of operation; and if this prove true, will not the individual workers in the railway service be called upon to bear each his proportion of this reduction in income, and is this not, therefore, a question of paramount interest to the million or so people who are engaged in the railway service and live upon the income they receive in payment for their labor?

To offset the extraordinary advances in the general cost of living, those engaged in this company's service, in 1903, insisted that material and general increases in wages were a necessity that could no longer be postponed; and general adjustments were thereupon mutually agreed upon, with a resultant total increase of payroll disbursements for the next ensuing fiscal year of over eight hundred thousand dollars. For that same year the company fortunately received an increased average rate of forty-seven one-hundredths of one mill a ton a mile upon its total freight movement, a sum in itself wholly insignificant and inconsequential, but which, when averaged over the year's freight tonnage, became a total of nearly eight hundred thousand dollars, an amount almost sufficient to make good the year's wage increase. The shareholders received no increase of dividends, and the road's net earnings were practically the same as in the preceding year.

This experience in which you have beneficially participated, illustrates the close and inseparable relation that exists between the average transportation rates received and the possible wage disbursements of a railroad; and I can give no more apt illustration of your individual and personal interest in this rate question as it inevitably and always mutually affects the finances of the road and the wages of those engaged in its service.

While I shall not permit myself to be drawn into a profitless newspaper controversy with anonymous, and more or less flippant, writers, who credit me with opinions that I do not hold and consequently have never expressed, I shall not, on the other hand, be deterred from giving the freest expression to opinions, based on years of

examination and study of the many and intricate problems involved in this great subject, and that I believe are worthy the most careful consideration by each and all of the more than twenty-three thousand persons who share, as their means of livelihood, in the annual payroll distribution by the Boston and Maine System of about sixteen million dollars, a sum equal to nearly one-half of its annual gross income.

I differ with the Interstate Commerce Commission, and with those who advocate increasing its powers, only upon the one point that I believe to be of vital interest, namely, the power to make rates. I am heartily in favor of such carefully thought out additional legislation as may be found needful for ending and forever preventing railways from conspiring to give, or their customers combining to exact, any favors or facilities that may not, under like circumstances and conditions, be given to and received by all; but I am fully convinced that the power to fix the price at which railway transportation shall be sold can be left with safety only in the hands of those who must assume, and have no way of escape from, the care and expense of producing that transportation; and that legislation tending to separate these two indissolubly connected and paramount responsibilities is communistic in its tendencies, and in contravention of the natural laws of supply and demand.

Is it not one of the unalterable workings of natural law that whoever exercises the power to fix the maximum price at which a product shall be sold, must likewise fix the minimum price and must also ultimately assume and control the cost of making that product? As no workable plan has yet been devised for equitably dividing the producer's responsibility of fixing the price at which his product may be profitably sold, or of guaranteeing its cost, and as the only product of the railway company is transportation, will it not unalterably follow that when government takes the first long step of using its power to fix the maximum price at which that product shall be sold to the public, it must also fix the minimum price; and then, sooner or later, take the next, and much shorter, steps leading to government ownership and operation of the railways and thereby assume and control the cost of making as well as the selling price of this transportation product? And, if this be true, is not this the method which the socialist has, in season and out of season, insisted should be applied?

For the members of the present Interstate Commerce Commission, collectively and individually, I have the greatest respect. They are able and honorable gentlemen, and I have no doubt of their willingness and ability to use justly any power that may be committed to their charge; but neither they, nor anyone else, can give assurance that their politically selected successors will be proportionately well-fitted, mentally or otherwise, to satisfactorily carry on the work.

It is argued by some who favor giving the Interstate Commerce Commission full rate-making powers, that for ten years after it was created it exercised this power; that its use was harmless to the railways then, and therefore would not hurt them now. This argument fails to state the whole case. The railways did indeed submit for a time to the exercise by the Commission of this power, but it soon became so pervasive in its spread that they found cause for alarm as to the final outcome, and they therefore took the matter into court where their contention that the Commission's power over rates ended when it found them unreason-

able, and that it had not been given the power to substitute and make effective other rates that it considered reasonable, was sustained.

The present widespread, and somewhat inflammatory, discussion of the railroad rate question would lead one not familiar with our great and unprecedented national prosperity to suppose that by the arbitrary exaction of unwarrantably high railroad rates, our industries and commerce must be, as a whole, in such a state of prostration and decadence that radical, and even violent, legislative means of relief ought at once to be applied. But what are the facts? From 1893 to 1903 (1904 statistics not being yet available), the freight moved one mile by the railways of the United States had grown in volume from ninety billions to one hundred and seventy-one billions tons—an increase of eighty-one billions tons—or about ninety per cent, while the railway mileage, during the same period, increased only seventeen per cent. The average freight rate received by all the railways in 1893 was eight and ninety-three one-hundredths mills per ton per mile, while in 1903 it had fallen to seven and eighty-one one-hundredths mills, a reduction of one and twelve one-hundredths mills. Now the average rate for 1903, which was less than one-half that received by European railways, does not seem to be so excessive as to become an arbitrary and insurmountable barrier to the free and profitable movement of our domestic and foreign commerce; and when we further find that this reduction of one and twelve one-hundredths mills in the average freight rates of 1903 yielded in money, when spread over the tonnage volume of that year, the enormous total of one hundred and ninety-one million dollars, and that this contribution to the country's commercial wealth was made by its railway systems under the workings of the natural laws of supply and demand, and without the intervention of statute law, may we not well hesitate and take time to consider whether the intrusion of statute law upon this satisfactory business condition is, after all, as necessary as we are being asked to believe?

There is in some sections a persistent and almost hysterical demand for railway rate regulation, but what is really meant is not "rate regulation" but "rate reduction," and if this demand is enforced to an extent that will be of any appreciable value to the people at large, will not the railways, that in 1903 earned a surplus of only one hundred and twenty-one million dollars, and paid their shareholders an average dividend of less than 3 per cent, find it necessary to reduce their operating expenses to meet proportionately this loss of surplus income, and when such reductions become necessary do I need to point out to you where the greater part of this shrinkage must be borne?

But as he who criticizes and objects to proposed methods is in reason bound to suggest something in substitution, I assume the necessary responsibility and, with becoming modesty, offer the following:

The present laws seem adequate and sufficient, if thoroughly applied, to enable the Interstate Commerce Commission to bring to light, punish and prevent every form of rebating and secret rate giving or taking, as rapidly as the cases are brought to its attention, and therefore further legislation upon this branch of the subject seems at present to be unnecessary. The other principal abuses and evils alleged, and to which congressional attention has recently been called, are said to arise out of the improper use of privately owned freight cars, and of private side tracks and railways of the so-called Industrial Combinations,

I suggest that if these privately controlled special facilities and their owners are, to the extent that they deal in transportation, brought within the scope of, and made amenable to, all laws that are now, or may hereafter be, applicable to transportation companies engaged in interstate commerce, the alleged abuses and evils will at once become controllable and can be wholly eradicated. If the rate-making power is then found to need further supervision and regulation, the Interstate Commerce Commission should have added to its present full power of investigation that of recommending to the railways the substitution of rates that it thinks reasonable for those that, upon investigation, it has condemned, and if within reasonable time—say thirty days—the railways interested fail to adopt these recommended rates, the Commission should make to Congress a report of its findings and recommendations, and of the failures or refusals to comply therewith, leaving to Congress the duty of applying such remedies as it may then think needful.

This plan has worked well for so many years in our own Commonwealth that its trial by the General Government would seem to be at least worthy of consideration. It would have the wholesome, and I think necessary, effect of preventing an accumulation of frivolous complaints, with which the Commission is quite certain to be overwhelmed if the proposed plan of giving it the final adjudication of all rate cases submitted to it is adopted; and judging from the working of our Massachusetts laws covering this matter, the restraints against arbitrary and unjust acts by any of the railways would be so sufficient and wholesome as to bring substantial and even-handed justice to all parties in interest.

In conclusion, I will add that in this necessarily condensed and somewhat fragmentary presentation of what I believe to be a subject of profound and far-reaching personal interest to every person engaged in railroad work, I am not trying to build up a propaganda, or initiate a general agitation with the purpose of coercing the opinions of those charged with the duties of suggesting and framing changes in, or additions to, our national laws. I have tried to present, in a dispassionate way, some of the facts, as I interpret them, connected with one branch of the great economic evolution that is now going on in our common country, and I leave them with you for such further consideration and use as you may think it wise to make of them.

The address was listened to and followed with the closest attention by the Brothers who found great pleasure not only in the speaker's forcible delivery, but in the clear, concise and convincing arguments used, and at its conclusion evidenced their appreciation by hearty and continued applause.

Chief Abbott then called on Assistant General Manager Lee, who in responding, said that he had come in response to an invitation to dinner and not expecting to speak, therefore had no speech prepared, but wished to say that he had listened to President Tuttle's address with the greatest pleasure and thanked the engineers of the Brotherhood for their kind invitation to be with them on this occasion, and that if he were eligible, he would at once file his application to become one of them himself. He

spoke of his and Brother Mitchell's (our chair. G. C. of A.) efforts in regard to carrying out the terms of our schedule in justice to all, and the friendly settlement of the many delicate contested points which so often came up in regard to it, and complimented the Brotherhood on having so fair and conservative a gentleman as Brother Mitchell as their chairman of the General Committee. (Hearty applause.)

Chief Abbott then stated that all would be pleased to hear from any of the other officials, many of whom were seated on the platform, but as no one responded, he declared the entertainment closed, and that with the officials at the head, followed by the invited guests with the Brothers and their ladies following (in all about 800) the march would be taken up for the banquet hall where a banquet by J. A. Dill & Co., caterers, as only Dill & Co. can furnish, was laid. After all had been shown to their places, Chief Abbott called on Bro. G. R. Dority, our Grand Chaplain, who asked the Divine blessing, then all fell to and did ample justice to the variety and abundance of good things before them.

An hour or two were pleasantly spent in sociability by those not in a hurry to get home, and all agreed that the whole affair was a pleasant and fitting observation of the passing of the fortieth milestone in our Division's history.

The thanks of the Brothers and ladies are due to the committee having the affair in charge, consisting of Chief Abbott, Bros. C. H. Woodman, F. Brothers, F. W. Boody, W. Schackley and G. C. Farnsworth, for the successful carrying out of the affair and for the good time enjoyed by all.

Another pleasant feature of the occasion was the meeting again of many of the members of the "Inglewood Club," who went to the last Convention in Los Angeles, and it seemed like Brothers and Sisters indeed, meeting again by the hearty handclaps and affectionate greetings extended towards each other, and the exchange of many reminiscences of that long and pleasant trip to the land of "sunshine and flowers."
N. H. B. W., Div. 61.

Drv. 637 was recently presented with a most beautiful Bible. The donor was the estimable wife of our worthy C. E. Ed. McCormick. Mrs. McCormick heard us discussing the merits of buying a larger Bible and to our surprise at our last regular meeting in 1904 it was sent in to us, the Division passing an appropriate resolution thanking her for the same and accepting it as a beautiful Christmas gift.

Div. 637 is in first-class condition and all running an engine here are members

of our organization except one or two and we hope to have them in line pretty soon. We have a good contract and very few grievances, and they are easily adjusted when they do arise.

Because we live in Mexico is no sign we are out of the world. Our work for the B. of L. E. is carried on with as much zeal as it is in any locality.

ED. LOONEY, F. A. E.

MR. H. M. HINKLE, Air Brake Instructor of the Philadelphia Division of the Pennsylvania Railway, was the recipient of a well-merited compliment, when on Christmas day, a committee representing the passenger engineers and firemen of the Philadelphia Division, called at his home on Brown street, West Philadelphia, and presented him with a handsome gold chain and charm, on which was engraved his monogram. Before presenting the gift, Brother Austin, of Div. 45, made the following address:

Mr. Hinkle, we have come to perform a most pleasant duty. But before that duty is accomplished, I wish to say a few words in behalf of the passenger engineers and firemen of the Philadelphia Division, whom I represent.

Hard and earnestly have you labored to help each of us pass the air brake examination. While running your train you still found time to hold in the air brake room of the P. R. R. Y. M. C. A. Building day and evening classes, and during those instructions you bent every effort to impart to us your extensive knowledge of the air brake. That we profited by your thorough and practical instructions was shown in the successful result of the air brake examination which we have recently passed.

And now, Mr. Hinkle, in behalf of the grateful passenger engineers and firemen of the Philadelphia Division, I present you with this chain and charm—a token of grateful friendship.

Mr. Hinkle was genuinely surprised, and appeared very much affected. He thanked the passenger engineers and firemen, through the committee, assuring them that he had done only his duty in helping his fellow men, and that the compliment was an undeserved one.

Members of the committee were: Mr. C. H. Smith, Road Foreman of Engineers, Philadelphia Division, Brother Johnson, of Div. 74, Brothers Austin and Cough, of Div. 45, and Brother Strouse, of Div. 75, B. of L. F.

MR. W. MILLER, having resigned to accept a place with the D. & R. G. Ry., sent the following complimentary letter to the Terminal employees:

St. Louis, Mo., Jan. 15, 1905.

MR. H. A. Walters, Chair, Committee, B. of L. E.,
MR. W. E. YOUNG, Chair, Committee, B. of L. F.,

Terminal Railroad Association of St. Louis,

GENTLEMEN: As I am about to sever my connection as Master Mechanic of the Terminal Railroad Association, I beg through you gentlemen to ex-

tend to you and the members of your Brotherhoods, who are employees of this association, my most sincere thanks and appreciation for the able assistance that you as a whole have rendered the mechanical department during my administration, and I wish to advise that it is with my deepest regret that I am leaving the Terminal before having had the desired opportunity of becoming more acquainted with all of you gentlemen.

Notwithstanding this, I want to inform you, one and all, that your action and good service that you have rendered the Terminal since my coming to this company did not escape my observation, and I feel that it is my duty to extend to you cheerfully my commendations, so that you may know that your services have been appreciated.

Hoping that we may again be associated together, and wishing you all the best of success, I remain

Yours truly,

WM. MILLER,

Retiring Master Mechanic.

THE following complimentary letter from members of Div. 375 to members of Div. 439 bears evidence of goodwill that only comes from manly consideration of the welfare of each:

SPENCER, N. C., Dec. 21, 1904.

To the Officers and Members of Div. 439, B. of L. E.,

SIRS AND BROTHERS: Whereas Mr. S. R. Richards, our Master Mechanic, having resigned his position here to accept a position on the Plymouth Division of the N. Y., N. H. & H. R. R., and our relations having been so pleasant and satisfactory, we send this to you with the highest recommendations of Mr. Richards. He has been with us eighteen months, and no engineer has been known to complain of the treatment at his hands. He has always treated us in a cordial manner, and has been a true friend to us in every way. The relations between us have been so pleasant and harmonious that we take pleasure in recommending him to you. Hoping you will have in him the same friend we have found him to be, and that you will give him your hearty co-operation, as he deserves the hearty co-operation of all engineers, and we do not hesitate to say that our loss is your gain.

Yours fraternally,

J. L. ALLEN, Chief Engineer,

W. W. CLEMENT, F. A. E.

A RECEPTION and banquet was recently given to Bro. E. P. Roesch, of Division 186, and Mr. Chrysler, former Master Mechanic and General Roundhouse Foreman, respectively, C. & A. Ry., at Slater, Mo., in token of the respect in which they are held by the railroad men of the Western Division and the citizens of Slater. Each was presented with handsome silver sets by the railroad men.

The meeting was presided over by George M. Blackburn. The presentation speech was made by O. P. Storts, which was appropriate for the occasion and thoroughly appreciated by the large audience, which was limited to the capacity of the hall. He also read an address prepared by Engineer Griffin in behalf of the railroad men, reviewing the successful ad-

ministration of Brother Roesch, and presented him with a beautiful set of silver as an evidence of the goodwill of his many friends.

In response Brother Roesch made a very modest reply, stating that he was not prepared for the occasion, and felt that he was unworthy of such evidences of goodwill and confidence as were shown him. He unselfishly gave the credit of his successful management to the railroad men of Slater. Whatever personal success he achieved he believed to be due to the fact that he had always tried to do right, that he was confident and probably inspired confidence, but remarked,—“possibly I have erred in judgment or I would not be out of a position.” He expressed his profound regret to leave the hundreds of friends he had made in Slater, to whom he felt closer than any class of citizens he had lived with for the same length of time. He closed with the remark that wherever he cast his lot and wherever he had a home, there was always a home for his friends in Slater.

Mr. Chrysler also made a brief yet appropriate speech in acknowledgment of the courtesies shown him. He was followed by W. G. Perdue of Bloomington, Passenger Train Master Wallace, W. H. Lain and Train Master Marquette, each of whom expressed his best wishes for the retired Master Mechanic and Round-house Foreman.

A set of complimentary resolutions was presented to each of the retiring officials, signed by G. M. Blackburn, Chairman Engineers; W. H. Lain, Chairman Carmen; C. B. Bennington, Chairman Firemen; Frank Wetton, Chairman Round-house men.

After the reception a banquet was served at Maneke's, and the ball opened at the Walton building. Music was furnished by the Marshall Orchestra.

SLATER RUSTLER.

NEVER having read anything in the JOURNAL about Division 639 since we were organized, March 13, 1904, I take the liberty to request space in the JOURNAL to advise our Brothers of what we are doing and how we are getting along.

At a regular meeting held Dec. 18, 1904, at our new meeting rooms, 407 Bridge St., Borough of Brooklyn, New York City, Bro. John Puffenberger of Division 292, was a visitor, and by special request of Mrs. F. T. Tucker, wife of our C. E., presented us with a handsome new Bible as a Christmas present, 1904. Brother Puffenberger spoke in part as follows:

“Brother Chief and Brothers of Brooklyn Terminals Div. 639, I consider this one of the greatest honors of my life to present to you this great and good work,

the Holy Bible, upon which all good is founded and teachings contained within its covers; and it reminds me of my boyhood days, and my good old mother and her advice to me; coming as it does from the wife of your Chief, through me to you. I honor her for the great work she has done in the interests of the G. I. A.” Turning to our C. E. said: “Take this Bible, I deliver it into your hands for your Division. May it be a blessing to you all.” Applause.

Brother Tucker, C. E., replied in part as follows:

“Brother Puffenberger, I thank you sincerely for this Christmas gift to Div. 639, also for your kind words and expression of good will. This present comes from one with whom I have lived twenty-four years. Again, sir, I thank you on behalf of the officers and members of Division 639.” Applause.

Later in the meeting Brother Puffenberger complimented our C. E. on the growth of Division 639, having doubled our membership in nine months; also on no Brother present having a grievance, and our fine meeting room, saying it was a credit to us.

O. E., Brother Tucker, gave us a good account of the Grand Union Meeting held in Cleveland, Ohio, Nov. 21, 1904.

Bro. Geo. W. Dereamer gave us some appropriate remarks on good of the Order, also Bro. E. L. Harrington and others. I consider this one of our most interesting meetings.

O. C. SHATTUCK,
F. A. E. Div. 639.

A JOINT meeting of Gate City Div. 368, and Atlanta Div. 207, B. of L. E., was held in the hall of Div. 368, Sunday, Jan. 8th, 2:30 P. M.

The following program was very successfully carried out:

Grievances—How to prevent them and the easiest way to adjust them. Bro. J. I. Whiddon, Chr. G. C. of A. So. Ry.

Our Brotherhood—How to make it the greatest factor of all, in the improvement of railroad service. Bro. W. O. Keenan, Div. 207.

Shorter Hours on Duty—How to secure them. Bro. W. L. Simmons, Div. 368.

Our Sick—Our duty to them, do we do it? Bro. T. O. Waters, Div. 368.

The talks were listened to attentively and were very much appreciated. There were something like a hundred members of the two Divisions present, besides quite a number of visiting Brothers.

Divisions 368 and 207 have established the custom of holding a joint meeting every sixty days, and are making quite a success of them. Interest in the meetings is growing and the attendance increasing, and the joint meetings are now looked

forward to with a great deal of pleasure. The good to be derived from such meetings, when properly conducted, programs for entertaining, etc., is incalculable, not speaking of the good to be derived from the social side of the affair.

I have reserved for the last the most notable and enjoyable feature of this particular joint meeting. We were most joyfully surprised that the Committee of Arrangements had secured the presence of our worthy Assistant Grand Chief Engineer, H. E. Wills. Brother Wills made us a talk of an hour and a half that was listened to with undivided attention and utmost appreciation. Before he was half through every heart in the hall was his for the asking, and every man in the hall rushed eagerly forward to grasp his hand and receive a few kind words personally from him, before he quitted the rostrum.

It was more like an old Methodist love-feast than anything I have attended before in years.

I think every Brother went forth from this meeting with renewed vows and a stronger determination to live right and do right, attend the Division meetings, share his part of the burdens of the Brotherhood and to give honest toil and be loyal to his employer.

A resolution complimenting and thanking Brother Wills was passed unanimously.

WALTER L. SIMMONS,
F. A. E. Div. 368.

DIVISION 64, Worcester, Mass., held its Third Annual Banquet at the Bay State House, Jan. 8th, at 2 P. M., when the engineers and guests did justice to themselves and everybody else. The banquet began at 2 and lasted until 8:20 P. M., interspersed with selections of music under orders of Bandmaster Davis. All trying to see who could eat the fastest and most, the banner went to Bro. S. E. Norman, who said he took after his father who ate lots and after his mother for eating long.

The Division had as guests Bro. C. R. Mitchell, Chr. G. C. of A. Boston & Maine, C. M. Richardson, Chr. G. C. of A., Boston & Albany Division of New York Central, Mr. S. D. Sands, Chief Clerk B. & A. freight office, G. T. Jones, foreman Washburn & Moen Wire Works, and J. H. Johnson, poet of Div. 64, and Jim is a whole team with a band. Bro. G. F. Darling was toastmaster and a better one could not be found.

The first speaker called was Bro. C. K. Mitchell, who spoke on the good of the Order. Bro. C. M. Richardson was the next speaker introduced, and gave us a lengthy talk, "What to do to bring members to meetings." Chief Engineer Bro. T. J. O'Neil was then called on, who spoke of years past and today's railroading.

Brother Darling called for the next speaker, the homeliest man in the Division, as he said, who crawls out of his hole in the form of Palmer to come down and fill up, and then return and sucks his clams till we go to Jordon Pond. Bro. O. W. Clapp gave us how times were years ago on the B. & A., Bro. M. L. Hamilton gave us a history of Division 64 since it was organized. Bro. T. B. Wardell and others spoke. Bandmaster Davis had music between the speeches. Poet J. H. Johnson was called, and read a poem composed by him especially for the occasion, which was highly appreciated by those present, but I fear the Editor will think it too long for insertion.

The speaking over, everybody smoked, told stories of narrow escapes, and of the good and bad times years ago, and compared them with today. It was a day for a good time, and it was a good time.

Business being such it kept many away who intended to go, but never mind, Brothers, a hot time is coming later on at Jordon's Pond, and Jim Johnson, the poet, will be on deck with a new lot of stories to settle your clams, while Bandmaster Davis looks after the music.

Brother Darling, the toastmaster, being one of the guards, had to leave us at 5:45 to report at headquarters for roll call, after which he was on deck to see that we all had oil enough on our valves to reach home.

Letters of regret were read by Brother Davis from Bro. F. S. Evans, Chr. G. C. of A. of the N. Y., N. H. & H. System, who was sick in bed and unable to attend, but at this writing I am informed is much better; also letter from Bro. E. W. Hurley, A. G. C. E., business keeping him away.

The speeachmaking and good time lasted till 7 o'clock, and we shall look forward with pleasure for another one like it in January 1906.

Yours fraternally,
L. A. STOODLEY.

President Tuttle's address, delivered before Div. No. 61, at their fortieth anniversary meeting, with request to publish in full, reached us when our space was all taken, but we considered it of such importance that we concluded to hold out three local items. We regret this necessity, but hope no serious objections will be made, They will appear in March number.

SPECIAL NOTICES.

Adair Div., 365, B. of L. E., has changed halls. Commencing this date the above Division will hold its meetings in Shelby Street Market Hall, situated on Shelby between Market and Jefferson Streets.

Wanted—To know the whereabouts of W. H. Stitt. Was last heard of in vicinity of Seattle, Tacoma, or Portland firing for the U. P. R. R. Anyone knowing his whereabouts will confer a favor by writing to J. E. Stitt, Neodesha, Kan.

Wanted—The address of Frank I. Goodwin, who was running out of Raton, N. M., about eighteen months ago. Address E. H. Colip, F. A. E. Div. 251

Will Mr. Gilbert Cranshaw, engineer, correspond with Mr. W. J. Haynes, M. M., De Soto, Mo. Last heard from at Springfield, Mo.

Anyone knowing the whereabouts of E. S. Eberlein, of Allegheny City Div., 108, will confer a favor by notifying Bro. M. S. Anderson, 919 Main St., Allegheny City, Pa. When last heard from he was at George's Run, W. Va.

At a meeting of Div. 421, held Dec. 28, 1904, a resolution was adopted instructing the F. A. E. to notify the Grand Office that the expulsion of J. B. Stevens, Nov. 10, 1904, was a mistake on the part of the Division. Brother Stevens is entitled to membership and is in good standing.

Frank Edward Baker, who is said to have run an engine out of Trenton, Mo., in the early part of 1904, and who is the son of Admiral Baker, of the English Navy, 30 years of age, light complected, has been left the entire estate of his uncle, who died some months since, and his address is desired by Mr. C. T. Bradshaw, Pueblo, Colo., who has been searching for him for the past three months.

Members of the following Divisions will correspond with the F. A. E. of their Divisions immediately:

<i>Division—</i>	<i>Division—</i>
435—C. J. Hardy,	409—W. T. Clark.
Thos. McKeever.	186—J. McKinley,
548—Job D. Williams,	C. F. Groner.
J. J. Cahill.	453—R. A. Riggs,
552—John Scanlon,	H. B. Drullard.
C. R. Edmunson.

LOCOMOTIVE ENGINEERS' MUTUAL LIFE AND ACCIDENT INSURANCE ASSOCIATION.

Official Notice of Assessments 692-695.

SERIES F.

OFFICE OF ASSOCIATION, ROOM 803, SOCIETY FOR SAVINGS BUILDING, }
CLEVELAND, OHIO, Feb. 1, 1905. }

To the Division Secretaries L. E. M. L. and A. I. A. :

DEAR SIRS AND BROS.:—You are hereby notified of the death or disability of the following members of the Association :

Four Assessments for payment of these claims are hereby levied and Secretaries ordered to collect \$1.00 from all who are insured for \$750, \$2.00 from all who are insured for \$1,500, \$4.00 from all who are insured for \$3,000, and \$6.00 from all members insured for \$4,500, and forward same to the General Secretary and Treasurer.

Members of the Insurance Association are required to remit to Division Secretaries within thirty days from date of this notice, and the Division Secretaries to the General Secretary and Treasurer within ten days thereafter, on penalty of forfeiting their membership. (See Section 25, page 80, of By-Laws.)

Secretaries in sending remittances will send same to and make all drafts, express money orders or postoffice money orders payable to M. H. SHAY, General Secretary and Treasurer. Secretaries located in Canada will please remit by draft or express money order. We will not accept packages of money sent by express, unless charges have been prepaid. The JOURNAL closes on the 18th of each month. Claims received after that day will lie over until the succeeding month.

NUMBER 3.

Russian Autocracy.

A massacre, wanton in its nature, is given as the cause of the absolute destruction of Minister Von Plehve with a dynamite bomb which horrified the world, but a world of people who recognized that with autocracy dethroned and reasonable liberal conditions substituted, the Czar and his ministers would be as safe in Russia as in other countries.

The war with Japan, with its lack of justification and success and consequent

necessity for forcing Russians, utterly opposed to the war, to don a uniform, shoulder a musket and forsake their families, all represent force—the element always used to sustain the Russian autocrats, and the scenes of force and brutality in dragging men into the service had a large tendency in bringing on the disturbances which culminated in the use of more force.

When a great concourse of the common people, mostly workingmen and their families, working at starvation wages and wages established by the Russian govern-

ST. ISAAC'S CATHEDRAL ST. PETERSBURG, RUSSIA.—In the Palace Square the common people gathered to petition the Czar for redress and received the lash, to club and bullet.

ment, which pays married men 125 copecks, 62½ cents, and single men 25 copecks, 12½ cents a day, in the government foundries, congregated for the purpose of petitioning the Czar, they were met with whip and bullet and hundreds fell killed or maimed by their own countrymen armed to sustain the autocratic government, abhorrent to all Christian people. Work was suspended almost everywhere, and riot seemed the general order of things, the soldiers whipping, clubbing and shooting to drive into submission, but the terrorism did not remain altogether with the poor workmen and the common people. There was evidently fear and trembling in the palace of the Czar and the minis-

your honest work at a period when all Russian workmen should be laboring unceasingly in order that we might vanquish our obstinate enemy. Strikes and disgraceful demonstrations led the crowds to disorders, which obliged, and always will oblige, the authorities to call out troops. As a result, innocent people were victims. I know that the lot of the workman is not easy. Many things require improvement, but have patience. You will understand that it is necessary to be just toward your employers and to consider the condition of our industries. But to come to me as a rebellious mob in order to declare your wants is a crime. In my solicitude for the working classes I will take measures

GENERAL VIEW OF MOSCOW, RUSSIA, FROM THE KREMLIN.—The Cossacks drove the strikers across the river, whipped, clubbed and finally shot many.

try, and the Czar finally agreed to meet a delegation of workingmen, when he is said to have been very affable, and said to them:

"I have summoned you in order that you may hear my words from myself and communicate them to your companions. The recent lamentable events, with such sad but inevitable results, have occurred because you allowed yourselves to be led astray by traitors and enemies to our country. When they induced you to address a petition to me on your needs they desired to see you revolt against me and my government. They forced you to leave

which will assure that everything possible will be done to improve their lot and secure an investigation of their demands through legal channels. I am convinced of the honesty of the workingmen and their devotion to myself, and I pardon their transgression. Return to your work with your comrades and carry out the tasks allotted to you. May God assist you."

These workingmen said nice things about their reception, but it is charged that they were selected by their employers and that they did not represent the workingmen, and their action was dis-

owned and condemned at a public meeting, and the disturbance did not stop, as it was evidently hoped, and St. Petersburg, Moscow, and many other centers of industry needed an army to sustain the autocrat's authority.

These disturbances are commonly called strikes, but the disturbance extended to all the Polish cities. It is Russian Poland, but contains few Russians, and it is evident that there is a common sympathy with the movement, which, it seems to us, makes it assume quite a political character, and it is evident this thought has actuated the Czar in issuing an imperial decree ordering the formation of a committee headed by

of the past generations in Russia will lead the people to put little faith in the promises of the autocracy, and particularly the centralized power in the hands of a bureau of autocrats.

Forty years ago a law was granted in Russia containing what appeared to be absolute guarantees against arbitrary action by the police. Since the promulgation of that law it is said that more than half a thousand amendments, or by-laws, have been made, by which the original grant is denuded of the features that made it worth while. In 1903 there is a record of 6,500 cases of persons arrested for political offenses. Not one of these alleged offenders had a trial before either

KREMLIN PALACE AND CATHEDRAL, MOSCOW, RUSSIA.

Senator Chidlooski, a member of the Council of the Empire, instructing the committee to ascertain the cause of the disturbance and to prevent such disturbance in the future, the committee to consist of representatives of government departments, the various industries and the workmen. It is also said that the Czar has consented to the revival of the Zemsky Sobor or Ancient Land Parliament. This was a parliament of land owners and had little to do with Russian politics, but possibly it might lead to some reforms; but it is hardly possible that the millions of workmen would have faith in such a move, for the experiences

a jury or a magistrate. In every case the investigation and the punishment were conducted and inflicted by the police. Of the number mentioned 1,583 were liberated, 45 were sent before courts-martial (the offenses being of a military nature, as well as political), 1,503 were sent into exile and the remainder were punished with more or less severity, as the passions or the judgment of the police magistrate dictated.

Dr. Fishberg, in explaining Russia's industrial system, says:

"Trade unions and strikes are still unlawful in Russia. Less than fifteen years ago there were no labor organizations in

that country, and the men who first started them and joined them were treated as traitors by the government, and were sent to jail or to Siberia. But the movement could not be stopped. Organizers from England, Belgium, France and other industrial countries helped it forward, and eventually the unions attained such strength in St. Petersburg, Moscow, Baku, Odessa, Kieff and other industrial centers that the government has been obliged to extend a grudging toleration to them. That is to say, it has refrained from actively repressing them.

"But the point that cannot be too much insisted on is this—the striker in Russia is regarded as a rebel against the govern-

no laws restricting the labor of women and children, no laws to enforce more or less humane conditions of labor, as there are in other industrial countries.

"It is true there is a law fixing the hours of labor per day at eleven, but it is entirely different in its purpose and character from the laws regulating hours of labor in this country. The idea of it is to provide that all factory operatives, mine workers, etc., shall work eleven hours a day; their employers can force them, by the help of the law, to work for that period. But it is quite possible, by the payment of 'graft,' for an employer to extend that already too long working day to almost any length.

PALACE OF PETROPSKY, MOSCOW, RUSSIA.—It was in this palace that Napoleon took refuge when Moscow was in flames, Sept. 15, 1812.

ment, and the whole force of the government is *ipso facto*, arrayed against him. Russian children are taught in school that it is their duty to sacrifice themselves unquestionably (1) for the czar, (2) for their master, and (3) for holy Russia. Observe that the master is placed before the fatherland!

"The master—the employer of labor—is regarded as an essential part of the autocratic system. The government fears that if this authority is weakened the people will lose respect for authority in general. This, I suppose, is one reason why there are no factory regulation laws in Russia designed for the benefit of the workmen,

"As the right of public meeting is denied in Russia, the strikers inevitably come in contact with the police and the military. Until quite recently, it has been the practice to break up even the smallest assemblies. Military intervention generally becomes necessary because the police—the ordinary police, not the secret police—are very inefficient in Russia. They cannot be relied upon to break up a mob or enforce the policy of the government. The soldiers—particularly the Cossacks—must be called in. The policemen in Russia are shamefully underpaid. Even the captains of the police only get about \$16 a month, and, of course, they

are always open to receive 'graft.' Fifty cents is a liberal bribe to offer even to one of the police captains, and for \$1 he would do almost anything. This inefficiency of the police explains why the troops are called in so often to uphold the cause of autocracy in the cities."

The provincial assembly of Kharkoff in its address to the Czar said: "It is not enough to make laws, it is indispensable to guarantee their observance."

No doubt the autocrats have had their nerves sufficiently shocked to offer some sort of sop to the laboring men, revolutionists, terrorists and anarchists—but unless there is a new order of things the autocrats will, at the earliest opportunity, make use of the police and army if necessary, to crush opposition, and then beat and starve the leaders to death. There may be a Magna Charta, but it is likely to be of the King John order, to be violated at will, unless the army joins the opponents of autocratic power, and demand liberty, and a liberty that insures a voice in the government under which they live. May that time be near at hand!

THE EDITOR.

A Railway Romance.

GRACE BOTELER SANDERS.

All day, the rain in misty sheets had fallen. At night, the darkness was relieved only by the glints of silver. The mountain brooks, overflowing with sweetness, poured down the hillside and were joined by dozens of little streamlets that were hurrying to the river and the sea. Each train passing through the C., B. & Q. tunnel crawled carefully. In the overhanging precipices lurked danger. The loose alluvial soil, washed by the spring rains, carried floods of rocks with it, sometimes falling on the passing trains, sometimes on the very track where the unsuspecting victims were rushing into the mouth of death.

"Look out for the rocks. Bridge all safe."

This message greeted the engineer as he reached Monroeville. With a sigh of mingled pain and relief, he climbed on to the seat box.

"Orders," he said, bluffly, as he handed the crumpled yellow sheet to his fireman. "I dread tonight."

Billy granted.

"When it begins to rain in this country it never knows when to stop," he said. "It's been a regular flood for a week. I'd think the bridges would be pretty shaky."

"This is a good road." Frank Carlisle wiped the polished brasses carefully, inspecting each part of the machinery before he left the station.

"When you think of all the danger, it's terrible. Rushing along in the darkness headlong, maybe to safety—maybe to death. Think of them poor fellows last week!" he shuddered, involuntarily. "Struck a rock forty miles east of here. The engine turned a double somersault and buried her nose in a gravel bank. The caboose and fifty coal cars, with scarcely a moment's warning, plunged into the river. 43's crew was deadheadin' to Hinton; only their fireman escaped. I don't know how he managed, the current was like a millrace, but he was a good swimmer. Why, when Mike Flanagan picked him up, he was just worn out."

"My wife's always givin' me fits 'cause I won't quit the road," spoke up the fireman. Soon as I get money enough to go into business I think I will, but it seems like I can't save anything. I don't know what would become of her and the children if I'd die."

"I haven't any children, but"—Frank Carlisle cleared his throat loudly—"there's an old mother watching at the window every day for me. I've been on the road thirty years. Never had an accident. Some day, I suppose, I'll get my 'Everlasting,' if I'm doing my duty—and—"

"If we're ready," whispered Billy, solemnly.

"Yes." Carlisle read the orders again to hide his emotion.

"It might as well come one time as another, I reckon. What time have you, Billy?"

"Six-thirty."

"Train's ready," called the conductor. "We'll have to be gettin' out of here. It's going to be a terrible night."

In a short time second 46 was on its way to Grafton. A gloom gathered over the misty sky. The night and the storm fell together. As the train rattled on, the wind king swept down upon Grafton, twisting telegraph wires, poles and trees in a confused mass together.

The river burst its banks, and like a sheet of silver rushed down over the highways, sweeping everything with it. One hundred miles away 46, little knowing its danger, hurried to meet the storm. The crew watched with much interest the boiling white clouds toward which they were traveling.

"Ain't she a regular twister? I bet she's at Grafton, now."

"I hope she'll stay there till we're out of her way."

First one, then another voiced their fears.

Lightning in a dark cloud to the right flashed vividly. The trestle loomed in sight. How each timber creaked as the panting engine ascended the bridge.

Down beneath him, hundreds of feet, Carlisle saw the cruel rocks, which gored the water into foam. The last of the trestle disappeared.

"We're over at last. Thank God!" he said. "Twenty minutes to make up before we reach Grafton. Your steam's droppin', Billy. Only 120 pounds. Get up on the box and I'll fire awhile. Say, I'm as nervous as a girl tonight."

The engineer shoveled steadily. Billy Andrews, with hand on the throttle, watched the glaring headlight, which threw a yellow stream of light on the path before them.

* * * * *

The operator at the flag-stop nearest Grafton walked the floor uneasily that rainy night. Once—twice—thrice—he had signaled the terminal, receiving no reply. This and the fact that he had no orders for the eastbound train, added to his worry over the storm.

"Nearly time for 46," he spoke aloud. "I've no orders. Wire's down. The bridge has been shaky for three days, no matter what they say to the contrary. If this rain doesn't cause a washout, I don't know what will."

A thundering which shook the tiny building now announced the coming train. Like a rocket "Big Liz" shot past the lighted window, turned the curve and was swallowed up in the darkness.

"Gone," he cried, "God help them!"

All other sounds were now drowned by the rush of the storm. Suddenly a terrific knock was heard. Roy Ellis drew the bolt cautiously.

"Who's ther?" he called.

"Tim Simmons," growled a deep voice. The door flew open. In its framework, behind a background of darkness, before him—a blaze of light—stood a dripping figure. Breathless, he cried:

"Bridge's gone over the New. Telegraph! Stop the train! Quick, Roy. My only son's on that train tonight, rushing to his death. Hurry."

The operator's face blazed. All the hours of torture were now explained.

"How'd you find it out?" he demanded.

But his visitor stopped him.

"A hobo came to my house not thirty minutes ago. He saw the timbers fall. Don't wait for questions. 46 passed ten minutes ago. Do now and talk afterward!"

With sickening dread, Ellis took his seat at the table, touching the instrument lovingly.

His failure of a few minutes before came back to him. But he signaled again and met no response. With a groan, he buried his face in his hands.

"Send that message, I say." Simmons, like an enraged giant, stood over him. A rough hand gripped the boy's shoulder.

"I can't."

"Why?"

"Line's dead!"

For a moment the clock ticked loudly. Two men watched and prayed while the train sped on.

To Ellis came the inspiration first. Before the other knew what he was doing the phone bell rang wildly.

"Hello! Hello, Central! Is there a phone near the New River Bridge?"

"Call Grafton!"

"Line's Down. Can't. Try to get Newman. It's a matter of lives, Central."

"I'll try," came back a girl's voice, strong and clear.

Every nerve tingling, Ellis waited. Soon the answer came.

"George Jones, half a mile from the bridge, has one. By transferring, I think we can reach him."

"Thank God!" Simmons opened his clenched fists, listening for the voice again.

"Tell him," Ellis' whole form quivered with emotion. "Tell him the washout has destroyed the bridge. No. 46 passed half an hour ago with ten passenger coaches. They must send a messenger to flag the train. Good-by!"

As the tinkling bell ceased, Ellis sank into the chair. Simmons still crouched by the window watching the sheets of rain.

"Are you a Christian?" he asked tremulously.

Ellis nodded.

"Then, for God's dear sake, pray."

Simmons continued his petition in disjointed sentences. Ellis dropped to his knees and with face turned heavenward humbly asked His aid. And as these moments passed, where was the train? Did the Watcher guide them?

At the verge of the chasm a messenger stopped the train. They had turned the curve near the river when a bright fire suddenly appeared on the tracks before them.

A funny little figure stood beside the signal light and as the train stopped waved aloft a burning brand,

"The bridge! The bridge!" it shrieked.

Rough winds tossed back the black cloak, revealing the form of a girl, brown of eye and pink of cheek. Her work done,

the bright face paled, she tottered and fell before them.

The engineer sprang to the rescue, pulling the oil-skin cap from a dainty little head running over with brown curls. He paused aghast, peered first into the deep gulf where the heavy timbers had fallen crashing into the river, then back at the brilliantly lighted train with its living freight.

"What's the matter?" cried the passengers.

"Who is it?" as they saw the unconscious form.

"Some girl has saved us from great peril," said the engineer softly; then

the track and of the difficulty she experienced in lighting the pine sticks which she had brought from the yard at home.

A purse of gold was given her by the grateful passengers. The president of the road voted her the gold medal for bravery with a perpetual pass.

But in after days the most delightful of all the pleasant memories, was that of the face which first smiled at her when she regained consciousness. In fancy, the honest blue eyes beamed on her again and she seemed to hear the voice that thrilled her through and through as he said:

"WELL, I SHOULD LIKE TO KNOW WHAT SHE IS DOING." "STEADY, NOW! LOOK RIGHT AT ME."

added, "If she had not warned us, you can all see what the end would have been."

He carried her into the nearest car; tender hands bathed the pale face, cut from her feet the shoes jagged by rocks.

Dazzled by so much splendor, the girl lay contentedly on the crimson velvet cushions. When stronger, with many admiring eyes watching her rose-bloom face, she told the story.

Told of the message by telephone, the lonely tramp through the blinding rain, of an invalid mother left alone and of the terrible climb over cliffs to the bridge. How the rain ceased before she reached

"Brave little girl—the saver of the train."

The cottage near the bridge now stands empty. It was Frank Carlisle who transplanted the sweet wild rose (now blooming for him alone) to the prettiest cottage of Grafton.

It was a fragrant June day when Frank Carlisle and Georgia Jones were wed. Time has dealt kindly with them both, for in their tiny home happiness alone reigns.

At the foot of the bridge Engineer Frank always pauses with thoughts of the long ago. He never tires of tell-

ing the story of Georgia's bravery and his happy courtship, then adds:

"It's an ill wind that blows nobody good."

Tom Thornton's Superstition.

BY JO CUSTER.

Two miles below G—, near a treacherous curve on the Southwestern, Amelia Strong lives with her grandmother in a modest little cottage, surrounded by a small farm right in the heart of the pine belt. The country roundabout is sparsely settled, their nearest neighbors living some two miles distant at the outskirts of the little village. Here amid the pines in the foothills of the Ozarks, where medicine is a rarity and doctors are unknown, where Nature tints each cheek of her children with indelible rouge, this mere slip of a girl has grown into womanly beauty.

Trainmen passing day after day had been wont to wave at her familiar figure, clad in blue calico and white apron, but hesitated for fear of a father and a double-barreled shotgun. Tom Thornton, one of those wild and reckless engineers found on passenger runs of all trunk lines, waved one-day on his engine and received a response, much to the amazement of his fireman.

Tom's run was the fastest on the road. He was a good engineer, a fine machinist and a conscientious fellow. He was young and full of pluck and perseverance. When the dispatcher gave him an order to make up an hour's time whenever his train came in late, he could take it and be depended upon to carry out his chief's instructions. Like a great many people, and especially railroad men, he was a bit superstitious. Black cats, rabbits and cross-eyed folks were his hoodoos. The influence of these had caused him no end of trouble in the way of suspensions, and had placed not a few demerits opposite his name on the records of the master mechanic's office.

Rounding the curve the next night on his northbound trip, he saw a light in Amelia's window, and remarked to himself that her bean must be down helping her burn the midnight oil. Such was not the case. Men are oftentimes stupid creatures, and this particular one was not an exception to the rule. She had placed the light at the window to see if he would discover it, and answer with a short blast from the whistle.

Several days later Tom slowed up near the section crew, and the foreman climbed aboard the engine to inquire of the trouble. Tom pretended to have found some "bad track" near the curve and re-

quested him to remedy it. "Say, Jim," he added, "who is that little specimen of feminine beauty that lives back there in that lonesome-looking cottage?"

"That's old lady Strong's granddaughter."

"What's her name, then?"

"Amelia—she's an orphan."

"Amelia who? You section men are about as dense a lot as a gang of Australian shepherds."

"Well, you might know that it was the same as her grandmother's," the foreman replied, as a broad grin parted his face from ear to ear.

"Not necessarily. Well, tell her the first time that you see her that I would be pleased to make her acquaintance. I am partial to orphans," said Tom, as he reached for his throttle and left a long cloud of smoke in his wake and a wondering trackman to look for the supposed bad track he had told him about.

The old section man told her what Tom had said, and after finding out his pedigree and inquiring into his general make-up—for most women are suspicious of railroad men—she agreed to let him come down some time on one of his lay-offs. The old fellow requested her to put it down in "black and white," for fear Tom wouldn't believe him on account of the prank he had played with him.

Tom received the note from the operator at G— on the following night when he went in to register. He scrawled an answer on a message blank, stating that he would be down Sunday, and handed it to the operator, who took it between yawns and hung it on the hook.

The following day, bright and early, Tom went to the master mechanic's office and applied for transportation. He boarded the train as it came through the shop yards, and seated himself in the chair car.

"Hello, Tom, what are you doing on here?" inquired Bob Stevens, the conductor, as he came through for the tickets. "I thought that you would stay in town today for the football game."

"I did intend to, but there is a fellow at G— who has a farm for sale, and I thought I would go down to look at it. Farming, you know, is a good thing to fall back on after a fellow has 'lost his nerve,' as is frequently the case on these fast mail runs."

Tom made the conductor believe that the farm in question was near the curve, and prevailed upon him to have the engineer slow down near there so he could get off. This would save him a walk of two miles over a rough road.

Arriving at Amelia's, a black cat ran across his path and darted through the fence.

"I don't like that at all," he said, as he mounted the steps and knocked at the door.

Amelia admitted him, and after an awkward introduction on his part she welcomed him into the parlor. She was agreeably surprised at seeing him, as she had not received any word of his coming. Tom mentioned the note he had left with the operator, and was astonished to see her face color a little when he asked if she knew him.

With a certain amount of womanly delicacy, she told him that the young man was a little in love with her, and that he no doubt harbored a little jealousy toward any one that might happen around

"Please don't throw at Pluto," Amelia begged; "that is my pet, and gran'ma wouldn't like it one bit if she knew it."

"Well, the old saying you know, 'Love me, love my dog.' But I don't like black cats, and haven't any special love for those of any other color. They seem to hoodoo me."

"Hoodoo! What in the name of creation is that?" she asked.

"A kind of bad luck," Tom replied, in a polished railroad accent.

They started home after getting a small basket full of chinquapins to eat around the big open fire.

Tom stayed for supper after receiving a most cordial invitation from both Amelia

PICTURE TAKEN AT THE SILVER WEDDING OF MR. AND MRS. JOHN L. VANDIVER, AT THEIR HOME IN BALA, PA.—Mrs. Vandiver is a daughter of Third Grand Engineer Bro. D. Everett and wife, who attended the twenty-fifth anniversary of their third daughter's marriage on January 21, when more than one hundred guests were present to wish them many returns of the day.

to see her. To both it looked as though the missive had been intentionally intercepted. A prank of that mischievous little god of love in this remote part of our great mundane institute.

This was a typical autumn Sabbath. The bluejays and thrushes fluttered among the trees, some fussing in a bird-like way, while others of a seemingly sober disposition sat in little sun spots enjoying one of Nature's sun baths. It was an ideal day for hunting chinquapins, and Tom and Amelia, followed by the cat, strolled down into the grove to pick those that had opened. Upon seeing the cat, Tom proceeded to hurl stones at it.

and her grandmother. The cat purred around his legs at the table, and Tom bridged the chasm that formerly existed between them by slyly throwing it a few scraps. These were received by the cat as a token of his esteem and affection for him, and were reciprocated by his playfully scratching the big engineer's foot.

Shortly after their meal was finished and the customary chat over empty cups had ended, the nag was hitched to the sulky and Tom was driven to the station. He arrived in time to take No. 2, the fast northbound train. He departed with numerous invitations to come down to Sunday dinners; go with a party on a fish-

fry; go to camp-meeting; and the fact that the latch-string was always hanging on the outside of the door was favorably impressed upon him. It was a case of rural hospitality and true love at first sight.

He was a frequent visitor at the little cottage, and he was always welcome; for he was a man in the true sense of the term—a fair exponent of that higher order of railroaders found on all of the great systems of today. He was reckless only when he sat upon the seat-box of his locomotive, and his great heart throbbed with each pulsation of the exhaust. Then he was daring.

Several months after first meeting with Amelia his aged mother died. He felt alone in the world. This sad event in the young man's life made him more sympathetic; seemed to Christianize him. His familiar face was missed at the downtown resorts. Though he never drank, he spent much of his time there with the boys in a "quiet game." Now he was avoiding the very appearance of evil.

Like all mortals in love, Tom began to grow suspicious of his rival, the operator at G—. He well knew how easily he could put an end to his earthly existence by a few extra touches to a train order. This fear grew upon him, and he had come to the conclusion that one or the other would have to resign.

This was noticed more forcibly on Christmas Eve, when he went in to sign for orders, and was greeted with a scowl. This phase of the crisis puzzled him, and caused him a sleepless night after he had made the run to the other end of the division.

The call-boy came to wake him as usual, but found him up and dressed.

"How late are they this morning, little man?" he asked, sighing and looking out of the window at the falling sleet.

"Two hours and fifty minutes, sir," replied the lad, as Tom signed the book and handed it to him. He tucked it under his little gum coat and started out after the fireman.

Fifteen years before, Tom Thornton had called the little fellow's father, the last day that he spent on earth, when he rode his engine into the jaws of death to save the lives of those in the coaches, while he could have jumped and saved his at the peril of the rest. The company had given his only child this position in recognition of this faithful performance of his duty.

"Such is life, though," thought Tom. "Two hours and fifty minutes late and a slippery track. That's pretty tough for Christmas. The same old story—'drawbacks' in all the walks of life! I guess that they will put about ten cars to the 53

today, and expect me to make up about two hours of the lost time. If they do, some of the passengers that haven't accident policies will want to get off and walk home."

He had not miscalculated the situation. They pulled out of T— with a very heavy train. It was up-hill work for eighty miles, with slippery rails and running against a storm of sleet. The fireman worked as he had never worked before, and not until the crest of the ridge was reached, did he breathe a sigh of temporary relief. He knew that sixty miles of the track ahead was mostly down grade and that the train would roll.

At O—, Tom went in to get orders. "The dispatcher wants to know if you can get to S— for No. 1," repeated the telegrapher as he copied the message.

"Tell him yes," Tom answered, as he looked at his watch and saw that it meant the cutting out of forty minutes of the lost time.

The conductor and Tom signed the order, and each took a copy of it. They both hurried from the telegraph room, for each minute meant a mile of steel traversed. The operator sat at his key and reported them two hours and ten minutes late, as they pulled out of the train shed.

Running into H—, he whistled four times for the white light, but the red remained.

"That's queer," he remarked to his fireman, "orders here for No. 2; something must be the matter with No. 1."

He reversed his engine and slowed down so the operator could give him the order. No. 1 had lost time and the meeting point had been changed. The man at the key at G— had been instructed to hold the red light on No. 1, and keep them there until No. 2 had arrived.

"I'll never see any light in the window tonight. It's past ten and everyone is in bed by now, or ought to be. I wouldn't mind if I were tucked in at the boarding house myself."

The thoughts of a good feather bed at the terminal made him crouch a little nearer the boiler. He was thinking not only of rest and sleep, but of someone—well, of someone else! Amelia, at that far-away little home, was doubtless dreaming of a neat little cottage that Tom had pictured to her on one of his recent visits. She was eagerly waiting for the day when he was so drive up to the front gate with the parson.

"Give the old kettle a good fire, George," yelled Tom, good-naturedly, to his fireman. "It's a hard pull to the top of the hill and it will take a full head of steam to make it. Once over and we'll strike that curve at sixty a clip."

To the boys in the engine it seemed sixty miles an hour; to the passengers a hundred; but to the speed recorder, seventy-nine. Seventy-nine miles an hour down grade with twelve cars and nine of them loaded with human freight, all longing to see the faces of those that were to meet them at their destination. It was a wild ride. A wild one even to the old conductor, who thought of the dangerous curve at the foot of the hill, and knew how hard such a train would be to control in case anything should happen to the air brakes.

Tom's engine struck the curve at a ter-

When Tom told them of the hoodoo that had run across the track in front of them, they wanted to mob him for throwing them into so many ungraceful and undignified positions. He had faced the god of love and his little darts, and various dangers of railroad life, but this was the first time that he had ever been confronted by a lot of irate passengers. The conductor reprimanded him, and ordered him to mount his engine, telling him at the time that he would report it to the master of trains.

The passengers started back to the cars when they were stopped by a shrill whis-

VIEW OF BIG HORN RIVER, NEAR CUSTER BATTLE-GROUND.—Mrs. J. Britton, Phot'r.

rific rate of speed and adjusted herself perfectly to the elevation of the outer rail. The whole train balanced itself like a great ship upon the crest of a mighty billow.

"There goes a cat across the track," yelled the fireman.

No sooner spoken than the slapping of the emergency brakes against the wheels sounded like the report of a cannon. The passengers played hide-and-seek with one another, and they all imagined that death was near at hand. They finally collected their wits, and several started forward to save the lives of the engineer and fireman.

tle of an approaching train, followed by the flickering glare of an electric headlight; then the black outlines of a massive mogul, emitting fiery embers toward the starless sky. There was a scurrying of feet; a silent prayer; then a deathly stillness.

A crash!

Total darkness that seemed like the wings of death encircled the scene. The hissing of steam and the grinding and gnarling of the drivers of the southbound engine sounded like a beast of unknown species.

The home of Amelia's grandmother was

converted into an improvised hospital until the relief train could get there. Only the engineer was killed, dying at his post like a hero, and with his hand grasping the greatest of life savers—the air brake. The fireman jumped and escaped with a broken wrist. Many of the passengers came out of it unhurt, while others were not so fortunate.

The investigation proved to the satisfaction of the management that the operator at G— was at fault, and all the blame rested on his shoulders. When the engineer of No. 1 blew for the signal light, the operator turned it white and

BRO. J. BRITTON, MEMBER OF DIV. 624, SHERIDAN, WYOMING, AND CROW SQUAW.—Mrs. J. Britton, Phot'r.

let him by, contrary to the orders of his dispatcher.

He received his dismissal and his name was entered upon the black list of the road. He cursed his luck, and regretted the fact that he had failed to get the scalp of the man who had defeated him in a statesmanlike manner in the coquest of a woman's heart.

THE worst place in the world for a scold or for one who glories in his skill in the use of the two-edged sword of sarcasm is in any publication.—*Nat. Printers' Jour.*

The Vial's Secret.

BY E. F. STEARNS.

The hour had come wherein lower New York draws the cover of its roll-top and bustles away toward the elevated road and uptown dinner.

In the laboratory, Gunnison, assistant chemist to that eminent analyst, Dr. Merriweather, had concluded the process of cleaning up for the night. He had slipped out of his apron and into his overcoat, and was about to switch off the lights, when Dr. Merriweather came from his tiny private office.

"All done, eh?"

Gunnison eyed with veiled distrust the bottle in the doctor's hand.

"Is there anything you wish me to do—" he began, perfunctorily.

"No! Not tonight! Let me see! You're going over to Jersey City in the morning, aren't you?"

"To report to those Graydon Mining people—yes, sir."

"All right. Go straight over there from home. That will bring you back here to the laboratory by noon?"

"Easily, I should think."

"Well, that's time enough."

Merriweather placed the bottle on the table and seated himself upon the distilled water carboy.

"Very likely I shall have left when you get back—Johnson's acid works, over in Greenpoint, have managed to get into some sort of muddle again. Go to work on this stuff as soon as you come in. I want to report it tomorrow night."

Gunnison reached for the bottle and examined it.

"Solution Bromide of Soda," he read. "Brand Brothers, Manufacturing Pharmacists. What about it, doctor? Some one getting suspicious of Brand Brothers' preparations?"

"Not quite. It just came in from the Coroner's office for analysis."

"The Coroner's office?" Gunnison opened his eyes.

"Nothing less. There's a thrilling mystery in that bottle. The label, as you see, informs us that it contains bromide of soda—a harmless sedative, of course. The last man who took a dose of it died within six hours!"

"And they think—"

"That the stuff's morphine, instead of bromide, and that the old fellow was dosed to death with it."

"Purposely?"

Merriweather shrugged his shoulders.

"That young sawbones Carney, who brought in the thing, spent a solid hour spinning the yarn to me. The late lamented was an old chap up town. He'd been confined to his bed for months, I understand, but they hardly expected him to go off like this. He had all sorts of money and no relatives, save a niece—an orphan—who went to take care of him something like a year back."

"And what led Carney to think that it was morphine poisoning?"

"He says that he knew it for morphine poisoning on the instant. To all appearances the old man had risen from bed and tried to cross the room; but he must have fallen and carried down the medicine table with him. Plates, glasses—everything—were smashed to bits, with the single exception of that bottle beside you. Carney asked one of the maids about it. She had been helping the niece with her nursing, and she recognized it at once. Here's where the clues begin to bristle, Gunnison.

"The maid told Carney that the family

BURLINGTON TRAIN CROSSING BRIDGE AT FORT CUSTER, MONT.—Photo. by Mrs. J. Britton.

"And they suspect the niece?"

"Carney does, and I imagine that he has implanted that belief pretty firmly in the Coroner's office. It seems that about 3 o'clock this morning some one routed Carney out of bed, and he found the old man's butler on the steps, with a hurry call for medical aid. The family physician is out of town.

"Well, before long he was examining the poor old chap. None of the women had had sufficient strength to move him—he lay stretched on the floor, just as they had found him. He was just breathing, and Carney went to work to revive him; but it was no go. The old man died within ten or fifteen minutes."

doctor—his name's Macgruder—had been in during the evening. The old man had suffered considerable pain all day, and Macgruder wished to leave some morphine for him. He asked for a bottle in which to dissolve some tablets, and, according to the maid, the niece gave him that one. Later on, while the maid was in the room, the sick man called his niece for something or other, and that prepossessing young woman very calmly gave him a tablespoonful of the stuff. Macgruder had instructed her to administer it by half-teaspoonful doses."

"Do you—do you suppose a young girl could commit a cold-blooded murder like that?"

"The old man was pain-racked and peevish, and very frequently swore point-blank at the girl. Maybe she's one of these hysterical mortals who go irresponsible after a prolonged strain, such as this nursing must have been. Then, too, the old fellow had willed all his money to her, and Carney says there's a stack of it. She may have needed some."

Gunnison was breathing rather heavily. Dr. Merriweather arose and yawned. He turned to leave the laboratory. The assistant chemist slid from his stool and started after him.

"Dr. Merriweather!"

"Eh?"

"What—what did you say the dead man's name was?"

"Golden—Philip Golden, I believe. He was a retired broker, or something of the sort—lived up on Madison avenue."

The door closed behind Merriweather. Gunnison gripped the table for support and choked back the sharp cry that had almost escaped him.

Editha Golden, the niece in the case, happened to be Gunnison's dearly beloved fiancée.

* * * * *

Shades were drawn at the Golden home. A silent maid escorted Gunnison to the library, and there he waited, awed at the uncanny stillness of the big house.

Very shortly the curtains parted and a slim girl entered, beautiful but haggard and pathetically weary of mien.

"It is all over," she said.

"Yes, little girl, it's all over."

Gunnison gathered her into his arms, and for a little time she sobbed on his shoulder. Presently she allowed herself to be drawn down beside him on the couch.

"Bobby, dear, it's so good to have you here," she sighed.

"But why didn't you send for me during the day?"

"I—don't know. I—I think I was—afraid."

"Afraid?" Gunnison smiled with tender incredulity.

"Yes. I—wanted to see no one, not even you, Bobby. I—I was afraid, and—"

Her voice died away and the girl stared across the room at the fireplace.

"What is it, child?" Gunnison asked, gently.

"Bobby!" Editha's eyes were wide with terror as she faced him suddenly. Her voice dropped to a whisper. "I never meant to tell a soul—never till the very day I died! But I can't—I can't help it. I can't bear it alone any longer. All day I have felt somehow that the servants knew—that—"

"Knew what?"

"And that doctor last night, too—he said nothing, but when he left he stared at me so strangely. He must have seen it—he must have found it out. He'd be sure to know—a doctor would know at once—wouldn't he!"

She clutched his hands, and he felt that she was trembling violently.

"Bobby, I—I—killed Uncle Philip!"

"Editha!" Gunnison's heart seemed to cease beating.

"I did! I know it! I killed him!" she moaned, clinging to him like a frightened child.

"Hush! You don't know what you're saying, Editha. Some of this infernal pack of servants will hear you, and—"

"Oh, I'll be quiet," Editha hurried on, the words tumbling forth excitedly, "but I must tell you, Bobby. I must—I'll go mad if I don't. Last night Dr. Macgruder came in for a few minutes—he was leaving the city. Uncle Philip begged him for something to ease his pain, and the doctor took some morphine tablets from his hypodermic case and asked me for a bottle to dissolve them. I gave him one of those bromide bottles—poor Uncle Philip needed so much of the stuff to quiet him that we have empty bottles all over the house. There was a half-empty bottle of bromide on the table, too, and after he had fixed the morphine, Dr. Macgruder handed it to me and cautioned me to label it at once, before I confused it with the bromide. Then he hurried away, for he had barely time to make his train.

"Yes?" Gunnison forced from dry lips.

"I put the morphine bottle at the edge of the table and apart from the others, and went to my desk in the next room to write the label. Oh, Bobby, I was up all the night before!" she pleaded suddenly.

"Go on, Editha."

"I suppose it was simply criminal, but I was so utterly fagged that while I was writing my head began to nod, and when I had finished I fell fast asleep at the desk. I must have been there more than an hour before uncle called me. I was sleepy and completely confused for a while. Ellen was in the room—the second waitress, you know—and she had been trying to quiet him; but he insisted upon having me give him a dose of the bromide. He was so impatient and overwrought that I hurried over to the medicine table, picked up the bottle and poured out a tablespoonful. He took it, and then—"

"And then?"

Editha shuddered.

"I went into my room and fell asleep across the bed. I think that it was a little past 3 when the crash aroused me. Uncle had left his bed and fallen and overturned

the medicine table. Everything on it was broken."

"Everything?"

"I think so. We sent William for a physician and he brought Dr. Carney—a young man. He said that nothing could be done. Oh, Bobby, think of it! I must have seized that morphine bottle in my excitement, instead of the bromide—and I killed poor uncle! I never realized what had happened until I found the label on my desk this morning!"

Gunnison, during the narrative, had regained some degree of composure. Palpably, she knew nothing of Carney's gruesome theory, nor of the unbroken bottle. He turned to the girl with what, under

The Graydon Mining matter could not be postponed, so Gunnison did not reach the laboratory, with its fateful bottle, until 1 P. M. the next day.

Merriweather had left. The office boy was holding the place in solitary glory. Gunnison entered the laboratory and closed the door behind him.

On the table, as he had left it the previous evening, stood the bottle. He snatched it up angrily, and raised his arm as if to dash the thing to bits.

That would settle it. Either the bottle held morphine or it held bromide of soda—death or life. Which? Neither he nor any other could tell without analysis. Gunnison had resolved never to learn.

THE C. & A. RED TRAIN, THE ALTON LIMITED, BRO. M. H. BUTLER, OF DIV. 19, AT THE THROTTLE.
—Courtesy F. M. Butler.

the circumstances, passed for a confident smile.

"Edith, haven't you excited yourself a great deal about nothing? I don't believe you ever confused those two bottles."

"But if I didn't—if I gave him the bromide—why did he die?"

"That might have happened any other night, little girl. Macgruder has always said that, you know. His heart was weak. When's Macgruder coming back?"

"Tomorrow night."

"Then you may be quite sure that he'll explode that foolish notion of yours, Editha. He'll tell you that a bad heart was responsible."

"I hope so. But—oh, if I only knew!" cried the girl.

But suddenly a new aspect of the case flashed over him. Suppose that he did shatter the thing? Might not the very act later loom up as a transparent trick.

Gunnison caught his breath. Intentionally or otherwise, the bottle must not break. He replaced it upon the table with the utmost care.

For an hour he paced the floor, trembling at times in an agony of indecision. He dared not destroy the stuff. Dare he analyze it?

The chemist uncorked the bottle with a firm hand, selected a clean test-tube and poured out a little of the liquid, water-white and enigmatic. He reached for one of the reagent vials on the shelf—and paused again.

Suppose that it should prove to be morphine? What then? The news would be transmitted through Carney to the Coroner. An inquest would certainly be held. Carney would give his testimony. Ellen, the maid, might positively identify the bottle and swear that her mistress had given of its contents to Golden. They would call it murder. Then they would look for a motive—and find it in Golden's will.

Almost with loathing, Gunnison sprang away from the table and the bottle.

The afternoon grew and waned. Gunnison tramped on and on and on, heedless of the passing hours, wrestling with his problem; now, maddened with the uncertainty; now cursing himself for not undertaking the analysis.

The closing of a door caught his ear. In an instant his brain had cleared. The emergency was upon him. Merriweather had returned. And, on the spur of the moment, quite a simple solution of the difficulty appeared to Gunnison.

He glided across the laboratory, uncorked the bottle once more, quickly inverted it over the sink and watched the liquid disappear down the drain. He hurried back to his desk, drew forth a note-book and hurriedly set down a spurious record of the analysis. He produced a report blank, the report for the Coroner, and inscribed in a neat hand the information that a bottle submitted by one Dr. Carney had been found to contain a solution of bromide of soda, free from adulterants.

The chemist mopped the perspiration from his forehead, bathed his burning face in cold water, smoothed his rumpled hair, and, picking up the report, walked to the door of Merriweather's office.

The doctor was at his own desk, writing away under the incandescent bulb.

"I'm through with that stuff from the Coroner's office," Gunnison said, rather hoarsely.

"Eh?" Merriweather whirled about in his chair.

"That bromide of soda bottle."

"Pshaw! Have you been working at that, Gunnison?"

"Yes. I—"

"I meant to tell you—rather, to leave a note for you, about that," said Merriweather. "I went at it myself this morning—made an analysis out of sheer curiosity."

The report crumpled audibly in Gunnison's hand. Merriweather had analyzed it—yes, and reported it as well!

"What—what did you find?" the assistant chemist managed to ask.

"Ei-yah!" Merriweather yawned and

stretched, and to Gunnison the operation consumed hours. "Why—ah—there was nothing under the sun in that bottle but a dilute solution of bromide of soda." Merriweather turned back to his desk and hunted for a cigar, as he talked. "I tell you, Gunnison—nothing personal in this; of course—if there is one thing worse than a young chemist, it's a young doctor. This Carney chap must have a head full of dime-novel romance that he's trying to fit into everyday life. Positively, from what he himself told me yesterday—eh?"

Merriweather realized with considerable astonishment that he was alone in the office.

Below in the street, Gunnison was pushing frantically through the crowd. An echo of the night before dinned in his ears—"But if I only knew!" And he sacrificed the toes and ribs of the populace, in the speed of his transit; for she could know—now.

A Woman's Pleasure.

BY SYBIL CONSTANCE BARLOW.

"Lucky fellow, that Barry Seymour! On the high road to fame and fortune," remarked Lord Donoghue, and when his Lordship said anything it was not to be contradicted, so the listeners tried to look interested, and remember who Barry Seymour was. One of the many rising young artists who had two pictures on the line in last year's Academy, and was now going to paint Lord Donoghue's daughter, the beautiful Alix. Barry Seymour himself was very delighted with his good fortune. Many a time he had longed to paint that face, the face which had more charm for him than any other, the face which haunted him so very, very often.

"You really promise to sit for me! You're divine," exclaimed Barry, gratefully.

"I know it," returned Alix, surveying her old friend with a saucy air.

"When shall we have the first sitting?"

"Whenever you like."

"Tomorrow at eleven?"

"Impossible! I am going shopping with Mrs. de Hawtris."

"Wednesday, then?"

"I leave town on Wednesday, but I shall be back by Saturday."

"Any day I like," groaned Barry.

"Well, what about the following Monday?"

"Yes, I will come then." And so she did, late, it is true, but so charmingly penitent that Barry could not remonstrate.

"You look hopelessly fashionable," he said. "Now I am going to transform you into a picturesque maiden, like this," and he showed her a rough sketch.

Lady Alixe cast off her hat and cape, and calmly rearranged her hair.

"That is better," said Barry. "I will set to work."

Never had he taken more pains, and certainly never had he succeeded so well. The morning flew by all too quickly, but his model was gracious, and promised to come every day until the portrait was finished. I fear an unprecedented amount of sittings were required, and Barry soon found his model so fascinating that the studio was intolerable to him without her presence.

he was only spoiling his former efforts.

"I shall only come once more," she said, on leaving, and Barry assented.

But when she came he found it utterly impossible to continue.

"I cannot paint today; it is useless to try," he said, at last, throwing his brush down impatiently.

Alixé came behind his chair and regarded her likeness critically.

"You are spoiling it."

"I know, but for all the world could give I cannot go on."

"Supposing," she said, hesitating a little, "that I did what—what you asked me to. Would it make any difference?"

Barry started up.

SHAY LOCOMOTIVE N. P. RY., MOUNTAIN CLIMBER OUT OF YACOLT, WASH., BRO. W. J. HAAG, DIV. 379. AT THE THROTTLE.

Alas, for the builder of dreams and fancies! One day poor Barry could restrain himself no longer, and very much astonished Alixe by offering himself to her. She was a little pleased at first (women don't often consider the feelings of their victims), then the capricious young lady grew angry at what she termed "his presumption," and she left the studio.

"You must never speak to me like that again," she wrote, "I will be generous and come for you to finish my portrait, and then—good-by."

Two more sittings accordingly took place, but Barry's power seemed gone. In silence he worked away at his ease, but Alixe observed with annoyance that

"Oh, don't!" She drew away from him half frightened.

"Don't what? I have done nothing, but this is what I am going to do." Alixe submitted meekly, and I fear another day was lost, but after that Barry set to work in earnest, and it was not long before the picture was completed. Alixe came to see it when framed, and was well satisfied with the result.

"It is beautiful, much too beautiful to be like me."

There was something unusual in Alixe's tone, something jarring and unpleasant. Barry noticed it, and saw, too, for the first time, hard lines round her mouth, and a cold, haughty look in her eyes. He took her hand, but she drew it away.

"Why, Alixe, what is the matter? Are you vexed? Is it 'Mustn't touch' today?"

"Yes," she said, low, but clearly; "to-day and every day, Mr. Seymour. I—I have changed my mind."

His white face puzzled her. She did not understand his expression, and felt pettish.

"Well," she said, breaking the silence, "you don't seem to care much."

"If I care," began Barry, passionately—but her silvery voice checked him.

"Oh, don't go into heroics! I can't bear scenes, you know; and I'm awfully sorry!"

"Sorry!" That word from her lips, so spoken and so meant, was an insult to him.

"If you don't wish for a scene, leave me, for God's sake!" said Barry, huskily; and he turned away and stood by the window until Alixe had left the room, shrugging her dainty shoulders.

"Oh, yes!" she said to a girl confidante, "my picture is finished, and well done, too. I felt convinced he could do it if he set to work in the right frame of mind. Poor Barry! he nearly spoiled it in the middle; but I managed that."

"How?"

"Why, the silly fellow lost his senses," replied Alixe, glancing complacently at her reflection in the mirror, "and when I refused him, my portrait suffered. I was not going to let my reputation be spoiled by a dabb, so I—I humored him for a little. By the by, do you remember Sir Douglas Probyn, and how I quarreled with him? He is just come back from abroad, and is now very rich. Aunt is going to take him to the Academy, and I have instructed her to show him my portrait and watch the effect. I hope—"

But Barry sat silently before his easel with untouched palette, and beside him lay the shreds of a torn canvas.

The Car Seat Hog.

BY VIRGINIA MILLER.

The day was hot and sultry and the train crowded, rendering travel anything but pleasant. Jack liked comfort, however, so he leisurely walked the full length of three coaches in search of a vacant seat, and finding one, appropriated it, placing his gripsack on the end next the aisle. At the next station several passengers came into the car, but Jack was too busy gazing out of the window to notice the longing eyes turned toward the resting place of his grip, until a young man, stopping by his side, asked, courteously: "May I occupy this seat, sir?"

"This seat is engaged," fibbed Jack,

glibly. "A gentleman stepped out just this minute, but will soon be back. He left his baggage purposely to hold it."

"All right," said the young man, quietly. "But I am very tired, and, with your permission will occupy it and hold the satchel until he comes back," and, suiting his actions to his words, he lifted the grip and slipped into the seat.

Jack frowned and inwardly grumbled at his luck. At first he thought only of his own discomfort, and took no pains to conceal from the stranger that he resented the intrusion. Not until the conductor came along collecting fares did it pop into Jack's selfish little brain that he had fibbed himself into a ridiculous situation. What if the stranger's destination were beyond Springfield, his own station? He tried to see the young man's ticket, but failing in this, settled back in his seat with a hope, from station to station, that the next stopping place would see the last of his unwelcome seatmate.

The young man waited expectantly for the return of the stranger whose absence he was enjoying in the comfortable possession of a seat. He had accepted Jack's statement in good faith, but the man's prolonged absence, coupled with the boy's evident desire to get rid of his seatmate, made him suspicious, so long before Springfield was reached he had grasped the true situation, and had made up his mind to punish the selfish prig by his side for his deception and discourtesy.

Jack's nervousness increased visibly as the number of stations between the racing train and Springfield lessened, and when the engine puffed out from the last one, with the stranger holding his gripsack still aboard, he was in an agony of suspense, while the man with the bag read on as calmly and coolly as if he were in entire ignorance of the drama going on by his side.

"Springfield," called the conductor, and getting on his feet Jack in sheer desperation reached for the grip. But he did not get it, for the stranger, with an air of surprise, drew it away from his touch, saying: "I beg your pardon, sir, but this is not your baggage."

"It isn't yours," stammered Jack.

"I do not claim it, but as I have it in charge, I propose returning it to its owner," was the cool answer.

"I'll save you that trouble," replied Jack. "I know the fellow, and shall take it to him," and he made another grab for the grip.

"Hands off!" retorted the guardian of the myth's baggage, in a louder tone than was necessary. "Here, conductor!" he called. "Here's a chap who wants to walk off with somebody else's baggage. The other somebody put it into a seat to

hold it, of course, but he doubtless got left somewhere, since he has not put in an appearance to claim his property. There is no name attached to the bag, so this youngster is trying to make believe it is his, and wants to walk away with it."

"Ho, ho," exclaimed the quick-witted conductor, catching the gleam in the speaker's eye. "There is but one thing to be done under such circumstances, and that is to return it to Columbus to be stored with other unclaimed baggage for identification."

"But the gentleman left the gripsack in my care, and I shall take it to him. He is a friend of mine," claimed Jack.

"Hold on, there!" said the conductor, flinging back his coat so as to reveal a police badge. "There's got to be more proof about this than your say so. Describe the man who left the bag? Was he young or old?"

"Youngish like," answered Jack, and went on to describe the myth's appearance, but between the young man at his side, and a few sympathizing passengers who combined to confuse him, he became so tangled up in this attempt that he gave up and fled in despair from the train, leaving his grip in the hands of the conductor, and a smile of triumph on the face of the young man, who had the property returned to Columbus, whence, after considerable delay and expense, Jack succeeded in regaining possession of it.—*Young People.*

In a Mexican Prison.

"Look out ahead there!" the engineer shouted as the big black locomotive darted around a sharp curve at the foot of a long down-grade. Beyond the curve there was a tangent for the space of three or four telegraph poles, and at the other end of the little stretch of straight track a long, low wooden bridge. The road had been rushed in real American fashion, and the steel structure that now spans the wide stream, had not been placed.

Rounding the curve, the driver glanced back to see if the green markers on the rear Pullman were still coming, for it seemed as if the speed of the train would snap the sleeper off as a boy flings a wet cob from the end of a stick. The engine appeared to hesitate an instant as she found the tangent, and then to give a wild leap forward. The sun's reflection glared up into the cab windows as the river flashed beneath. It was as if she had left one bank and alighted on the other.

"That's where my trouble began," said the driver, twisting on his narrow seat, and turning his head slightly, but not enough to take his eye from the track.

"I was pulling freight at the time," he went on, releasing the lever and giving her another notch as we struck the upgrade beyond the river, "and they were driving us day and night. We used to have to come down the canyon back there as fast as they would fall and fan 'em over the bridge as fast as we could, 'consistent with safety,' as Mr. Robinson would say. If you failed to hit this hill at the thirty rate, it was cut and double, delay freight, interrupt passenger traffic, and court disgrace."

The driver moved his left eyebrow slightly with the faintest possible glance at the steam-gauge, and the fireman who was leaning over the boiler, dropped to the coal deck.

"Of course, you understand," the driver explained, that these Mexicans didn't send for us. The few Yankees who, for the climate or other reasons, came down here, were taken under protest, but the railroad they wouldn't have at all. As often as there was an accident there was an arrest. Every time a peon perished a white man went to jail. The influential and more or less intelligent men were against the American and his fire-wagon, and the peon followed the fashion of hating the Yankees. He would go out and stand on a bridge out of pure cussedness, knowing the driver would stop rather than run him down, and, at the same time, run the risk of rotting in a Mexican dungeon. Well, this day of my downfall, I came round the curve with a big consolidation engine, and about a mile of traffic on my trail. As I rubbed round the corner I saw a pig of a peon just starting to walk over the bridge. I whistled, shut off, threw on the air and finally reversed the engine. The peon stopped, turned and scowled. Before the air could travel to the rear of the train, the heavy load had kicked the engine across the little level space. I leaned out of the window and watched the face of the fool Mexican. When he saw that the train was not going to stop he turned deadly yellow. I pulled the whistle-valve wide open, the peon crossed himself and sunk trembling to his knees, and at that moment the pilot picked him up and scooped him into eternity.

"We doubled that day, and when I got to the end of my run they were waiting for me. They marched me off, unwashed, to the court, and from the court to the jail. Here I had plenty of time (but no water) to wash, and time to rest and think it over. The railway officials appealed to the United States Consul, but the Consul was busy, or tired, or attending a banquet or something, so I stayed in jail.

"Months passed. Scores of prisoners, criminals of all classes, came in, sat in silence for a space, and passed out again.

As near as I could count time, I had been in jail a year, when one fine day they threw a little Englishman in. As the soldier shoved the man through the doorway he gave him a vigorous kick, and the Englishman whirled and knocked the soldier out into the yard. 'Bravo!' said I, and the little Briton turned and came close. He asked how long I'd been in and I told him. I ventured a guess that they would shoot him at sundown. 'Not on your sombrero,' said he, 'I'll be out by that time.'

"To my surprise the Englishman showed not the least uneasiness. He had some tobacco and made cigarettes, but I could not smoke. I had been so long on the vile jail victuals that I dared not take the risk.

"Late in the afternoon we heard a great hubbub outside, the door opened and in swept a bewildering woman. She glowed and glistened in the shaft of sunlight that followed her, and looked like a beautiful butterfly in a muddy lane. "Ah, Signor," she cried, giving both hands to the

Briton. A severe-looking man, whom I was able to remember as the Jeffe Politica, the chief or head of the government police, followed the young woman, and a moment later the jailer came in with the soldier who had been knocked down. The soldier was very angry. The Englishman explained to the girl and the girl spoke Spanish like lightning for a whole minute. The Jeffe said something, and the girl told the prisoner to go outside and show them just how he had been jailed. I saw a devilish grin on the old rascal of a chief's face as the soldier and the Englishman stepped out. The Briton looked mean as he could, caught the soldier by the collar, shoved him in and gave him a kick that fairly lifted him off his feet.

"'Bravo!' shouted the girl, the chief smiled, the jailer scowled and the soldier slunk away.

"After that they began to investigate the Englishman's other offense. The girl did most of the talking. Her cheeks were flushed and her dark eyes glowed as she argued and pleaded for her friend, but it was a long time before the chief showed any signs of melting. Finally, however, he agreed to let the man go upon the payment of some slight damage done to the property of a Mexican restaurant keeper.

"As soon as his fascinating counsel had succeeded in freeing him, the Englishman began to intercede for me. Up to that time I had been sitting on a long bench with the rest of the prisoners, unnoticed, being about the size and shape and color of the others about me.

"After listening for a few moments the chief threw up his hands and started for the door. He was hungry, thirsty and hot. Already he had been persuaded by the eloquence of the butterfly-colored interpreter and was impatient to be off.

"My heart and hopes went down, but the girl turned, gave me her warm soft hands, and said the chief would come tomorrow.

"'To-morrow,' I gasped, and she withdrew her hands and hurried away.

"She was gone, the dungeon was silent, and still the sound of her musical voice seemed to echo from the dingy walls. She was gone, and it was dark, save for the recollection of her sunny smile, that, lingering, lit the prison gloom. She was gone and the world grew cold again, but my hands were hot where her finger-tips had touched them.

"'To-morrow she will come,' I repeated, and fell asleep.

"The next day dawned as the day before had dawned. There were the same sights and sounds, the same hot stuffy smell in the atmosphere, the same sad faces about, another scant meal, and the same soul-crushing silence to follow. The

morning passed, the afternoon waned, the evening shadows fell about the old jail, but the chief came not. The lift this rift in my clouded life had given me, served only to deepen the gloom in which I seemed to sit. I tried for hours to put the brazen woman out of my mind. I tried to hate her. After all, she was not two pesos better than a peon. She had lied to me when I had asked nothing of her. I closed my eyes to shut out the memory of her and saw her as plain as day. My hands were still warm. I fell asleep hearing the echoes of her melodious laughter, and dreamed that I was back in God's country, where they have grass and rain and running water.

"The next day began just as the three hundred and sixty-five others had begun, but when I had eaten what I could swallow of the morning meal, and sat down to try to think, the door opened quickly and the butterfly blew in. She stood for a moment, glancing this way and that. I watched her and hated her. 'Signor! Americano!' she called, then catching sight of me, she fluttered across the little patch of sunlight that came in through the one narrow window, cooing like a dove: 'Signor! Ah, Signor!' and I felt the hate going out at the back of my neck. She put out her hands, and as I stood up, touched mine and then dropped them again. I watched her and could have died for her.

"Rapidly, in bad, broken English, she told me how her friend, who was a mining engineer, had been obliged to go to the hills, and that she had, by the merest accident, seen the Jeffe passing her mother's shop that morning and asked after me. The old sinner had thrown up his hands and confessed that he had not thought of me since he left me. She had gotten him to promise that he would meet her at the jail in an hour, and she had come to talk to me and cheer me up until he could arrive. That was the shortest hour of my life. She had brought tobacco and cigarette paper, and she made me smoke and I smoked it, and enjoyed it as I had never enjoyed a smoke before.

"When she had been there ten or fifteen minutes, the old rogue came in, and she upbraided him for being an hour late. I learned then that the old chief was the girl's uncle, and immediately his stock went up.

"The girl did the talking, but for nearly an hour the head of the detective bureau sat silent, impassive as the sphinx. Suddenly, as if the thing had just occurred to him, he began to make terms. The girl listened, smiling and frowning alternately. Presently she explained.

"I was to be released conditionally. The chief was to go over the road with

A GOOD ILLUSTRATION OF THE GROWTH IN THE MOTIVE POWER ON OUR GREAT TRUNK LINE RAILROADS—ENGINES NO. 1 AND 1141, NORTHERN PACIFIC RAILWAY.—Courtesy Bro. C. C. Dean, member of Div. 290.

me on the engine, and if I could satisfy him that peons were in the habit, as I had stated, of walking, standing or sitting on the track for the purpose of annoying the engineers, I was to go free. If there was no evidence to justify my assertion, I was to go quietly and peacefully back to jail and 'await trial.'

"I consented, of course; was immediately released, got an engine at once, and a few days later the Jaffe and I were sailing down the canyon. We had covered two-thirds of the run, and as often as we came upon a peon he stepped aside and allowed us to pass him without bloodshed. To my consternation and deep disappointment, the peons appeared to be getting sense. I had almost lost heart when we rounded Diable curve, and found a peon on the bridge. Suddenly now, and with startling vividness, the recollection of the awful look of agony that I had seen upon the other peon's face came to me. I forgot my trial and the man of the law who stood behind me in the cab. The shadow of the dungeon that had haunted me all day disappeared. My only anxiety now was to save the peon. I worked the lever, kicked the cylinder cocks open, gave her steam in the back motion, but to no purpose. She literally skated across the short stretch of straight track, and when I looked out again her nose was on the bridge. The peon stopped, turned round, and glared defiantly at the black engine. Seeing we were not going to stop, he jumped out on the edge of the bridge, and grinned insolently up into my face as I passed him.

"The train came to a stop with the caboose barely off the bridge, and when the chief walked back he met the peon, and when he had grown weary of kicking him, they rolled him into the way-car, the conductor gave me a go-ahead signal, and I pulled out. We had to cut and double on the hill and the delay went down against the peon. At the trial that followed, the old chief was the principal witness, and prosecuting attorney. They gave the peon seven years in the 'Hot Country,' he added, reaching for the rope, 'and I have not seen a Mexican on the bridge from that day to this, and that was ten years ago.'"

"And what of the mining engineer who found you out and the raven-haired angel who rescued you?"

"The Englishman made a fortune in the mines, married the girl, took her away with him, and, as a compromise between England and Mexico, they live in Spain; and if this story had been much longer we must have cut and doubled, for this is the end of my run."

The hostler climbed into the cab, the yardman pulled the pin, and the big en-

gine rolled away to the roundhouse and to rest. The engineer stood and watched her until she was lost in the sea of cars that covered the maze of tangled trackage.

Then he turned and waved his hand to me and said, "Adios."—*Cy Warman, in the Winnipeg Voice.*

Beans and Peanuts as Food.

The Department of Agriculture reports most interesting experiments made by Professor Poffa, of the University of California, upon men engaged in hard manual labor most of the time and students working to support themselves while pursuing their studies. The Professor says: "Nuts are the cheapest source of energy, peanuts ranging far ahead." The price, 3.6 cents per 1,000 calories of energy, is at less cost than any animal food, or potatoes at 90 cents a bushel. Peanuts deserve special mention because the cheapest domestic nut containing the highest percentage of protein, with maximum fuel value and minimum refuse. Ten cents, for instance, will purchase more protein and energy when spent for flour and meal, but these are raw materials, requiring considerable preparation before they are eaten. This is not necessary with fruits and nuts. Ten cents' worth of peanuts will contain about four ounces of protein and 2,767 calories of energy. Although peanuts supply protein and energy for a smaller sum than bread, they are outranked by dried beans, which, at 5 cents a pound, will supply for 10 cents over 200 grains of protein and 3,040 calories of energy. If more peanuts and dried beans were used by the fruitarians the diet would be enriched and the cost decreased. Fifteen cents a day was the average cost, with fruit, nuts, beans, and a limited quantity of cheese and eggs.—*The Outlook.*

Charcoal a Disinfectant.

Charcoal may be had of any druggist, usually, in either powdered or tablet form. The powdered form may be taken mixed with honey. Its effect is to absorb gases and impurities from the stomach and intestines, and it acts as an internal disinfectant. Ask your physician.

MR. MATTHEW WRAGG, the oldest engine driver in the world, has just died at York, England. He was close on 80 years of age, and fired on the old No. 1 engine, which is now on view at Darlington Station. He had been a driver for 60 years, never had an accident and was never fined.

Correspondence.

All contributions to our Correspondence and Technical columns must be in not later than the 10th of the month to insure insertion.

Articles must be written on one side of the paper only. Noms de plume may be used, but every article must be signed with full name and address of the writer to insure insertion.

We shall be glad to receive articles on any subject of general interest to the fraternity.

All communications are subject to revision or rejection, as the Editor may deem proper.

The Editor does not assume responsibility for the opinions expressed by contributors in this department. C. H. SALMONS, Editor and Manager.

A Song for Old-Timers.

I toss my old chapeau in air
To cheer Divisions everywhere,
Now forty years surviving;
They're worthy of our best acclaim,
Because they've won an honest name.
Today they all are thriving.

They've witnessed dismal days of old,
When up men scarce their heads could hold,
And chains they trailed behind them;
When whips were cracked with vengeful might,
And wrong was victor over right,
And vicious foes did grind them.

Oh, what a change! The honest cause
Of Brotherhood has won applause
From men of every station;
Officials of our railways now,
Impartial and with truth allow,
'Tis proving men's salvation.

Division sixteen, some moons ago
Screamed out her forty summer crow,
Without a fear or falter;
And eloquently all declared
How every joy and woe they shared,
Since first they kissed her altar!

They're worthy of sincerest praise,
Of eloquence and pleasing lays,
Those pioneers all over,
Who kept their membership along,
From days, when smarting under wrong,
Till now, chin-deep in clover.

—SHANDY MAGUIRE.

Trouble and Triumphs of Travel.

BY SHANDY MAGUIRE.

[Continued from February JOURNAL.]

"Then you intend to leave on Friday?"

"Yes, if his nibs from the lower regions stood at the door, saying, 'Thou shalt not pass,' I'd say, 'Get behind me, Satan, for I shall pass.' Here is a telegram sent me by Mr. Wills, which Dick Kelly and

Myer Hurley have helped me to, which says the pass is waiting for me in Chicago."

"Very well, you will not have to wait for me."

"Good girl! Just think of the scenes in the rotunda and parlors of the Hollenbeck just now! The boys and girls are there from every part of this continent between old Mexico and Vancouver, and we here; but we shall get there and foregather with them in a very few days. The many conventions which we have attended leave nothing but pleasant memories in our breasts, and we can look back on this one also with the very same endearing feeling of gratefulness for being participators in its never-to-be-forgotten enjoyments.

Long, long be my heart with such memories filled!

Like the vase in which roses have once been distilled;

You may break, you may ruin the vase if you will,

But the scent of the roses will hang round it still.

You see, I am calling upon Tom Moore in his most witching language to express the fullness of my heart tonight, for my own limited vocabulary is too poverty-stricken to tell my joy.

Next morning I sent a letter to General Superintendent Clarke, asking him if the pass between Buffalo and Chicago had reached his office to kindly send me it. In the same letter I explained the telegram which I received from Mr. Wills.

The train carrying my letter was not thirty minutes in Scranton when the characteristic kindness of the gentleman manifested itself in the following reply, sent me by wire:

"An enclosure to you this evening on No. 3."

When the train arrived I found my pass to Chicago and return, and as good things were flying in flocks about my head just then, I met Trainmaster J. H. Halleran, of the R. W. & O., by chance, who asked me:

"How are you fixed to Buffalo?"

"Around the horn," I answered.

"I'll take care of you our way."

"God bless you," I replied; "and as I am not in the habit of talking Him to death suing for favors, to be given me without earning them, He may pay more attention to me than to those who are perpetually begging of Him to help them out."

Next day Kittie bossed the job of packing the trunk, and I was her most abject slave. When I got it to the station the same evening, I tell you that feeling like the proverbial dog with two tails didn't express my elation as I watched my opportunity to approach the check dispenser when he'd have a little group around him. The moment came, and I said:

"Dan, please check this trunk for Los Angeles!"

Well, that same trunk traveled a good many miles around the continent, but never before did I look upon it so endearingly as on this occasion.

A native heard me asking for the check, and as I stowed it away in my pocket I started from the baggage room, he following.

"Say, are you goin' wid the trunk?"

"Yes."

"Is the ould woman goin', too?"

"Yes, Jim; you don't suppose I'd go without her?"

"Begob, it's aisy for ye to take her. The devil resave the cint it will cost ye; wherein if I only was goin' up to Kano's Bridge I'd have to fork out the tin cints."

"That's so, Jim; it won't cost anything for railroads, anyway."

"I wish I was goin' wid ye."

"I don't; you'd talk me to death before we got half way."

"Begob, and you're not noted for carryin' a tongue in your own mouth. that has to be greased to keep it from rustin', by a long shot."

"Oh, dry up, and don't make a show of me here on the street. Wait till I get back."

"Give me a quarter and I'll give ye me blessin'."

"Here! That's to get rid of you."

"Put it there avic," said he, stretching me his hand, and while I was warmly shaking the honest old fellow's calloused fist, he said:

"God bless ye, the devil miss ye, and if

ye die before ye get back, may the Master of all divils take ye."

I recognized the pith of the prayer so uniquely expressed, and we parted, I feeling that in my life's experience I had often paid many times more than a quarter for an offering of words to the Deity in my behalf not so sincerely said.

On Friday morning at 4 o'clock, May 13, we left home on the flyer of the R. W. & O. Division of the N. Y. C., just as "night candles were burned out, and jocund day sat merry on the misty mountain tops," with a far-away wistful look in our eyes and a suppressed feeling of exultation in our hearts as we commenced our long ride towards the other side of the American Continent. We were whirled gaily along the shore of Lake Ontario, and as our train was approaching Lewiston, ere curving for the home stretch of seven miles to Niagara Falls, I looked toward the northwest from our elevation and saw one of as grand sweeps of pastoral scenery spread out before my view as there is on the continent. The newly springing green of the fields, trees and gardens; the various colored houses nestled in the groves, the Niagara River threading its way to the lake a few miles below in all its splendor of light blue after its tumble over the falls, and Brock's monument towering on the heights beyond, where the flag of old England floated haughtily in the morning breeze, bringing to mind the quatrain of one of her distinguished poets:

"Catch hold of the wings of the morning,
And flop round the earth till you're dead,
But you'll not get away from the tune that they
play,

To that blooming old rag overhead."

Then the run alongside the river, catching glimpses of it here and there in its seething, tumbling depths below, which geologists claim have been 60,000 years eating away in its descent from the level of its banks, then lifting one's head and beholding the master work of all, the Great Niagara Falls! and in almost speechless rapture I whispered to my companion:

"We have just passed through a stretch of scenery of which we may not see

the equal for pastoral beauty until our return."

The only piece of road I was not provided with documents to get over was between Niagara Falls and Buffalo, about 30 miles. I went to the cab of the engine attached to the train and was recognized by the knightly looking chap accoutred in blue jeans, a long sight more becoming to a man, and in this instance, representing more honest chivalry than all the old fossils that ever marched in the train of Godfrey DeBouillon or Peter the Hermit, clad in their tin suits of life preservers, and said:

"Say, Jack" (his name wasn't Jack and you all know the reason I don't tell it), "do you think Tom —, the conductor, can change a one thousand dollar bill to take our fare out of from here over to Buffalo?"

"You're flush, aren't you? Don't let him see the stamp of the U. S. on either paper or specie or I'll annihilate you when we get there."

Tom sang out, "All aboard," as we clutched hands, he saying:

"You must be going on quite a trip with your two satchels to keep you in ballast trim. If the three or four passengers in the last coach are any inconvenience to you, say so, and I'll drive them ahead and let you have the whole of it to yourselves."

I merely mention this instance of the freemasonry of the rail to you, gentle reader and fellow tramp, who enjoyed the occasion as well as myself, to explain that all the manifestos ever issued by the master minds of railway management can never prohibit good fellows from giving the glad hand to each other without getting an introduction through the ticket office, and the curse of Mohammed on the small fry of pasteboard punchers who do not respond when there is no danger in doing so. (Charlie Harkens, of Div. No. 1, you dear old cash dispenser, take notice.)

We arrived at Buffalo on time, about 9:30 A. M., and at 1:30 P. M. the same day our train was to leave for Chicago. I arranged ere leaving home to have my whereabouts known daily until I'd arrive

at Los Angeles, so as to be in touch with "the loved ones behind."

At the Arlington, in Buffalo, I got a telegram from "my eight-year-old, with the golden hair," who was asleep when we left, who went direct to the telegraph office and had the messenger fire this after us: "Grandpa, don't forget the little prairie dog you promised to bring me. "RUTH."

In response to her repeated inquiries of what I would bring her back, I told her a nice little prairie dog, and my feelings at the deception I played on the child in a thoughtless manner, exalting in her estimation such a worthless thing as a prairie dog, were not pleasant. Here she is, dear

reader, looking just as jolly as when around the house, lilting a transposition of the old song, after I made the promise:

"I've got a little cat,
But I don't think much of that,
For grandpa will bring me a bow-wow-wow."

We left Buffalo on time. We got a much-needed sleep that night, and considerably refreshed the morning after, we stepped off the train in Chicago, where we had to remain until 10 o'clock the same night. (To be continued.)

A Fair Share of Prosperity.

MALVERN, PA., Feb. 6, 1905.

"But this subject is dreary and I've only a word more,
And I will write it without favor or fear,
That a fair share of prosperity of this line of road
Is due to the skilled engineer."

EDITOR JOURNAL: The above verse is one of many written by an engineer in the early sixties, and is no better nor worse than any of its fellows, but it contains a thought that was, no doubt, strongly entrenched in the mind of the engineer who wrote it.

"A fair share of prosperity * * * is due to the skilled engineer," and why not? What applied in his day applies now and has applied in all the intervening years, and the only criticism that can be placed on his assertion is his modesty in presenting his thought. Yet we cannot censure him too severely, for you who were running in those days know what a modest set of fellows you were in expressing your convictions; but had he claimed a great share or a greater share of prosperity he would not have been amiss.

You who have been running these many years do not have to ask yourselves why this is so; your work and your heart tell you that it is so and it could not be otherwise, for if it were not for the brains, the good judgment and the skill displayed in handling your work the railroads and the business of our great country would come to a standstill.

Have you, who sit on the grand upholstered seats of the modern trains, or you whom prosperity has placed in the gorgeous counting houses, ever given the matter a single thought of him who has brought prosperity and riches to your feet? I fear not.

The writer has watched thousands of passengers being discharged from the trains in our great depots and fling past the panting locomotive with its grimy master perched on the box, hardly one out of twenty will compliment the "grimy master" with as much as a look in his direction, but pass him and his monster by as though it was not the brains, good judgment and the skill of that same

man who had brought that great load of human beings through safely and on time.

Should he, however, have arrived late, the man who had an appointment, with a scowl on his face, would look to see what manner of man the railway had placed upon such an important train and possibly file a complaint reflecting on his judgment, and yet he may have displayed good judgment in bringing his train in a few minutes late, rather than on time at the risk of disaster.

The skilled engineer lives rigidly up to the rules and he will go through on time if that be possible; but should he in his judgment consider it unsafe to do so, no rule will tempt him to take chances that would imperil the safety of his human freight, and his judgment would be accepted by his superior officials.

But wherein is the engineer more skilled than his fellow employees? I will give one instance and there are many. In this wide continent we read almost daily of occurrences where the engineer has been disabled or killed at his post, leaving his train stranded. Could the brakeman, could the baggagemaster, could the conductor, or could the fireman, if he were a green one, take the train safely to destination? Could the superintendent or the general manager move it, were they aboard, if they themselves were not skilled at the business? No! The train must remain until an engineer is sent to move it.

So much for his judgment and skill, but how about his bravery?

We have had accounts of bravery among the soldiers in the far Eastern War, but no act of bravery displayed by those soldiers exceeds that of the engineer who nightly faces the many dangers he knows not of and is ready to meet any and all as they come to him.

The peril, particularly that of the early days when railroads were built with a rush, leaving the cuts unsloped, the embankments not properly braced, was great, as no one knew on a stormy night when he was going to run into a rockslide or into a sunken embankment or a disabled bridge,

and no one between him and danger but a track walker—what a farce—with five miles of track to watch and care for.

The engineer feels on stormy nights that he must face this as well as many other dangers and into these dangers he is the first man.

This brings to my mind an incident that occurred many years ago.

An engineer named Langdon had a "run in" at Sang Hollow. When brought to the office the superintendent said, "Well, Mr. Langdon, what do you know about the accident at Sang Hollow?"

As quick as a flash the engineer replied, "I know all about it, Mr. Superintendent; I was the first man there." And this tells the whole story; he is the first man to meet the trouble and being the brave man that he is, he knows the situation and is brave enough to accept it.

Now, about the recompense for this skilled and brave man. Is it in proportion to the service he renders the great railroad companies? We think not; but the theme is of such importance that we feel it could be better told in another story, and will close this one by again quoting the machine poet:

"That a fair share of prosperity of this line of road
Is due to the skilled engineer."

FOOTBOARD.

Defense Fund.

SCRANTON, PA., Jan. 29, 1905.

EDITOR JOURNAL: Having waited in vain for some more able Brothers from this section to accept the invitation of our Editor to contribute to the JOURNAL, I thought I would try my hand.

Division 276 is located here, having a membership of over 150 active members, all interested in whatever is best for the Order. I, as one of them, will have to plead guilty of having voted against the proposition to create this fund to be used in case of trouble. My reasons are these: We have been led to believe that should trouble arise there would be an injunction placed on this money and it could not be used for the purpose intended. If this

is a wrong idea I should like another chance to vote on this question. I should like to ask, however, if the members have not always responded promptly to any call for assistance from our Brothers.

I have been interested in Brother Freenor's remarks about an endowment insurance. I think it would be a grand thing for us to think we could see the color of some of this money ourselves. I must admit that as it is I think we have the best insurance in the world for men in our class. Just think of it! It cost just \$77.50 last year for the three policies of \$1,500. Still, I think it could be made better at very little cost. I am surprised at some of our Brothers finding so much fault after each convention because there have been no changes in the plan of our insurance. When they send a delegate uninstructed to the convention they seem to forget that it is not the Grand Officers but the delegates that make the laws, and when enough delegates go instructed they can pass any law.

I can sympathize with Brother Kern, C. E., of Div. 109. In my humble opinion, the only remedy is to enforce the law on non-attendance, and if the Brothers would take the time to read the laws, also the Rules of Order, a good many of these squabbles would be done away with, and we would have more time to devote to the good of the Order, as recommended by Bolivar. I think, as Brother Nixon says, the younger Brothers should come to the front, but this does not excuse the older ones and the laws are made for all.

It is rather late to acknowledge it, but we had a call from our Assistant Grand Chief Hurley last summer. We all enjoyed his visit, and hope to see more of our Grand Officers in the future.

As this is my first attempt, I will close. Hoping this will escape the waste basket I am,

Yours fraternally,

LACKAWANNA.

Insurance Fund.

PHILADELPHIA, PA., Jan. 18, 1905.

EDITOR JOURNAL: I hope Bro. J. F. Freenor, of Div. 372, will not give up his argument in relation to the endowment

fund, for if there is any good merit in the plan, he should not grow weary in well doing. For the sake of argument on the one side, I do not believe it possible for the B. of L. E. to have such a fund. In the first place, I have been informed that as we are incorporated in the State of Ohio, any changes that might be of any great benefit to us as members would be ruled out of order, as conflicting with the laws relative to our act of incorporation. So, as we began, no doubt we must continue, and mutually assist only the widow who, no doubt, in many cases is again married and happy, and the orphaned children who are better able to take care of themselves than he who has for years been a member of our insurance, and by old age is in that condition where he is unable to realize anything upon his policy, and it has become a condition of great sacrifice for him to be able to keep it up without adding any additional cost at his age, for an endowment certificate. We must continue as we began and be pleased, if we are able to do that, at the small cost which at present our insurance is; whereas, with the endowment feature, the cost would become so great that many would forfeit, and as our laws are now, both the B. of L. E. and the insurance.

I do not know the Brother's plan, but if there is any additional cost to the old men, it would be a hardship to them, and it would have been better if we never had had an insurance tagged on to us.

In the beginning of the organization no insurance was contemplated, and so it ever should have been, and had each and every member who has belonged to it for thirty years or more, invested his money monthly what it has cost him, he would today in investments have more than the face value of his policy in investments to keep him in his old age.

That is one side of it, and some will say, "What about the many widows and orphans that our efforts have helped to keep the wolf of poverty from the door and raised the children to good citizenship in many communities?" That is the other side of the case.

Now, the other side is those who have

contributed to the latter for many years, and they themselves are now old, suffering, in distress, through sickness and distress of injury. Can nothing be done for them? Over 41,000 members in the insurance and nothing can be done. Such being the case and our insurance having grown so fast, let me say to the young men, you may not be able to do much for the old men, but you can do much for yourself, and in this way go in for a certain number of year endowment insurance, if you have to pay a state tax for the same in every state in the Union; and then when you are so unfortunate as to reach a certain age in life you will know that you will receive that which will assist you in your declining years. But it will cost you much more and you must be willing to pay, and then and only then will you think of the immense sums of money we spend in other ways that, outside of the insurance, must come from your pocketbooks, which at a less cost you would receive better benefits from.

There are things which it is to your interest to think over and act intelligently about, but while I believe that your insurance is one of the best in the land, I also admit that it has not reached out to cover all conditions that exist among railroad men; but that is no excuse that engineers should not join the Brotherhood. Staying out will not make it any better, whereas if you come in you will have a say and possibly can be one of those who will be able to get the old fogies out of certain ruts.

Keep it up, Brother Freenor, you are right—you are wrong. Right in endeavoring to better us, as you see it—wrong in believing for one second of time that our delegates to our conventions can make a good thing when they see it. Evidences of this can be found in every proceedings of our conventions for years. The good resolutions offered and rejected! No doubt we can excuse them, as they have been handicapped by such a large attendance that it would take too long to consider them—too many excursions—too good a time anticipated. Fraternaly yours,

C. B. NIXON.

Endowment Clause in Insurance.

FOND DU LAC, WIS., Feb. 7, 1905.

EDITOR JOURNAL: I have carefully watched the JOURNAL for some comments on my pet subject, viz.: the endowment clause to our insurance. Brother Onderkirk, it seems, did not read all my articles, or else he must have seen my plan. I will again outline it here.

Twenty dollars from each policy in effect would create a fund of about one million dollars. The interest at 5 per cent would amount to about fifty thousand dollars annually, with which amount I propose to pay off the oldest policy holders as far as it will go. That will cancel each policy so paid. In consequence, no assessment will have to be levied to pay this claim. Our capital is bound to increase, owing to new members coming in. There is the whole plan. It is simple.

Now, then, the laws of Ohio, under which we are incorporated, do not permit a mutual association such as we are to go into the endowment business, but we can overcome that part easy enough, if we are willing, and I am ready to do so, and I believe every member who can see through my idea will be willing at the next convention. All that is required is that we establish in connection with our mutual insurance association a voluntary endowment association. All that will be required will be that each participant be a policy holder of the present association. No one can prevent us from doing that, and for \$20 on each certificate deposited we can see paid out to the old policy holders \$50,000 per annum and the capital remain intact, and your turn will come next unless your claim is paid from the mortuary fund. Just think! living old members will get this benefit; besides, it will reduce the assessments. Can you figure? It's there, plain as can be.

I see Brother Winters, of Div. 362, is hitting them hard. That's right, Sam, give it to them. Brother Nixon tackled a hard subject, as hard as my own, but I will endeavor to assist him a little. We could readily reduce expenses by reducing

representation; but, Brother Nixon, you can't do it at the convention, as there seems to be a certain element following the conventions as delegates that blocks the wheels of progress. Being smooth talkers, they succeed in getting elected to each convention. Without being instructed, they go there, have a good time, bully the convention into what they want by their smooth talk, and by that means frustrate our advancement among the fraternal orders.

Brothers, this is harsh talk, but it implicates no one, and if it is not true you have no right to be offended, and if it is true you certainly have no reason.

I believe in reducing the representation on some plan as follows:

For each 100 members and not exceeding 150 on a system, one delegate to be elected; over 150 and not exceeding 250, two delegates. For example, the W. C. System has less than 150 members and sends three delegates; besides, when a delegate is absent from the Convention Hall no time be allowed, and that all delegates be allowed actual time required going to and coming from convention; all delegates to be paid by the G. I. D. and a uniform assessment levied for the purpose.

Further, establish the convention city where our Grand Officers are located. That alone will save the Brotherhood several thousand dollars, inasmuch as that takes considerable time at each convention.

Let each Division instruct its delegate; not leave it to him to do what he sees fit, just because he will listen to some smooth talker and conclude he is all right, but if under instruction from his Division he must do as he is told.

I have lost all faith in convention actions just for the reason above stated. All follow the smooth guy.

Brother Editor, I hope I have not kicked over the traces. I mean no harm, but would like to awaken the members from their slumber.

With best wishes, I remain,

Fraternally yours,

J. F. FREENOR, Div. 372.

Our Consul is Reminded of Early Days.

NIAGARA FALLS, ONT., Feb. 6, 1905.

EDITOR JOURNAL: I have read with much interest the article in the February JOURNAL written by Brother Harkins, of Div. 1, and the picture of the engine "Ruby" recalls old times, and I recognized at once the picture of George Roby. It was in the early part of the sixties, just what year I don't remember, when the Western Division of the New York Central, being short of engines, borrowed two from the Michigan Central. One was called the "Salamander"; I don't remember the name of the other, but think it was the "Ruby." Geo. Roby came with the "Salamander" and as my engine was in the shop for repairs, I was put on to teach him the road. He had not been in Rochester long before word came from Detroit that something was wrong between him and the Brotherhood of the Footboard (that was the name of the B. of L. E. at that time), and some of the members of Div. 18 requested David Upton, the Master Mechanic, to send him back to the Michigan Central, which he did, and I ran the "Salamander" for about a month.

The next fall I, in company with Bro. John Frier, visited Kalamazoo and on our way back made application to the engineer at Kalamazoo to speak to the conductor to pass us to Detroit. The engineer was Al Priest, since dead. When I told him we were New York Central engineers, he asked for our cards, which we gave him. He then said, "Get on the train and I will fix you." We saw him talking to the conductor and supposed it was all right, but when the conductor came to us in the car he demanded our fare. We asked him if the engineer had not spoken to him. He replied, "Yes, and if you had kept away from him I would have carried you. He told me to get your fare or put you off the train." We paid our fare and alighted at the Russell House in Detroit for supper, and in the evening Roby came over and apologized and wanted to give us back the money we paid on the train, but we de-

clined to take it. I merely mention this little incident of by-gone days to show the feeling for and against the new organization.

I fired for Bill Robinson, the man in whose brain the first thoughts of the B. of L. E. originated. He was running on the Niagara Falls Division of the N. Y. C. I was young at that time and I remember of often hearing him say that the engineers should organize for self-protection.

I also fired for Charley Wilson. Both these men were Grand Chiefs of the order. P. M. Arthur was an engineer on the Central Road at the same time. Now all three are dead, and what changes!

Again, I am at Niagara Falls, but on the Canadian side of the river and representing the United States as the American Consul, and having been a charter member of Div. 18, have seen the order grow from one Division to be the most powerful labor organization in the world, and I feel proud of my membership of nearly forty years.

The B. of L. E. has changed the complexions of the master mechanics and they are a little more careful in the selection of their language when addressing their engineers than David Upton, Allan Sweet and several old-timers used to be.

Fraternally yours,

W. H. H. WEBSTER, Div. 328.

Write for the Journal and Sign Name.

GRAND RAPIDS, MICH., Feb. 6, 1905.

EDITOR JOURNAL: It has been a long time since I have seen a column in the Correspondence Department of our JOURNAL that contained more interesting reading for myself than the contribution from the pen of Bro. C. A. Harkins, of Div. 1.

I commenced my career as an engineer on the Fort Wayne, Jackson & Saginaw Railroad in the year 1870, and engines of the "Ruby" type together with the inside connected so-called "Hounds" and "Winds" were about the only kind of locomotives in evidence upon the Michigan Central System. That picture of the "Ruby" took me back to the day when I thought she and others of

her class were "things of beauty," and to have one to run would be "a joy forever." We have an old engineer with us here that fired for a time the engine described and no doubt he could give us some interesting reminiscent data. I would be pleased to hear more from Brother Harkins and hope he may be able to dig up a picture of one of the old inside connected engines.

I cannot agree with some of the Brothers that a mistake was made by taking the Division Addresses out of the JOURNAL. It is or should be the custom of all Brothers to file away their JOURNALS, and I consider it a matter of no great inconvenience to refer back a few numbers if the Division Addresses are needed. We need the space that was occupied by the matter in question, and we need now some effort on the part of our Brothers to fill up this space and make our JOURNAL second to nothing. We certainly have the ability in our ranks to make our "medium of thought" one of the most interesting magazines extant. We are getting some splendid contributions now on technical and general matters. Such articles as Brothers Quirk, Roach and others send in, are both instructive and entertaining. We have plenty of members that need not be ashamed to give us their experience as engineers and who could, if they would, write very entertainingly on affairs in general which would tend to the good of our order. I think that every Brother who sends in a contribution should not fail to give his name, address and Division number. I do not like the idea of a Brother "hiding his light under a bushel" so to speak. Give your name and address. It is possible that some Brother after reading your letter would like to correspond with you, and if you have given name and address he need not go to the trouble to find where Division so and so is located. Fraternaly yours,
J. W. READING, Div. 286.

Conferences.

BLUEFIELD, W. Va., Jan. 16, 1905.

EDITOR JOURNAL: In the December and January JOURNALS appeared some very

able articles on conferences of railway officials and their employees and the effect it could have on evils that exist. There is no doubt, in my mind, that much good could come out of such meetings, but when a conference is held and officials from the president down to road foreman are present, is it safe for a lay employee to give his views of the situation and offer suggestions? While the president may be a fair, honest, broad-minded gentleman and called the meeting hoping to benefit the service and conditions by what the men offer, is there any assurance to the men that there is not a wheel within a wheel that might wheel him out of a job for making a suggestion that might reflect on some subordinate official's ability or his department? There are lots of evils on all railroads that the higher officials know nothing about, and great care is taken that they do not learn, that would go a great way to improve the earnings of the road and improve the conditions of employees. The tendency of the day is to use, "The Art of Railroadng;" that is, to put the faults up to the other fellow and make a personal reputation instead of everybody, and all departments working together in harmony for the common good of the road.

Fraternaly yours,
OBSERVER.

Long Hours.

CHESTER, S. C., Feb. 9, 1905.

EDITOR JOURNAL: Never seeing anything in the JOURNAL from Div. 85, I thought I would try my hand at writing and see what the Editor would do with it.

Our freight run is 94 miles and the passenger men run 220 miles and get \$125.70 per month; freight men get 4 cents a mile. We have a good set of officials, but they are great on long hours. We have to work on freight 14 hours and 20 minutes before overtime can be received, and still there is a lot of overtime made here. So you can see that it means long days, something the average man does not like, and I do not believe in the interest of the company, and it certainly does not conduce to safety, which the public

are clamoring for. For one, I say, God bless every effort for shorter hours.

Fraternally yours,
LONG HOURS, Div. 85.

If shorter hours schedules cannot be made with the companies and better opportunities for rest obtained than this statement contains, then the Legislative Board of South Carolina should get in the field and push a measure in the legislature that will make the hours and conditions for rest reasonable, and safer for both the employees, the property of the company and the public.—EDITOR.

Overtime Rate Too Low.

SEYMOUR, IND., Feb. 6, 1905.

EDITOR JOURNAL: As has been clearly demonstrated to us in the last four or five years by the railroads of this country, the large engines and long freight trains have come to stay, which, as all engineers in this class of service know, has added largely to the labors of enginemen. Not only have our hours of labor been increased, but we have had greater responsibilities heaped onto us. The engine must be kept in the best possible shape from the start until the trip is completed; and if the steam drops back ten pounds the train stops and the engineer must report why the engine failed to steam, and, as we well know, an engine will not hold up in steam continuously for eight or ten hours when worked to its full capacity.

Fifty or sixty air-brake cars must be handled with good judgment and intelligence in order to avoid damage to drawbars, etc. But it is not necessary to speak of these things, as we are all familiar with them. The great question is, What are we going to do about it; how are we going to better our condition in this matter?

In my opinion, the solution lies in the rate paid for overtime. There must be a radical change made in this line, as the present rate for overtime is so low that our pay is reduced as soon as the overtime rate takes effect on each trip. Let every Division wake up to the needs of its members and send a representative to the

meeting to be held in the near future for this purpose. Yours fraternally,

JOHN KERNAN, Div. 89.

Induce Attendance.

SHREVEPORT, LA., Jan. 30, 1905.

EDITOR JOURNAL: I notice in last issue of the JOURNAL a correspondence signed "Bolivar," requesting discussion through the JOURNAL on non-attendance of members at Division meetings.

I think Brother "Bolivar" has started a good ball rolling, and I hope it will be rolled until it completes the circuit and gathers all the snow (cold and indifferent members) so they can be warmed up and thawed out. I believe a great many members do not attend meetings because they do not realize the importance of it, and others fail through cold indifference; but the point in view is to devise some plan to get them to attend, and in order to do this they must be given some interest in the meetings. Let them know that the success of each meeting depends to some extent on their presence, and when they show up at a meeting, call on them for their opinion on such matters as may come up for discussion. I think Brother "Bolivar" hit the keynote when he said "discuss subjects pertaining to our duty in serving the company." If we would devote more of our time to subjects of that kind and "cut out" this "rag-chewing" about petty and personal grievances, we would not have so many letters from the Master Mechanic asking us to explain some engine failure, or be invited to his office to receive sentence of suspension.

Let us make the Division room a training school, devoting at least one hour at each meeting to the discussion of such subjects as will be interesting and instructive to all, and if needs be, let the C. E. name a topic at the next meeting. By doing this each one will try to have a correct version of the subject. If all would adopt such a plan and live up to it our finances would increase and our grievances would decrease, and I believe if it were practiced throughout the Brotherhood, the time would not be far distant

when a B. of L. E. card would be good for a "job" without the holder being examined.

Let us hope for and strive to attain to such a high degree of excellence. Make our mark high and climb to it.

Wishing to hear from others along this line I am,

Yours fraternally
FLAT WHEEL, Div. 599.

Too Much Acrimonious Debate.

GRAND RAPIDS, MICH., Feb. 7, 1905.

EDITOR JOURNAL: I see in the present month's JOURNAL an article on the question of non-attendance at meetings. This is a question about as hard to settle as the labor question with the public. I will make a few suggestions as I see the cause why so few attend meetings and so little interest is manifested. The article written by Bolivar says that "Bill, Bob and Andy" talk too much. The fact is, "Bill, Bob and Andy" have a right to talk. However, a familiar scene in the lodge room is, Bill speaks first, Bob comes next, and can hardly wait until Bill sits down; Andy is ready when Bob gets through. Some timid person has dared to take issue with them in defense of his idea of the subject. Then "Bill, Bob and Andy" fire another volley; they are all in favor of the same thing, but in their earnestness and desire to talk they have a heated debate, and after the smoke clears away, they find they all favored the same idea.

By the time the different subjects have been treated as just mentioned, about five or six hours have been consumed in transacting the business before the meeting which could have been done in a couple of hours, and been more satisfactory to the majority. Then, too, it has been done according to the idea of the machine. Our sessions are too long, and members get tired listening to "Bill, Bob and Andy."

My remedy would be for the Chief to silence those fellows after having had one opportunity to express their ideas. If protected by the Chief from being fired upon by "Bill, Bob and Andy" half a dozen times business would be done promptly,

and according to the wishes of the majority rather than of the minority.

"Bill, Bob and Andy" are old charter members, and a Sunday spent in the lodge room is a great pleasure to them, but the younger engineers desire the business transacted quickly, making the session shorter. They desire to spend Sunday with their families, calling on friends, or going to some entertainment; the still younger engineers enjoy spending their six or eight hours with their sweethearts rather than spend that time listening to "Bill, Bob and Andy's" ideas. Again, I say make the sessions shorter, transact business with dispatch, go into social session, talk air-brake, valve motion, fast runs, and anything else that is of interest, and all will stay who care to.

Brother Bolivar suggests the remedy of expulsion to force members to attend. We have many ways now that a member can be expelled. I would discountenance any new roads in that direction. If a member pays his dues and never attends meetings, we cannot afford to lose him. If a call were made, he doubtless would be the first to respond, so I would suggest that no means other than the one we have advocated for the expulsion of members; that list is already too long.

The non-attendance is caused largely from lack of interest. The lack of interest is caused by the long sessions, occupying too much time in transacting a small amount of business.

Yours truly,
MEMBER OF 206.

Discretion and Indiscretion.

PHILIPSBURG, PA., Jan. 31, 1905.

EDITOR JOURNAL: Discretion is the guardian of innocence and innocence is the safest guarantee of a peaceful and happy life—such as we often see on the brow of youth and beneath the gray locks of old age. Indiscretion is the source of discord between hearts that were made to love each other, and wherever its influence appears it scatters throughout life regret, disagreement, strife and displeasure. How little do some of us comprehend or count the many mistakes and faults we commit each

day through being a little indiscreet. Alas! There are too many of us who believe with honest sincerity that the imperfections of indiscretions are of a trifling nature, never thinking how it alters the name of contributing towards the breeding of a multitude of other evils, of which here are a few samples:

First, to seek to hear or see what others wish to conceal.

Second, to ask such questions as would embarrass those to whom they are addressed.

Third, to talk too much in company, affording no opportunity for others to speak.

Fourth, to be jealous of the merits and attractiveness of others.

Fifth, to have too much curiosity which generally weakens the mind and breeds suspicion and rash judgment.

Sixth, to coax or beg your friend to divulge a secret.

Of the last two imperfections, it can safely be said that those who are not filled with curiosity have tender consciences and tender consciences are not subject to rash judgment, for as bees in misty weather keep in their hives to arrange their honey, so the thoughts of those who have tender consciences should not venture in search of objects that lie concealed amidst the cloudy actions of their neighbors, but to avoid meeting them they keep their conscience clear in their hearts, so as to arrange the good resolutions of their own amendments; and I may say of those who divulge what has been intrusted and revealed to them that they do not judge correctly what use it may be to them to keep a secret, until it is too late; consequently, it is hard for such to avoid the sin of gossip. They never stop to reflect on their thoughts, hence they fall unconsciously into the habit of loose criticism, which often injures many a reputation and saddens many an innocent life. Naturally, they divulge their secrets and secrets of others, which is nothing but the inward disturbing of mind and peace.

I have said something of too much talk and in reference to it all I have to say is

this—weigh well what you intend to say before it reaches your lips. Be very circumspect, for you will always find a great amount of superfluity and when you have determined what to say, still retrench something of it, because in the end you will perceive you have said too much. Silence is the most powerful weapon, and is of infinite service in the spiritual world. We read in history of a day when Rome would have been freed from the tyranny of a hero had it not been for too much talk of a self-satisfied and silly officer, who divulged the secret. We read of the ancient pagans who made a goddess of secrecy and represented her with sealed up lips and placed her statue in the temple of joy as an appropriate symbol of the effects of this quality.

Finally, let us remember that happiness of life does not consist in performing extraordinary acts of virtue, but in the observance of little daily duties of life, of which I hope, dear readers, has not been your lot to have wasted the golden years of your life from youthful age down to decrepitude and silver hairs to have neglected these little duties of daily life.

Fraternally yours,
T. S. KEATING, Div. 467.

An Engineer in 1840.

MIDDLETOWN, N. Y., Feb. 5, 1905.

EDITOR JOURNAL: I have just had a short and pleasant visit with Bro. Lester Aldrich, who is 86 years old, a member of Div. 267, B. of L. E., Asheville, N. C., and a member of the Insurance Association. He is at present residing at Middletown, N. Y., with his son, Bro. L. C. Aldrich, a member of Div. 292. He tells me he is a second cousin of the Hon. Clinton Aldrich, ex-U. S. Senator of Rhode Island, and also a second cousin of the late Wm. H. Baldwin, President of the Long Island Railway Co.

My visit with him was very interesting. Brother Aldrich being in a reminiscent mood, recalled many instances of his early life, stating that he was born of English parentage at Smithfield, R. I., in 1819, in the same house where his father was born.

His father, Esek Aldrich, was a machinist and worked at his trade for a man named Slater, making cotton machines in a small near-by village, named for him Slaterville, claimed to be one of the first works built in America for the manufacture of the cotton-gin.

Brother Aldrich, in the year 1832, at the age of 13 years, went to work with his father in the mill, remaining with him for one year. He then sought his father's permission to go to a place called Stonybrook to work in the cotton machine works which were located there. His father gave him the desired permission and 25 cents in money and sent him on his way. After arriving at Stonybrook, he secured the employment he sought at 50 cents a day, providing he contracted to remain three years. After he had signed the contract his new employer asked him what arrangements he had made about his living expenses, board, clothing, etc. He replied that he supposed he would have to pay for it if he could. His employer, feeling interested in him, as he seemed ambitious, put him in charge of the care of two yoke of oxen, a horse, a cow and the pigs to feed twice a day for his board; and the employer's clothing, after he had finished with it, was made over for him by the family. He virtually put in fifteen hours a day for three years, at the expiration of which he drew his salary, and with the 12 cents remainder of the 25 cents which his father had given him when he left home, he purchased a suit of blue clothes trimmed with brass buttons, and took a trip to Boston, July 4, 1836, to witness the celebration. This was his first introduction to the locomotive, the sight of which inspired him with a new ambition.

After looking the locomotive over he concluded that if he could learn to put one of these machines together he would be the greatest man on earth, the complications being so much greater than the cotton machine, which he had mastered. He determined to put his thoughts into execution and made inquiry where he could find the man who employed the machinists, and was informed that he would

have to go to Lowell, Mass., and proceeding to Lowell he hunted up the superintendent of the road and gave him his experience, but learned that he would again have to sign an agreement to serve the company three years in the capacity of an apprentice at the machinist trade. He signed the contract, entering the service of the Boston & Lowell Company.

At the expiration of the three years' service, in 1840, he was promoted to the position of locomotive engineer, and assigned to the "Patrick," a five-ton, hook-motion engine, without cab, built in England. Engineers were not promoted from fireman in those days; it was necessary to qualify as a machinist.

After a time he resigned from the service of the B. & L. and accepted service with the Essex Locomotive & Machine Company, taking out engines. Resigning from this position he secured employment with the Erie Railway Co. as a locomotive engineer, working on construction during the building of the road between Hornellsville and Dunkirk, and when completed ran the first passenger engine between these two points. From there he went to Cincinnati, and was employed by the Niles Locomotive Machine Works as foreman, where the late William Sellers, of the William Sellers Co., of Philadelphia, Pa., was employed under him as timekeeper and paymaster.

From there he went to Vicksburg, Miss., as Master Mechanic of the Vicksburg & Jackson R. R., where he lost his entire family during a yellow fever epidemic. Some time after this sorrowful event he tendered his resignation to the management of the road, but it was not accepted. He then asked for a leave of absence, which was granted, and he went to Salisbury, N. C., where he met and married his second wife, raising a second family, the son above mentioned, one in Asheville, N. C., Lester Pearson, an engineer running on the Southern and a member of Div. 267, and Dexter, living in the state of Georgia.

While at Salisbury Brother Aldrich erected a shop and did business in building cars, and at this late day, on some of

the old trucks you will find the name of L. S. Aldrich, car builder. He finally sold this shop to the Western & North Carolina R. R., and through some peculiar circumstances in the transaction, he lost the money he should have received from the sale of the shop.

After the Western & North Carolina R. R. had received the property they converted it into a railroad shop, appointing him Master Mechanic at Salisbury. The company was slightly embarrassed financially about this time and in need of power. Mr. Richard Norris, of the Norris Locomotive Works, visited Salisbury for the purpose of selling locomotives. The cash not in sight, Mr. Norris concluded he would not open an account with them, but would deliver the engine to Mr. L. S. Aldrich, trusting him for it, which was agreeably arranged and the engine delivered and named "Junaluska."

From choice he resigned the position of Master Mechanic, going on the road running an engine. The road was afterwards absorbed by the Richmond & Danville, now the Southern.

After 37 years of service on this one road, he was called to the office and advised that he was to be retired from service. He asked his informant what the charge was against him, and was told that there was not the scratch of a pen against him in all his years of service, but that he was simply retired on account of his age. His reply was that there was one road they could not retire him from on account of age, and that was the road to Heaven.

Brother Aldrich has certainly had a long and eventful experience in railroad life, and it seems a pity that any company should put such a man entirely out of service, giving him no place through which he could earn a living. It would seem that no one in railroad service has any business to get old.

Fraternally yours,
J. PUFFENBERGER.

The Texas State Legislative Board, B. L. E.

SMITHVILLE, TEX., Feb. 4, 1905.

EDITOR JOURNAL: Experience has taught us that reports of Legislative Board work

sent to officials of Subdivisions are seldom read to members, the majority of whom know nothing of what is being done. The JOURNAL reaches every individual, hence we consider it the better vehicle for conveying knowledge of the work of the board to the members in the state.

The ninth biennial convention of the Texas State Legislative Board, held at Fort Worth, April, 1904, instructed its chairman, Bro. C. D. Johnson, of Div. 206, to have introduced measures providing that all red flags used for the protection of track and bridge repairs, washouts, obstructions, etc., be in charge of English-speaking flagmen; that pilots, with authority of conductors, be required on all light engines running over any part of a railroad outside of yard limits; to again take up the Derail and Switchlight Bill passed by the last Legislature and vetoed by the Governor; for amendment of the Anti-Trust Law so as to exempt labor organizations and farmers' societies from its provisions; to guard the Fellow-Servant Law and the Anti-Garnishee Clause of the Constitution to the full extent of his ability.

The Legislative Boards of the O. R. C., B. of L. F., B. of R. T., O. R. T. and State Federation of Labor were in session at the same time and place, and a union meeting was held and a resolution adopted to organize a Joint Labor Legislative Board consisting of the legislative representatives of each of the orders named. In compliance with this resolution, E. P. Curtis, of the O. R. C.; C. D. Johnson, B. of L. E.; J. S. Myers, B. of L. F.; H. G. Wagner, B. of R. T.; A. O. Petty, O. R. T., and Walton Peteet, State Federation of Labor, met in Austin, May 20, and organized by electing E. P. Curtis, chairman; J. S. Myers, vice-chairman; A. O. Petty, secretary; C. D. Johnson, treasurer, and Walton Peteet, press agent.

At this meeting the bills approved by the different orders were taken up and considered. It was thought best to limit the number of bills to be introduced in the Legislature to as few as possible, hence each selected one bill as preferred.

Following is a synopsis of the measures referred to:

An educational law which will require all children between the ages of 8 and 15 to attend school a certain number of months each year, provision being made for invalids and those who from necessity are forced to work and who attend night school. Federation of Labor.

A bill requiring railroads to place switchlights on all main line switches and keep same lighted from sunset to sunrise; and also to place derailling switches on all sidings at way stations where cars are left standing. B. of L. E.

A bill which will require all telegraphers who handle train orders to pass a satisfactory examination before a board of examiners as to their competency. O. R. T.

A bill creating the office of Labor Commissioner and defining his duties and authority. B. of L. F.

A bill to amend the Fellow-Servant Law, intended to abolish the doctrine of assumed risk found in court rulings. O. R. C.

A bill prohibiting railroad companies from operating trains with less than a full crew to safely handle the same—requiring one engineer, one fireman, one conductor and one brakeman on all passenger trains and two brakemen on all freight trains, and that all light engines running over the road shall have one engineer, one fireman and one conductor. B. of R. T.

Circulars containing a synopsis of these bills were printed and issued to the local Lodges and Divisions of the different orders, to be by them presented to the candidates for legislative honors for an expression of opinion; also urging active participation in the pending campaign.

Very little attention was paid to these matters by officers of Subdivisions of the B. of L. E., many of the delegates to the Fort Worth Convention, who were loud in urging that such work be done, doing absolutely nothing.

Brother Johnson, by his individual efforts, secured many signatures from can-

didates, and this, with the good work done by members of the other organizations, brought us many friends to House and Senate.

The Legislature convened January 10, 1905. The joint board met on the 9th and prepared for business. At the request of the G. I. D., Brother Johnson prepared what is termed "The Experience Bill," providing that any person who shall engage to act in the capacity of a locomotive engineer upon any railroad in the state of Texas must have first served three years as a locomotive engineer or fireman; also, that conductors must have had two years' experience as freight brakeman. Brother Johnson dropped the Flagman Bill to take up the Experience Bill.

Brother Johnson's report for January is to hand, and shows satisfactory progress being made. All of the foregoing bills have been introduced and referred to committees. Some of them have been reported back favorably and one, the Full Crew Bill, has passed the House.

A few measures favorable to labor have been introduced with which the joint board has had nothing to do, but which they support as far as consistent.

Several measures of a detrimental character have been presented that the board is vigorously combatting.

The chief attorneys of almost every railroad in the state, with a few general managers and many, very many, lesser lights, have been at the Capitol fighting every bill we have introduced, endeavoring to repeal or emasculate the beneficial laws in the statutes for our protection, and to get all they can for themselves. Unlike us, they have several of their attorneys in the House and Senate—a tremendous advantage.

In the present Legislature there are but five union men—two printers, one O. R. C., one B. of L. F., one B. of R. T.; note the absence of the B. of L. E.

The Citizens' Alliance and its spawn, the Retail Merchants' Association, are in evidence, asking to have the Wages Exemption Law repealed.

We might complain about the apathy

and indifference of the engineers of Texas to Legislative Board business, but on second thought we have not much of a kick coming; they take about as much interest in it as the average engineer anywhere, and that is—none. To one who witnessed the perfect smoothness with which the "rejection" mill of the Committee on Constitution operated at the Los Angeles Convention, and the entire absence of any interest at the fountain head of the organization, this apathy of the rank and file is not surprising.

T. P. O'ROURKE, Sec.-Treas.,
Texas State Legislative Board.

Direct Legislation.

LITTLE ROCK, ARK., Feb. 5, 1905.

EDITOR JOURNAL: Progression is one of the laws of Nature; perfection in any condition is an ideal to be striven for, rather than an actual consummation. Experience proves that all human contrivances of whatever nature for the advancement of the interest of mankind are capable of progressive improvement and civil government is no exception to this rule. The rights of man as partially embodied in the Constitution under which we live date farther back than the American Revolution, and were inherited from our English ancestors, who forced their concession from King John on the field of Runnymede. These privileges are fast slipping from our grasp, and it behooves us, as a people, to guard them jealously.

When our Civil War began, the freedom of the slave was not thought of, but in time it was demanded by the North; also when the Revolution was first agitated, there was no idea of a separation from the mother country for at least some time. But finally, it was the only alternative short of absolute submission to England.

When the time came to form a government for themselves, there were many in favor of modeling it after that of Great Britain. Among the men who favored this system and who was the most prominent, was Alexander Hamilton. He did not believe the masses could be trusted. He thought them fickle and ignorant, and that the best results could be obtained by

appealing to their cupidity and fear; therefore, he recommended a strong government. Those on the other side of the question, mainly Thomas Jefferson and Patrick Henry, believed that all power should come from the masses, and that the people could always be trusted to preserve their liberty. Jefferson, among other things, said that there were two subjects on which he desired to lay particular stress, and upon the observance of which he believed the future welfare of the country largely depended, and those were:

Free common schools supported by the State, and local home rule when every citizen could have a voice in the welfare of the community.

Of course our form of government was an experiment, but it was an improvement on anything that had preceded it. Patrick Henry pointed out the dictatorial powers of the President, and the immense power he could wield by reason of the federal patronage and being commander of the army and navy. Jefferson, to curb this power somewhat, proposed that the term of office be made six years and he to be ineligible for a second term.

The Supreme Court experiment has not proven altogether a success, as shown by the decrease in the income tax and injunction cases. Jefferson spoke of this court as the "Sappers and miners who are working night and day to undermine the fabric of our Confederation;" and, again, the election of U. S. Senators by State Legislatures has proven a blunder, and is unpopular at the present day.

But what concerns us most is the legislative branch, not only in Congress, but in states and municipalities as well, or more properly speaking, our representative system of government. Representative government has been referred to as the half-way house between a republic and a monarchy, and the experience of the American people for the past generation has been that the system needs improving.

The theory of having representatives to conduct the business of legislation with no restrictions thrown around them but a paper constitution, seems all right and

appears to be labor-saving and convenient; but in practice it is found that many of the delegates betray the people for their own selfish advantage. This is notorious, not only in states but in many large cities, and the general government is no exception to the rule. That we will always have representatives in our legislature, there is no doubt, but at the same time there is no reason why safeguards should not be thrown around them in such a way that should they betray their obligation, the people can veto their acts, or should they fail to pass laws that the people want, then the latter should be in a position to pass such laws independent of the legislature. We would then have what might be termed a Guarded System of Representative Government, and as long as there was no actual necessity for it, the people would not invoke the veto power or initiate new laws, and we would also then have Home Rule, as spoken of by the "Sage of Monticello."

Government by party is not an unmixed blessing. One's own party may have, perhaps, four leading issues, two of which you may feel inclined to support, and the other two one may be opposed to; yet, under the party system, you have to swallow the whole platform or vote some other ticket, which may contain the same objection. How much better and simpler it would be if the initiative and referendum was in effect in all the states, and every great question of either a state or the national government could be decided separately on its merits; then if there is a mistake, the people have no one to blame but themselves.

Three states in the Union have the initiative and referendum imbedded in their constitutions, and the legislature of Nevada recently submitted an amendment to the constitution embodying the referendum without the initiative, which was voted on and adopted in November last, and carried by five or six to one; and the above reform will be considered this winter by perhaps more than a dozen different legislatures, and in a great many of these states it has been indorsed by both the great political parties.

As an objection to direct legislation, it has been urged that if it were in effect we would be deluged with many laws, but happily we have an object lesson on that subject. I quote from *Wellman's Weekly* of St. Louis, or rather the "Direct Legislation Record" portion of it:

"What has been the result of direct legislation?" the Governor of South Dakota wrote shortly after it went into operation. 'Since this referendum law has been part of our constitution, we have had no charter mongers or railway speculators, no wild-cat schemes submitted to our legislature. Formerly our time was occupied by speculative schemes of one kind or another, but since the referendum has been made a part of the constitution, these people do not press their schemes on the legislature. Hence there is no occasion to have recourse to the referendum.'

"The South Dakota Legislature passed 101 or 102 laws at its last session. The same year the legislature of North Carolina passed more than 1,000 laws, and in one week Governor Odell of New York State vetoed 118 laws, and Governor Pennypacker of Pennsylvania vetoed 84. Thus these governors said by their vetoes that in one case a little more and in the other a little less than the total number of laws passed by South Dakota should never have been passed by their own legislature."

Direct legislation means fewer and simpler laws.

Fraternally yours,
ROBERT HERIOT, Div. 673.

Too Much Gall.

NAPA, CAL., Feb. 1, 1905.

EDITOR JOURNAL: In the afternoon and evening of life the mind becomes reminiscent, especially so when one has stepped aside from the passing throng, and exchanged the society of his comrades on life's stage for the companionship of horses and cattle, dogs and birds. Fortunate is he who in his retirement can forget and forgive those who have given him displeasure and annoyance, or at least whose mind does not dwell on unpleasant associations of the past, but whose memory habitually reverts to those noble souls,

those trusty comrades who have stood shoulder to shoulder with him in the days of his activities, giving him constant cheer and support. More fortunate still is he who has reason to believe that he has contributed some small share of cheer and support to others. Take away this consciousness of well-doing and these pleasant memories of the kind acts of others, and life would be a dreary desert.

These meditations come to me on this stormy February day, when I can do little else but feed and bed the stock and look out through the storm at the growing crops. I would like much to spend the day in the roundhouse at Oakland Point, where I would doubtless meet some of those who were "coupled in" with me in the snow sheds of the Sierras, the sage brush plains of Nevada, and the valleys of the Golden State, and with them recount the adventures and experiences of long ago.

As this privilege is denied me, I seek to rejoin my old-time associates through the medium of the JOURNAL. I am thinking now of one who during those old days contributed more of the wine of life to myself and others than it was ever in our power to reciprocate. It seemed to be his mission on earth to make others happy. His great warm heart was incapable of harboring aught but charity and good will for his fellowman. Speaking for myself, my life has been brightened, and I believe lengthened, by contact with this generous, joyous soul. Phipps was of Irish birth, born in Donegal, I think, but of that I would not be sure. There was no race suicide in that part of the world, and the Phipps family was a numerous one. There came a crisis in the affairs of the Phipps's, as indeed it came to all of the people of the little green isle. It was the year of the bad potatoes. "A condition, not a theory," confronted Phipps père. Not caring to have a famished progeny on his hands and not having the means to emigrate to America or Australia, he did the next best thing. He took his brood and crossed the channel, taking up his abode in England,

and here the subject of my sketch spent much of his early life, which probably accounts for the fact that he developed the characteristics of two nationalities. The unbounded mirth and ready repartee of the Hibernian, and the unlimited "cheek" or "gall" of the Englishman.

The Phipps's eventually came to America, prudently coming one and two at a time, and as the immigration laws were not enforced so strictly then as now by our efficient commissioner Sargent, *they all got in*. But I did not set out to write a history of the family, only a sketch of one of its members. I first encountered "Alf" as a fireman on the Mountain Division of the old Central Pacific in the early 70's. It was the rule in those days that a fireman must serve a year in the shops before being promoted to engineer. It came to Phipps' turn for promotion, and those in charge of the Sacramento shops wishing to avoid trouble, he was assigned to the Rocklin shops, of which I was foreman, with an injunction from the "old man" (Stevens) to me to "make him behave himself." If I were writing a history of the Rocklin shops I should designate the year of Phipps' apprenticeship as the "year of jubilee." It was such, at least, to all except myself, who was charged with the enforcement of discipline and of efficient service to my employers. Seeing that the sphere of action under my command was entirely too limited for my apprentice, I put him out on the road several months short of the limit, and thereby saved my force from utter demoralization.

To railroad men on the Southern Pacific lines in California, Phipps needs no introduction or description. He was known to all. To others, I will say that he was a giant in stature, standing over six feet in height, with proportionate breadth, and was once of comely features. His voice—his laugh—well, the only way I can convey an adequate idea of these is this. If my big Percheron horse should, in imitation of Balaam's ass, exert the power of speech or laugh a human laugh, I should believe that it was Phipps incarnated. I said he was once comely; that

was before the dispatcher gave a "cross order" to two trains in the sheds, one of which was under Phipps' control. In the resultant mix-up Phipps was thrown as from a catapult against a shed post. The post was reduced to pulp and splinters, and a cheek which had hitherto proved invulnerable received a severe contusion. After that Phipps' face presented a composite, or before-and-after appearance. The doctors patched him up and he was given a run in the San Joaquin Valley.

In escaping the dangers and difficulties of mountain service, he encountered new troubles. Evans and Sontag, the train robbers, were working the territory covering Phipps' run, and seemingly attracted by the genial qualities of the stalwart engineer, they made it a point to stand Phipps up whenever they could combine their other arrangements with the arrival of his train.

This happened so frequently that Evans and Phipps came to understand each other and the holdups were conducted in a quiet and orderly manner, and a mutual feeling of respect and attachment is said to have grown up between robber and engineer. (Incidentally, Mr. Sontag died from lead poisoning, some forty pieces of the metal being lodged in his anatomy—Mr. Evans is a guest of the state at Folsom.)

After these adventures Phipps found an open switch one night and although he managed to crawl out from under his engine unhurt, there was lost in the wreckage some old duds of extra clothing, and this leads to an incident which, when I have related, must close this story, as it is milking time.

Phipps conceived the idea of making a claim for compensation for the loss of his raiment on the basis of his own valuation. He divulged his scheme to the Master Mechanic, an old switchman who has long since been put on the superannuated list, and is now doing odd jobs about the steamers. From him Phipps got a letter of identification, and so armed presented himself in the office of Fabian, the "death agent." To him he graphically described the wreck, and incidentally spoke of the loss of the pride of his wardrobe. Now,

claim agents, unlike cashiers of banks, do not cash claims at sight. The usefulness of a claim agent to his employer is measured not by his alacrity in making settlements, but by his ability to defer them. If the claimant lives at considerable distance from headquarters, repeated trips may after a while induce him to let his claim go by default. Fabian was always willing to pay \$25 on claims ranging between \$100 and \$500. If that was not satisfactory to the claimant the matter was referred to the lawyers in the next room, who were hired by the month. Phipps' first visit to Fabian was of a social nature, only introductory to the business in hand. It would be tedious and unnecessary to describe other visits to the agent's office, extending over several months, during which time Mr. Fabian was considering the claim; but the cordial manner of Mr. Fabian encouraged Phipps to believe that the award would much exceed his utmost expectations, and in reporting progress to "Mack," he told him his claim was good for \$100. With this sum he would buy a really good suit of clothes, something he had never possessed, and throw out a twenty for the entertainment of the boys.

At last the day of settlement came. After the usual greetings, Mr. Fabian told Phipps that he was convinced that he was entitled to some compensation, and thrust a check into his hands. The recipient was too modest to examine the face of the check in the presence of the officer, but a glance disclosed the figures 250. Phipps' impulse was to call out the whole force of the general office to accompany him across the street to the cafe, but he restrained himself and hastened to the Oakland boat, where, in a secluded alcove, he drew forth his prize for examination. It called for *twenty-five dollars*. He resolved at once to keep the amount of award from "Mack," fearing the storm of ridicule from that worthy, but when somewhat recovered from his chagrin, he replied to his questioner, "I got \$25, Mack, and I think I am *damned well paid*," and Mack said, "Phipps, you remind me of a man who came into a Kansas town without a

bean, and by sharp practice managed to beat a number of citizens out of considerable money. Finally the victims corralled him in the street and proposed to mete out punishment to him without the interposition of the law. One proposed to hang him, another to burn him. Just then a wild-eyed citizen rushed in who proved to be a Jew clothier, who had contributed a suit of clothes. He exclaimed: "No, shentlemen, don't do that—don't burn him. Cut his gall out and give it to me."

D. J. BROWN.

A Veteran of the Order.

ASHLAND, ORE., Jan. 10, 1905.

EDITOR JOURNAL: All old veterans are worthy of note for their good deeds and

western fever turned thousands towards the Pacific, which caught Brother Chandler, and he landed at Rocklin, Cal., in '75 and secured work on the C. P. R. R., and has been a continued employee ever since.

Brother Chandler joined Div. 54 at Port Jervis in 1867 and has been a continuous member, being transferred to Div. 110, afterwards to 425.

Brother Chandler has seen some pretty hard times in early railroading on the C. P. R. R., and three or four years ago gave up the main line and took switch engine at Ashland, Ore., until the big oil plant was completed and he was installed as engineer, which position he now holds, firing the big boilers with fuel oil and running the big air compressor that loads the loco-

BRO. C. K. CHANDLER, MEMBER OF DIV. 425, AT HOME WITH HIS MACHINERY.—Courtesy Bro. T. Herbig.

faithfulness to their duties, as generally shown by long membership in the B. of L. E. and continued service for one company. We have with us Brother C. K. Chandler, who is hale and hearty at 63 years. Brother Chandler commenced railroading in 1861 for the "Eary" R. R. between Port Jervis and New York City until '69; went to the M. K. & T. between Junction City and Emporia. He faithfully performed his duty until the

tive with fuel oil, and supplies about one mile of air pipe for testing cars and other purposes around shop and roundhouse, and the big oil pump that pumps oil from cars into the 55,000 barrel tank.

Brother Chandler keeps everything neat and clean, and greets everybody with a pleasant smile, and is always anxious to know how all the boys are and how everything is going on the main line.

THOS. HERBIG, Div. 425.

Instruction by Correspondence.

BROOKFIELD, MO., Feb. 9, 1905.

EDITOR JOURNAL: In reference to correspondence schools, Bro. Edw. Kavanaugh's letter in the February number of the JOURNAL, page 140, is a good one. I think it would be a good idea to have a regular correspondence course of instructions through the columns of our JOURNAL each month, if not more than one or two pages. It would surely be a benefit to the young engineers and also to some of us older ones that may, perhaps, be getting rusty in regard to a technical education; not that I think a regular correspondence school a bad thing. Quite the contrary, I think they are a blessing to many a man who seeks an education through such means and sticks through it and graduates. But, on the other hand, the correspondence schools extort many a dollar from our engineers for which they gain scarcely anything on account of lack of time to study and give the lessons they thought they require and the correspondence school is dropped and the latter named has the money—the engineer the experience.

I think that a regular correspondence school course of instruction would be a good thing and a benefit to every Brother who wishes such and will devote a few minutes' time each week to such studies and would actually be the means of saving to our Brother engineers thousands of dollars per year, that might be extorted from them by correspondence schools annually for tuition in same, for which many an engineer, I dare say, derives practically no benefit, not through any fault of the correspondence schools, but on the part of the engineer not being able to fulfill his part of the contract on account of not having sufficient time to study; and others, perhaps, find it not as easy as they expected and it takes up too much of their valuable time, otherwise, holding down a drygoods box on the street, railroading and telling yarns. If such men never get anything better than what they now have, it is their fault.

Please have a technical correspondence column for the benefit of us locomotive

engineers; and Brother engineers who can, let us make it a point to review and study, if necessary, the technical column each month.

Yours fraternally,
SMITH HORTON, Div. 616.

B. of L. E. Hunting Club.

FORT SMITH, ARK., Jan. 9, 1905.

EDITOR JOURNAL: No doubt some of the JOURNAL readers will remember the hunt taken by the club last year, which was written up in the March JOURNAL, 1904. I was requested by several of the Brothers to write up our hunt this winter.

The members of the club are Bros. J. S. Carson, C. E. of Div. 638; W. H. Van Horn, of Div. 428; R. E. Brocchus, James Moore, J. B. Kirkbride and myself, of Div. 445; Messrs. C. E. Boss, M. M., of the Paris & Great Northern Railroad, and F. McCaughey, of Lodge 345, B. of L. F.

On December 2 the members of the club met at Kosomo, I. T. There we left the Frisco Railroad for our hunting grounds, some fifteen miles distant, over a very rough wagon road.

After arriving at our hunting grounds, we made it our first business to fix up our camp in good order. After a good supper a large fire was built, and as the shades of night began to close in around our camp the pipes were filled and, seated around the camp fire, we began to tell stories of former hunts. Soon we heard a lone wolf howl far up the side of the mountain. He was answered by another. Then the bob-cats began to squall; even the owls lit in the trees just over our tents and joined in the serenade. But we had no fear, as we were plentifully supplied with the best of firearms and ammunition. So we promised to make it interesting for them in the morning.

Our long drive over the mountain had tired us and we soon sought our cots, for we wanted to get an early start in the morning. Soon the heavy breathing told of the slumbers. Nothing could disturb us. We had no fear of being rudely awakened by the call-boy calling out: "No. 1, thirty minutes late." The only call that we heard was at 5:30, when the cook called us for breakfast.

NO. 1.

Breakfast was soon over, when we started out. It was a fine morning. The sun's rays lighted the valleys and mountains. The autumn leaves were a golden brown. Oh, what a beautiful picture, here where Nature is supreme, and not a hand to mar the scenery! The tall, gray rocks added to the beauty. As we climbed up the mountain our thoughts went back to the ages and ages it took to build up this country. Here was a country within a radius of forty miles with only a few Indian cabins scattered ten or fifteen miles apart.

Soon we heard the report of a rifle, and then the glad notes of a horn. We hastened in the direction from which the report came, and found that Brother Carson

NO. 2.

had killed the first deer. We took off our hats to Brother Carson.

The second day Brother Brocchus killed a deer. On the fourth day he killed the largest buck that any member of the club had ever seen.

Picture No. 1 shows Brothers Brocchus and Carson, with the large buck between them. Brother Brocchus is telling how it was killed. Brothers Brocchus and Carson are called the two scouts Buffalo Bill and Kit Carson. They are both fine shots, and a deer seldom gets away from either if they get a shot at it.

Picture No. 2 shows Brother Van Horn and myself bringing a deer into camp. Brother Van Horn is in front.

Picture No. 3 shows two deer and a

NO. 3.

turkey killed by Brother Brocchus. The larger deer in the picture is the one spoken of above. It weighed two hundred and fifty pounds and had fourteen points.

Picture No. 4 shows the club at dinner, and picture No. 5 shows us at a social game of high-five.

Brother Brocchus, as usual, carried off the honor of killing the most game, with Brother Carson second. Brother Kirkbride, Brother Brocchus and Mr. Boss killed the same number of turkeys. Each one had good luck, and all said that enough had been killed long before our stay was up. We are not "game hogs," and do not wish to destroy more than we can eat.

A few incidents occurred while on our

NO. 4.

hunt that caused quite a lot of joking afterwards, but did not look so funny at the time. While Brothers Moore, Van Horn and myself were hunting in a thicket, Brother Moore came upon a large panther. The panther was about fifty feet from Brother Moore, and it ran out past Brother Van Horn. We gave it two loads of buckshot, but they did not stop it. We asked Brother Moore why he did not shoot it. He said: "I, doggy, I was shaking so I could not hold my gun still!"

One day Brothers Kirkbride and Van Horn were hunting up the side of a rough canyon, when Brother Kirkbride saw a panther lying on a rock just above him. He made a hasty retreat to where Brother Van Horn was. Here they were found a few minutes afterwards by two other members of the club. When asked why he did not shoot the panther, Brother Kirkbride said that he did not know; that he was not scared, but only felt uneasy

NO. 5.

about the safety of Brother Van Horn. Another time, Brother Moore killed a fine deer. When he started to where the deer was lying he jumped two more and stopped to shoot at them. He crippled one and followed it about half a mile, when he saw a panther after it. He went back after the deer he had killed, but could not find it. He said he was not scared at all. Of course not!

While hunting on the top of a mountain with Brother Van Horn, we heard something making a noise—breaking twigs and bushes. On investigating, we found evidence of Mr. Bruin. From the size of the footprints in the soft ground, we decided that he was no small one. We held a hasty consultation to decide what we had better do. Brother Van Horn said that he thought we had better let him go, for if we did kill him we could not get him to camp, and we were not looking for bear; in fact, we had not lost any. Just then we heard four rapid shots fired in the canyon below us, and then the welcome sound of Brother Brocchus's horn. I said that Brother Brocchus had killed the bear. Brother Van Horn started down the side of the mountain at a 2:30 gait. I told him not to go so fast, as there might be more than one bear, and it might come back our way. The manner in which Brother Van Horn got behind a tree showed that he was something of an athlete. After a short wait we went on down to where Brother Brocchus was, and found that he had killed a fine deer.

Our ten days were soon up, and the teams came to take us back. We could not help regretting that our hunt was over for 1904. As we left our camping grounds we looked back and saw a little blue smoke rising through the trees. We fired a salute and joined in singing, "Tenting On the Old Camp Ground."

We arrived home and returned to our runs, feeling much benefited by our outing. All agreed that we had had the most successful hunt we had ever taken.

GEORGE DANIELS, C. E., Div. 445.

After Big Game.

EDITOR JOURNAL: On the morning of November 29 I left Denison to join a hunting party for our annual outing, arriving at San Antonio in due season, where I was met by the famous hunters, Brothers R. E. Nave, Jas. Senn, and L. E. Mays, of Div. 197, and W. B. Dial and George Wright, members of Lodge 145, B. of L. F., of San Antonio, that fair city of the South.

We bade farewell to San Antonio and its memories at 9 A. M., December 2, taking the Sunset Limited for our camp

BROS. MAYS, NAVE AND SENN WITH THE FIRST DEER.

—six of the best equipped and happiest hunters on the green earth. We had a full supply of the latest improved fishing tackle and traps, while a finer lot of guns was never seen in any camp. There were Savage rifles, pump-guns, and 22 target guns for shooting squirrel and small game and for target practice. In addition to all this we had left all the apron strings behind us, we had no more sick men to sit up with, no more goats to ride, no more door mats, millinery bills, or chores, and our wives would split the kindling. We arrived at Uvalde, 100 miles west of San Antonio, at noon, and were met by a Mexican who was to take us to camp by wagon, and traveled southwest in the direction of Old Mexico. On the third day we arrived at our camping place, and selected a beautiful spot in a grove of live oaks on the banks of the Nueces, and this time we had a kodak with us. However, none of us were expert enough to get a point of view of the beautiful

MEXICAN GUIDE AND BRO. NAVE WITH TURKEY.
AND BRO. L. E. MAYS.

scenery, and were compelled to stick to the subject we were most interested in, viz.—the hunters and their game.

We put up our tent and got everything in place before dark, and a fine supper was soon spread before us, for we were well supplied with the choicest eatables afforded in the San Antonio market. After a good night's sleep and an early breakfast, each shouldered his gun and set forth in different directions to look for game. Some climbed the mountains, while others went down the valley, and after walking and watching for hours, tired out, hungry, disappointed and in most angelic humor with ourselves and the whole world, which suddenly took on a blue and hazy appearance, each tramped back to camp hoping that the "other fellow" had done better, yet ashamed to be outdone. When I arrived at camp all were in but Brother Nave, and as it was

WAITING FOR DINNER.

getting late I was a little uneasy about him remembering his little conversation last year with a Havilena hog, but the boys said not to worry for if he found a deer trail he would follow it to Mexico, and while we were thinking of firing a signal to him to guide him home if lost, Brother Nave came in sight walking slowly through the brush and cactus. He sent the Mexican back to get a buck he had left some two miles away and horse and rider soon disappeared. Only a short time elapsed, however, before his return with the deer, and we had some of it for our supper. It was one of the finest specimens I ever saw and we could hardly wait until next morning to try our luck again. All this homesick feeling was gone and we awoke in the morning with faith in ourselves, our prospects and our guns. Sure enough we had a good day's sport and brought in all sorts of game except turkey.

So far Brother Nave would only hunt with his Savage rifle, but that meant large game, and as one of the boys said he thought turkey would be good for a change, Brother Nave said he would go out and kill one for him and made good his promise in a very few minutes. I secured a snapshot before he unloaded it.

Brother Senn was down on his luck during the whole hunt and we could not understand it at all until we found that there was a woman at the bottom of it and Brother Senn had himself been pierced through the heart by Dan Cupid's dart, and was to be married shortly after his return to San Antonio. Every time he looked down the gun barrel he could see instead of the eyes of a deer, the dear eyes of his true love; when he listened for the woodland sounds of rabbit or squirrel the music of his sweetheart's voice drowned out even the song of the nightingale; and in the smoke of his pipe

BROS. MAYS, NAVE AND SENN PLANNING AFTER-NOON HUNT.

there arose before his eyes a fairy face and the figure of a woman who haunts his waking dreams. Brother Senn was rather slow company, but his appetite, strange to say, was strictly on time.

We enjoyed many hours spent with rod and reel, for the fish were plentiful and easy to catch. The Nueces at this point is deep, the water clear as crystal, so that all kinds of fish could be seen under eight or ten feet of water in great numbers.

L. E. Mays landed the first fine trout and Brother Dial killed a Mexican hog and I am indebted to him for the skin which I am now having dressed for a rug. I am very proud of this one as he took off the skin after dark, and they make beautiful rugs. Brother Dial is an expert rifle shot and a very fine cook. I had prided myself on being the finest cook in camp, but on this trip I was compelled to yield that honor to him. Brother George Wright was our

"bread baker," but his long suit was shooting quail on the wing with his favorite pump gun. Quail could not get up too fast or too often for him, and had no chance for life in front of his gun.

Spring's Children.

BY GEORGE COOPER.

Oh, March is a rollicking boy,
Of bluster and din he ne'er tires;
He shouts in his infinite joy—
To all sorts of fun he aspires;
He rattles the windows and doors,
He whistles o'er forest and lea;
The chimney and roof he explores,
For a mischievous fellow is he!

Now April's a shy, lovely girl,
Who timidly wanders along,
And golden, with sun, is each curl,
And wakes in her heart a sweet song.
Though oft she grows pensive and sad,
And tears on her cheek we may see,
Ah, look! in a twinkle she's glad!
Oh, a bonnie, wee lassie is she!

But May is a beautiful maid,
Who sings with the birds and the rills;
She roams over meadow and glade,
Her smile lights the valleys and hills.
With glances so winning and true,
With step that is gladsome and free,
And eyes of the bonniest blue—
Oh! the Spring's peerless daughter is she!

The Value of Books.

In an address at the opening of a village public library, Hon. John Morley, the

eminent English statesman, said he was not so foolish as to claim that books were the only education.

Work was an education, politics were an education, and the divinest of all arts, music, was an element and an agency in education.

But, after all, without free access to books and without some knowledge of how to handle and use books, education must be a narrow and mutilated and imperfect process.

In his time he had to perambulate in England among what were called the middle class, and he was constantly appalled at the shocking trumpery that he found on the shelves of those who were kind enough to entertain him on those occasions.

Every one talked of Shakespeare, Milton, Bacon, and so forth, but he wondered how many copies of Shakespeare, of Milton, or of Bacon's essays they would find in people's houses.

Then he asked himself, by the way, how many in that room, if they were told they could not leave till they had pointed out what in their view were the great passages in Shakespeare, or the great lines in Milton, or the great words of wisdom from Bacon, would ever get out of the room.

He was not at all confident that there would be many.

Everybody who was able to possess anything beyond bread and cheese and clothing ought to possess three or four or five books, and they would be surprised, he thought, how very slim the volume would be which contained the gems and the pure gold of literature.

It was a great mistake to think that they could not enter into the treasures of literature unless they possessed a large library.

Poetry was not a taste which came to every one, but he who was not stirred by it led but a mutilated existence.

If a man asked him what poet he should begin with he would say Byron. While not the greatest of poets, Byron had got daring and energy and the historic sense, and it must be remembered that early in

the last century he was the great central inspiring force of democracy in the continent of Europe.

When democracy extended its reading and applied itself for inspiration to poetry, Byron would once more have his day.

He entirely agreed with a friend of his who said that when he turned out the light and locked the door of his library, leaving all the procession of saints and sages, warriors and martyrs, the champions of freedom, of truth and justice, those who had been trampled down and failed, those who had succeeded and been torch-bearers of truth in a sort of sublime solitude and darkness, he felt more than in the working day the true pathos of mankind—the real mystery of time.

We must not undervalue the real benefit of good books in the home. It is to our shame that we step into many homes of our well-to-do engineers and see no good books on table or shelf. In most of our homes are growing children who are starving for good literature. In these days of splendid magazines that are within the means of our class, every one should be supplied with good, sound reading.

Parents, think this over. .Subscribe for some of the periodicals handled by our worthy Brother Oliver, of Casanova, Va., and you will not only be helping yourselves and children to keep abreast with the times, but will be aiding a crippled Brother to support himself.

Sisters, accept the help offered you through our pages by embracing the Study Club. The worthy chairman this month points out to us the way by which all can come into the work. No matter where you live magazines will reach your postoffice address if you will but take them, and the hours you spend together will not be wasted, but full of benefit. Give your children every advantage in the pursuit of knowledge by placing before them good books, thus eliminating the evil effects of trashy novels that find their way into the hands of our boys and girls. Look well to what they read and accept the advantages held out to your-

self. We are never too old to learn, and let us now, if we never have done so, begin to learn "the value of books."

Our Insurance.

DEAR EDITRESS: I have been reading Sister M. L. Robertson's article in the January JOURNAL with a great deal of interest. I have a profound admiration for her depth of thought and brilliancy of intellect, but although not her equal in either, I wish to take issue with her in some of her statements for the good of the order. At present I have very little data at hand from which to deduce conclusions, but will use what I have and try to open a discussion on this very important topic. All of our members must be well informed on the subject in order to vote intelligently on it in the fall, and nothing brings out ideas like a discussion.

Our Secretary's first statement, that our membership has increased two-thirds during the last two years, taken in connection with the increase of the death rate 70 per cent, or $\frac{7}{10}$, does not make such an alarming statement after all, especially taking into consideration that 1904 was World's Fair year. We would expect from this that the insurance has been greatly increased, when the facts are, the members were assessed only 25 cents on a policy more this year than last, which would not bankrupt many. We would expect from the desire for age rating that it was the old members who made this terrible increase. Now, let us refer to this month's JOURNAL and see how it reads. We find Sister Brow, who has belonged $12\frac{1}{2}$ years, and surely has borne her proportion of the burden. Two others of the four whose date of admission is given have belonged 3 years and 4 months and $2\frac{1}{2}$ years, respectively, and the causes of death, to say the least, reflect somewhat upon the rectitude of *some* one who was responsible for their admittance. May not *this* be the key which will unlock the door wherein lies the skeleton of increased death rates?

Now, my Sisters, do you call it fair in an assessment insurance such as ours to raise the assessments when the Sisters are

past the age when they could become wage earners, and their husbands, if they are still living, are paddling in the same canoe? It seems to me this would kill our insurance quicker than any other law you could enact. I may be arguing from wrong premises, as the wording of Sister Robertson's article is what I am going by.

In the case of those who are now members, if the law would include those, it would be an *ex post facto* (after the deed) law, which would not hold water in any court in the land. Make the raise on those who from now on wish to enter our R. V. A., and whose rating in all other insurance almost approaches the prohibition point, and we are with you. But do not increase the rate for those who are already members and have borne the heat and burden of the day. Our whole insured membership stands with me in this.

The young members say, "If we must pay from now on until we are old and then have payments increase, we will withdraw now, while eligible to other insurances that have stood the test and not increased payments." The older members will withdraw because they think the law unjust. I think when the law passes, if pass it should, there will be few left in the V. R. A., at least in our Division, except those who are so sure of a near passage over the river that the expense would not be commensurate to the benefits. In other words, our young members would be like the Irishman who said he "wouldn't belong to a game he had to die to beat," and join the endowment rank of some insurance.

If our V. R. A. is to be constantly subject to radical changes such as this, it will militate against its increase of membership. We don't like to stand on a platform that we can't be sure of in sunshine and shadow; where a plank is apt to be abstracted at any time and the unwary fall into the ditch, or where a higher one may be added and we stub our toes and come to grief. Let us have an experience meeting and discuss this to a finish, get a stable foundation in some manner and then—let well enough alone. MRS. GEO. W. MORSEY, Ins. Agt. Div. 33.

Against Age Rating.

For our order the year 1905 has dawned auspiciously. Beyond all question when it lapses into old age still greater prosperity and advancement will have been achieved.

No other woman's order has such a progressive path opened to them because our members are all wives of men of one industrial calling. Loiter not over failures we have made, remember them only to avoid them in the future.

As the question of rating our insurance according to age has been launched, I would like a word on the subject. It should be very thoroughly discussed in our Divisions before the referendum vote is taken. This is a vital question to all insured members, and should be looked at from all viewpoints.

We all know the V. R. A. is business and not charity. By our venture as policyholders our money will return to our own.

My views are opposed to age rating. It would be an injustice to all old members who have stuck to the craft when it was very frail and many times we paid as high as \$2 per month when two policies would not bring \$500. By so doing we gave encouragement to others to come in and help the cause along.

Now many of us are too old to become insured elsewhere, and many of our husbands have been forced out of service as engineers owing to old age, and it is hard even now to keep our assessments paid up.

To raise the rates will force many to drop out, myself for one. I have carried two policies since 1892. I think the policy fee should be raised for one way to get a surplus. Our membership is now largely made up of young, ambitious women, who, I trust, will have consideration for the old standby's.

MRS. W. E. HOYT.

Note from Fort William, Ont.

DEAR SISTER EDITRESS: I suppose by this time you will be thinking that New Ontario Div., 324, G. I. A. of the B. of L. E. has died a natural death in its in-

fancy, but it just seemed as if it took us so long to get started. At first we were up against it for a hall, but finally got that remedied. We organized here on the 12th of October with a charter membership of 19, expecting more to follow. So far we have been very successful as far as good attendance is concerned. The Sisters are all good hustlers, but we did not have a chance as our organization was somewhat hurried, only one regular meeting being held with our organizer to instruct us. Of course you all know what that means. But thanks to Sister Grant, who has had experience in Division work, she having been a member of Ottawa Div. before meeting with us, willingly came to our rescue and has done all that she could possibly do. We all feel that she has been and will continue to be such a standby.

Well, we gave our first at home in our new hall on Jan. 12th inst., it proving a great success. Everybody enjoyed himself to the fullest extent, dancing and cards being the features of the evening. Judging from the interest taken by our Brothers and witnessing their evident enjoyment of the evening, we felt fully satisfied with this our first at home, and I am sure that every one will look forward with pleasure to our next.

Our regular meeting days are first and third Tuesdays of the month, and we will be glad to meet with any Sisters who may happen to be in Fort William on those days.

Our election of officers for 1905 resulted in all the old officers retaining their offices for the current year.

I am sending along a picture of our charter members with Sister Sproule, our Organizer, in it, and we would deem it an honor to have a cut put in your JOURNAL. It was taken the day after our organization just before our new Division treated Sister Sproule and Brothers to a drive around our pleasant little town and suburbs.

Only five of the Brothers turned up. Of course, we would have been pleased to have seen them all. Owing to a rush of work on the road at the time, more were

unable to be present. We hope in the future to report good progress, both socially and financially.

Our Division sends greeting to all sister Divisions, and wishes one and all a happy and prosperous New Year. Div. 324.

NOTE.—Sisters of the G. I. A., please do not send pictures of groups of members, because we cannot print them in our department. The number of Divisions is growing rapidly, and we have not the space to spare for these pictures that can only be of local interest. I have requests to return them in many cases months after they have been sent, and could not do so on account of my inability to tell which from other. Hereafter all such pictures will be returned at once so they will not accumulate. The space must be used in a way that will be beneficial to all.

EDITRESS.

Make No Change.

Sisters, I have just been reading the JOURNAL, and was particularly interested in Sister Robertson's article in regard to "Rating Assessments According to Age." Of course we cannot all see alike, but it does seem to me it would be making the greatest mistake possible to make any change in our insurance. Sister R. after setting forth the dreadful condition of the V. R. A., and predicting its downfall if we do not accept the age rating at once, says in her next paragraph, "There is no need of a panic over this matter, the V. R. A. never was in such good condition as it is today." If it is in better condition than ever why not let well enough alone? She asks what is the cause of such a large increase of death rate? I think it is plain enough. We must expect a higher death rate when we have 5,000 or 6,000 members than when we had only 1,000 or 2,000. Again, she says, "As the average age increases more deaths follow, more assessments, more forfeitures will result, which nearly always occur among the younger members," etc. At last, the result will be a membership composed of those who are too old to join other associations. I think that would be the result if we were to

have age rating. Would it be fair that the old members should have to pay twice as much, and perhaps more than that to keep in the V. R. A. because they are too old to go into any other association? Where can you find a better or more solid insurance than that of the B. of L. E.? They do not have age rating, as I understand. The originators spent a great deal of time in getting our insurance as near as possible like that of our Brothers, and deserve great credit for it.

No, Sisters, let us leave our insurance remain as it is, the assessments are light on all of us, and are alike on each policy. I don't think we can be in such a dreadful state. In the last six months we have only been called on twice to pay for more than two deaths in one month, October and November we had three to pay for. In July we did not have any, so you see more than half of the deaths have been paid from the surplus, and the surplus increases as well as the death rate.

AN OLD MEMBER.

Greeting from Richmond, Va.

MADAM EDITRESS: Months have glided into years and years have almost numbered a decade since I knocked at your door for admission to the pages of the JOURNAL. Now kindly give me space to send a loving greeting to my many friends, for the sake of "auld lang syne." I am not dead, neither have I been sleeping during this long period of silence. Silence is golden, as we all know, and I have been keeping my precious metal well polished and brightly shining, by hard work in our beloved cause; never, for even a short time, have I been idle.

I am glad to report our Division, 228, Richmond, Va., in a most prosperous condition financially and socially; seldom do you find a band of brighter, more energetic or sympathetic women, working for a common cause. Our meetings are looked forward to as an oasis in our deserts of R. R. cares and anxiety, when the warm hand pressures and kindly words make us stronger for life's battles. Each member vies with the other in lending her personal aid to make our coming to-

gether a pleasure. Our treasury is never empty, being continually replenished by the proceeds of home socials, entertainments, etc., in winter, and in summer excursions to the seashore. Our annual excursion to Buck-Roe-Beach is an epoch in the history of our Order. 'Tis a veritable family reunion, where pleasure reigns supreme, and cares that infest the day fold their tents like the Arabs, "And as silently steal away."

If any one doubts my statement let him go with us in July, 1905, and taste of the fountain of pleasure, and be rejuvenated by a dip in Virginia's briny deep. While enjoying all these pleasures we have not been unmindful of others not so fortunate, but have passed along "the cup of comfort" which the Lord has given us. Last winter we furnished a room complete for the sick poor in one of the Mission Hospitals, homes have been made glad by the bright flowers of love sent to cheer them, and hearts happy by inhaling the perfume of blossoms, or by more substantial aid, when needed.

So you see idleness belongs not to Div. 228; though her voice is not often heard her influence is constantly felt. Charity you all know begins at home, so our Division has a "Sick Benefit Fund," for its own members, that has been in successful operation for a year, and has proven very beneficial, for while working for others we are reaping a benefit. On October 25 Virginia and Richmond threw wide open her doors to welcome the "Mutual Interest Board." The ladies were highly honored by being invited to entertain them. Never was evening more pleasantly spent in music, eloquence and good fellowship, not forgetting the inner man, for the way to a man's heart is through the table. Long may these Brothers live, and we all say come again and bring your wives, for Virginia is ever proud of her noble R. R. boys wherever they may dwell, and says to all occasionally Come Home! Come Home! "Breathes there a man with soul so dead who never to himself has said, this is my own, my native land!" Our Sunny South is now wrapped in snow, the song birds have flown to other climes,

and it is almost impossible to keep warm, even by a bright fire, so will bid you adieu, wishing Divisions and homes happiness and prosperity. I am yours in F. L. and P. Mrs. C. F. CONLEY, Pres. Div. 228.

Grand Ball at Trinidad, Colo.

Last night there was one of the biggest crowds of dancers ever gathered together at Castle Hall, the occasion being the grand ball given by Ivy Division 330, G. I. A., to the B. of L. E. The ladies have been making their preparations for the dance for several weeks past and not the smallest detail was overlooked to make the affair the success that it was. Every Division was in the hands of a capable committee, and from the time the dance began until the last bars of "Home Sweet Home" were played, the fun was of the spontaneous and contagious order.

Mr. and Mrs. T. R. Ryan headed the grand march, and behind them came 150 couples of people. The dance cards were book shape, bearing a pink carnation, the lodge flower, and there were twenty-four dances and six extras on the card. Each lady member of the lodge had a dance named for her, and below the line was some figure of speech of railroad phrase.

Every lady who belonged to Ivy Division wore a pink carnation and the colors of the lodge, red, white and royal purple.

The music was exceedingly good, being furnished by Ferraro's orchestra, and it was of the kind that makes dancing a pleasure.

In the banquet room of the hall the ladies served a supper that was characterized by its merit, and they cleared \$37 from the supper alone. The dance will net them over \$140. In another room there were card tables for those who did not care to dance, and these were filled with players most of the time.

New Divisions.

ANOTHER LINK.

North Star Div. 338, Staples, Minn., auxiliary to Div. 144, B. of L. E., was organized in Staples Friday afternoon, December 30, by Mrs. J. A. Morton, assisted by Mesdames Conley, Smith, Robinson and Quinlan, all of St. Paul.

After the Division was organized, a banquet was served, to which the engineers were invited. The tables were decorated with the colors of the Order and pink carnations, the Order's flower. On the center table was a miniature Christmas tree, also displaying the colors.

At the close of the feast, which the boys say was a fine one, there was a speech by Mrs. Morton, the Grand Organizer.

and remarks by a number of the Brothers. It was not known that the Brotherhood contained so many orators. It was a question which one was the best, but it was finally conceded that Sam Gorman carried off the honors.

The Division president, Mrs. Wilson, was called upon and made a few remarks. She reviewed some of the good which the Auxiliary had accomplished, and she said she was pleased that the engineers' wives had taken up the work here. She urged all to avail themselves of the insurance feature of the Order. She also remarked that the day was of peculiar interest to her as it was the 29th anniversary of her wedding.

Public installation was held in the evening, and the engineers present voted it a pleasant affair, and hoped it would be the beginning of many such gatherings for the engineers and their families.

ANOTHER IN PHILADELPHIA.

On October 11, 1904, Philadelphia Div. 332, of the G. I. A. to B. of L. E., was organized by Sister T. C. Smith, G. O., assisted by Div. 112 and 27 of Philadelphia. The new Division opened with 18 members, and have 25 now.

After Sister Smith had organized and instructed us in the work of the Order we adjourned for supper. At 8 o'clock Sister Smith called the meeting to order for public installation of officers.

Division 51, B. of L. E., to whom many thanks are due for furnishing all our paraphernalia, were well represented; there were also members of Div. 112, 27, New Century of Philadelphia, Camden, 810 of Wilmington, Del., 17 of Detroit, Mich.

After the installation there was a social entertainment, Miss Grace Lawton, daughter of our insurance secretary, gave several recitations in a very able manner. There were vocal and instrumental solos by the daughters and friends of members. Brother Warnick, F. A. E. of Div. 51, presented the new Division with a beautiful Bible, which was received by the president in behalf of the members in a very neat speech, and Brother Lawton framed our charter very handsomely, after which refreshments were served by Grace Lawton, Vera Gilmore and May Warnick, daughters of members, to which the Brothers did full justice, proving that engineers like good things. After wishing success to the new Division all departed to their homes well pleased with their day's work.

SECRETARY DIV. 332.

ANOTHER IN EAST ST. LOUIS.

Thursday afternoon, December 8, in East St. Louis, Ill., another link was added to the chain which for the past 18 years has been lengthening and binding together not only the wives, but the

families of the Locomotive Engineers, in protection and fraternal love.

This Division makes its initiative bow with fifteen or more charter members, who have selected as a name that of one of our most lovable and faithful Grand Officers, Mrs. Harry St. Clair. Through the untiring efforts of Sister Dunn, who was elected President, St. Clair Division came into existence.

I feel very grateful indeed to Sister Dorsey, our third Trustee of Insurance, who came down from her home in Springfield, Ill., and so ably assisted in the organization, also to Sisters Start, Hans and Williams, of Divisions 50 and 306 of St. Louis, who so kindly assisted.

Following the organization the officers were elected and installed. A more enthusiastic set of officers would be hard to find. At the conclusion of the ritualistic work a short social session was held, cream and cake being served. The Divisions represented were 14, 50, 136 and 306.

While in St. Louis I was most comfortably cared for in the home of Brother and Sister Sweet's. We trust that this link, 342, will never grow rusty or disconnected; but why speak of this, knowing that in this Division is the metal which will make interest coincide with duty.

MRS. CHAS. SURSA, Organizer.

Notice.

A union meeting of the G. I. A. will be held in I. O. O. F. Hall, in Columbus, O., on March 14, under the auspices of Div. 52. The ritual work will be exemplified and fancy drills given, including the Installation Drill. Sister Murdock and other Grand officers will be present. All members of the G. I. A. are invited, and the Ohio Sisters especially urged to come to this meeting.

EDITRESS.

Study Club Program for March.

"Ho for the stormy cold March days!
Aye! There is nothing like them."

—Old Song.

Quotations—Verse of favorite song.

- "The real race suicide." "The White Plague."
References: Everybody's Magazine, May and June, 1904; McClure's, January, 1905; Munsey's, July, 1904; The World Today, January, 1905.

Pearson's, December, 1904; Modern Women, July, 1904.
- The Dowager Empress a power in Russia.
Chicago Record-Herald, Jan. 25, 1895; Munsey's, May, 1904.
Books of reference on this subject:
The Awakening of the East. P. Leroy Beaulieu.

The Russian Advance. Hon. Albert Beveridge.

Russia and The Russians. Edmund Noble.

4. Marriage.

References: Harper's Easy Chair, February, 1905; The Luxuries of Children and some other luxuries. By Book—Edward Sangford Martin.

PART SECOND.

As this meeting will no doubt be held on or about the 17th of March, we outline the following study:

- Quotations—From Irish poets.
- Song—"The Harp That Once Through Tara's Halls."
- Character Sketch—St. Patrick.
References: Story of Ireland, by A. M. Sullivan, and Ancient Irish Church, by Rev. Gaffney; First-class Encyclopedias.
- Character Sketches—Daniel O'Connell and Robert Emmett.
- Song—"Wearin' o' the Green" (or clubs can make their own selection).
- Recitation—From J. Whitcomb Riley, or others.
- Song—"Kathleen Mavourneen." (Clubs make their own selection of Irish songs and impersonations.)

We do not wish our club members to confine themselves to the references cited in our programs, but use every means possible to add to their knowledge of the subject. Wherever an item in the dailies applies to the subject in hand, use it, by all means. Again, some of our clubs are so isolated that no public library is possible. In this case the Tabard Inn Library is available. It is what is termed a traveling library. Then each one in a club may take a different magazine. Much information can be gained by an exchange. Should it be impossible to secure references, the club may use its own judgment as to subject. Never let the interest flag for lack of work.

We are glad to receive encouraging letters from our club members. The subjoined is from Springfield, Mass. "Jolly Hard Workers" it is called, and rightly named.

A fine report comes from Fort Wayne, Ind. This will be published later.

All Secretaries of Study Clubs should send for blanks. But one report has been received for 1903 and 1904. Reports of clubs are to be made out for the term of eight months; this constitutes a year's work. Immediately upon the close of the "year," May 31, the report should be sent to the Chairman of the Study Club Committee. Blanks for this purpose can be had by applying to

C. E. CUNNINGHAM,

904 Wheeling St., East Toledo, O.

WEST SPRINGFIELD, MASS., Jan. 27, 1905.

To the Members of the Study Club Program Committee.

FRATERNAL SISTERS:

"He who will not when he may,
When he will shall have nay."

When your letter came I promised myself the pleasant task of replying at once to tell you about our little interested band of Jolly Hard Workers,

the name given to the few members of Div. 61 who represent the organized Study Club.

With many interruptions, time taken to prepare gifts for the holidays, November and December seemed to have passed in the twinkling of an eye.

As the subjects appear each month, I ponder on the many hours of thought spent in preparing them for the approval of the many readers all over the continent, and I think the Committee deserves recognition from us all, that they may be stimulated in their good work.

While perhaps the topics are not to the liking of all, yet I doubt if we could do better. Many require thought and study, but when we think of the world's accumulation of knowledge in science, art and literature, our free access to public libraries, our task is easy and the knowledge ours for the seeking.

We are not booming, but persevering. Our membership is eight, seven of the number belonging to the G. I. A., and a more interested, zealous band of workers it will be hard to find. Each subject is carefully studied before its presentation, and the members consider their time profitably spent even when they have been to some inconvenience to procure references.

Visitors manifest an interest which is evidence that they feel repaid for meeting with us. The one member who styles herself the 'laziest one' usually has pages of most interesting matter for our enjoyment. We always have quotations from some favorite author, and feel that each time we meet something is given us to hold in memory.

"I hold it truth with him who sings
To one clear harp in divers tones,
That men may rise on stepping stones
Of their dead selves to higher things."

May an awakened interest in all the Study Clubs be the manifest appreciation of your good work.

MRS. C. F. FLAGG, Director.

Division News.

THE members of Div. 293, Hoisington, Kan., who know so well how to take care of the social features that help the cause of our Division, gave a final banquet for the year 1904. It was held at the home of Mr. and Mrs. C. H. Young, who were the guests of honor. For elegance and good taste it was rarely surpassed. It was commented upon as one of the social events of the year.

Now for the year 1905. Well, we have entered upon it with our re-election of the same officers, enjoying each other's pleasure and bearing with one another's faults. If love is to flourish in our Division we must each be slow to take offense, and not only willing, but glad to pardon at the first and faintest sign of penitence; still more, to overlook entirely the sin which has been a blunder or an accident. Life and love are in a great part the art of bearing with other people's shortcomings. Someone has wisely said that scarcely a novel was ever written which could have run to the end if the hero and heroine had been fully frank with one another.

Much may be forgiven to those who loved much

by those who return such affection. The slate should be wiped clean, and transgression be as though it had never been.

A Happy New Year to the dear old JOURNAL, the ENGINEERS' JOURNAL, I mean, one of the best JOURNALS published. Let every member of the G. I. A. worthy of the name read it during 1905.

M. H.

AS WE have not overburdened you with news from Centennial Div., 221, Nashville, Tenn., and having allowed several functions to be disregarded, will mention our latest and best I believe

On January 2nd, the Auxiliary entertained in the form of public installation. Some 200 invitations drawn from the married and unmarried element were given. Our hall is superb in its settings and formed a fitting background for such a representative gathering.

Several Brothers made interesting talks, which were encouraging, complimenting the Sisters on their fine interpretation of the work, saying the B. of L. E. did not engage in one gotten up so well and executed so faultlessly.

Brother Courtney, of Div. 473, possibly made the best talk; knowing our principles he added, "That did well for the Brothers, for they needed them; but the Sisters' principles should be love." And if we possess love our grand old G. I. A. need fear nothing, for love constraineth us to forbearance, humility, etc.

Our President, in a graceful manner, responded feelingly, thanking them for the high esteem in which they held the Auxiliary. The new officers presented their President with a beautiful bouquet of carnations and ferns.

A brilliant program was given which reflected great credit upon the participants, most especially in the recitations of little Misses McGriff, Misses Hadder and little Miss Myrtle Carter. These lassies were loudly applauded.

Sister Bower's little girl, only nine years of age, possesses a rare voice and sang almost divine. She favored us with two selections.

After the program a banquet was tendered the guests who were seated at beautifully decorated tables whose color scheme denoted red and white effect. A tempting menu was served, and I think each guest declared it a success, to be repeated in the near future.

MRS. D. W. THOMPSON, Cor. Sec. 221.

DIV. 53, of Minneapolis, Minn., has just finished a successful year. Many were the entertainments and parties given, not the least of which was the Blue Jay social and country store. It was a kind of humbug, but P. T. Barnum has said that the people like to be humbugged. Any way all who patronized the country store got their money's worth. Sisters Whitchurch and McLane were dressed as country girls and attended to the store. They certainly looked green and fresh, but proved to be capable salesladies.

Like all Divisions we have had our afflictions, but Time, the great healer, has come to our rescue and all are now well again. We made very little change in our officers at election time; our meet-

ings are always pleasant, therefore we enjoy them.

This Division has a policy of never looking for trouble, and consequently we never find it. We are starting the year 1905 with a determination to do better than ever before. SEC. 53.

Div. 268, Colorado City, Colo., at their regular meeting Jan. 10, had a pleasant diversion in the form of installation of officers.

The newly-elected President, Sister Dibble, in a few well-chosen words presented the retiring President, Sister Pack, an elegant silver chocolate set. The gift was from the Division in appreciation of her faithful services. Sister Pack will be remembered as delegate to Los Angeles and already possesses a Past-President pin.

Our Division is here in sight of Manitou, the Garden of the Gods, and the everlasting, rugged mountains. We can step to our doors at any time and see old Pike's Peak, generally snow-capped, standing like a sentinel over us. With such romantic surroundings how can we help being happy, healthy and harmonious?

But to come down from the heights, I must tell you that after our installation we partook of refreshments, and after a social time well spent we adjourned. MRS. DAN PHELAN.

As Mistletoe Div., 181, Denison, Tex., has not been heard from lately I would like to ask for space to tell of the pleasant time we had at our installation. We held our regular meeting Jan. 11, at 2 P. M. and at 3:30 P. M. we opened our doors to the Brothers and their families and had our installation. Our Grand Officer, Sister R. W. Mays, acted as installing officer. Our President, Sister Oland, was re-elected, as were most of the officers. Our musician, Sister Bevan, who has served us so faithfully for the past five years, was presented with a cut glass creamer and sugar bowl, as a token of love and appreciation. After installation, we had a delightful program of songs and piano selections by daughters of our Sisters and Brothers, and a speech by our Grand Officer, after which all were invited to the banquet room, where a turkey dinner was served. The Brothers of Denison Div., 177, recently presented us with a beautiful assortment of dishes and silver, and this occasion afforded us an opportunity of showing the usefulness of the gift and our appreciation of the same. A pleasing feature of the banquet was the toasts given and responded to by Div. 177 and Mistletoe 181. After several pleasant hours spent together, we separated feeling that all were well paid for braving the weather, which was very cold and rainy, to carry out the program prepared for this day. SEC., 181.

Div. 12, Chillicothe, O., held, Thursday evening, January 26, at the B. of L. E. Hall, a public installation of officers for 1905, to which we invited a few friends and members of B. of L. E. Div. 65 and wives. This was our first effort at anything of this kind for the public, and I think you would have said we did well. I believe we rather surprised ourselves. All made an effort to do credit

to Div. 12, and I believe we succeeded, as all present praised our work and thought it beautiful.

We had quite a good year in 1904. We made on entertainments about \$116 for our treasury, took in eight members, and some of the old ones had their interest renewed. All of the old officers except two were re-elected, and we are hoping for a good year again this year. Of course, we are still a small Division. We enroll 31 members, six of whom do not reside here, and there are always a few who will not take an active interest. I suppose it is so with all Divisions.

Sister Cassell, if you can find room for mention of this in the JOURNAL I think it may please and encourage us, and we would be pleased at any time to receive visits from our Grand Officers who can find it convenient to come. SEC., Div. 12.

Div. 284, Battle Creek, Mich., had a most enjoyable time at the close of their regular meeting, January 12. At this time the officers were installed in the presence of a large gathering, composed of the families of the members, who had been invited for the occasion. After the ceremony a fine banquet was served, Mr. M. J. Jones acting as toastmaster in his own pleasing manner. A splendid program of vocal and instrumental music and readings was thoroughly enjoyed. These good times once in a while are both pleasant and profitable, as it brings our families in closer touch one with the other. PRESS COR.

Div. 205, Neodesha, Kan., has had a few pleasant gatherings the past month, and I send the account that you may know how we stand in the way of good-fellowship.

Sister R. G. Woods, of Wichita, formerly of Neodesha, has been visiting her many friends here, and was given a very pleasant surprise at the home of Brother and Sister M. W. Lansdown. The ladies took refreshments with them and made a nice spread, which all enjoyed. After a pleasant evening with different games the guests departed at a late hour.

On January 23 Sister Baker invited the Sisters, with their families, to surprise her husband. And he surely was surprised when he came home and saw the house full of people. He soon discovered that the invasion was made by friends, and that his home was to be the scene of a social gathering. Sister Baker served a nice lunch. Cards and conversation were the pleasures of the evening, and it is needless to say that every one enjoyed the hospitality of the hostess. COR. SEC.

THE Ladies' Auxiliary to the B. of L. E., Clinton, Ia., had its annual banquet and installation of officers last month in the B. of L. E. Hall. The rooms were well filled with the members of the Auxiliary, members of the Brotherhood and invited guests, which latter included a goodly number from Boone, Ia.

After an elaborate two-course supper the officers were installed. Mrs. Robert Primrose acted as installing officer and Mrs. C. E. Goodwin as marshal of the day. The work of the ladies was well done and elicited many compliments. After the

installation Mrs. Goodrich was presented with a beautiful souvenir spoon as a token of the appreciation of her services the past year. The majority of the officers of the Auxiliary were re-elected for this coming year.

The B. of L. E. rooms were prettily decorated for the occasion with bouquets of carnations and pink candelabra, the use of the Auxiliary colors adding to the beauty of the decorations.

Mrs. Claude Easterly furnished the music for the social hour, and the most enjoyable evening closed with songs and music by Mr. and Mrs. Will McNicholl.

H. P. G.

Div. 102, Evanston, Wyo. Now it is our turn; we have been quiet long enough. We have not been rusting all this time, but quietly sawing wood. The most pleasant time we have had lately was on November 11. About twenty B. of L. E. members and their wives quietly gathered at Brother and Sister Gunnell's at 8 o'clock and proceeded up the hill to Brother and Sister Baker's to give them a little surprise in honor of Brother Baker's 40th birthday, and also, the Brothers wished to show their love and appreciation of Brother Baker's untiring efforts and faithful work as Chief of Div. 136 for eight years past, and re-elected again.

A handsome leather rocker was presented to him during the evening, Bro. Al Coey making the presentation. Brother and Sister Baker showed their appreciation immediately by both trying the chair at once, but the chair was strong and no damage was done.

During the evening some pleasant music was listened to, and last but not least came a delicious supper, which was not slighted by any one.

About midnight we departed for our homes, wishing Mr. and Mrs. Baker many returns of the day.

MRS. CLAUDE LINSLEY,

Sec. Div. 102.

It is a long time since Carnation Div., 246, Joliet, Ill., has been heard from, but we want you all to know that we are still alive and prospering.

On the evening of Jan. 9, we held our annual installation of officers at which there was a large attendance of members with their husbands and friends. We first listened to a fine program composed of vocal and instrumental music and recitations. Then came the ceremony of installation, Past-President Sister R. S. Russell acting as Installing Officer, and Sister J. H. Haggart as Installing Marshal, to whom much credit is due for the efficient manner in which they performed their duties. This being over we marched to the dining room where we found a bountiful supply of good things to eat, and from the way they disappeared I think the engineers' wives sustained their reputation of being good cooks. The remainder of the time was spent in dancing, and when at a late hour good-night was said, all voted they had had a most enjoyable evening and hoped to have an invitation to come again next year.

Twice a month (usually Wednesday afternoon) luncheons are held at the homes of our members. The time is spent in playing cards and having a

general good time. Refreshments consisting of coffee, sandwiches, pickles and cake, are served, when a plate is passed around and each one is expected to pay a dime.

We also give a euchre party every other Monday night, and to say that everyone enjoys these parties is putting it mildly, which is proven by the good crowds we always have. Euchre is played till about 11 o'clock when prizes are distributed and refreshments served; there is only one thing we regret and that is the time passes so quickly.

So you see we are doing something all the time to better our Division, both in a social and financial way.

Our meetings are interesting and the attendance good; nevertheless, there is always room for improvement.

With best wishes to all G. I. A. Divisions for a successful and prosperous year.

COR. SEC'Y.

THE ground was covered with snow and ice and you had to keep in the middle of the road to walk. Cold like we seldom have in this country. It took a brave woman to venture out of doors, but nevertheless you could see from all directions members of the G. I. A. all headed for their hall in Springfield, Mo., Jan. 12. It was installation of officers. Although it was so cold and dreary without, it was bright and cheerful within. After the regular routine of business President Noleman declared all offices vacant. Sister Beckerleg was installing officer and Sister Chas. Dubuque, marshal. Both did their work in a pleasing manner. All the old officers were re-elected and hope they will have the support of the whole Division. Sister Noleman has filled President's office for five consecutive terms and has been our delegate to the last three conventions, which shows her popularity with Div. 84. Being conscientious and kind to all and regular in attendance she deserves the honor.

After the meeting the members of the B. of L. E. Div. 83 were invited to partake of lunch served by the social committee, which was done with credit to the ladies. All did justice to the same and had a jolly good time, as we were fortunate enough to have quite a number of the boys with us, and it is so seldom we can get them. Those present were: Bros. W. A. Noleman, C. E. Div. 83; E. V. Horner, present sheriff of Greene county; Chas. Dubuque, J. Moran, Robt. Shaw, Wm. Price, F. P. James, P. Moore and Chas. Rhode. All voted the time too short and went home hoping to meet again soon.

On Wednesday evening, Jan. 25, Div. 84 gave a farewell reception at the home of Brother and Sister F. E. Gano, in honor of Brother and Sister G. W. Smith, who leave for Spokane, Wash. The evening was spent pleasantly and socially. An elegant luncheon was served and much enjoyed by all. At a late hour when good-byes and good-nights were said all departed wishing Brother and Sister Smith God-speed in their new home.

We have made it a rule in our Division to take up a penny collection at each meeting for a flower fund. When one of our Sisters is sick we use this money to purchase flowers to send to her. All who have been recipients seem to appreciate them. We also have a social fund. We pay 10 cents per month, the proceeds of which we use for refreshments when we have initiation or socials at any of the Sisters' homes. We find this way so much better than soliciting among the members, and we always have plenty of money on hand. We have a committee to collect and it serves for three months.

VERITAS, Div. 84.

Div. 176, Chattanooga, Tenn., gave a public installation on January 11. We have been congratulating ourselves ever since because we did so well, as it was our first appearance in public as an Auxiliary. We think our Brothers were pleased and surprised, and there were ten of them there, so many more than usual, that the surprise was ours a little.

After the installation we had a short musical program. Sister Hulse's niece gave us a violin solo and Sister McCollun a very beautiful piano solo. The others who helped in the program were friends of the Division. We all thanked them heartily. Last but not least were the refreshments, which were enjoyed by all.

There were 150 present, ever so many who had only heard of the Auxiliary. They were surprised that the floor work was so beautiful. The ladies wore black skirts and white shirtwaists, with pink carnations, making it so much more impressive than if they had worn different costumes.

We hope to have something else to report to the JOURNAL before long.

Mrs. W. T. CAREY.

It is not often you hear from Div. 486, Allandale, Ont., but we are silently working hard all the time, and have added a large number to our order the past year. February 2 being the anniversary of our organization (just thirteen years ago), we thought our new members could not get acquainted better than by having an at home. Our hall not being large enough, Bro. George Cummings kindly offered his commodious home for the occasion. Just Brothers' wives and sweethearts were in attendance. If any of you were ever entertained by Brother and Sister Cummings you will have a faint idea of how all were taken care of on the evening of February 2. Three of the oldest engineers on this division were there, Brother Tennell, Bro. Alex. Clark and our host, Brother Cummings. Cards, games and music were plentiful. Oysters were in abundance, as were all other good things.

The at home was made more interesting by a feature some of us have not yet seen, but hope to—the silver wedding day of Brother Logue and wife. Brother Cameron gave an address, in which he asked Brother and Mrs. Logue to stand up, which they did, when they were presented with a beautiful present suitable for the occasion, Brother Cummings making the presentation.

The hours were beginning to get small, so the time came to break up, which all did, expressing

themselves as having had a most enjoyable time. Come again, Geordie.

N. CLARK, Div. 161, G. I. A.

G. I. A. Voluntary Relief Association.

TOLEDO, O., March 1, 1905.

To Division Insurance Secretaries, V. R. A.:

You are hereby notified of the death of the following members of the Association, and for the payment of these claims you will collect 75 cents from each member carrying one certificate, and \$1.50 from each one carrying two; providing, however, that no one be assessed on a certificate, if the application for same was dated later than January 31, 1905.

ASSESSMENT No. 198.

Died Jan. 15, 1905. Sister Eunice Ryan, aged 62, of Div. 47, Newark, O. Cause of death, fatty degeneration of heart. Carried two certificates, dated October, 1890, and September, 1893, payable to Mary A. Bounds, daughter, and John A. Ryan, husband.

ASSESSMENT No. 199.

Died Jan. 26, 1905. Sister Ann E. Hassler, aged 69, of Div. 20, Allegheny, Pa. Cause of death, catarrhal asthma. Carried two certificates, dated July, 1894, and February, 1898, payable to Albert Hassler, son.

ASSESSMENT No. 200.

Died Jan. 26, 1905. Sister Ruth E. Funk, aged 55, of Div. 246, Joliet, Ill. Cause of death, pneumonia. Carried two certificates, dated May, 1900, payable to Edgar Funk, husband.

ASSESSMENT No. 201.

Died Jan. 30, 1905. Sister Agnes L. Miller, aged 43, of Div. 112, Philadelphia, Pa. Cause of death, shock from operation for ovarian abscess. Carried one certificate, dated August, 1904, payable to David I. Miller, husband.

ASSESSMENT No. 202.

Died Feb. 19, 1905. Sister H. O. Whitney, aged 36, of Div. 96, Chicago, Ill. Cause of death, carcinoma of liver. Carried one certificate, dated February, 1904, payable to H. O. Whitney, husband.

ASSESSMENT No. 203.

Died Feb. 1, 1905. Sister Sarah C. Birkhimer, aged 42, of Div. 15, Sedalia, Mo. Cause of death, double pneumonia. Carried two certificates, dated January, 1904, payable to Delaphene Birkhimer, adopted daughter.

Members will pay their Insurance Secretaries on or before March 31, or be marked delinquent; and in order to reinstate must pay a fine of 10 cents on each certificate besides the delinquency. Insurance Secretaries must forward to General Secretary and Treasurer not later than April 10, or stand delinquent till remittance is made.

Assessments Nos. 201, 202 and 203 will be paid from the Assessment Fund.

Members in good standing Dec. 31, 1904, forty-eight hundred and thirty-one in the first class; and two thousand and seven in the second class.

MRS. GEO. WILSON, Pres. V. R. A.

M. L. ROBERTSON, Gen'l Sec'y and Treas.

Air Pump Failures.

BY R. H. BLACKALL.

[A brief synopsis of a paper read before the Northwest Railroad Club by Mr. W. Parnell, of the C., St. P., M. & O. Ry.]

There is now some discussion as to whether it is a violation of the Safety Appliance Acts for a train to be taken beyond the first side track after the air pump has failed.

The failures are given under the head of complete and partial. Under the head of the former are loose air pistons due to nuts coming off from the rod, the end of the rod breaking or cutting its way through the piston. These failures are not due to improper construction, and cannot be prevented by any special form of lock nut or kind of steel in the rod. Improper repairs and poor tools are responsible for these failures, also lack of proper repair parts. As most of these improper repairs are made in round-houses, he believes in keeping this work to a minimum outside of the shop.

Hammering the end of the rod to remove the piston tends to fracture the rod. This practice is considered inexcusable. The use of a set in tightening nuts has the same effect. The use of nuts that do not require to be drawn is a source of loose nuts in service.

The next most frequent defect resulting in failures is loose reversing plate cap screws. Some roads have done away with this trouble entirely by the use of a lock nut.

The brass air valves used formerly broke occasionally and worked into the air cylinder, where the piston would strike it, causing the rod to be bent. This seldom occurs with the new steel valves. Steel valve seats in use at present should be moved to the receiving valve side, where the conditions can be met more satisfactorily by the brass. Steel seats should be

used exclusively on the discharge side of the pump.

Some few failures have also come from the bending of the reversing valve rod. This happened more particularly before these rods were case hardened.

Under the head of partial failures come those cases where the pump is unable to supply the proper pressure, thus causing a shortage of air, stuck brakes, and detentions, as well as reducing the safety of the train. The causes for insufficient air supply, aside from the conditions that may exist on the train, are loose air piston packing rings; leakage by the piston rod or back into the cylinder from the main reservoir. The leakage by the rod is generally due to the packing giving out, and in the case of metallic packing this is generally due to a poor design or absence of proper lubrication. The leakage by the valves, particularly the discharge valves, results in excessive heating, destroys lubrication, and, therefore, produces rapid wear as well as greatly reduced efficiency.

There is almost as much necessity for the automatic lubrication of the air cylinder as there is for the steam cylinder.

The suction opening, or strainer of the pump, is greatly neglected, and is often responsible for the lack of air. There seems to be a call for a larger strainer, and one that will catch the fine particles as well as the coarse, and prevent them from entering the pump.

A test in the East showed that a strainer, no dirtier than those frequently met with, required the pump to make 628 strokes and a time of 4 minutes and 8 seconds to acquire 100 pounds pressure on the engine. With the strainer removed, but 540 strokes and 3 minutes and 30 seconds were required to obtain the same pressure. In winter, engineers should watch carefully to guard against frost accumulating on the strainer and causing similar stoppage. Such accumulation is most liable where there is rising steam and when certain atmospheric conditions prevail.

It is believed that with the high steam pressure carried today the pump may be

run at such a speed that proper economy may not be derived, and some roads have adopted means, such as restricting the steam opening, so that the speed will correspond with that on engines where the steam pressure is but 140 pounds. This he considers proper practice, as it increases the life of the pump, and because there was never any objection raised in the past to the speed of the pump being too slow on account of the low steam pressure. Some roads limit the speed of the pump to from 130 to 140 single strokes to the minute. The objection to choking the supply is that the speed might be reduced too much in case the steam pressure became depleted; it is thought that the gains much more than offset any slight losses.

It is recommended that the Duplex Main Reservoir Regulation, shown in Bulletin 12 of the W. A. B. Co., be used, as it is a great help in train handling, and that it increases the life of the pump.

Two 9½-inch pumps are preferred for freight service to one 11-inch, and it is considered most desirable to have a main reservoir of large capacity.

The following is given as a good test to determine whether a pump is in good condition:

With the pump working against full pressure, note whether there is any tendency to stop when the pump is uncontrolled by the governor, and whether there is any unusual click or pound. In the absence of these, open the oil cup on the air cylinder and regulate the speed to 30 single strokes per minute; then note whether any air escapes at the oil cup or not on the down stroke. Any such blow indicates serious leakage by the packing rings or back from the main reservoir, as moderate leakage would cause no blow, owing to the space which must be filled as the piston descends. To complete this test, next stop the pump, and when the piston is at rest note whether there is any blow out of the cup. Any blow at this time is back leakage from the main reservoir, and is thus distinguished from back leakage by the piston packing rings. In addition to the foregoing it should be

noted whether the pump strokes are equal before the oil cup is opened.

A defective air cylinder will be noticed by the observing man without the necessity of a test. One sign of a bad order pump is a suction over but a portion of either stroke, or both, when the pump is working slowly against full pressure, or where it blows back through the receiving valves. These should be determined by listening at the suction, and not by covering same with the hand, as this is an unreliable method of seeking for defects. Other signs of bad order are an unusual click or pound, uneven strokes, the pump stopping occasionally when not controlled by the governor, a silent working pump, or one showing signs of heating by a burned appearance about the discharge valves. Sticking air valves should always be cleaned before trying to make any tests.

The discussion following the paper showed a sentiment favorable to the use of two 9½-inch pumps on an engine.

The idea of using one 9½ and one 8-inch pump did not meet with much approval, owing to the necessity for using different fittings with the two types, and from the general observation that the larger pump was much easier to maintain. The use of two different sizes of pumps would also necessitate the use of a choke in the steam pipe to the 8-inch pump; otherwise it would operate faster and do much more than its proportion of work.

The impression also prevailed that two pumps should be used, in order to meet the Interstate Commerce Law in case one pump should fail on the road.

Owing to pump failures, pump work has been stopped entirely in the round-house on the W. C. Ry. and a decided improvement has resulted.

On account of the pump on the left side being out of sight of the engineer, it was believed that the pump wore out faster and needed more repairs than did the one located on the engineer's side.

The great neglect of the pump strainer was touched upon, and cases cited where the strainer had been found broken in with a coal pick when the pump would

not compress air in sufficient quantities.

The oiling of the air cylinder received considerable attention, and the very general opinion prevailed that best results were obtained from a regular oiling of the air cylinder by a separate oil cup. Valve oil should be used.

The discussion brought out the point that the vent port of the governor being stopped up might be considered as a partial failure, since in this case the pump was very slow in starting to work.

QUESTIONS AND ANSWERS.

Q.—M. W. B.—Some of the boys have been having considerable discussion lately about some trouble a couple of them had with a straight-air equipment. The engine was a switch engine, and also had the automatic brake. They both say they didn't have the trouble when the straight-air was added, but that once in a while now they have trouble with the brakes sticking while using the straight-air. We naturally think the trouble is with the straight-air, as no trouble was had before it was put on. Can you tell us what would make the brake stick? It would go off all right if the automatic was used and then released, and then the trouble would not happen again the rest of the day.

A.—Your statement that the trouble was on a switch engine is the key to the difficulty. The pump on this class of engine is often about as poor as can be found because many times it is not required to do much more than to supply enough air to operate the driver and tender brakes, and is therefore permitted to get in a very dilapidated condition. Suppose this to be the case on the engine in question, and that the straight-air brake was being used with especial frequency, and that all excess had been done away with. In applying the straight-air the next time the pressure in the main reservoir would be drawn below that in the train pipe, and the pressure in the train pipe would flow back through the brake valves into the main reservoir, thus reducing the pressure on the train pipe side of the triple piston. This would cause air to pass from the auxiliary reservoir through the pipe to the double check and on into the brake cylin-

der. When the straight-air brake valve handle was moved to release position, the air that was between the triple valve and the double check valve would cause the check to shift and block off the exhaust through the straight-air valve. The brake would be stuck and might not release even if the automatic valve handle were moved to release position, as there is no excess pressure, or at least very little, at this time. A reduction of train-pipe pressure with the automatic valve would set the brake harder and at the same time give an excess of pressure in the main reservoir over that in the train pipe. Upon moving the automatic brake valve handle to release position again, the brakes would release, and as the pump had gained a little excess pressure in the meantime, a recurrence might not be noted until such time as the straight-air was again used with a frequency sufficient to do away with the excess.

Another combination of circumstances could also produce this same action:

Suppose the engineer was using the automatic brake and, in releasing, the brake valve handle was left in release position, and at the same time he started to use the straight-air brake. If the automatic brake valve was left in release position too long the auxiliary reservoirs would become overcharged. When the brake valve handle was returned to running position, one feed groove, taking air from the train pipe faster than the other, and perhaps assisted by a leak, would tend to cause the other triple to respond and the brake to apply harder on the engine or tender, on both of which the straight-air was already applied. When the straight-air was released the brake would stick on either the engine or tender, according to the one in which the triple had responded, and the brake would stick from the same action of the check valve as described in the first set of circumstances. The brake could be released in the same way as before, by first making an application of the automatic brake and then placing the automatic brake valve in release position.

In all probability the first case described is the combination of circumstances which

resulted in the action which you described.

Q.—G. F.—On the road where I am employed we haul trains that are mostly all air, and we have all the way from 40 to 100 coupled up. I don't know whether it is imagination or not, but I have the idea that a five-pound reduction on the train-line will not give as much holding power as I usually get for the same reduction on a train of 50 cars. I know that the total braking power is greater on the longer train in comparison with that on the shorter train, but what I mean is that the same reduction won't stop the train so quick if they are both going at the same speed. The only reason I see why this is so is because it doesn't take so long to make any certain reduction on a shorter train. This would give the braking power sooner but doesn't account for all the differences that there seem to be. Is there any other reason for this besides the one given?

A.—One of the instructions always given, covering the handling of air freight trains, is that it is not advisable to make an initial reduction of less than five pounds, and this should be increased as the length of the train increases. It is not considered good practice to make less than a seven-pound reduction on a train of 50 cars if it is desired to obtain all of the brakes, and even then all on the rear of the train may not respond. The reason for this is that, as you stated, the longer the train the slower the reduction, due to the fact that the volume of air which the brake valve must handle is greatly increased as compared with that which must be handled on a train of 10 cars. This being true we know that there is a much greater chance for the auxiliary reservoir pressure to feed back into the train pipe, thus tending to permit the train pipe and auxiliary reservoir to remain equal, in which case the triple pistons would not respond. If the triple valve does respond, it will act slowly and the air which feeds from the reservoir to the brake cylinder will flow correspondingly slow, and there will be a strong tendency for a large amount of air to pass

through the leakage groove. This loss of air means that the braking power will be reduced according to the amount of air lost and, if sufficient, will permit all to escape; the brake in this case would not apply.

If there is this radical difference between a train of 10 and one of 50 cars we can readily see that the conditions will be still more aggravated on a train of greater length, especially on a train of 100 cars such as you cite.

A reduction of five pounds on a train of 100 cars will have comparatively little effect, and what you thought happened certainly did.

With brakes in first-class condition a ten-pound reduction on a train of 100 cars will not apply more than 60 brakes, and a reduction of fifteen pounds will not apply more than 81 brakes. This is the result of reductions made with freight equipment of the eight-inch type, and the number of brakes that would apply in a 100 car train of ten-inch equipment would be even less than this, since the feed grooves in the larger triple used with this equipment would permit even a greater feed from the auxiliary reservoir back to the train pipe. Not only this, but there would be a still larger volume to feed back; the more air that feeds back the greater the volume that must escape to the atmosphere through the brake valve, and the slower the response of the brakes.

Q.—B. H. D.—I want to get a little information on the way they put the pipe on engines where two pumps are used. The one I am running has two pumps and they seem to be putting two on all of our big engines that come. What I don't understand is why they use the same size steam pipe that they do when they use only one pump. I can't see the use of putting on two pumps when they don't give them any more steam than they do the one pump. Where does the gain come with them piped this way? Why don't they use a pipe that will carry twice as much steam as the pipe used with one pump?

A.—One reason for the method you outlined is that, so piped, the engineers can-

not abuse the pumps by opening the steam throttle and permit them to race. With but one pump in use on an engine, and the same size of steam pipe as used with the two, an engineer can run it at such a speed as will cause it to overheat, burn out the oil, and wear out much faster. This is especially true where engineer uses poor judgment and where the train pipes are neglected to such an extent that it is necessary to work the single pump too fast to overcome the leakage.

With two pumps on one engine, and connected to the one-inch steam pipe, 60 per cent more air can be compressed without any danger of the pumps becoming overheated. The life of the pumps will be correspondingly increased.

In order to limit the speed of a single pump on an engine some roads have adopted the practice of putting a choke in the steam pipe, so that a safe speed can not be exceeded. This, as you realize, might be objectionable under certain conditions.

The use of the two pumps practically does away with engine failures due to the failure of one pump.

The feeling in regard to this matter is covered in the synopsis of a paper on this subject read before the Northwest Railroad Club which appears in this issue.

Q.—L. G.—Can you tell me what share of the weight of a car is used as braking power, that is, how does the pressure of the brake shoes against the wheel compare with the entire weight of the car?

A.—This is commonly referred to as the percentage of braking power. In passenger service the braking power very generally used is 90 per cent. In freight service the percentage is 70 per cent. As a rule, but in special cases it is as high as 90 per cent. This latter figure is seldom exceeded in cars that are subject to interchange. In special cases where the grades are very severe, and where the cars are generally all light or all loaded, as high as 130 per cent is sometimes used. This extreme of braking power is seldom employed except on roads where ore is handled almost exclusively, and where the cars are not subject to interchange.

Where such conditions exist the cars are generally very light in weight as compared with the heavy loads they carry, and it is necessary to increase the braking power in order to obtain adequate retarding power. The necessity for this high percentage of braking power is better realized when we consider that with a 100,000 pound capacity, car weighing 40,000 pounds empty, and having a braking power of 70 per cent of the light weight, the braking power is reduced to approximately 17 per cent of the total weight of the car and contents when loaded. In speaking of the braking power on any vehicle the power exerted refers to the total brake shoe pressure against the wheels when there is a pressure of 60 pounds in the brake cylinder.

Engine Failures.

J. W. READING, Div. 286.

GRAND RAPIDS, MICH., Feb. 6, 1905.

EDITOR JOURNAL: The articles from Brothers A. M. Cousins and J. E. Henley, published in December, 1904, JOURNAL, relating to the cordial feeling existing between the management and the engineers on the N. & W. Ry. was decidedly good news. The officers of the above-mentioned line have certainly struck a very essential keynote in their desire to bring about better results in their locomotive management, and the Brothers on that line should feel proud of their G. C. A. and the management that extended so much courtesy and other evidences of their good-will.

It would be great and good news to know that the managements of other lines were adopting the plan introduced by the officers of the N. & W. It certainly would be cheerful news to hear that those in authority on the various lines of railways had decided to meet upon a common level the rank and file of the engineers in their employ and in a friendly way discuss best methods for better service. This evidence of friendly consideration should inspire every right-thinking engineman to put forth his very best efforts to improve the service.

Engine failures are by far the most serious thing the management of a railroad has to contend with, at least as far as the everyday routine of business is concerned, and any discussion in our JOURNAL that will educate our members in a practice that will help bring about better results would be appreciated by our employers and bring lasting benefits to our Brotherhood at large.

The discussion of engine failures should not be confined however to leaky tubes, and otherwise defective boilers, but to every cause that has the effect of delaying traffic by complete or partial engine breakdowns.

The engineer that tries to excel, who tries to "get out of the rut" and be a leader, a man that is careful, thoughtful and consistent at all times, one who reads and profits by the experience of others, is the man who will have the smaller number of engine failures charged against his record. Time and space will not permit going into extensive detail of the many causes of engine failures, but with the kindly permission of the Editor the writer will endeavor to show wherein the competent, earnest and thoughtful engineer, one that makes a studied effort to give to his employers the very best service at his command, has been in the past, and will continue in the future, to be the man whose labor is appreciated, and the one that can successfully eliminate, or at least help to eliminate, some of the many causes for engine failures.

In this article it is proposed to depict the course of the skilled engineer from the time that he reaches the roundhouse until his return from a round trip over the road.

By way of digression will say that it is not expected that every locomotive man will coincide with the views of the writer, and whether they do or not discussion on the subject for or against is solicited. The Technical Department of our JOURNAL welcomes anything that will tend to enlighten its readers.

The engineer who makes a study of his profession and is willing and anxious to give good service will be at the round-

house in ample time to carefully inspect his engine and strive to do the best he can should any unfavorable conditions confront him. If possible he will go under his engine and examine carefully eccentrics, links, truck frame, springs, cellars, brasses and any other portion not mentioned liable to defects.

(Right here is where the critic will get in his work by saying we have an engine inspector for that work; he is paid for it, we are not, etc. It may be true that engine inspectors are employed, but it is a fact that no one man is liable to discover all defects, and the writer's experience has been that the men best fitted for inspectors are not the kind that are employed generally.)

After a careful inspection of the machinery, etc., under his locomotive the competent man will perform a like duty from the outside. He will note particularly the condition of the waste on top of the driving boxes, examine all rod, guide, piston and valve stem cups; he tries for loose nuts and otherwise notes particularly condition of rods and guides. He will give the tank a like inspection looking for defects in the tread or on the flange of the wheels and will always look closely for any evidence that would indicate a wheel loose on axle. He will lift the covers of journal boxes, note condition of lubrication, brasses and wedges; he does this latter work knowing that roundhouse men have been looking after the tank journal bearings, but his "bump of caution" prompts him to know positively. This man whom we have taken for our model will be sure to note the amount of water in the boiler and will get his information from the gauge cocks; he will never leave the roundhouse without seeing that the flue, side, and crown sheets are in condition for service; the condition of grates will be carefully considered; both injectors will be tried. He will not open the throttle of his air pump until he has put a small amount of good oil in the air cylinder, also oiled swab that lubricates piston between steam and air cylinder of the pump. He will open the drainage cocks on steam chamber of pump, after

which he will just break joint in air pump throttle giving pump a chance to get rid of condensation and warm up slowly. He knows that a pump needs more lubrication when first started than at any other time and consequently he gets his lubricator working and for a few seconds allows oil to feed quite freely. He will not only feed oil a little freely into his air pump at the start, then feed to valves and cylinders as soon as condensation has been blown out.

Our skilled man when oiling around will have engine placed so that he can oil each shoe and wedge and do it right. He will be very particular to know that his eccentrics get their lubrication, and will never put oil on the sponging on top of a driving box that has got so hard and packed from cinders and dirt that oil cannot penetrate the mass; if he does nothing more he will raise the waste and try to get the oil where it will find its way to the oil holes and thence to the top of journals where it is wanted. This skilled man knows that many an engine delay and failure has been caused by hot journal bearings that were caused by excessive friction between hubs and boxes of both driving and truck wheels and he never oils at any time that he does not put some oil between the parts named.

Our competent engineer will not forget that there are oil holes in both ends of the reach rod and also at the bottom and top of the reverse lever; he knows that it will make a vast difference in the heavy labor performed in a heavy switching service; he has found out by experience that where engines are in a pool that these latter named oil holes might as well not be there as far as a great number of his brother engineers are concerned, and he would have no trouble in getting this information could he hear the reverse lever clatter which soon is in evidence where oiling the parts in question has been almost entirely neglected.

This competent man wants his air pressure pumped up so that he can look for leaks and make a roundhouse test of both his tank and driver brakes. He wants to know something about the piston

travel, condition of shoes and leverage, and will be sure to make a service and emergency test of the driver brake.

Having now reached a point where our model engineer is about to get out of the roundhouse we will leave him for a time and consider the antagonism of our critics. We can imagine that they are saying "no engineer can find time to give so much attention to his engine. A man would have to show up about five hours before he went out to accomplish it all and besides we don't get paid for it." We can also hear them saying that "if defects needing repairs are found and the transportation department was in a hurry for the engine the engine would have to go out if in the opinion of the roundhouse foreman she was safe for another trip." They would argue that "work already reported had been crossed off as not necessary and that men were fools to bother their heads about work when the roundhouse foreman pitted his judgment against theirs and allowed the work to go undone."

In the opinion of the writer a careful inspection of a locomotive can be made in anywhere from forty minutes to an hour and there is not one minute of an engineer's time more valuable to himself than the time he consumes in trying to find out whether his engine will stand up for the round trip. Every engineer has had more or less experience in disconnecting and doing other disagreeable work in breakdowns, and it can be said without fear of contradiction that every engineer who has seen a reasonable amount of service, and has taken time to inform himself of the conditions before leaving the home terminal has on various occasions prevented for himself not only the labor of the disagreeable work necessary in breakdowns, but has saved himself the odium of an engine failure. Further on in this article we will endeavor to make plain the manner in which our model engineer handles his engine while out on the road, and we will not forget to tell you the course he pursues when the work he reports is considered unnecessary, or allowed to go for another trip.

(To be continued.)

Electricity—Magnetism and Induced Currents Simple Dynamos.

BY ELWOOD A. GRISSINGER, E. E.

If we take a bar of iron and wind around its length a number of turns of insulated wire and then pass a current of electricity through the wire, the iron becomes a magnet and is capable of evidencing all the phenomena of permanent magnets, which were discussed in the preceding paper. In addition, however, a magnet so produced has the decided advantage of regulation within the limits of its saturation; *i. e.* its strength can be varied from zero magnetism to its full strength. Permanent magnets have a certain fixed strength of field, which is always practically the same and cannot be altered in the ordinary way. A magnet formed by passing a current of electricity through many turns of wire wound around it is called an *electro-magnet*. Electrical history records the first one to have been made in 1825.

Every electro-magnet has a north and south pole, same as with permanent magnets. The same kind of a field of force exists, except that fields of much greater strength can be produced with electro-magnets than with permanent magnets. In order to produce a north and south pole, the wire must be wound in the same direction around the iron. Wherever a reversal of direction in the winding occurs, there will be formed a consequent pole. If a bar of iron is wound with insulated wire and the former removed, there will remain a spiral or helix. If a current of electricity be passed through the helix (also called *solenoid*), there will also be an evidence of magnetism. If this solenoid while carrying a current be freely suspended, it will assume a position due north and south, showing a principle of the perma-

FIG. 1.

FIG. 2.

nent magnet. The solenoid, by virtue of many turns of wire closely grouped and current traversing it, has a magnetic field of force same as any other magnet. Fig. 1 shows a solenoid and Fig. 2 a simple electro-magnet. They are both the same, with the exception of the iron core.

The arrows show the direction of the current, while N and S represent north and south poles, respectively. If a current be flowing through Fig. 1 and small particles of iron be brought near, they will be drawn into the helix and retained by the magnetic effect of the coil. If the direction of the current be changed, the north and south poles will change places. The insertion of an iron core into a solenoid immediately causes the lines of force to pass through it. The iron gathers them in, as it were. Why? Because it has a far less resistance to the passage of lines of force than air. Most of the lines were in and about the solenoid before the iron was inserted, but after the latter operation they have become collected.

Electro-magnets can be made of any shape, and with any grade of iron or steel for the core. The softer the iron, the quicker it will attain its maximum magnetization for any fixed strength of current, and the more rapidly it will part with it. Therefore, for any piece of electrical apparatus in which a reciprocating or vibrating motion is controlled by magnetism, the softer the iron should be. Magnetism produced in soft iron will only last as long as a current of electricity is maintained in the coil of wire surrounding it. If instead of soft iron steel be used, the strength of the magnet will be increased more slowly until saturation is reached. After the current is cut off the steel will retain nearly all the magnetism it has acquired; hence, it is seen that steel is not suited to any apparatus where rapid reversals of current or rapid changes in the strength of same are necessary for successful operation. It has been found that a bundle of soft iron wire for the core of an electro-magnet gives better results than a solid mass. They will receive and give up magnetism faster than a solid piece of soft iron. It has

been noticed, likewise, that when a rod of soft iron is magnetized by a strong electric current circulating around it, a sound is emitted at the time of closing the electrical circuit. A similar sound is created when the circuit is broken quickly. This sound is presumably due to the molecules of the metal, which have been given something of a vibratory motion in consequence of their rapid magnetization or demagnetization.

From a description of the electromagnet, it is but a step to the subject of induced currents. By induction, in general, is meant the effect which a body carrying an electric current will exert upon another body adjacent to or at some distance from the first. It was in 1831 that Faraday discovered the phenomena of induced currents. Such currents can be produced in a copper wire from the influence of a second copper wire, which latter is traversed by an electric current. They may also be produced by means of magnets acting upon a metallic conductor. The simplest means of illustrating such inductive action is by Fig. 3.

FIG. 3.

Here we have a coil of wire—a solenoid, in fact—which has been wound on a long spool or bobbin, and has its terminals connected to a small indicating instrument (a galvanometer, for example). If a permanent magnet be thrust quickly into the solenoid, the needle will be deflected in one direction, but will immediately return to rest. If the magnet be quickly with-

drawn, the needle will be deflected in an opposite direction to what it was at first, but immediately comes to rest. As fast as such a magnet can be inserted and withdrawn, just so rapidly will the needle of the indicating instrument vibrate. The needle vibrates because a current of electricity is induced in the circuit of which it forms a part. Another method of producing the same result is shown in Fig. 4.

FIG. 4.

In this case there is one layer of wire wound as a helix and connected with a primary battery. Upon the first coil, but insulated from it, is wound a large number of turns of insulated wire. This second coil is connected to an indicating instrument as before. If the battery be connected to the first coil, a deflection of the needle will result. If it be disconnected, an opposite deflection of the needle will take place. As often as such connection is made and broken, there will be a deflection of the needle. Deflections always occur in opposite directions when the circuit is opened and closed. If an iron core is inserted in the coil, the deflections of the needle will be greatly increased. The same results can be attained if the battery circuit is kept closed and the two coils are moved longitudinally and relatively with one another. The same result will also be attained if the battery is connected to the first coil and provision made so that by inserting a resistance in series with the battery, its current strength can be varied, deflections of the needle can be produced. Every time the strength of current which flows is changed, the needle will show a movement. That movement will be in a

different direction, depending upon whether the current is increased or decreased in strength. This phenomenon is, as you see, obtained in different ways; yet, in each case, it is an induced current that is set up in the wire. This phenomenon of induced currents is the basic principle of all dynamos and motors in use today. The importance of the discovery is apparent.

The simplest form of a dynamo in general use at the present time is contained within the upper box of every wall telephone set. This little dynamo is used to ring the bell. Every time you call up central by turning a little crank you operate a small dynamo, which generates sufficient current to ring the bell of your telephone and call the operator's attention at the central office. This form of dynamo is further simplified in Fig. 5, so as to make an explanation easier.

FIG. 5.

In this figure N and S represent the north and south poles of a horseshoe magnet, or the north and south poles of two different magnets. From N to S, therefore, lines of force thread their way uniformly through the rectangular loop. For convenience of illustration and explanation, bearings are omitted from the drawing. The loop is shown with a small handle for turning. Next this handle is a two-piece commutator, which can be made from a copper or brass tube slit in two, each half placed opposite on a piece of wood, and each half connected to one end of the loop. Upon the top and bottom of this commutator a copper brush presses lightly, these brushes or strips being connected to the circuits to be supplied with electricity. In this case, the

loop and commutator forms the *armature* of the dynamo. N and S are the *field poles*, which are stationary. The armature of any dynamo is the portion in which the current is induced, and almost always is the revolving element. Many alternating current generators are now made in which the armature is stationary and the field revolves. This is particularly so in machines of high voltage. The extension of the handle in the figure represents the shaft of the armature, which in practice is supported in bearings, and instead of a handle on the end has a pulley or can be directly connected to the source of power.

When the loop is placed in a vertical position, as shown, the greatest number of lines pass through it, and as the loop is moved from this position toward the right or left 90°, it will reach the horizontal, and at this point will embrace the smallest number of lines of force during a complete revolution. When the loop is stationary no E. M. F. is generated, but the moment a movement of same is made an E. M. F. is induced in the loop, which causes a current to flow to commutator sections to which it is attached, thence to the brushes, through the line and whatever devices may be included in the circuit, no current will flow unless the circuit attached to the two brushes is closed upon itself or through some auxiliary apparatus such as a motor, lamp, resistance, etc. If the circuit is open, a difference of potential will be maintained at the brushes, but no current will flow until it has an outlet, so to speak. Let us suppose that the magnetic field is uniform, and will remain so; also that the loop is just past the vertical and that we will turn it in a right-hand direction, as shown by the arrow. We will further assume that the outside circuit is closed. Then as soon as a movement, the loop cuts lines of force above and below. The upper part is moving in one direction through the field and the lower part in an opposite direction. As seen in the figure from the arrows, the current in the upper half of the loop will be from front to back, and in the lower half from back to front. As

soon as a half revolution is completed, however, the part of the coil which was on top is now at the bottom, and the current which was from front to back in that part of the loop is now from back to front. For every half reduction of a coil in a two-pole field there will be a change in the direction of the current. It is seen, therefore, that an alternating current is generated, and some means must be devised to change the same if direct current is desired. That is the function of the commutator, it commutates or rectifies the current.

Fortunately, there is a point called the *neutral point* or *diameter* of commutation, where the E. M. F. is reduced to a zero value and changes sign from plus to minus or *vice versa*, as the case may be. Plus and minus mean positive and negative, same as we learned when discussing primary batteries. At this point of zero value, the brushes should be placed so that when current changes direction in the loop, and hence in the commutator segments, these segments have traded places under the brushes, and while the direction of current has changed in the coil, it still travels in the same direction through the brushes. This can be easily seen by tracing the flow of current as you imagine the loop to rotate. The same results could be obtained if the loop were kept stationary and the magnets revolved, but it would not be as simple a method mechanically.

The strength of the E. M. F. developed always depends upon the number of lines of force which the coil or coils cut. Such strength can further be varied by changing the effective length of the conductors, changing the number of revolutions or the strength of the magnetic field. All other conditions being the same, the faster a dynamo is run, the higher voltage will be which it will generate.

If we plot a curve to show graphically the nature of the E. M. F. which a single coil dynamo will generate, we will find a curve or set of them like Fig. 6. In this

FIG. 6.

curve it is seen that the E. M. F. varies from zero through a maximum to zero every 180°. If instead of one coil we make it two, which coils are placed at right angles to one another, and the number of commutator segments increased to four, we would then obtain curves as shown in Fig. 7. From this we gather

FIG. 7

that the greater the number of coils, and hence commutator segments, the more nearly we approach an absolute straight line of E. M. F. Constant potential dynamos in practice possess this feature. If such were not the case, incandescent lamps would show unpleasant changes in the intensity of the light, and motors running from such dynamos would show wide and annoying variations in speed. For incandescent lighting and for power purposes, it is absolutely necessary that an even pressure be maintained for any condition of service.

Breakdowns.

BROOKLYN, N. Y., Feb. 13, 1905.

EDITOR JOURNAL: Coming home from the late convention at Los Angeles over one of the trunk lines, while running along at a good speed, I felt the emergency go on and as soon as we stopped, I, of course, went up to the head end to "rubber," and found that the cap had come off the front end of right side rod and the rod bent so as to strike guide yoke; so I stood on the bank with other passengers while the engineer was disconnecting. She was a Rhode Island, three-wheel connected, with the main connections and the eccentrics on the middle pair of wheels, so you see all that was necessary to do was to take down the forward side rods on both sides and run as an ordinary four-wheel connected, but he began to strip everything from the disabled side, and I could not help thinking of what that poor fireman must have thought of the ability of his engineer when compelled to take down that heavy main rod and put it up on the front end

of the engine, and after the engineer had taken a tumble to himself, to take it down again and put it up in place, and I could see that he knew they were working wrong, but he did not dare to say a word, as the engineer was very overbearing and bossy.

I was talking to a passenger about it and said to him, "I can't see for the life of me what he took down that main rod for, but you wait and you will see him put it up again," and he did. Well, he was three hours doing the job, when it could have been done in twenty minutes, and he had about six Mexican greasers to help him handle the rods, too.

This circumstance was brought to my mind lately, when reading of the friction that exists between engineers and firemen, and I thought, "Could you blame that fireman for being mad when he realized the incompetency of that runner?" How much better it would have been if they had been on better terms and the fireman could have given his views. I suppose if that engineer had got discharged for too long a delay or got suspended thirty days or so, the B. of L. E. would have made a kick to get him back in his place. This was an old runner, too, off from one of the largest trunk lines east.

Brothers, let's get out of our rut and down off of our high horse and take the fireman into our confidence.

CON. TROLLER.

Stop Leaky Pistons.

WHEELING, W. VA., Jan. 28, 1905.

EDITOR JOURNAL: Seeing the many kicks registered in the JOURNAL regarding various matters, I feel encouraged to make a few myself. The Interstate Commerce Commission is looking after the safety device question and getting matters pretty well along.

Of what use are all the block signals if you have an overflow pipe in cab, and injector slobbering steam and water, steaming windows so it is impossible to see out? Injectors with uncoupled overflow pipes, and those with such pipes run out of sight into ashpan, should be abolished. Do any of the Brothers ever think of this, or have they had an accident or burnt an engine

on account of one or the other? Again, we have leaky packing to contend with, and "can't see ahead" is a common complaint, which is but little regarded by the powers that be, so long as the engine will run and haul cars.

Do you think it right some Brothers should condemn a good glass water gauge and, through their influence, deprive the majority from the use of this convenient and essential means of noting the rise and fall of the water in boiler? I think an engineer can do a much better job of pumping with a good glass especially when using alkali water, as some roads delight to do. It seems that some railway companies want alkali water, putting soda-ash into good water in order to make trouble. This sort of water will jump at an open gauge cock or any opening made in boiler; whereas, a gauge glass being open at both ends shows the action of water as taking place in boiler. Many Brothers can confirm this, having used saline water during the past dry season. Don't you think the B. of L. E. should use its influence with the I. O. C. to bring about better conditions?

Think about these things, Brethren, and remember that block and interlocking signals, automatic air brakes and coupling devices are not the only safety appliances we need.

Fraternally yours,

JAS. E. MAGONAL.

Equalizing Valve Stuck—Can Brakes be Set?

GLENN'S FERRY, IDAHO, Feb. 10, 1905.

EDITOR JOURNAL: For the past five days here on the Oregon Short Line, the engineers have had an argument in regard to an air question. It is this: Is it possible to set the brakes on a train with the engineer's equalizing piston in a Westinghouse brake valve stuck solid to its seat, by putting the engineer's brake valve in emergency position?

Some here on the O. S. L. Ry. claim it can be done. I claim it cannot be done, for the best air books I can get tell me the train line position must be reduced to set the brakes, and increased to release the brakes; so, if the engineer's equalizing

discharged piston is stuck solid to its seat, I cannot figure any way to decrease the train-line position by putting the brake valve to emergency position. So, if we get no response from the train line exhaust, how are the brakes to be set by the use of the engineer's brake valve?

Suppose we are carrying 70 pounds of air train line pressure and 90 main drum. Drum pressure we draw off 25 pounds with the surplus application.

Please say what part of the train line, with its connections, still remains 70 pounds not molested, from which, as stated, 25 pounds has been reduced.

Fraternally yours,
A MEMBER OF DIV. 366.

What Was Wrong With the Gauge?

TEXARKANA, TEX., Feb. 10, 1905.

EDITOR JOURNAL: I had a brake valve on my engine. When I made a service reduction train line the gauge hand would drop 10 pounds, and seem to stop or almost stop and then go on down slow or at a regular rate. When I stopped drawing off air, train line hand would raise 5 pounds. At first there would be a heavy blow from train line. This is with light engine, pipes were open to little drum, and there were no leaks. Where was the trouble?

Fraternally yours,
MEMBER, Div. 496.

Handling Trains on Heavy Grades.

TACOMA, WASH., Jan. 22, 1905.

EDITOR JOURNAL: Seeing an article in the October JOURNAL, 1904, "What the Railroads are Doing in Handling Trains on Heavy Grades," I will endeavor as best I can, to describe a trip over the mountain end of the Pacific Division of the Northern Pacific Railway. That is, I will try to describe that part of the work which differs from railroading on the level or over a merely undulating country.

The fundamental principle of railroading, of course, is the same here as elsewhere, namely: That a man must constantly keep uppermost in his mind the fact that "two objects cannot occupy the same space at the same time."

What I will say in this letter I do not intend as an instruction, by any means, but simply to give the many engineers in different parts of the country, whose experience has been limited to the prairies, but who are interested in their vocation, an idea of just how trains are handled on long, heavy grades.

I was employed for ten years in engine service by a prominent railroad in Illinois,

but I will confess that on going to work here I found my knowledge very limited indeed; and right here I must not neglect to say that I received many a good suggestion from the engineers on the Pacific Division and always found them ready to give needed counsel and advice.

There are no doubt many members of Div. 238 much better able to cope with the subject than myself, but probably do not care to write, and having both the leisure and inclination, I came to the conclusion to write the matter up myself.

Our mountain division extends east from Tacoma to Ellensburg, a distance of 125 miles. We cross the Cascade Mountains through what is known as Stampede Pass, "tipping" over the summit while going through Stampede tunnel, a tunnel of almost two miles in length. The heaviest grade is between Stampede and Weston on the west side of the mountains. The distance between the two points is nine miles, with a descent of 1,000 feet. There are several grades in the United States that are steeper, but none that needs the exercise of more care in handling trains, on account of there being long stretches of straight track approaching the foot. The chain gang engines are tandem compounds of the consolidation type, equipped with two 9½ inch air pumps, one on each side, also the duplex pump regulation. They pull from 850 to 900 tons from Tacoma to the foot of the mountain grade, wending their way up through Green river's picturesque canyon until we come to Lester. Lester and Easton are the terminals for the helper engines. Lester lies at the foot of the cascades on the west side and Easton on the east. Upon arriving at Lester a heavy helper engine is added to the train, being attached to the rear end. They help the train to the summit and then either "drop" back to Lester or continue down the other side to Easton, always being directed where needed most by the dispatcher. If it is necessary to cut off the helper while the train is moving and before "tipping" over the summit, the helper engineer shuts off steam as gradually as possible, to prevent breaking the train in two. When trains of any class by train order or trains of the same class by time table meet on mountain grade, the ascending train must take the siding. If it becomes necessary in ascending to take the siding and wait for another train it is the duty of the helper engineer to work steam until the train is stopped, and when stopped, the lead engineer must not release until the rear brakeman has set sufficient brakes to hold the train. Then again, before starting, the engineer should set the air while the brakeman is releasing the hand

brakes. On getting them all released the helper engineer gives his engine steam and whistles off. The lead engineer then releases, whistles off and the train is ready to start. These precautions are taken for safety and to prevent breaking the train in two. In descending, when it becomes necessary to stop and wait any length of time, it is the duty of the front brakeman to set sufficient brakes to hold the train, after which the engineer releases. This keeps the auxiliaries charged so that a start can be made at any time by simply releasing the hand brakes. After arriving at Easton we follow the Yakima River to Ellensburg.

On the return trip, on account of the grade not being nearly so heavy approaching the mountains as on the west side, the same engines pull from 1,200 to 1,400 tons to Easton, necessitating on arrival there the adding of two helper engines to the train, one about eight cars back and the other on the rear's end. The passenger trains are simply double-headed up the mountain, but on the freight trains the engines are distributed, as I have mentioned, for train safety and to prevent an undue strain on the draft rigging. After getting the helper engines in position and testing the air to see if it is working through to the rear end, the conductor brings over an air-brake test card which gives number of train, number of engine, gross tonnage, number of cars, number of brakes O. K., condition of air appliances on engine, and after consulting together with regard to braking power, conditions, etc., the engineer must sign the card, also stating if he needs the assistance of hand brakes and how many. The card is then forwarded to the Division Superintendent. The train then proceeds to the summit, providing there are no trains to meet; but after "tipping" over the summit and coming out of the west end of the tunnel the train must be stopped. This is necessary in order to see what condition the brakes are in and to give the brakemen an opportunity to turn up all of the retainers. If the engineer stated on the air-brake test card that he needed the assistance of hand brakes to make the descent, brakemen must set the number stated on the card before leaving the summit. If hand brakes are used, they must be set of the head-end of the train, care being exercised to set them harder on the more heavily loaded cars, to avoid wheel sliding. It is the duty of the brakemen to ride out on top while making the descent. The conductor remains on the rear end, where he can watch the air-gauge with which every caboose is equipped and be ready to act in case of emergency. The helper engines have additional pipes leading to the air-gauge from the train line so

that the helper engineers can see the condition of the air pressure at all times, although their brake valve is cut out.

Now, we will say that we are ready to commence the descent. We know that the brakes are all working, that the maximum air pressure is pumped up, and, in addition, that the retainers are all turned up. Retainers should all be turned up to prevent an undue amount of braking on a few cars, also give the engineer a better opportunity for recharging and maintaining maximum air pressure. The engineer makes the first application and recharge as soon as possible after leaving the summit. He should do this for two reasons: first, to see how the brakes are holding while the speed is still low and the train still within the limit of safety; second, on account of the retainers being turned up an additional air pressure is kept in the brake cylinders, and, consequently, with a given train pipe reduction, a greater brake cylinder pressure is obtained after the first application and release than with the first application. Also, on account of the brake cylinders being empty, the first application after leaving the summit should be the heaviest, and should consist, as a rule, of one reduction, say fifteen pounds. It is best never to make less than eight to ten pounds reduction at a time. An application should consist of one and seldom more than two reductions. If the engineer sees that with a ten-pound reduction the speed of the train slows down too gradually, he makes a further reduction of ten pounds and slows the train down more quickly and then releases, because the longer the pressure is left applied the weaker the pressure in the auxiliaries becomes and the more air is lost by brake cylinder leakage. It is best to apply and recharge as often as consistent with the work to be done, because in this way the auxiliaries can be kept charged as near the maximum as possible. Besides this, economy is practiced in the expenditure of air by sometimes being able to reapply before the air has ceased escaping from the small port in the retainers. It is impossible to maintain an exact uniform speed. Like everything else, an engineer has to learn by experience just when to release. He must not release too soon, for if he does the speed will increase too much before the auxiliaries will have time to be recharged. Then, again, he must release before the speed is reduced too much, especially on the heavy curves or let-ups in the hill, for if he waits too long before releasing the retainers are apt to stop the train. This can be much more easily avoided with a train that can be handled with the air brake alone, for then, as a rule, it is not necessary to reduce to very

slow speed before releasing. But with a heavy train of coal, for instance (as there is no more braking power on a load than on an empty) weighing 1,200 tons, and contained in not more than eighteen cars, where it is necessary to have one-third of the hand brakes set in addition to the retainers in order to control the train while recharging, it is more difficult. If the engineer sees that he has waited a little too long before releasing, he should immediately commence working steam, and continue until the speed of the train has increased enough to prevent stopping. In recharging, it is necessary to leave the brake valve handle around to full release position so as to permit the full flow of air from the main reservoir to enter into the train line through the large ports, in order to recharge as quickly as possible. For once no harm is done if the train line should become overcharged a little, unless the train consists of empty cars.

On a level all of the braking power can be used for stopping, but in descending heavy grades a certain amount is needed for holding power. If with a seventy-pound train-line pressure a fifteen-pound reduction is necessary to keep the speed from increasing there are only five pounds left with which to stop the train. Furthermore, on a level the instant steam is shut off the speed of the train begins to decrease. Consequently, to obtain the same results, an application must be made much sooner on a train descending a long, heavy grade. For instance, we will say that the maximum speed limit is twenty miles per hour descending such a grade. In such case it will be necessary to make the application while the speed is about fifteen miles per hour or less, and by the time the brakes take hold the speed will have increased to twenty miles per hour. In descending a mountain grade, should the engineer see that with a full application he can only keep the speed of the train from increasing, or very gradually slow it down, he should immediately call for hand brakes. (The one short blast of the whistle will never become obsolete in mountain railroading.) He should also get the sand running, and after the train has slowed down to within the limit or safety, release in time to prevent stopping. That is, if the air supply is not exhausted too much, in which case the train should be stopped until recharged. It is easily seen that it is of as much importance to watch the air gauge as it is the water glass. If the train is extremely difficult to hold the water brake should be applied, and if necessary, kept working continuously until the foot of the grade is reached. It should be applied when the speed is not too great. Before applying it, however, the driver brake must be

cut out and bled. For this purpose there is a bleed cock connected to the cab within easy reach of the engineer.

Now, for the benefit of those who do not fully understand the water brake, I will explain it. It is a simple device with a globe valve on the boiler head below the water line and within convenient reach of the engineer, and with pipes leading from it to the exhaust passages in the cylinder saddles. (Often there are two valves, one for each cylinder.) In using the water brake the throttle should be left closed and the cylinder cocks open. The water valve should then be opened about half a turn and the reverse lever then placed several notches back of the center. The color of the discharge from the cylinder cocks should then be noticed. If it is a dense white the water valve is open far enough, but if it is a bluish color the valve should be opened until the discharge becomes white. At night the proper amount can be told by the sound, the same as water or steam in the gauge cocks when running without a water glass. The nearer the reverse lever is pulled back to full stroke, or toward the "corner," the more the braking power is increased. The water admitted to the cylinders has nothing to do with the braking power, but simply acts as a lubricant to the valves and cylinders while the engine is reversed. It is necessary, though, to feed oil to the cylinders the same as when working steam.

It is generally known that it is a dangerous practice to release at slow speed with a long train, because on account of the brakes being applied from the engine they set first on the head end, the cars, of course, bunching together. Then again, on account of the train line receiving its supply of air from the engine, the brakes nearest the engine release first. Consequently, if the brakes are released at too slow a speed, the head end will keep moving while the rear end is still stopping, and as the slack runs out quicker than the brakes release, it is not necessary that one be a philosopher in order to see what the result will be. In mountain grade work this is overcome on account of all the retainers being turned up, as they retard the release until the liability of a shock is overcome. It is a good idea, though, to turn up the driver brake retainer just before releasing. However, it often happens that it is necessary to cut out the driver brakes entirely on account of the danger of overheating and loosening the tires, but they must be kept in use as much as possible.

The combined automatic and straight-air brake with which the engines are now equipped is a much better holding device than the driver brake retainer, as it can

be worked independently and there is no danger of it leaking off. After reaching the foot of the mountain grade and continuing on towards Tacoma, the descent in the first fifty miles is over 1,700 feet. So, even after leaving the foot a train will sometimes run faster than is really desired. One consolation, though, is the fireman is getting a rest. I failed to mention that in the mountain district a strict block system is maintained.

Handling air on long heavy grades, as on the level, some men are more proficient than others; just as some men have a faculty for music, so some have a greater faculty for handling air than others, no matter what the conditions. The perceptive power, the ability to force the effect of a reduction, is more acute in some men than others.

In conclusion, I will say that in descending a mountain grade an engineer should never let a train get to going too fast, but if possible, should at all times keep the speed low enough to allow an unexpected stop to be made within a reasonable distance. He should not let his mind relax from his work and should never take reckless chances. The latter may be a glorious trait in a soldier, but hardly the proper characteristic for a railroad man.

Fraternally yours,
JOHN WHITEFORD.

Collapsed Flues Might Cause Explosion.

GARRETT, IND., Feb. 6, 1905.

EDITOR JOURNAL: In regard to the inquiry of Bro. H. E. Smith, of Louisville, Ky., of what caused the explosion in engine 945, will say a collapse of flues might produce the effect he mentions. We have had a similar circumstance here.

Fraternally yours,
MEMBER Div. 153.

Who Was Right?

AURORA, ILL., Feb. 12, 1905.

EDITOR JOURNAL: I wish to hear the opinion of some of the Brothers as to who was right and who was wrong in the execution of train orders on one of our railroads not very long ago. To make the circumstances easier understood, we will use the letters in the alphabet from A to M to represent the stations.

A is the eastern and M the western terminal of the division. Trains approaching A are superior to trains of the same class moving in opposite direction.

No. 3 and No. 6 are first-class trains. No. 3 is a westbound train. No. 6 is an

eastbound train. No. 6 is several hours late, caused by an accident west of M. Before leaving A, No. 3 receives the following order:

"First and second No. 3 have right over No. 6 A to M."

On arrival of No. 3 at K it receives the following order:

"First and second No. 3 will meet first No. 6 at L."

On arrival of first section of No. 6 at L, first section of No. 3 proceeded to M without further orders. Engineer of second section No. 3 refused to proceed without an order against second section of No. 6. The question is, which engineer was right and which was wrong?

This, I understand, actually occurred, and as it is liable to occur any day with ourselves, it is very important that no mistake be made in the execution of the orders.

The orders were regular, the dispatcher not knowing when he gave the original orders that there would be two sections of No. 6.

I have a fixed opinion in the matter myself, and will give reason for same, if there is any misunderstanding among the Brothers regarding it.

In reply to Brother Lindsey in regard to taking siding at Batavia would say, his first order contained three specific movements. The first to run Extra Clair to East Portsmouth; the second, to take siding; the third to meet Extra 354 West at Cohoon. The first movement was in effect until arrival at East Portsmouth. The second movement was in effect until Extra 352 East left Cohoon, and no longer. The third movement was superseded by the second order. Now, Brother Lindsey, suppose you took sidetrack at Cohoon before receiving the superseding order; you certainly would consider the second movement in the order fulfilled, and it would be. If the dispatcher wanted you to take siding at Batavia the order should have read:

"Extra 352 East will meet Extra 354 West at Batavia, instead of Cohoon. Extra 352, East will take siding."

Brother Pursell certainly would have no right to use order to run from D to C after 1:20 P. M. The order made the time of No. 9 1:20 P. M. at B. The schedule time of No. 9 at C is 1:16 P. M. This schedule time is all he had to run by after 1:20 P. M., as the order was no longer in effect. If there was a train at C and the dispatcher wished to run it as First No. 9, he had a perfect right to do so after 1:20 P. M. You can see, Brother Pursell, that it might not be safe after all.

Yours fraternally,
JAMES LENAHAN, Div. 32.

MARCH, 1905.

Associated Effort vs. Individual Liberty.

The National Civic Federation has brought together leading men of all classes, creeds and interests, and has given opportunity for the discussion of the great question of the relations of labor and capital on a broader basis and with greater educational tendencies than any like gathering in the history of nations. It has gathered in at these meetings educators, who need education on the labor question; heads of great industries employing thousands, who learn from the labor leaders what organized labor stands for, its aims and objects; the social economist, whose mind is biased by ancient history rather than modern conditions; the representatives of the Church which have in the main stood aloof, or made appeals to the laboring men to be good, seldom questioning the attitude of their better-paying parishioner, the employer; hence the National Civic Federation offers opportunity for representatives of organized labor to meet with all these on a common level, and to tell not only what their associations stand for, but what it is in commercial life that makes them necessary, and to furnish proof that they are not a detriment but a benefit; that they are character builders, and that the bettered conditions brought about by them are a benefit to both the social and commercial interests of all classes. It is the best opportunity labor-

ing men have ever had to put themselves right, and to enlighten the public on social economy as they know it from practical experience.

The subject to come before the first meeting of the new contingent, the Industrial Economic Department of the Federation, is: "How far does associated effort involve the curtailment of individual liberty?" Certainly a very broad subject, and one that is likely to submerge a large part of President Eliot's millions of the vague public he said he stood for at the last meeting.

Ruskin said: "I hardly know anything more strange than that you recognize honesty in play and do not in work. You have an umpire in your play and your prize ring, but your prize merchant gains his match by foul practice, and no one cries out." Quite true. It is only those who suffer who cry out, but laboring men learned long ago that the cry of one voice was not heeded; and Parliament and legislatures have demonstrated the futility of appeal for redress, except when organized society has been strong enough to endanger their political positions. Labor has not found many such men as William Pitt, who in answer to a petition from working men for an arbitration act in 1800, said: "The time will come when manufacturers will have been so long established and the operative not having any other business to flee to, it will be in the power of any one man in the town to reduce wages and all other manufacturers must follow. If it ever does arrive at this pitch, Parliament, if not then sitting, ought to be called together, and if it cannot redress your grievances, its power is at an end;" but in 1814, 2,000 masters petitioned Parliament to repeal the statutes of Fifth Elizabeth, which regulated apprenticeship, and a counter petition, signed by 800,000 working men was presented. The moneyed influence of the 2,000 masters won the day, and industrial disorganization was complete. Parliamentary reports ascribing as the immediate effect of the repeal, the growth of sweatshops supplied with half-paid apprentices and children, and the journeymen driven to famine and the female workers to prostitution. So the necessity for organized self-help is not at all new, for laboring men learned years ago that standing alone meant to be plucked; that as there was no umpire in work, as Ruskin said, they must combine their forces in self-defense, not that every employer was unfair, but, as Pitt truly said, one unfair employer, if in a competitive business, tends to make all unfair, and as no evil is ever effectually cured except by those who suffer from it, a solid, compact association was found necessary for even

moderate success in that direction. The result has been some degree of voice in the conditions under which they shall serve, which is deemed a corresponding degree of liberty not detrimental to society, morally or commercially, for the organizations means better wages, having the means, better buyers, and better living which means mental uplifting and a higher morality, and higher morality means justice more rightly applied and higher liberty.

The question, "How far does associated effort involve the curtailment of individual liberty," is evidently intended to apply to the influence of associated laboring men only, divided into three propositions, apprenticeship, the closed shop and the boycott.

The first question, "Does restricted apprenticeship curtail individual liberty?" should not stand alone, but should be coupled with results. Unrestricted apprenticeship in any desirable work means eventually an over-supply, lowered wages and undesirable conditions, detrimental to all who have learned the trade and tends to degrade the quality of work done; and unrestricted apprenticeship would ultimately be of no benefit to any but the employer who desired cheap labor with which to undersell his competitor. So that individual liberty to work for whom they pleased and at any price, regardless of the evil influences that might result, is not in the direction of individual liberty for any who aspire to fair conditions, but license for employers who would use it for the destruction of the organization his business represents.

But organized labor is not alone in these restrictions; doctors and lawyers are examined by men of their profession under laws created by their own influence. An auctioneer goes from one city to another, pays a license to sell his wares, and if his competition is objectionable to the local merchant, on petition he is taxed out of business; the difference is only in the distinction of who applies the principle.

The boycott is another thing complained of as inimical to individual liberty. We do not commend this weapon, but the practice is altogether too common in all walks of commercial life to put particular stress upon the open and above board action of organized labor in this direction; for what organized labor does in the way of a boycott is but a small percentage.

The oil trust, the book trust, the paper trust, the tobacco trust, the meat trust, the farmers' alliance, citizens' alliance, employers' association, and hundreds of other associations of capital boycott men who will not conform to conditions and profits fixed for them. The strike breaker is a boycotter of the meanest kind, a char-

acter that the honest employer detests, but buys at a high price when he refuses to negotiate with his employees, and concede reasonable conditions, regardless of public welfare or individual liberty, and now the states of Kansas, Missouri, Iowa, Illinois and Texas are boycotting the Standard Oil Company for the same reason organized labor applies it, and when all of President Eliot's vague public who practice the same principles, and doing so have no right to complain, are counted, he will find he represents a vastly smaller percentage of the vague public whose individual liberty has been curtailed than he seems to think.

General Sherman said, "Force is as necessary for the government of mankind as the Almighty finds the electric fluid necessary to clear the atmosphere."

Lawyers find a living in settling what some one thinks is curtailed individual liberty. Statutes are made for the purpose of fixing a limit to individual liberty, and individual liberty, in the sense implied in the question under discussion, must be measured from the standpoint of the common good of those directly affected by associated effort.

What is needed is the intelligence to discern the right and the humanity and moral courage to apply the remedy. The cure will not be found in unlimited apprenticeship, the open shop and unlimited competition for labor, while every other factor in commercial life practices the reverse. We must have something consistent with common interest which gives those who work at manual labor reasonable opportunities which considers their individual liberties as much as any other class. No backward step, but conditions which tend to elevate and make for good citizenship, not measured by dollars but character.

May the National Civic Federation be the means of letting the light so shine upon this important subject, that eventually all men may enjoy a greater share of individual liberty and with it a greater degree of comfort.

LINKS.

THE F. A. E. of Div. 510, Moose Jaw, Can., requests us to say that there is no work to be found in that section at this time, and but a short time for those who have positions. To go into that rigorous climate at this time can result in no benefit to one out of work, but will result in distress for themselves and others who can ill afford to render the assistance expected of them. Keep away.

BRO. O. MONTANYE, F. A. E. of Div. 521, has been appointed Road Foreman of

Engines on N. Y. S. & W. R. R. Brother Montanye has been in the employ of the company for thirty years, and has been F. A. E. of Div. 521 for ten years, and is a Brotherhood man all the way through, and the Silk City Brothers are well pleased with his promotion and wish him success in his new position.

J. W. M., C. E. Div. 521.

PAN AMERICAN Div., 544, of East Buffalo, N. Y., gave their fifth annual ball at Visitation Hall, Jan. 17, 1905. A large party attended, including Brothers from the N. Y. C., B. R. & P., Erie & L. V. R. R.

Miss Smith gave some very fine musical selections, which were appreciated by all. Later they retired to the banquet hall, where a very tempting repast awaited them presided over by the Brothers' wives. The table decorations were very tastefully arranged. The dancing kept up until the wee sma' hours, when they all adjourned to their homes well pleased with the good time they had had. J. C.

BRO. CHAS. P. ANGELL, of Div. 452, who has been Assistant Road Foreman of Engines for Pittsburg Division of the B. & O. for the past ten years, has been appointed Assistant Trainmaster, with headquarters at Connellsville, Pa., vice H. R. Hanlin, transferred; effective Feb. 1, 1905.

BRO. T. G. AVERILL has again been promoted from Air Brake Instructor to Traveling Engineer on the Eastern and Western Divisions of the B. & M. R. R., with headquarters at Boston, Mass.

Brother Averill was our delegate to the St. Paul Convention, as some of the delegates will pleasantly remember him. The members of Div. 163 wish Brother Averill success in his new field of work.

J. C. OAKLEY, F. A. E. Div. 163.

WASHINGTON, Feb. 2.—After much rivalry between Texas and Arkansas for the postmastership at Texarkana, the lively town situated on the border line between the two states, President Roosevelt has appointed and the Senate has confirmed a dark horse to the job, and he comes from Texarkana, Tex. The Brotherhood of Locomotive Engineers recommended to the President for the job an ex-engineer, Lyman S. Roach, crippled at his trade, and now living at Texarkana, Tex. The President thought he ought to be a good man from what the Brotherhood said of him, and so, while the politicians fought it out, the President sent Roach's appointment to the Senate and the Senate went ahead and confirmed the appointment.—*Cleveland Press*.

MR. THOMAS FITZGERALD having been promoted from the position of General Superintendent to that of General Manager, the members of Div. 97, Baltimore, Md., formulated and adopted the following letter of congratulation and co-operation:

T. Fitzgerald, Esq., General Manager B. & O. R.R.:

At a regular meeting of South Baltimore Div., 97, Brotherhood of Locomotive Engineers, held January 29, 1905, it was the unanimous vote of this Division that we extend to you our hearty congratulations on your promotion to the high office of General Manager of so great a corporation. We are glad to see you succeed to the office which your long and continuous term of highly meritorious service so justly deserves.

We hope your term of service in your new office will be long and attended with the highest degree of success. We guarantee you our heartiest co-operation.

J. T. A. TROUP.

G. W. METCALF.

J. O. F. LOVELL.

BRO. THOS. F. HOWLEY, of Div. 403, has been appointed General Road Foreman of Engines on the New York and Delaware Divisions of the Erie R. R., with headquarters at Port Jervis, N. Y.

Brother Howley has been a member of Div. 403 since its organization and has served the Division as an officer in various capacities, his services as Chairman of the Local Committee of Adjustment and member of the General Committee of Adjustment having been particularly satisfactory to the Division.

Brother Howley has been a successful engineer for twenty years, and while making a mileage of 180 miles per day, six days a week for years, he has found time to keep himself up-to-date on railway motive power matters, and the members of Div. 403 are convinced that the company has selected a man who will give satisfaction to the men and achieve results for the company which will be satisfactory to them also; and while we shall feel the loss of Brother Howley from our Committee of Adjustment, it gives us pleasure to have one of our Brothers selected for so important a position as the one to which Brother Howley has been appointed.

F. A. E., Div. 403.

MR. W. L. KELLOGG, who for the past two years has been Master Mechanic of the Southern Kansas Division of the Missouri Pacific, having resigned his position to accept a position of Superintendent of Motive Power on the Flint & Pere Marquette, the following resolution was adopted by the engineers of Div. 364:

WICHITA, KAN., Jan. 24, 1905.

Resolved, That we sincerely regret that we have been deprived of the influence and gentlemanly treatment that we have always received at the

hands of our Master Mechanic, Mr. W. L. Kellogg, and also regret that the Missouri Pacific R. R. has lost an untiring worker for the interest of the locomotive and car departments, though we rejoice at his promotion, knowing that wherever he goes advancement and bettered conditions for the engineers will follow; and we know that the engineers on the Pere Marquette R. R. will receive the same generous treatment tendered to us while he was here, and that we must therefore congratulate them.

W. A. THOMPSON.

GEO. LAHEY.

W. T. BRAY.

At a regular meeting of Div. 23, B. of L. E., at Memphis, Tenn., Feb. 6, it was announced that Mr. E. T. Horn, Superintendent of the Memphis Division of the Y. & M. V. R. R. and Superintendent of the Memphis Terminals of the I. C. and Y. & M. V. Ry., has tendered his resignation to take effect Feb. 10th, to take charge of the St. Louis Division on the 11th. The following resolutions were unanimously adopted:

Resolved, It is with regret that we are to lose the services and association of such an efficient officer. Mr. Horn since his coming among us has made friends among all the employees, and while he has never forgotten or neglected the interests of the company, he has won our respect and appreciation by his fair impartial treatment and consideration in all matters pertaining to the interests of the employees.

We wish him much success in his new field of usefulness, which our association with him has fully demonstrated, he is so ably fitted to fill.

Resolved, That a copy of these resolutions be sent to Mr. E. T. Horn, a copy spread on the minutes and a copy sent to the ENGINEERS' JOURNAL for publication. Respectfully,

H. V. NEVILLE. T. H. HINER.
H. K. SINCLAIR. S. P. JONES.
T. G. WALTON.

Mr. C. H. Temple, having been promoted and assigned to Winnipeg, Div. 657, formulated the following complimentary letter:

REVELSTOKE, B. C., Jan. 28, 1905.

Mr. C. H. Temple, Master Mechanic, Central Division, Canadian Pacific Railway, Winnipeg, Man.

DEAR SIR: At a regular meeting of Ash Kennedy Div., No. 657, B. of L. E., held at Revelstoke on the 18th inst., we, the undersigned, were appointed a committee to convey to you the feelings of our Division on the occasion of your departure from the Pacific Division.

We, therefore, beg leave to say that it was with sincere regret that we, as a Division and as individual engineers, learned of your removal from here as our executive head.

The fair dealing and justice, and we might say the leniency, that has characterized your record as Master Mechanic on the Pacific Division, has often been the subject of favorable comment among us, and will long be remembered by us all. Also, the

amicable and cordial relations that have always existed between yourself and us, both as a Division and as individuals, is something we regard with extreme satisfaction and pride, and for the mutual benefit of all concerned, we hope and trust that the same conditions will obtain in your new field of labor.

While we regret your departure from the Pacific Division, we are at the same time very much pleased to know that your services here have been appreciated by the higher officials by an appointment to a much more important position, and should we in the future have the good fortune to be associated with you again, we hope it will be when you have attained a still higher position.

With kindest regards to Mrs. Temple and family, we remain,

Yours truly,

ALLAN MCNAB, C. E.

H. CREELMAN, F. A. E.

LOUIS PATRICK.

A NEW FEATURE OF AIR BRAKE EQUIPMENT.—We call the attention of our readers to the advertisement of the Morrison Air Brake Safety Valve that appears in this issue. All railroad men know the damage and risk that now follow trains breaking apart, or air hose bursting on running trains. This valve is designed to control the brakes and prevent this damage.

HIS WORSHIP is the title by which Bro. Wm. Phemister, a member of Div. 133, at present in active service as a passenger engineer running between Niagara Falls and London, on the Grand Trunk Railway System, must be addressed, he having been elected to the honorable position of Mayor of Niagara Falls, Ont. This goes to show that he has always done his duty to his fellow-citizens and to the company for which he works.

He is now the chief magistrate of the city on the Canada side of the big waterfall. All honor to him who reflects credit on all members of our profession.

W. F. BAINES, F. A. E., Div. 133.

We reach across the mystic lines between the two countries—no barrier to our brotherly fellowship—and join our Canadian Brothers in hearty congratulations to His Worship, Brother Phemister.

EDITOR.

BRO. J. J. O'NEIL, a member of Div. 369, and formerly Traveling Engineer of the Wisconsin Division O. & St. P. M. & O. Ry., has been promoted to Assistant Superintendent of the Minnesota Division, with headquarters at St. James, Minn.

The members of Div. 369 desire to express their unqualified approval of the company's selection and feel that Brother O'Neil deserves all the good fortune that can come to one who has honored himself

by the performance of every duty to the company and associates.

As an engineer, Brother O'Neil ranks as one of the best and is thoroughly familiar with all the conditions of the service, and the members feel honored that one of their number has been selected for this position, which we are satisfied he will fill with credit and to the satisfaction of his superiors.

On the eve of his departure for his new field of labor, about thirty of Div. 369's members met with Brother O'Neil to congratulate him and tender their best wishes.

In the promotion of Bro. M. J. Keating, of Div. 241, as Brother O'Neil's successor as Traveling Engineer, we feel that the company has made another creditable selection, as Brother Keating is fully qualified to fill the position.

The Brothers of the Wisconsin Division are to be congratulated on having such an efficient and amiable gentleman as their Traveling Engineer.

COMMITTEE, Div. 369.

THE members of Old Colony Div. 312, Boston, Mass., and visiting members from Division 439, were very much surprised and delighted with an unexpected visit from two of our Grand Officers, our Grand Chief, Brother Stone, and Grand Guide, Brother Tucker, at our meeting February 12. It was the first time our Grand Chief has been with us and he was given a hearty welcome to our Division. There were about 120 Brothers present, and it bears out the advice given to our members by their officers that it pays to attend your Division meetings, for all who heard our Grand Chief and Grand Guide speak, will have something to think of for quite a while.

Our G. C. of A. report was being read and Division 312 had invited Division 439 to be present. The Brothers were all sorry our Grand Chief had to leave Boston on the 3 P. M. train for New Jersey that afternoon, but had the satisfaction of hearing good advice from one who is in close touch with our whole membership, and who has the good of our organization at heart.

Fraternally yours,

C. P. SHUFELT, F. A. E., Div. 312.

THE twenty-fifth wedding anniversary—silver wedding—of Bro. and Mrs. Fred H. Tucker was held at their home, 170 Hull St., Brooklyn, N. Y., on Saturday evening, January 28, 1906. The parlors were handsomely decorated for the occasion. The bride was becomingly gowned in silver gray. The favors were white and silver badges. Guests began to arrive at 8:30 P. M., and at 9:30 the house was full.

The following Divisions were well represented: B. of L. E. Divisions 105, 157, 269, 419, 639. G. I. A. Divisions 201, 234, 244, 272. Many letters of regret were received from friends out of the city.

Among the many useful and valuable presents received were a quartered oak roll top desk and chair, and a large silver soup ladle from Div. 639, B. of L. E., suitably inscribed; a large silver serving dish with name and number of Div. 201, G. I. A. to B. of L. E. on the cover; also a beautiful piece of cut glass and four pieces of silver from Harmonia Chapter, O. E. S.; Mrs. Tucker is Past Worthy Matron of this Chapter.

Many valuable presents of cut glass and silver were received from kind friends.

The evening was very pleasantly spent by all with music, singing and dancing. At 11 P. M. supper was served, and it was a jolly crowd. Space will not permit the mention of names, as there were about seventy-five people present. EDWYN.

Div. 99, G. I. A., gave another of their suppers and entertainments on Saturday evening, Jan. 21, in Engineers' Hall, Boston, Mass., which was largely attended by the Brothers and Sisters and friends.

The supper was from 8 to 9, and the tables loaded with good things in abundance testified to the efficiency of the committee having it in charge, consisting of Sister Mitchell, chairman, assisted by Sisters Kidder, Berry, Nowell, and Pierce.

At 9 o'clock the entertainment committee, consisting of Sister Getchell, chairman, assisted by Sisters Woodman, Shackley, Place, Baldwin and Lindsey, gave a fine program of entertainment, consisting of opening chorus by the committee; solo, Miss Hale; readings, Sister Woodman; solo, Brother Patterson; solo, Sister Downs; recitation, Master Freddie Berry, and closing chorus by the committee and which was much enjoyed by all present, and all had to respond to calls.

Remarks were made by Brother Dority, our Grand Chaplain, and also by some of the other Brothers present, complimenting the ladies and their committees on their success in ministering both to our bodily and mental needs.

Sisters Shackley, Buckman and Patterson kindly and efficiently acted as accompanists for the several numbers.

After the entertainment the floor was cleared for dancing, and many enjoyed the pleasure of "tripping the light fantastic" until nearly midnight, and all voted the affair a success in every way.

Give us some more just like it, Sisters, and God bless you all. N. H. B. W.

ON Dec. 15, 1904, at 2:30 P. M., the ladies of Valverde Division 123, gave a pub-

lic installation of their newly elected officers, which was followed by a banquet immediately afterward. All the members of Division 251 and their friends received a cordial invitation to attend, and all availed themselves of the privilege that possibly could.

The ladies handled the installation ceremony with due credit to themselves, and everyone present complimented them on the neatness of their work.

The banquet was something to be well remembered, and looked forward to by all present. Our light-weight, Brother Foster, was there, as the ladies will testify, and one of the large chairs was placed at the table for his special benefit. Brother Campbell, it was claimed, fasted for two days before the banquet, and it would have done you good to have seen him eat. Brother Connors just came in off the road and all agreed that he should be entitled to a medal for his eating ability. Brothers Bourne, Kinchloe, Peden, P. Boyle, Vincent A. Boyle and several other Brothers present were following Brother Connors a close second, which speaks volumes for the ability of the ladies as cooks.

Knowing our worthy Chief, Bro. R. B. Kelley, and our genial F. A. E., Bro. E. H. Collip's liking for everything good, we were very sorry that they were unable to attend.

All enjoyed themselves to a late hour, when they departed for their homes, wishing the Ladies' Auxiliary success in the future.

MEMBER OF DIV. 251.

IN MY last correspondence with you, you wrote me to let you know as to the success of the second annual ball of Div. 11 and its Auxiliary, Div. 128, to held on Wednesday, January 25, at Indianapolis, Ind.

Well, we pulled the ball off on time, and the public that participated appeared to enjoy themselves, and there was about \$100 left after paying expenses; but our hearts were not in it, and had it been possible we would have postponed the ball. Because of the sudden death of Brother Burchett, of Div. 492, who was killed at Lafayette on the night of the 24th, very few of our members danced.

Div. 11 also lost a Brother this month, J. P. Gray, and last month Samuel Crowe, so you can realize that there was too much depression to counteract the enjoyment that a ball given by railroad men generally produces.

WM. M. BLYTHE, F. A. E., Div. 11.

THE B. of L. E. and B. of L. F. of Galeton, Pa., gave their eighth annual masquerade ball on Jan. 2. The hall was beautifully decorated with red and white festoons, which covered the ceiling and

walls, and many remarks were heard that the hall had never looked so pretty. The gas lights were decorated with flags, red, white and blue, as were the walls. On wires, which seemed to cover the entire ceiling, were hung red, white, green and blue lanterns all lighted, which added greatly to the effect. The boys worked hard decorating and may well be proud of their efforts.

The Galeton orchestra, composed of five pieces, furnished the music. The musicians were seated upon the stage, while back of them was a very real looking engine just coming out from the roundhouse doors, with head and signal lights burning.

It is estimated that fully one hundred couples were in costume. The dancers presented a pretty picture, with the bright colors, ever changing in the numerous combinations. There were at least 150 people present who were not in costume. These latter were not permitted to dance until after the unmasking which occurred about midnight, when all adjourned to the Hotel Imperial where full justice was done to the excellent supper served there.

The committees were composed of such names as Charlie Ashpan, George Smokestack, Baldy Cylinderhead and a dozen other names taken from parts of the engine. The order of dancing contained a line for each dance, such as "Baldy, swing that girl behind you," "Do not pass the brewery without orders," etc. There was a saying or joke on some one of the boys for every one of the twenty-five dance numbers.

Dancing was kept up until the "wee sma' hours," when everyone went home tired but happy, and all wishing the railroad boys would give their delightful parties oftener.—*Galeton Press.*

AS I have not seen anything in the JOURNAL from Division 151, I will endeavor to give you a few items. Division 151 is located at Burlington, Iowa, a Mississippi River town, built on four hills, about 28,000 inhabitants, and has good railroad connections—located on the main line of the C. B. & Q., with four diverging branch lines. The C., R. I. & P. and T., P. & W. also enter the city.

Division 151 was organized in 1868, and for many years was a flourishing Division. Then came the Q strike of 1888, which came very near ending Division 151, and great credit is due to Bros. Simpson, Parmer, Richards and a few of the "Old Heads" who stuck together, and by meeting from house to house succeeded in keeping the old banner floating. We are now on the main line with right of track.

Division 151 now has 81 members in good standing, composed of engineers on

the lines comprising the Q system, namely: C., B. & Q., C., B. & K. O., St. L., K. & N. W., B. & N. W. also C., R. I. & P. and T., P. & W. men.

Sister McBride visited our city Dec. 12th and organized a Division of the G. I. A., to be known as "The Burlington" Div. 843. The ladies start out with twelve charter members and the good wishes of the Brothers. After the work of organizing was completed the Sisters repaired to a nearby cafe where they proceeded to enjoy themselves by "filling up" on the good things which were prepared for them.

Yours fraternally, TRAB.

Division 225 gave a grand ball on Jan. 8, and if you will allow me space I will give the readers of the JOURNAL an account of it.

At 8:45 the guests began to arrive, and at 9 the grand march commenced. The grand march was led by Bro. E. T. King and Miss Katherine Donnigan, the beautiful and accomplished daughter of Bro. Owen Donnigan. It was a grand sight, over 100 couple of well dressed ladies and men in the grand march; and after the sixth number dinner was announced. There were plates for 168 couples. After dinner the program was continued, and was not concluded until 2 A. M. when Home, Sweet Home was played, and after thanking Professor Deal and his most efficient orchestra for their delightful music we all went to our homes; and from the expressions of all present they enjoyed one of the grandest balls ever given in our city. This ball brought together many of our new Brothers, of whom we have a great many, all of whom are fine gentlemen as well as good engineers and Brotherhood men. Our Division owes thanks to the following Brothers for their interest taken in this ball, for without hard work we would not have made a success: Bros. Thomas Murphy, E. T. King, W. H. Davies, Mike Sexton, J. W. Shepherd, J. E. Morgan, E. A. Vickroy, J. P. and J. G. Cairnes and R. E. McCarty, all who gave their time to the Brotherhood, and to all others who assisted to make this ball a grand success.

Now, when it comes to looking handsome, Brother King made all look like a plugged penny, as he was acknowledged to be the handsomest man on the floor. While Brother Davies would not get many prizes at a beauty show he was the most popular man on the floor, that is, among the ladies, for he caused more than a score to fall out with their sweethearts. We do not blame the girls, they couldn't help it; it is a sin to turn such a man loose in society to go around breaking hearts, as he does. Now as to Brother Morgan, he was

Johnny on the spot, everywhere at once, especially if he was needed. He tried to cut a figure among the ladies but did not make much of a show, for someone was always reminding him of what was coming when he got home. Bro. Jim Cairnes had no snow, for he was handicapped by the presence of his wife. Brother McCarty did not show up until dinner was announced, and did not leave until after everything to eat had disappeared. He is not to blame, for he is only a boy, tips the beam at 290 and still growing, I think that has something to do with his appetite. Next comes our Chief Engineer; well, he is "it," he danced so long and hard that it took his wife and all the neighbors three days to rub the rheumatism out of his bones. Hoping this will not find the waste basket, for if it does it might discourage me from writing again, I am fraternally yours,

R. L. EAKER, F. A. E. of Div 225.

THE visit of Warren S. Stone, Grand Chief Engineer of the Brotherhood of Locomotive Engineers, of Cleveland, and Mrs. W. A. Murdock, Grand President of the Ladies' Auxiliary, of Chicago, to Terre Haute on June 24 was the occasion of a brilliant reception, at which there were almost two hundred people present. The rooms in the building were decorated in carnations, evergreen and American flags, and at the foot of the platform on which the various speakers sat was a bank of palms. Breinig's Orchestra and the Centenary Quartet gave excellent musical selections during the evening.

The first part of the reception was given to addresses and music. John Redmond, Chief Engineer of Div. 25, presided and introduced the speakers in a pleasing manner. The invocation was given by the Rev. U. G. Leazenby, pastor of the First Methodist Church.

Following the invocation Mayor Bidaman gave an address of welcome in which he made many complimentary remarks to railroad men in general and particularly to the railroad organizations. He spoke of the worth of railroad men, both officials and employees, to a community, and praised highly the class of men who manage and who are employed by Terre Haute roads.

J. M. Lindley, road foreman of engines of the Vandalia Line, followed, who spoke of the evolution which has taken place in respect to the higher grade of morality that is permeating railroad life and of the ennobling influence it is having on the men and their lives. He paid several terse compliments to the Brotherhood of Engineers, and closed expressing wishes for a continuance of the same feeling that is

now existing between employer and those employed.

Following Mr. Lindley was an address by Auditor W. S. Roney, of the Vandalia Line. He opened his talk with several short humorous stories that touched closely railroad life and suggested incidents that have happened to almost every railroad man. His address dealt particularly with the interior workings of the road and in several short examples he showed how many men are actually needed for safe transportation, while the average traveler rarely thinks of more than the conductor or the engineman.

John L. Davis, Chief Train Dispatcher and Division Operator of the Vandalia Line, next gave an address. His talk was brief but brought out one of the most important parts of railroad work, the close relationship that exists between the train dispatcher and the engineman. He showed the safety to life and property and the great responsibility that depends primarily on this relationship, which is, perhaps, the closest relationship borne between any two men in any work of life, each man working hand in hand with the other and in perfect accord.

Following Mr. Davis was an address by the Rev. Victor A. Schnell, rector of St. Patrick's Church. He spoke of the motto of the Brotherhood, "Justice, Truth, Sobriety and Morality," and dwelt for a short time on each part, speaking of the immense value of these qualities to any life and of the worth of each alone and as combined with the others.

Mrs. Murdock, President of the Ladies' Auxiliary, gave a short talk relative to the work of the Auxiliary and of its origin and life. She spoke of the value of the organization as an incentive to social life, and also to the morality of the members. She also spoke of the effect that such an auxiliary has on the home life.

Mr. Stone's address was very brief and dealt principally with the purpose of the Brotherhood. He gave some interesting statistics concerning the growth of the organization and also concerning the present standing, both financially and in reputation. He talked of the tactics which are used by the organization to avert strikes and to instigate a friendly feeling with both employer and also with men who are not members of the Brotherhood.

The program closed with a drill by the members of the local Auxiliary. The remainder of the evening was given to old-fashioned dances in which fifty or sixty couples took part.

Visitors from Logansport came in a special train.—*Vandalia Times*.

On Monday night, Feb. 6, the members of Div. 224, the oldest Division in Mexico, and of Div. 669, the youngest in Mexico,

met in joint session at the Division hall of the latter. The occasion of the meeting was the election and installation of officers of Div. 669, which had been instituted by Bro. H. D. Rogers, C. E. of Div. 224, assisted by several other Brothers of his Division on January 29. At the time of the organization of the new Division the offices were filled temporarily by appointment.

Bro. M. W. Cadle, A. G. C. E., who was making an official visit to all Divisions in Mexico, and had been attending the Union Meeting of the O. R. C. and B. of L. E. held in Mexico City on the 6th, was present and gave some valuable instruction to the new Division, which was appreciated by all present, who included not only the members of Div. 224 and 669, but also Brother Pierce of Monterey, Brother Holmes of Acambaro, Bros. Hally, Wood and Englebright of Pueblo, Brother Russell of Aguas Calientes, Brother Kroft of Chihuahua, Brother McCormack of Monclova, Brother Rayer of San Luis Potosi and Brother Faris of Jimulco, who were delegates to the Union Meeting with the O. R. C.

Brother Cadle emphasized the necessity for faithful attention to duty on the part of officers and faithful attendance on the part of members, and strict compliance with the law in all cases. Bro. I. M. Hutchinson of Div. 224, President of the Mexican Car Factory and general agent for the American Locomotive Co., was called upon for an address and responded with a few eloquent words of encouragement, closing with a generous offer to present the new Division with a full set of the necessary paraphernalia.

Before adjournment, a vote of thanks to Brother Cadle for his address and presence at the meeting was unanimously passed, as well as a vote of thanks to Brother Hutchinson for his generosity to and sympathy with the new Division.

Brother Hutchinson remains a loyal member of the B. of L. E., though it has been some years since he left the service and became identified with the great and varied enterprises that have brought him well merited success. DELEGATE.

On Feb. 2, 1905, Holston Div. 239, B. of L. E., had a call meeting for the purpose of listening to Assistant Grand Chief, Bro. H. E. Wills.

The meeting was called to order by our General Chairman, Bro. J. I. Whiddon, who made a short talk, then introduced Brother Wills, who talked for two full hours, giving good advice, encouragement and admonition, and often referring to the portrait of grand old Brother Arthur hanging on the wall, and of the good he had done, and of his being responsible for so many Brothers now owning nice, beau-

tiful homes, and through him this Brotherhood had attained the high standard it now holds. At the close of his address came short speeches.

At 4 P. M., a committee of Div. 71, auxiliary to Div. 239, were admitted and very cordially invited us to the adjoining hall, where a repast awaited us. The invitation was very readily accepted, and our meeting then adjourned until 7:30 P. M., and proceeded to the adjoining hall.

After the banquet Brother Whiddon, our General Chairman, addressed the Brothers and Sisters, and urgently requested the Sisters to look into the privilege of the insurance and see that their husbands carried their full limit, and to take it upon themselves to see that the assessments were paid each month before they were classed among the delinquents.

Brother Wills then addressed the Sisters complimenting them on their cooking, and referred to their Grand President in complimentary terms, and then requested the Sisters to urge their husbands to attend their Division meetings as regularly as possible.

Mrs. W. J. Caldwell, President, in behalf of the Auxiliary, presented Brother Mills with a bouquet of white roses.

At 7:30 P. M. the gavel sounded in our hall and the Brothers came to order, and were given the pleasure of having Mr. G. R. Loyal, Supt. of the Knoxville Division of Southern Ry., as our guest.

Brother Widdon made a short talk and then called on Superintendent Loyal, who made a short address in which he urged the engineers to live up to the rules of the company and try and reduce the number of accidents. Mr. Loyal closed by thanking us for the privilege of meeting with us.

Brother Whiddon then called Brother Wills, who explained the principles of our Brotherhood and what it would and what it would not stand for, and urging the Brothers to live closely to the rules and not let the cause of accidents be traced to the engineers.

At the close of Brother Wills' remarks, Mr. Loyal retired, and short speeches were made by all present. Eleven o'clock having arrived all too soon, the meeting adjourned.

We all enjoyed the evening very much and seldom witnessed such interest manifest among the Brothers present. It being the first time a Grand Officer had met with us since 1894, each Brother present feels that not only he, but the whole order, will reap benefit from Brother Wills' visit to Knoxville.

J. D. BISHOP, F. A. E. Div. 239.

SPECIAL NOTICES.

Will Bro. Charles Chase correspond with Bro. Thomas O'Donnell, F. A. E., Div. 44, Lock Box 104,

Rawlins, Wyo.? When last heard from he was on a road in Mexico.

Any one knowing the whereabouts of Geo. W. Flanders, or maybe better known in the West as James Flanders, an engineer, will confer a favor by addressing Mrs. Minnie Hayes Colcord, 14 Henry St., Haverhill, Mass.

Will J. W. Short correspond with Bro. O. D. Morris, F. A. E., Div. 378, 730 Ross St., Springfield, Mo.

The address of J. W. Yocum, formerly a member of Div. 187, Fort Worth, Tex., is very much desired by his wife, who reports that she is in great need. Address Mrs. Sallie Yocum, Sapulpa, I. T.

Will Bro. C. H. Hopkins please correspond with Bro. R. M. Slaughter, F. A. E., Div. 442, 514 Monroe Ave., Jonesboro, Ark.?

Will Bro. F. J. Whitney please correspond with Bro. C. P. Shufelt, F. A. E., Div. 312, South Walpole, Mass.? When last heard from, about one year ago, he was firing a heating plant in New York City.

The traveling card of Bro. W. A. Jackson, dated Jan. 21, 1905, has been lost or stolen. If presented, please take up and send to Bro. J. F. Barbour, F. A. E., Div. 224.

Wanted—To know the whereabouts of W. L. Neal, who was last heard of in Memphis, Tenn., last April. Any one knowing his whereabouts will confer a favor by writing to Rose Neal, Stinesville, Ind.

Information is wanted of the whereabouts of the son and daughter of Bro. John J. Savan, deceased. The son's name is John, the daughter's Minnie Scott Savan, supposed to live in Detroit, Mich. Brother Savan's last service was on the Central Pacific, out of Wadsworth, Nevada. Address Edgar Shepley, Admr., Sparks, Nev., C. E. Div. 158.

Members of the following Divisions will correspond with the F. A. E. of their Divisions immediately:

Division—	Division—
435—Thos. McKeever.	496—Lincoln Grow.
504—E. E. Cowan.	

OBITUARIES.

[In accordance with the action of the Ottawa Convention, no resolutions of condolence, obituary letters or poems will be published in the JOURNAL. All deaths will be listed under obituary heading only, with cause and date of death.]

Parsons, Kan., Jan. 20, of paralysis, Bro. Wm. H. Clark, member Div. 179.

Shawnee, Tenn., Jan. 22, killed in a wreck, Bro. M. J. Mooney, member of Div. 455.

Wichita, Kan., Jan. 13, Bro. Albert Gray, member of Div. 364.

Detroit, Mich., Jan. 14, committed suicide, Bro. Geo. Burchill, member of Div. 1.

Meadville, Pa., March 4, 1904, Bro. A. B. Atwood, member of Div. 43.

Meadville, Pa., July 17, 1904, Bro. W. B. Sweetman, member of Div. 43.

Meadville, Pa., Sept. 2, 1904, Bro. W. C. Burr, member of Div. 43.

Meadville, Pa., Sept. 30, 1904, Bro. G. S. Howden, member of Div. 43.

Chicago, Ill., Jan. 13, Bro. Thomas Derbyshire, member of Div. 19.

Springfield, Ill., Jan. 26, Bro. C. L. Rouen, member of Div. 19.

Troy, N. Y., Jan. 25, of heart failure, Bro. Alton H. Wilson, member of Div. 87.

Lafayette, Ind., Jan. 23, killed, engine derailed, Bro. Lindsay Burchett, member of Div. 492.

Garrett, Ind., Jan. 26, killed in wreck, Bro. P. J. Shannon, member of Div. 153.

Philadelphia, Pa., Jan. 26, of exposure in a blizzard, Bro. Wm. E. Wise, member of Div. 45.

Buffalo, N. Y., Jan. 4, Bro. C. J. Maurer, member of Div. 15.

McKees Rocks, Pa., Dec. 19, 1904, Mrs. Margaret Cox, mother of Bro. Frank Cox, member of Div. 148.

Hinton, W. Va., Jan. 19, killed by jumping from his engine, Bro. J. B. Keesey, member of Div. 101. Grafton, W. Va., Jan. 19, Eliza Stone, mother of Bro. W. C. Stone, member of Div. 284.

Montreal, Can., Dec. 6, 1904, of Bright's disease, Bro. C. St. Denis, member of Div. 89.

Phillipsburg, N. J., June —, 1904, Bro. J. M. Crevellry, member of Div. 30.

Augusta, Ga., Feb. 2, Bro. A. G. Toy, member of Div. 323.

Spencer, N. C., Jan. 27, Bro. R. O. Ferryear, member of Div. 375.

Jersey City, N. J., Jan. 26, Bro. Anthony Denton, member of Div. 53.

Jersey City, N. J., Feb. 1, Bro. James Norton, member of Div. 53.

Columbus, O., May 11, Bro. John Killroy, member of Div. 34.

Columbus, O., Oct. 31, 1904, Bro. Lyons, member of Div. 34.

Columbus, O., Dec. 12, 1904, Bro. Malloy, member of Div. 34.

Athens, O., Nov. 26, 1904, Bro. Van Voorhease, member of Div. 34.

Bloomington, Ill., Jan. 31, of kidney trouble, Bro. A. W. Kinne, member of Div. 220.

Hooper, Neb., Nov. 12, 1904, of hemorrhage of bladder, Bro. J. S. Hough, member of Div. 259.

Indianapolis, Ind., Feb. 4, of heart trouble, Bro. Wm. Platt, member of Div. 11.

Savannah, Ga., Feb. 2, of appendicitis, Bro. Wm. A. Colvin, member of Div. 646.

Savannah, Ga., Jan. 28, killed in an accident, Bro. Wm. Guilfoyle, member of Div. 646.

Tipton, Ind., Feb. 5, Bro. S. A. Carter, member of Div. 120.

Rocky Mount, N. C., Dec. 13, 1904, Bro. G. F. Home, member of Div. 314.

Raisin Center, Mich., Feb. 4, killed in a wreck, Bro. S. T. Stone, member of Div. 248.

St. Louis, Mo., Jan. 30, Bro. T. J. Sullivan, member of Div. 278.

Niles, O., Jan. 29, killed by his engine turning over on him, Bro. Ellsworth Fryman, member of Div. 522.

Bucyrus, O., Feb. 3, of brain paralysis, Bro. Jos. A. Stewart, member of Div. 124.

Streator, Ill., Feb. 5, of injuries received by chaining car, Bro. Wm. Danewood, member of Div. 354.

Port Jervis, N. Y., Jan. 25, Bro. Lyman M. Lockwood, member of Div. 54.

Tacoma, Wash., Jan. 30, of dropey, Bro. Andrew McClelland, member of Div. 16.

Pittsburg, Pa., Jan. 28, Bro. H. B. Hunt, member of Div. 50.

Camak, Ga., Feb. 1, Bro. A. G. Toy, member of Div. 323.

Atlanta, Ga., Dec. 24, 1904, Bro. J. C. Butler, member of Div. 498.

Detroit, Mich., Feb. 7, John W. Carney, father of Bro. William and Joseph Carney, members of Div. 1.

Chanute, Kan., Feb. 7, Bro. John B. Blake, member of Div. 214.

Worcester, Mass., Feb. 8, committed suicide, Bro. Josiah S. Lovejoy, member of Div. 64.

Portsmouth, O., Jan. 17, Bro. Joseph Theobald, member of Div. 72.

- Geo. McNeillis, for defrauding his Division.
- 115—William C. Apgar, for conduct unbecoming a member, deserting his family, and vicious violation of his obligation to them and the Brotherhood.

The name of W. H. Rowling, expelled from Div. 38, should have been W. H. Bowling, for violation of obligation and morality.

PREMIUMS FOR JOURNAL SUBSCRIPTIONS.

We have arranged with the Webb C. Ball Co., Watch Manufacturers, Cleveland, O., for three kinds of watches, which we are offering as premiums:

- 1st. **The Ladies' Queen Watch**, 17 jewelled, 14 karat gold filled case. Selling price, \$30.00. To obtain this send us \$30.00 with the names of 30 subscribers.
- 2nd. **Gentlemen's B. of L. E. Standard**, 17 jewelled, 14 karat gold filled case. Selling price, \$50.00. To obtain this, send us \$75 and the names of 75 subscribers.
- 3rd. **Gentlemen's 21 Jewelled**, 14 karat gold filled case. Selling price, \$60.00. To obtain which send us \$100.00 and the names of 100 subscribers. Money must accompany the names of bona fide subscribers.

Those who contemplate working for one of these premiums should begin now, so as to have the JOURNAL start with Vol. 39, January, 1905.

If your JOURNAL address is not correct, or you fail from any cause to receive it, fill out this form properly, cut it out and send it to 307 SOCIETY FOR SAVINGS BLDG., CLEVELAND, O.

The B. of L. E. Journal.

LOCOMOTIVE ENGINEERS' MUTUAL LIFE AND ACCIDENT INSURANCE ASSOCIATION.

Official Notice of Assessments 748-753.

SERIES F.

OFFICE OF ASSOCIATION, ROOM 803, SOCIETY FOR SAVINGS BUILDING, }
CLEVELAND, OHIO, March 1, 1905. }

To the Division Secretaries L. E. M. L. and A. I. A.:

DEAR SIRS AND BROS. — You are hereby notified of the death or disability of the following members of the Association:

Six Assessments for payment of these claims are hereby levied and Secretaries ordered to collect \$1.50 from all who are insured for \$750, \$3.00 from all who are insured for \$1,500, \$6.00 from all who are insured for \$3,000, and \$9.00 from all members insured for \$4,500, and forward same to the General Secretary and Treasurer.

Members of the Insurance Association are required to remit to Division Secretaries within thirty days from date of this notice, and the Division Secretaries to the General Secretary and Treasurer

within ten days thereafter, on penalty of forfeiting their membership. (See Section 25, page 80, of By-Laws.)

Secretaries in sending remittances will send same to and make all drafts, express money orders or postoffice money orders payable to M. H. SHAY, General Secretary and Treasurer. Secretaries located in Canada will please remit by draft or express money order. We will not accept packages of money sent by express, unless charges have been prepaid. The JOURNAL closes on the 18th of each month. Claims received after that day will lie over until the succeeding month.

M. H. SHAW, Gen'l Sec'y & Treas.

We Offer \$1,000

For a Disease Germ That Liquozone Can't Kill.

On every bottle of Liquozone we offer \$1,000 for a disease germ that it cannot kill. We do this to assure you that Liquozone does kill germs.

And it is the only way known to kill germs in the body without killing the tissues, too. Any drug that kills germs is a poison, and it cannot be taken internally. Medicine is almost helpless in any germ disease. It is this fact which gives Liquozone its worth to humanity; a worth so great that, after testing the product for two years, through physicians and hospitals, we paid \$100,000 for the American rights. And we have spent over one million dollars, in one year, to buy the first bottle and give it free to each sick one who would try it.

Acts Like Oxygen.

Liquozone is not made by compounding drugs, nor is there any alcohol in it. Its virtues are derived solely from gas—largely oxygen gas—by a process requiring immense apparatus and 14 days' time. This process has, for more than 20 years, been the constant subject of scientific and chemical research.

The result is a liquid that does what oxygen does. It is a nerve food and blood food—the most helpful thing in the world to you. Its effects are exhilarating, vitalizing, purifying. Yet it is an absolutely certain germicide. The reason is that germs are vegetables; and Liquozone—like an excess of oxygen—is deadly to vegetal matter.

Liquozone goes into the stomach, into the bowels and into the blood, to go wherever the blood goes. No germ can escape it and none can resist it. The results are inevitable, for a germ disease must end when the germs are killed. Then Liquozone, acting as a wonderful tonic, quickly restores a condition of perfect health. Diseases which have resisted medicine for years yield at once to Liquozone, and it cures diseases which medicine never cures. Half the people you meet—wherever you are—can tell you of cures that were made by it.

Germ Diseases.

These are the known germ diseases. All that medicine can do for these troubles is to help Nature overcome the germs, and such results are indirect and uncertain. Liquozone attacks the germs, wherever they are. And when the germs which

cause a disease are destroyed, the disease must end and forever. That is inevitable.

Asthma	Hay Fever—Influenza
Abscess—Anæmia	Kidney Diseases
Bronchitis	La Grippe
Blood Poison	Leucorrhœa
Bright's Disease	Liver Troubles
Bowel Troubles	Malaria—Neuralgia
Coughs—Colds	Many Heart Troubles
Consumption	Piles—Pneumonia
Colic—Croup	Pleurisy—Quinsy
Constipation	Rheumatism
Catarrh—Cancer	Scrofula—Syphilis
Dysentery—Diarrhea	Skin Diseases
Dandruff—Dropey	Stomach Troubles
Dyspepsia	Throat Troubles
Eczema—Erysipelas	Tuberculosis
Fevers—Gall Stones	Tumors—Ulcers
Goitre—Gout	Varicocele
Gonorrhœa—Gleet	Women's Diseases

All diseases that begin with fever—all inflammation—all catarrh—all contagious diseases—all the results of impure or poisoned blood.

In nervous debility Liquozone acts as a vitalizer, accomplishing what no drugs can do.

50c. Bottle Free.

If you need Liquozone, and have never tried it, please send us this coupon. We will then mail you an order on a local druggist for a full size bottle, and we will pay the druggist ourselves for it. This is our free gift, made to convince you; to show you what Liquozone is, and what it can do. In justice to yourself, please accept it to-day, for it places you under no obligation whatever.

Liquozone costs 50c. and \$1.00.

CUT OUT THIS COUPON

for this offer may not appear again. Fill out the blanks and mail it to The Liquozone Co., 438 464 Wabash Ave., Chicago.

My disease is
I have never tried Liquozone, but if you will supply me a 50c. bottle free I will take it.

NUMBER 4.

Easter Thoughts.

The anniversaries of the birth and resurrection of Christ are the two great days of the year when all the people of the Christian world rejoice over the hope inspired by the life and example of the lowly Nazarene. On these days the people of many lands and many creeds, whether identified with any creed or not, all feel a kinship to the Church of Christ, sufficient to create a desire to commemorate His birth and resurrection. The celebration of His birth is the great festival of the home, in which His great lesson

of loving kindness is personified, while Easter is the glad consummation of hope inspired by His resurrection, hope of a future after this life which may bring joy, peace and rest in His kingdom, and this growing faith that man made in His image, who tries to emulate His example, may hope for life everlasting, is constantly enlarging the number who gladly join the great throng at the various places of worship and to have a part in the song of praise of Him who gave hope of a resurrection day. Millions observe the lenten season, with prayer and fasting, culminating with Easter and its glad tidings.

THE GARDEN OF GETHSEMANE WHERE JESUS WENT ON PALM SUNDAY AND WHERE HE WAS ARRESTED AFTER THE TREASON OF JUDAS.

We are more prosaic in America than in some of the older countries, but doubtless as earnest and sincere in our hopes in what we do to commemorate the beginning and the promise His life and resurrection give.

Russia is said to be the most extreme in its lenten season, which lasts seven weeks or forty-eight days instead of the usual custom of forty days, the period of the fast of our Lord in the wilderness. Passion week, where the Greek Church predominates, is exceedingly gloomy. Nearly everything is closed, wholesale business, the clubs, and all places of amusement,

of Christ, is brought from the holy place in the great cathedral and put in the center of the church; a sermon is preached and after vespers at 2 P. M., a figure of Christ painted or embroidered on an oblong piece of silk is provided and each of the audience lights a small candle and a procession is formed headed by boys bearing big candles, which marches from the altar to the tomb, the deacons bearing the cloth, typifying the body of Christ, on their heads and deposit it in the tomb. The great bell of Moscow tolls, and only tolls on Good Friday, except for the death of the emperor or the bishop of the province.

MOUNT OF OLIVES WHERE JESUS FORETOLD OF COMING EVENTS AND FROM WHICH HE IS SUPPOSED TO HAVE ASCENDED.

and musical instruments are silenced, not even a hand-organ is allowed upon the streets; but Passion week with all its gloom has at least a cleansing feature, as it is not only house-cleaning week, but every person must be thoroughly clean on Easter day, or they cannot attend church service; hence the bathing places are crowded, and those who can even buy new clothes for the occasion.

On Good Friday in Moscow they have a strangely impressive ceremony called the Burial of Christ, when a plain box covered with silk and gold, called the Tomb

of Christ, is brought from the holy place in the great cathedral and put in the center of the church; a sermon is preached and after vespers at 2 P. M., a figure of Christ painted or embroidered on an oblong piece of silk is provided and each of the audience lights a small candle and a procession is formed headed by boys bearing big candles, which marches from the altar to the tomb, the deacons bearing the cloth, typifying the body of Christ, on their heads and deposit it in the tomb. The great bell of Moscow tolls, and only tolls on Good Friday, except for the death of the emperor or the bishop of the province.

It is somewhat strange that the fable of the source of the bright colored Easter egg should have withstood the ages, like Santa Claus, and today we see the Easter egg and the hare always associated wherever they are displayed. The story

of the origin of the Easter egg and its association with the hare, places its inception in Germany, when, "Far back in the middle ages, the Duchess Rosalinde von Lindenburg fled with her children and servants to a little mountain village in Germany, as the safest place of refuge during her husband's absence in the wars. At that time chickens were unknown in that part of Germany and the duchess, wishing to aid the kindly peasant women, instructed her servant to bring with him, when he returned from bearing a message to her husband, a coop of the fowls. The chickens caused no end of wonder among the simple peasant people, and the eggs were highly appre-

this to the hare has been ascribed the laying of the Easter egg."

The love of children and the desire to please them, as well as to instill into their minds the importance of the day commemorating the Resurrection and hope of mankind, is doubtless accountable for the extension of the practice in all Christian countries.

In the celebration of Easter there are some features characteristic of country apparently differing because of environments, education and conditions of life. Florence has a very pretty one, differing from the colored egg and the hare to please children, both in the nature of fable, but that of Florence to please the

ROCK OF THE APOSTLES, PLACE OF JUDAS' TREASON FOR A FEW PIECES OF SILVER.

ciated by old and young. When Easter came, the duchess wished to give a festival for the children, but found she had little to give for either refreshments or presents save eggs. So the eggs were fixed and when the children came they were told to go out in the fields and hunt for nests. There among the green grass lay eggs gaily decorated, the first Easter eggs that the world had ever known. The children expressed great wonder that the hens could lay such beautiful eggs, when a little girl cried out, 'Oh, they didn't. I saw a little hare spring away from my nest as I came up and she must have laid the pretty eggs.' And from that day to

peasants. Of this it is said that "One of the old Crusaders made a vow that if he returned safely from his crusade he would leave money enough to have the custom of fireworks carried on forevermore. How much beyond the time of the crusades this practice dates none can say, but on the day before Easter a great car laden with fireworks and drawn by two snow white oxen, decked with garlands, is drawn up outside one of the city gates. In the morning a dove is let fly from the high altar of the cathedral of Santa Maria Del Flori, a dove which carries in its beak a lighted taper. It is the tradition that if this dove flies toward the fireworks and

CHURCH OF THE HOLY SEPULCHRE.

either by alighting upon them or by dropping the burning taper, causes them to go off, the year will be a successful one, and harvests will be good in the valley. The peasants believe implicitly in this tradition, but it is whispered that nowadays things are arranged so that the dove cannot fly wrong, even if it would."

But nowhere in all the world are people so carried away with Easter and the weeks that precede it, as in the environs of the Holy City, the religious excitement often becoming intense. In 1884 there was a riot in the Holy Sepulchre itself when some three hundred pilgrims were suffocated or trampled to death.

Here a cosmopolitan crowd gathers from all parts of the world, when Syrians, Arabs, Jews, Turks, Europeans of all nationalities and Americans, crowd the streets and the churches, and one of the most curious features of all is that the Greek and Roman churches both hold separate services in the church of the Holy Sepulchre, while the crowds at both services are kept in order by Moslem soldiers.

On Palm Sunday everybody carries a palm branch and the whole city is green with palm leaves, and on Holy Thursday comes the most interesting of all the ceremonies, that of washing the Apostles' feet. The patriarch of the church typifies Christ, and twelve bishops the twelve apostles, when the ceremony is gone through as nearly as possible like that described in the New Testament, the

Patriarch passing from one to another washing their feet, drying them with a towel and kissing each foot as he sets it down; and to this, as is told in the Bible, Peter objects and rises, but in the end submits. This ceremony over, a bouquet of roses is dipped in water and the water sprinkled around among the crowd.

This ceremony is of such great interest that on the night before the floor of the court is covered with pilgrims who sleep there so they may be sure of presence for the spectacle the following day; beside this there seems a great desire to occupy this sacred place, as they believe that the church of the Holy Sepulchre covers the ground where Christ was crucified, and that His tomb is there also.

The Eastertide thought naturally attaches itself to the places where Christ taught His lessons nineteen centuries ago, when the humble Nazarene was pursuing His beneficent ministry, through which He impressed upon the minds of men that God was Love and that man is the son of God, entitled to the hope of immortality. Nothing short of a divine personality can account for the effect upon the world of the life and teachings of Christ, accepted as divine truths by millions, and the hope so inspired, making Easter a world-wide day of rejoicing because of that hope.

With this we present a few pictures of the Holy City and environments with which Christ was associated and which we presume will have particular interest in connection with Easter thoughts.

THE EDITOR.

THE HOLY SEPULCHRE.

An Easter Song.

Arise, my heart, and sing thy Easter song
To the great anthem of returning bird,
And sweetening bud, and green, ascending blade,
Add thou thy word.
Long was the winter and the waiting long,
Heart, there were hours, indeed, thou wert afraid
So long the Spring delayed.

Shut in the Winter's alabaster tomb,
So white and still the sleeping Summer lay
That dead she seemed;
And none might know how in her magic side
Slept the young Spring, and moved, and smiled,
And dreamed.

Behold, she wakes again, and,
open-eyed,
Gazes, in wonder, 'round the
leafy room,
At the young flowers. Upon this
Easter Day
Awaken, too, my heart, open
thine eyes,
And from thy seeming death
thou, too, arise.

Arise, my heart, yea, go thou
forth and sing!
Join thou thy voice to all this
music sweet
Of crowding leaf and busy, build-
ing wing.

And falling showers;
How sweetly blows the Resurrec-
tion horn
Across the meadows, over the
far hills!

In the soul's garden a new
sweetness stirs,
And the heart fills.

And in and out the mind flow the
soft airs.

Arise, my heart, and sing, this
Easter morn;

In the year's resurrection do thy
part,—

Arise, my heart!

—Richard Le Gallienne,
in *The Summary*.

In the Yaqui Valley, Mexico.

VACUUM, SONORA, MEX., Feb. 22, '05.

EDITOR JOURNAL: After many days I have found time to snap a few pictures, which I inclose in fulfillment of promise made. They are of the cactus family, three of the nine or ten varieties that grow so dense in some places here in the Yaqui River Valley, and which say to you with their glistening thorns, "Go to the right or left," for you can neither go through nor over them; consequently, the roads in this part of the country lead you to all points of the compass in a distance of twenty miles. I presume you wonder how a person knows where he is going. Well, he doesn't know, unless he is certain he started on the right road, which he learned or has been told will lead him

to a designated point. Having started right, the cactus, with their millions of thorns, will keep you in the middle of the road.

The pictures I inclose are of the giants. They will stall you if you run up against them, and fill you full of thorns, from one to three inches long, so sharp they would make the point of a needle look like that of a railroad spike.

In No. 1, the one on the right is the Echo. It is just coming into bloom, which in a few weeks will develop into

ECHO AND SAHUARO CACTUS, YAQUI RIVER VALLEY, MEXICO.

a delicious fruit, inclosed in a burr very much like the chestnut, covered completely with sharp-hooked needles an inch long, to defend the fruit within. These, however, are easily dispensed with by burning them off over hot coals. The fruit resembles strawberries in taste, only intensely sweeter.

The burrs are used by the Indians for combs. One-half of the needles are cut off to make a handle, while the sharp points of the others are clipped off. It is an excellent substitute for both comb and brush.

The one on the left is a Sahuaro. This is also covered with thorns, but of a finer quality and more vicious nature. The black spots you see above on the limbs are the nesting places made by the woodpecker. Abandoned ones are used by martins, and sometimes by parrots.

Number 2 is a Pitahaya. The fruit of this is more easily taken, as the blossom remains on the end and is easy to take hold of.

On this fruit the Yaqui Indians can live without any other food. However, its season is short, six or eight weeks; nevertheless, during this short period they usually go on the warpath, and do much damage by obstructing the mails on stage

MEXICAN CACTUS.

lines, shooting down lonely travelers and sometimes soldiers, when they can get near enough to them, and destroy their own reputation as good citizens as well.

Number 3 is a tarantula. It may look small to you; still, as you see it now, it is covering completely the body of a mouse, which it has killed and is devouring. The small white streak pointing towards the sack of corn leaning on the stick of wood in the background is the mouse's tail, all that is visible. The white spots around and beneath it are grains of corn. These are about the size of the largest spiders of the North, so you can see it would make a

pretty good handful, and not a pleasant one.

Number 4 is another style of Number 1. It looked so much like a telegraph pole that I had to "shoot" it.

Fraternally yours,
JAMES TOWNEND, Div. 208.

The Message of Peace.

Bid the din of battle cease,
Folded be the wings of fire;
Let your courage conquer Peace,
Every gentle heart's desire.

Let the crimson flood retreat,
Blended in the arc of love;
Let the flags of nations meet;
Bind the raven, loose the dove.

At the altar that we raise,
King and Kaiser may bow down;
Warrior knights above their bays
Wear the sacred olive crown.

Blinding passion is subdued;
Men discern their common birth;
God hath made of kindred blood
All the peoples of the earth.

High and holy are the gifts
He has lavished on the race:
Hope that quickens, prayer that lifts,
Honor's meed and beauty's grace.

As in Heaven's bright face we look,
Let our kindling souls expand,
Let us pledge, on Nature's book,
Heart to heart, and hand to hand.

For the glory that we saw
In the battle flag unfurled,
Let us read Christ's better law,
Fellowship for all the world.

—Julia Ward Howe.

An Insurance Comedy.

There was a heated discussion going on in one of the Equality Life Insurance rooms, London. On presenting his claim for the twenty thousand pounds for which the life of his late

wife had been insured, what answer do you suppose Jack Dunstan received?

Perhaps, first, you had better be told something about Jack Dunstan. Three years ago, to the astonishment of all his fashionable friends, he had thrown up his commission in the Guards and sold his handsome person to a Scotch heiress of extraordinary wealth and hideousness. Perhaps the one lie of Jack's life was the one uttered at the altar. In his favor be it urged that it was uttered to save his father from ruin and disgrace, and that to the day of her death, Jack was a devoted husband to his unloved bride. Dunstan, senior, managed — or mismanaged — the

TARANTULA.

property of the married pair. All but the parties most interested saw that the old man's mind was totally unhinged; but Jack, ignorant as a child in business matters, firmly believed his father to be the sharpest, shrewdest man alive. And whatever Jack wished was right in his wife's eyes. Among other things, he had insured his daughter-in-law's life, Jack and she going through the necessary forms, as he bade them. In the course of time Mrs. Dunstan died, and Jack claimed the insurance. Said the polite officer of the company, after hearing him out:

"We prefer to give you another wife rather than pay the amount."

Dunstan told him, rather stiffly, that was not a subject to be joked upon.

"I am perfectly serious, Mr. Dunstan. Just cast your eyes over this policy. You will see that it gives us the option of replacing the loss." He paused for Jack to read the policy, and pursued, triumphantly: "Which is exactly what we purpose to do. We think it will be cheaper for us, and, ah—may I say—pleasing to you?"

"No, you may not!" snapped Jack. Then, I regret to say, he swore. "D—n it, do you mean to say that after receiving twenty thousand pounds, all you are bound to do in return is to offer me the first woman you pick up?"

"Oh, my dear sir," deprecatingly, "we should not think of presenting any but a young lady of good birth and reputation."

"You are very kind," savagely.

"It was an unusual method of insuring, I admit, but the amount in question was so large and everything else so satisfactory, and Mr. Dunstan, senior, so determined, that we concluded to yield to his whim. Pray, be calm, sir!"

But Jack could not be calm. When it was made clear to him that this was no practical joke, his anger knew no bounds. To appeal to the law was the last of his threats. It was, however, the only one

which could be answered. The polite gentleman pointed out to him that he could not deny his own signature, nor his father's, nor his wife's.

"And no one can blame us, for we wrote you full information—"

"My father attended to all correspondence."

"Our letter remaining unanswered, we sent a confidential clerk, instructed to find out whether these extraordinary terms were your ultimatum. You would not even see him. You referred him to Mr. Dunstan, senior."

It was too true. Jack was confounded. "Nevertheless," he said, doggedly, "I do not believe it would stand in law. I should like to see the president of the company about it, sir."

The polite gentleman believed the president was engaged, but would inquire.

Left alone, Jack paced the room, men-

MEXICAN CACTUS.

tally confounding his carelessness in intrusting such matters to his father's failing mind. So absorbed was he in his gloomy thoughts that he did not notice the door slowly open and the charming head of a young girl peep into the room. It was one of those delicious, babyish faces that seems made for love and laughter, with the bluest eyes man ever saw, and soft, red lips, that curved in a mischievous smile.

But when Dunstan suddenly turned, the smile fled. The long lashes fell demurely, and in the gentlest voice imaginable, she "feared she must have entered the wrong room."

"Can I be of any service?" he asked.

"You are not Mr. Dunstan, are you?" timidly.

"I am," said Jack, feeling ready to deny his identity if it displeased her.

"If you are," pursued his fair visitor, quite calmly, "I am the person chosen to replace your wife."

"There is no necessity for replacing her," briefly.

"Must marriage always be a matter of necessity?" saucily.

Then she was aghast, for she saw that she had wounded a proud man to the quick.

Dunstan grew pale, and began in a quick, harsh tone:

"If marriage was once a matter of necessity with me—"

"Oh! oh! I did not know—how could I? Pray, pray forgive me," she begged, with tears of real distress in her pretty eyes. "Oh, do not explain!" But Jack would explain. And somehow her sweet sympathy led him on from one confession to another. He sketched his early life of gay luxury—that of a wealthy and popular man about town; the crisis in his father's affairs; the old man on the verge of ruin—and of insanity, for losses affected his reason—distractedly imploring his son's assistance. "And, God knows, I could help him," said Dunstan, sadly. "I could speak three languages. I could ride and shoot. I could hold my own at billiards and polo, but I knew nothing of business, and I was up to my ears in debt, and so—"

And so—Jack had married a woman some twelve years his senior, whose infatuation for him was an open secret, and her money had paid his debts—wound up his father's business honorably.

"I tried to do my duty to her," added Jack, simply, "and she was fonder of me than I deserved. But she knew, and everyone knew, that I married her for her money, poor thing."

"If she loved you, and you were kind to her, I do not see that she was so much to be pitied," said his fair companion, earnestly.

Then Dunstan took her hand, gratefully. The young lady blushed. He kissed it. She blushed deeper.

"Will you not tell me," he asked, gently, "how you ever came in such a position as this?"

Oh! for some probable and touching excuse! But it is hard for a girl to collect her thoughts when a handsome and interesting man persists in holding her hand and looking into her face, particularly if she is not used to lying.

"I am curious, I admit. Besides, I should like to help you if you will allow me. Can you not confide in me?" he urged.

At her wit's end, she broke out, confusedly:

"Left a widow at an early age—"

"A widow? you!"

"Certainly. Why not?" defiantly, "with six small children and—and—oh!—and an aged mother dependent on me. I was ready to fall into the company's plans. Of course they pay me, and if—if—I had suited you, my future would have been assured. But, believe me, now that I know of your early sacrifice, I will be no party to forcing you into a second loveless marriage."

Dunstan had preserved an amused and incredulous silence; but to her last words, which seemed "those of truth and soberness," he answered, softly:

"Will you not?"

"Do not think so poorly of me. Besides, if you went to law about it, I am sure you would win your suit."

"I shall not go to law about it," he said, slowly. "I am thinking of accepting the company's terms."

"Will you authorize me to tell the president so?" eagerly.

"If you are satisfied as far as you are personally concerned."

"I am not personally concerned at all."

"What!"

"Surely you remember that you distinctly refused me. Please move from the door, Mr. Dunstan; I wish to go out."

"Not until you explain this comedy you have been playing."

There was a pause.

"Well," hesitatingly, "if I *must* confess, the president of this company is my father. I was in his private office when your affair was discussed. I wagered a gold bangle that I would get you to agree to his terms. Now, you are angry—I wish I had not told you! Oh, don't stare at me so, you make me nervous. I did not think you would take it like this. *Do* speak to me! I only did it for a joke. You must admit the situation was funny." She laughed to think of it, and then there came a little sob in her voice.

"But I would not have hurt your feelings for anything."

"You have done worse than that," said Dunstan, speaking at last.

"Bah! you are not in love with me?"

"I am not so sure of that. Ah, why did you let me think you might be my wife?"

The young lady stood with downcast eyes, flushing and paling.

"If I have done wrong," she faltered.

"You will try to repair it, will you not? You will give me a chance of winning you—unless, indeed, you are engaged, or feel sure you can never like me."

"I am not engaged," she faltered, "and I do like you—so far. And if you wish to

A Child Fancy.

When the day is nearly over, and the shadows are all gray,

There's a place in father's garden, where I dearly love to stay.

For I'm tired of all my lessons, and I'm weary of my play.

When the day is nearly over, and the shadows are all gray.

There's a motherly old willow growing close against the wall.

And I climb up in her branches and I know I cannot fall,

For she rocks me very softly, in her gentle, loving way.

When the day is nearly over, and the shadows are all gray.

try"—slipping her satin-smooth fingers into his. "No! you may not kiss me. Wait till we are really engaged."

"I could not possibly wait!" cried Jack.

"Ah! somebody is coming in!"

Somebody came in—a fine-looking, elderly gentleman. He said:

"I think I should apologize for this madcap's freak, Mr. Dunstan. She twists me round her little finger or I never should have allowed—Bless me! Madge, what does this mean?"

"It means," said Miss Madge, blushing like a rose, "that you owe me a gold bangle, papa."—*Frank Leslie's Illustrated Newspaper.*

Softly to her leaves and branches come the breezes of the night,

And they sing me songs of dreamland, in the dim and restful light;

"Sleep and slumber, sleep and slumber, little child," they seem to say.

"For the day is nearly over, and the shadows are all gray." —*Youth's Companion.*

Miss Beecher's Journey.

AN EXCITING STORY OF A CHICAGO GIRL'S TRIP TO THE MAINE WOODS.

Miss Maud Beecher was a Chicago girl. She came to Boston on a visit to her cousin, Miss Teresa Holland, a girl with a fad,

and that fad was old historic houses, of which Miss Teresa had made a large number of photographs. If Miss Beecher had a fad, it was the adornment of her own stylish person, especially with jewels, of which she had a rare collection.

The two cousins did not find themselves very congenial, and Maud soon tired of wheeling through the historic parts of Massachusetts in search of the most tumble-down houses there. She got on better with Tom Holland, and often begged him to take her wheeling with the other "fellows." Tom was seventeen, and he found his cousin very amusing.

At last Tom and the other fellows went to the Maine woods for a hunting trip, Mrs. Holland and the younger children left for their seaside home, and Maud and Teresa were left alone in the great city house. Teresa had almost finished an article on "historic houses," and Maud generously offered to remain with her till it was completed.

She repeated her rash offer as the hot summer days came on, but Teresa protested that it was cooler in the library of the big city house than on the piazza of the beach house, where the glaring sand reflected in one's face, or in the Maine woods, where mosquitoes and black-flies made life miserable.

Maud curled up in a big leather chair and read till her head ached, then she spent long hours doing her hair different ways, and trying on different costumes, to see if one might not be a trifle cooler than the others.

When Teresa announced that she had decided to write an article on photographic art studies before going away Maud walked out of the room without a word.

Teresa was surprised an hour later when Maud appeared with her traveling bag in her hand. She wore a covert cloth skirt and a silk shirt-waist. She had fastened a costly diamond pin in her hair, and another in her breast, to hold in her watch with its jeweled pendant. On her fingers were many rare gems.

"Well," exclaimed Teresa. "where now?"

"To the Maine woods to see Tom," Maud replied gayly. Teresa dropped her pen in dismay.

"Going to see Tom," she ejaculated, "and wearing all those jewels! Really, Maud, I shall have to telegraph mamma if you insist on this wild prank. Come, I will give up this article and go with you to the beach if you wish. I thought you were quite contented."

"No, Teresa, I will not let you sacrifice your precious article. I am quite determined to go fishing with the boys. Don't be a goose, Teresa, let me go. Mrs. Burridge is up there cooking for the boys. I

shall be chaperoned all right. It's no worse than wheeling with them all over Massachusetts."

Teresa gave it up and went back to her article after remarking that at least Maud ought to have sense enough to take off her jewelry if she didn't want to get robbed.

Maud protested that it was safer on her person than anywhere else, and that she had a chamois bag around her neck with all her stones in it. Then she started off down the street and Teresa soon forgot all about her, remaining absorbed in her work till the dinner bell rang. Then she remembered with a pang that her cousin had done a very uncircumspect thing, and felt bound to write Mrs. Holland about it.

Maud enjoyed her journey immensely, and was not at all alarmed to find she must spend the night in Portland, and leave at an unseasonable hour in the morning. She accomplished all her arrangements without difficulty, and was treated with respectful courtesy by all the railroad and hotel officials.

As the train bowled along northward in the early morning, she was congratulating herself and thinking with scorn of timid young maidens who never traveled alone, when she became conscious of a pair of eyes riveted on her face. Wheeling in her chair she encountered them. They were gray, unpleasant eyes, and they did not drop before hers, but their owner smiled boldly.

She turned quickly away and buried herself in a newspaper. The eyes still followed her, and she ventured to turn towards them again, and pretended to fall asleep, thus gaining an opportunity to study the offender through half shut eyes. He was a well dressed man, though Maud's mental comment was that he was "cheap."

"Probably wants to flirt," she thought angrily. "Well, I'm not that kind," and she involuntarily tossed her head again. Again the man smiled.

Just then an older man with a smooth, hard face joined him, and both began to talk earnestly, frequently glancing across at Maud as though she were the subject of their talk. At last she could endure it no longer and beckoned to the conductor.

"Those men," pointing directly to them, "are annoying me very much by their boldness."

"I am very sorry," returned the polite conductor. "I will see that it does not happen again." And he moved toward the young man.

The elder man rose as the conductor crossed the car and engaged him in a conversation, which Maud could not hear, but the conductor glanced back at her several times, and she knew there was

some mystery. She would have shrieked aloud could she have heard what the cool stranger was saying about her.

"The young lady is my sister," he said, "and this young man's sister. She has been insane for some months, though quite harmless and quiet. At last her mind became so deranged that we decided to take her to a quiet little camp in the woods. Her mother is there already waiting for her. She likes to fancy herself traveling alone, so we humored her by getting seats over here and letting her pay for her seat. It is one of her fancies to pretend not to know us. Her brother has smiled at her several times, hoping to get some sign of recognition. Poor fellow! He is very fond of her. I suppose we ought to have told you when we got on, but we hoped she would take the journey quietly. I assure you we will get off if she is troublesome," and he sighed deeply.

"Sad case!" murmured the conductor, and moved away.

Dr. Herman Aldrich was in the smoker at the time of the above interview, but when the conductor came through he stopped sociably and told him of the case. Dr. Aldrich was a warm friend of the Hollands, but had never met Teresa's cousin Maud. Had he dreamed who she was his interest would have been more than professional. As it was, he hurried his cigar and went back to his seat, which was next Maud's. He looked long at the girl's regular profile, and at last she turned her clear eyes full upon him.

In some way, known best by the man who professed to be her uncle, nearly all the people in the car had become acquainted with the story of the insane lady, and wherever she turned she met curious or pitying glances. She grew more and more nervous, and at last her composure gave way. Rising, she was about to pass down the car to the ladies' room, where she could be free from these annoyances, and think what was best to be done.

She had taken only a step or two when the elder man was by her side. He laid his hand firmly on her arm.

"Mattie," he said, "you had better sit right down."

At that moment there is no doubt but what Maud Beecher acted insane. She tore herself away from the man, and

commanded him to let her pass. She swore her name was not Mattie, and glaring wildly round the car, besought them all to save her from these wretches. She begged to know if an American lady could not travel alone without being attacked by ruffians.

"Will nobody help me?" she cried, and looking about saw everyone gazing pityingly at her, but not one started to her assistance. One woman fainted, another had hysterics, and the little conductor bustled up officiously, and said quite loud enough for Maud to hear: "She seems to be getting violent. We are near Green Pond station, and I think you will have to get off here."

"What!" she cried, "do you think I am crazy? Oh, my God!" And sinking into her chair, she buried her face in her hands.

BRO. S. L. SMITHER, DIV. 495, AND ONE OF THREE BUCKS, WEIGHING 325 POUNDS, RECENTLY KILLED BY HIM.—COURTESY BRO. H. J. M'GRADE.

As the train slowed up the two men took her by the arm, and commenced dragging her down the aisle. She fought them inch by inch, but they were strong men, and she a slight girl of twenty; so they had her at the door when the train stopped. Suddenly her face brightened.

"Oh, there's Tom Holland—Tom! Tom!" she cried, struggling with renewed energy. At that Dr. Aldrich's athletic form blocked the stairway. "If you know Tom Holland," he said, "I demand of these gentlemen proof that they have any right to coerce you in this way."

Before he reached the end of his sentence, he and the young girl occupied the platform alone. Both men took to their

heels, and have not been heard of since. The young lady swayed forward, and would have fallen but for the doctor's strong arm. He lifted her down from the train, and looked about for Tom Holland, who had been on the platform three minutes before.

The doctor had seen him at the same instant Maud had cried out to him, and seizing his grip, had made a rush for the door. He, too, was on the way to Tom's camping place, and decided, on seeing him, that Tom had driven down to Green Pond to intercept him. Here was the doctor with an unconscious lady in his arms, and no one in sight. His professional training made him quite equal to the occasion, but nevertheless it was awkward, and he swore softly under his breath as he carried Maud's limp form into the little station house.

The station master brought him a mug with some whisky in it, and he succeeded in bringing Maud back to consciousness. She sat up crying and looking wildly about her. Finding her dress loosened at her throat, she clutched wildly at her jewels, and finding all safe she looked in the faces of the doctor and station master.

"Who are you?" she cried. "You are not the ones who carried me off."

Then she called for Tom repeatedly, and sobbed out that if she had taken Teresa's advice she would never have come to this.

The doctor tried to reassure her, but she would not be comforted. So he sent the station master to find someone who was willing to drive them to Tom's camp.

The doctor was far from comfortable. No doubt this girl knew the Hollands, but she might be crazy, nevertheless. Her actions were suspicious enough. Perhaps Tom Holland would not thank him for bringing this girl to the camp.

Two hours later the question was settled for him. They overtook Tom driving in, and surprised him greatly. He had never received the doctor's letter saying he was coming, and of course Maud's advent was a surprise. Explanations passed on both sides, and Maud's shaken nerves began to quiet down. Mrs. Burridge put her to bed as soon as they reached the camp, and the doctor sent up a dose of bromide.

Two days later Miss Teresa Holland arrived. Her mother's advice had been, "Go up to camp and look after Maud yourself." Teresa found Maud very well taken care of when she arrived. She was swinging in Tom's hammock, while Dr. Aldrich read aloud.

The girls stayed two weeks and brought a new and happy change into camp. Teresa finding plenty to admire in old trees and rocks, developed into a very pleasant companion, and she could out-tramp any of them.

Maud was a good deal changed by her unhappy experience. She started quickly if any unexpected sound was heard, and she never went out of sight of some of the campers. This being her condition, Dr. Aldrich found it necessary to look after her very carefully.

One night, near the end of their stay, Maud and the doctor were strolling on the shore not far from the cabin, and both were strangely silent. Finally Maud spoke in a low and intense voice:

"Supposing, doctor, you hadn't been there? Tom never would have heard me. He wasn't watching the train at all."

It was the first time he had let her talk of her fright, for it agitated her.

"I was thinking of another supposition," he said. "Supposing you should go back to Chicago, as you have planned to do next month, what a blank you would leave behind you! Then, again, suppose you should let me join you there in the fall, and suppose you should come back with me and let me take care of you always. I love you, Maud," he finished simply.

"Well," she answered, "supposing I should."—*Cleveland Leader*.

Spring Fever.

When Dame Nature gets spring fever,
Then Dame Nature gets to work,
And that bird or bud would grieve her
That would e'er its duty shirk.
So she goes abroad and hustles,
Clothes the trees, makes birds to sing;
Aye, she strenuously tussles
With her fever in the spring.

When a woman gets spring fever,
She will take the carpets up,
Hubby dams like any beaver;
On the porch he has to sup.
When the carpets say, "Come, tack me!"
Then he swears like anything,
For he knows he's reached the acme
Of her fever in the spring.

When a fellow has spring fever,
Love to nature he will make;
In his heart he will receive her,
And the woman gets the shake.
With the daffodil and daisy
He'd fain loaf a while and sing,
For it makes him very lazy,
Does the fever in the spring.

—*Pittsburg Dispatch*.

Saved From Herself.

"Can I trust you, Maudie?"

"Trust me—in what way, Gerald? I am afraid I have not been paying much attention to all that you were saying."

She turned her beautiful flower-like face toward him with a mooking move, her blue eyes sparkling under their dark

lashes with a mischievous light in their depths, and with a coquettish lifting of the finely-marked eyebrows which distracted and unnerved him from the task he had set himself. Would she ever be serious—ever see that life held deeper interest than the whims and amusements of the passing hour?

His wife—this bewitching, lovely, irresponsible being! He went over to where she was lying in a long chair in the shadiest, coolest corner of the veranda, and taking her two slim, white hands in his strong, brown ones, he knelt beside her and said: "Maudie, I have to leave you here with Mrs. Tallyour, and I want to feel sure that you will be prudent and do nothing foolish or unsuited to your station as my wife, for afterward you would be sorry or ashamed—"

"Gerald!" she interrupted, with petulant indignation.

"Yes, darling, I must speak plainly. You remember last winter—it was unintentional on your part, I know—but still, how unhappy you were made by all the wretched talk and gossip that followed."

"That was three months ago, Gerald. I am older now, and more experienced. I am sure you need not remind me of that miserable affair—it is unkind of you."

She withdrew her hands from his clasp with a reproachful gesture and added, pouting:

"After all, it is not my fault that I am pretty, and I cannot help it if your friends will admire me and pay me attention!"

"But you will be careful, my darling; promise me—this fellow Perceval—"

"Oh! now you are going to abuse Lord Perceval again, I suppose; I am so tired of that topic; I shall not listen to a word against him, Gerald; I have known him all my life; he is my oldest and greatest friend, and I do not intend to give him up for any one; no, not for any one, not even for you, Gerald—so there!"

She sprang to her feet and walked quickly to the edge of the veranda, where she leaned over the balustrade with her head averted from him in an attitude of mutinous defiance. So small and child-like a creature, and yet possessed of such potentialities to wound and hurt the man who loved her with all the passionate intensity of his strong and sensitive nature. Such a slim, fragile-looking being, and yet so powerful in wielding an influence over the hearts of those around her.

A look of helpless and baffled anxiety passed over Major Jocelyn's handsome, careworn face. Without glancing at him his wife continued coldly: "I consider it very ungenerous of you to attack Lord Perceval in the way you have done lately, hinting at things against him, throwing out insinuations as to his character, but with nothing really definite that you can state against him. You know I like him, that he is my friend. I call it mean of you, Gerald, positively mean."

"There are plenty of things I could state against him if I felt so inclined, but there is no need to particularize. It ought to be enough for you that I tell you that I distrust and dislike the man. Lord Perceval has brought a slur on the names of too many women for any honest man to care for his wife to call him friend."

He spoke with angry emphasis, and afterward there was an ominous silence between them for some moments. It was

CHOCTAW, OKLAHOMA & GULF ROUNDHOUSE, NORTH LITTLE ROCK, ARK.—O. C. MOORE, 554. PHOTO.

at last broken by the girl saying with passionate reproach:

"Oh, it is cruel of you, Gerald, to speak to me like this, to want to quarrel with me in these our last moments together; to leave me with angry words upon your lips, making me so unhappy." Her voice trembled and broke, and her hands went up to cover the tear-laden eyes. In a moment he was at her side, all the severity had vanished from his face, and with his arms around her he was murmuring in pleading accents the words of penitence and love which made his peace for him before he left her.

A week had passed since Gerald Jocelyn had bidden farewell to his young wife and started on his journey through the desert to join the troops in advance. The still, blue heat of an Egyptian day brooded over the quiet villa, which from its lack of sign or sound of life seemed to be

prolonging its midday siesta into the evening hours. The clatter of hoofs outside aroused the attention of the solitary inhabitant of the veranda, a middle-aged woman, whose strongly marked features and keen dark eyes proclaimed her a person of intelligence and decided character. She threw aside the book she was reading, and advanced toward the flight of steps where the rider, an artillery officer, was already dismounting from his horse. As he caught sight of her the dark cloud of sorrowful anxiety which hung over his countenance was visibly lightened.

"Ah, Mrs. Tailyour, I am indeed thankful to see you! You are the very person who can help me," he cried.

"Anything wrong, Captain Ferguson?" she asked, eagerly, as he joined her in the shade. Then taking in the details of his horse's heaving sides and his own heated and worn appearance, she added with increased apprehension, "You have ridden fast—no bad news, I trust."

"Yes, very bad news; the worst, as far as I am concerned! Poor Jocelyn—my greatest friend, as you know—such a good sort he was. I never was so cut up about anything in my whole life."

He sank beside her on a seat with an air of dejected melancholy, and passed his hand wearily across his brow.

"Has there been a skirmish already?" Mrs. Tailyour asked, breathlessly. "I did not know any fighting was expected yet; the colonel reported all quiet in his last; is poor Major Jocelyn wounded?"

"He is dead, poor fellow! There has been no fighting; it was an accident—with one of the guns, I imagine, but the telegram only said: 'Accident, Jocelyn killed; meet train tonight.' That is all I know."

"Good God!" Mrs. Tailyour exclaimed. "Gerald Jocelyn killed! How shocking! I am terribly grieved. His poor young wife! only married six months!" The tears rose in her eyes as she spoke.

"Yes, his wife," Captain Ferguson answered, anxiously. "I rode out at once hoping to find you here and that you would kindly break the news to Mrs. Jocelyn and relieve me of the painful responsibility. I have not the courage to do it, though I don't suppose she will feel it much."

He spoke with some bitterness, and Mrs. Tailyour answered him quickly:

"You misunderstand her—indeed you do, Captain Ferguson. Poor child! Poor pretty child! She is but a child after all. The shock will be enough to kill her; a thoughtless, frivolous creature she may be, but I believe her love for Gerald is genuine and far deeper than any one suspected, deeper even than she herself is aware."

"She has a curious way of showing it, then, I must confess," Captain Ferguson replied with acerbity. "I never liked her, you know that, Mrs. Tailyour. A brainless, selfish coquette, without a spark of real feeling for any one but herself. I am sure I pitied poor Jocelyn for the life she led him last winter in Cairo, flirting with every man she met! And then that poor fellow Cummings shooting himself; that was a horrid business. However, this will sober her if anything will. Where is she now?"

"She is out riding with Lord Perceval; they started soon after breakfast and may return at any moment."

"That fellow Perceval! Brute! I wonder Jocelyn did not put his foot down there." Captain Ferguson frowned and relapsed into gloomy silence.

"See that little cloud of dust. That is their party, no doubt."

Mrs. Tailyour pointed to the distant, undulating line in the desert. "I dread this business! Poor little soul, she is not of the stuff for bearing trouble well. God knows how she may take it."

Some few minutes later the little cavalcade rode up, laughing and joking, to the villa, all unconscious of the two people who awaited its arrival in sorrowful silence, dreading the moment when their sad intelligence must be made known. Maud Jocelyn sprang from her horse and ran lightly up the steps toward them with a laugh on her lips—then something in the strange expression of the two faces that confronted her froze the words of merry greeting on her tongue.

"Oh, my dear! My dear!" Mrs. Tailyour said, pitifully, taking her by the hand and drawing her away.

"Oh, what is it, Mrs. Tailyour—what has happened? Gerald—is he ill? Tell me quickly. You have heard bad news," Maud stammered, in terrified accents.

"Yes, dear child, there is bad news—be brave!" and the older woman led the girl quickly away to her own room.

There, later, a voice wailed forth in anguish, "Gerald, my love! Gerald! Oh, I cannot bear it—it is not true! Dead. My dear love! Dead. Gerald, husband! Lying dead while I rode laughing and jesting across the desert!"

Then the thought of their last words together flashed across her mind; she seemed to see again the proud, handsome face, and hear again that pleading, earnest voice, "Can I trust you, Maud? Promise me."

And she had spurned his warning; had refused his last request, and set her whims in defiance of his feelings and wishes. As she rode by the side of Lord Perceval that day on the banks of the canal she had listened with pleased vanity to his whis-

pered words of admiration; words which conveyed to her mind the roue's worship of her beauty, and at the same time insisted that such beauty was wasted on the grave and serious-minded soldier, who was engrossed, heart and soul, in his profession. She had listened without protest to Lord Perceval's thinly-veiled sneers at her absent husband; she had been disloyal; a traitress in her passivity; false in word, if not in deed, to the brave and tender heart which beat with such true and passionate love for her.

That evening, outside the railway station, a detachment of soldiers awaited the train which was conveying to them the body of their dead officer and comrade, whom they had all respected and admired. Close by, the gun carriage was standing, on which Gerald Jocelyn was to make his last journey to the cemetery on the hillside a mile away, and at a few yards' distance a closed carriage was drawn up, in which sat Mrs. Tailyour, holding in mute sympathy the hand of the girl widow, who, white and tearless, leaned back beside her, immovable in calm despair. She had scarcely spoken since she recovered from the deep swoon into which she had fallen after hearing of her husband's death.

Captain Ferguson was standing near the carriage, and whispered to Mrs. Tailyour that the train was signaled; then he withdrew from her sight inside the station. Puffing and panting, the train swept in; there was a strange silence for a few seconds, followed by a muffled murmur of voices, the soldiers bent forward eagerly, and a message was passed down their line from one to another, accompanied by looks of amazed surprise. Mrs. Tailyour pressed her companion's hand tighter, the terrible moment had arrived; how would the girl face it? Was it possible that she possessed sufficient strength of mind and body for the horrible ordeal which she had set herself?

Then Mrs. Tailyour saw Captain Ferguson emerge from the station with a dazed look of consternation on his face, the result evidently of great and overpowering emotion.

He came hurriedly toward them, making signs to Mrs. Tailyour, which she failed to understand.

"Has it not come?" she whispered to him, as he approached.

"There has been a mistake," he murmured in reply; and Maud—though apparently unaware of what was passing around her—caught the words; her face woke to animation; she leaned forward, crying:

"A mistake! He has not come! Oh, tell me quickly, I can bear it, he is not dead, he is alive—I see it on your face!

For pity's sake, don't keep me in suspense—let me out—I must go to him!"

She was struggling to open the door when some one put Captain Ferguson quietly aside, and then, with a loud cry, Maud sprang past Mrs. Tailyour, and fell sobbing on her husband's breast.

Yes! there had been a mistake. Gerald was alive, though not uninjured, for he carried one arm in a sling, and a bandage round his head accentuated the startling pallor of his face.

Two words omitted in the telegram that day explained the mystery of his resurrection. "Accident, Jocelyn wounded, gunner killed," altered the whole meaning of the message. Private Brown, R. A., had the honors accorded to him which had been prepared for Major Jocelyn's funeral, and Gerald drove back to the villa with Mrs. Tailyour and his unconscious wife. Joy never kills, they say.

TOOK HIM HOME TO DINE.

but Maud approached very nearly to the shadow of the great unknown. She came back from the borderland of eternity, no longer a laughing, thoughtless child, but a woman in mind and feeling. The shock of a great sorrow, followed by a great and overwhelming joy, had awakened her sleeping soul, and brought to maturity the deeper and finer traits of character which she possessed, but which, hitherto untouched by the molding hand of sorrow, had lain quiescent in her and unknown.

Captain Ferguson averred that he had faced the horrors of war and endured many terrible experiences, but at no time in his life had he come so near utterly losing his presence of mind as in that moment when his dear friend, Gerald Jocelyn, stepped from the train and laid a hand upon his arm.—*St. Paul's.*

"Saying Grace."

"Come, come, mamma, to the window!
Cried Freddie, with eager face;
"Just look at my little biddies—
They are drinking and saying grace."

I quickly came at his bidding,
And saw a pretty sight;
Six downy little chickens
Drinking with all their might.

And as they sipped the water,
They craned their necks on high,
As if their thanks were lifted
To the beautiful blue sky.

And so I could not wonder,
So wrapt was his eager face,
That to him the little chickens
Were "drinking and saying grace."

A Story of the Tide.

BY F. A. MITCHELL.

"Where have you been this summer?"
asked one clubman of another.

"Nova Scotia. I have always heard of
the great tide in the Bay of Fundy and
had a desire to see it. I have had all the
experience of that wonderful sixty-foot
rise I want. I have no desire to see it
again."

"Why not?"

"Because I don't want to be reminded
that I have been a fool."

"I always like to hear fools tell of their
folly."

"I joined a party comprising Mr. and
Mrs. Underwood, Tom Underwood, their
son, and Maud Underwood, their daugh-
ter. We—"

"Did you go on account of the tide or
Miss Underwood?"

"No interruptions, please, if you want
to hear the story. We reached one of
those little Canuck seacoast towns early
in the morning, and after breakfast Miss
Underwood and I thought we would take
a stroll. We had come to the seashore,
and as there was no sea to be seen we
concluded to go and find it. There were
flats enough, and they were covered with
shells and seaweed, but no water. We
sauntered along until we met a man,
whom we asked which way was the bay,
then passed on in the direction he pointed.
He called to us:

"You're not going there?"

"Certainly. Why not?"

"It's a little late in the day."

"Late in the day? Why, man, it's
not 10 in the morning."

"But the tide will be coming in soon."

"That's exactly what we want to see."

"The man looked at me with a puzzled

expression, then turned and went his way.
Miss Underwood wondered what he could
mean, and we walked on. Later, I stopped
to examine some seaweed, and in facing
the direction from which we had come I
saw that the man was looking back at us.

"That fellow seems to be mightily in-
terested in us," I remarked, peevishly.

"They talk about Yankees being curi-
ous," observed Miss Underwood. "They're
nothing to these Canadians."

"We rambled on, sniffing the delicious
air one gets on a salt water coast, making
a collection of shells and seaweed, but not
getting a sight of the sea. We must have
gone a mile and a half from the hotel over
the damp red sediment left by overflow-
ing water when we heard a sound like
distant thunder.

"Is it going to storm?" asked my com-
panion.

"Not a cloud to be seen," I replied,
sweeping the sky with my eyes.

"There were some cattle back of us,
and we noticed that they all turned and
traveled inland, some of the smaller ones
hastening their speed as they proceeded
till their gait reached a gallop.

"I wonder why that wagon is coming
so furiously," remarked Miss Underwood.

"I don't see anything to come for," I
replied. "Nothing here but shells and
seaweed."

"The wagon came on, making a bee-
line for us. We stood watching the driver
lash his horses while a man sat beside
him who seemed to be beckoning us.

"Why, it's the man who was so inter-
ested in us!" exclaimed Miss Underwood.

"So it is. I wonder if he is coming to
invite us to his house," I replied, making
an effort to be facetious.

"Something must be the matter."

"Presently the team, drawing a four-
seated wagon, swung around beside us and
stopped. Our interested friend jumped
out, opened the door and told us to get in.

"What's the hurry?" I asked, standing
stock still.

"Hurry, you stupid ass! The tide's
coming!"

"I cast a glance seaward and saw a
great white wall of tumbling water mov-
ing like a twenty-thousand-dollar auto-
mobile. I seized Miss Underwood, lifted
her bodily into the carriage and rolled in
after her, and with my legs still sticking
out of the door the horses started shore-
ward. The driver lashed his horses and
shouted at them, while now and again I
cast a glance behind, and even now I
want to put my hands before my eyes to
shut out that horrible pursuing monster.
Miss Underwood looked back once, but
never again—"

"She clung to you pretty close, didn't
she?" suggested the listener.

"That's nothing to do with the story," replied the narrator. "Yes; it has, too," he added, with a sudden burst of confidence. "She was so terrified that she didn't know what she was doing, and, throwing her arms about my neck, she nearly choked me. Well, by this time the roar behind us was so near that I expected any minute to feel the cold water beating against my back. The driver was making for a rise in the ground, and it was neck and neck between us and the surf which should reach it first. The driver swore, the man beside him sat with folded arms and the corners of his mouth drawn down, while I was endeavoring to calm Miss Underwood. We reached the rise just as the outer layer of foam was tossed against it."

"Did Miss Underwood faint?"

"No; she sobbed."

"On your shoulder, of course."

"The man who had come for us had supposed on meeting us that we knew all about the tide. Fortunately, just as they gave us up for lost, the wagon came by, and he took possession of it."

"I suppose you said to Miss Underwood: 'Like should mate with like. Two fools would be a good match.'"

"How did you know that? It's exactly what I did say. Singular that you should have struck the identical words."

Setting a Lawyer Down.

Not long ago a prominent contributor to the columns of the Philadelphia newspapers was a witness in a trivial case in court and was being harried by a bump-tious county lawyer, who asked:

"So you are a writer, are you? Well, sir, with what great paper or magazine are you connected?"

"With none," was the modest reply.

"Then why do you call yourself a writer? What do you write—novels, scientific works, histories or what?"

"I write anything and everything that occurs to me as likely to be worth reading or to sell, whether it is worth reading or not."

"Well, then, for whom or for what do you write? You say you are not connected with any paper or magazine."

"Yes, sir. I so stated. I am an unattached writer for the general market."

"Just so. You write anything that occurs to you. Well, now, do you ever write up the proceedings of courts?"

"I have done so occasionally."

"Can you state to the judge and jury what particular kind of a court proceeding you would deem worthy of your pen?"

"Yes. If I saw a young lawyer treat-

ing a respectable witness in a very rude and disrespectful manner and making an ass of himself generally I should think that possibly worth writing up."

The court and jury smiled audibly. The judge took the witness in hand for a moment.

"How much do you think a scene like this, for instance, ought to bring if it were well written up?"

"It would depend upon the actors. If the lawyer were a person of any note or character possibly five or ten dollars."

"What would you expect to receive should you write the facts of this particular instance?"

"About 75 cents, your honor."

Counsel for the defense had no more questions to ask.—*Exchange.*

Trick Shot Just in Time.

"It was about twenty years ago—in the autumn of 1879, to be exact—that a thoughtless act of kindness on my part brought some important results for my welfare," said F. L. Stafford, who formerly traveled for a St. Louis firm in the country west of the Missouri river. "I was taking in the small towns in southeastern Kansas, traveling in a buggy from one to the other. Kansas, particularly in the southeastern tiers of counties, was very different then from what it is now. There were no branch railroads to speak of and the state had not got over the setback which the grasshoppers had given it four or five years before. Everybody was poor, without much to live on or do with, and I got more experience of bad trail and crossroads taverns in two years than I would care to repeat in a lifetime. Traveling by buggy alone, as I did, was not so safe, either. It had been only a few years since the Bender family's graveyard yielded up its secrets, and people a great deal better than they, when driven by want, were tempted to take every advantage of a lonely traveler.

"Between Neosho Falls and Kansas City, a region that saw a great deal of guerrilla fighting during the civil war, much of the resulting cussedness of mankind still lingered in spots. Here, driving along one day, I overtook a young man carrying a gun and a string of quail. I expected to stay that night at Jimmen's, a little place ten miles ahead, and had my doubts about the sort of grub and bed I should find there. The thought struck me that quail might help out the fare considerably, so I pulled up and bantered the young fellow to sell me the birds.

"I'll give you half of them for a lift to Jimmen's," he said. 'I walked from Neosho and I'm footsore.' Then he added:

'I want the rest of the birds for my own supper.'

"The young man's appearance bore out his words, for he showed the marks of long traveling. His clothes had been smart once, but were now shabby, and the only up-to-date thing about him was his gun; that was of the latest pattern, well oiled and in perfect order. I looked him in the face and his eyes met mine frankly. It was not the part of wisdom, as a rule, to pick up tramping strangers on the road, and I had an excuse for refusing him in the condition of one of my buggy springs, which was weak and sagged, but his appearance of hard luck touched my pity, and I wanted the quail.

"'Jump in,' I said, 'and sit light on the seat when we come to jolts, for I'd like to have that buggy spring last to Jim-sen's.'

"But the spring didn't last half way there. In a lonely part of the trail, with no house in sight, it snapped as the wheel went into a rut, and we both had to jump out to save being thrown out. I had no idea what to do except to foot it the rest of the way to Jim-sen's, leading the horse, but the young fellow with me had a different notion. Somewhere in his clothes he found a stout piece of cord and a jack-knife; cutting from a roadside sapling a length of wood to serve as a splice, he set to work to mend the spring. He was so self-reliant and handy about the thing that he rose several pegs in my estimation, and as the spring had been sure to break anyway, sooner or later, I began to think it was lucky that I had him along. He got the splice made all right, but he wanted a stone in hammering a wedge to stiffen the spring. I saw at a little distance off a stone that I thought would serve the purpose, and started to get it. With my back to the stranger I was just in the act of stooping to pick up the stone when I heard the report of his gun behind me, as a heavy charge of shot pelted past my head and shoulder, missing me by so small a margin that the wind of the shot flapped my hat brim. Astonished at this evident-ly treacherous attempt to kill me, and expecting a second shot instantly to follow, I turned and saw the stranger standing by the buggy with his smoking gun in his hand.

"'Why did you try to kill me, you scoundrel?' I demanded.

"He laughed at my words and look of dismay, for I spoke excitedly and my hair was lifting my hat on my head.

"'If I hadn't fired as I did you'd be in bad shape now,' he said. 'Look down at your feet.'

"There in the bushes, at my very feet, the body of a big rattlesnake was writhing and twisting, and I didn't think of

anything else until I had put some long steps between me and the serpent. I might have spared myself the trouble, for when I looked again I saw that it was the snake's body only that was threshing round in the undergrowth—the head, taken as cleanly off as a knife could have cut, had gone along with the charge of shot.

"'The rattler was asleep, and didn't sound the alarm till you almost stepped on him,' the young man said. 'Then he lifted his head and rattled at the same time. There was no time to say 'by your leave' before I fired. A half second more and you'd have caught it where doctors couldn't have saved you.'

"He lifted the snake by the tail, and, holding it out at arm's length on a level with his shoulder the headless body touched the ground. Alive, the snake must have measured five and one-half feet. It had lain so near me that by darting half its length it could have struck its fangs into my neck when I stooped to pick up the stone. It was not pleasant to think what might have happened if the gun had not done its work so quickly, and I walked back to the road feeling rather qualmish. The stranger stayed to cut off the rattles before he followed me. I have them now—a string of fourteen, such as rarely is seen—but I never like to look at them.

"The fixing up of the buggy was quickly completed, and the job was so thorough a one that it was fit to travel 100 miles without further repairs. As we rode in to Jim-sen's, my new friend told me that he was a trick shot, who smashed glass balls and clay pigeons at tournaments and on wagers for a business. His last venture had been as a star in a traveling show, which had gone to pieces in Neosho Falls, and there he had been left 'broke' to foot his way back to Kansas City. He proved an agreeable companion, and at Jim-sen's that night he went into the kitchen, won over the women folks by his blarney and was allowed to cook the quail for our supper and breakfast, which he did in the style of a French chef. Of course, after what had happened, I could not do less than pay his way and make him welcome to a seat in my buggy for the rest of the trip to Kansas City.

"We had to go over the worst part of the route next day—the worst in point of roads and in the class of people we were likely to meet along the way—and I was not sorry for company. The train robbing gangs were still at work in Missouri, and liable to be lurking between jobs on either side of the Kansas border, and the Indian territory desperadoes sometimes took a shy at business as far north when things got hot for them in their own country.

As we jogged along, Carson—Leander Carson was the name my friend gave as his, and proved its authenticity by exhibiting to me a show bill, in which he was set forth as the world's champion shot—kept his gun in hand, and bagged a quail or squirrel here and there by the roadside, which gave our journey something the air of a hunting trip. But I made our stops short ones, and pushed the horse all he could stand, not wanting to be caught over night in that bad country.

"Dusk overtook us in the last five-mile stage of the day's journey, and just as the roadside trees and bushes began to look 'pokerish' in the gloom the horse shied, nearly upsetting the buggy, and a man with a black handkerchief tied round the

harder to account for than our getting away from the robbers. We got to our stopping place all right, and said nothing there of what had happened, although the landlord and his hostler 'reckoned' we must have driven right smart to get the horse in such shape, and 'allowed' that the road we had come over was a pretty good one not to linger on if a man's team and wagon gear would stand the racket.

"It was Carson's particular request that nothing be told of our adventure with the bandits so long as we were together, and I respected his wishes. Even with me he was reluctant to talk on the subject, and refused utterly to say whether he thought the men were badly hit—which led me to

AN OUTING OF THE O. R. & N. CO.'S EMPLOYEES.—COURTESY BRO. H. HENSON, DIV. 362.

lower part of his face started from somewhere in the darkness and seized the bridle. In the bushes on the left I saw indistinctly another man and the shine of a rifle barrel covering us. I had just time to realize these things—then Carson, not raising his gun to his shoulder, fired right and left. The rifle went off in the air as the man in the bushes fell backward, the buggy bumped over the man in front and the horse was running away.

"Our danger was not over until I got the horse calmed down. He ran a full mile before I could bring him under control, and over such a road, how we escaped a smashup and broken necks is

think that he knew they were, and, like most men who have acted as principals in such cases, was disposed to let the matter drop from remembrance as soon as possible. Beyond this I have a suspicion that he had his personal and private reasons for not bringing himself to the attention of the authorities, which would be the result if our adventure were reported. Whatever the history of his past doing, Carson certainly played fair with me, and rendered me inestimable service. When he left me at Kansas City it was with a railroad ticket and a 'stake' in his pocket. Since then I have never met or heard of him."—*New York Sun*.

Correspondence.

All contributions to our Correspondence and Technical columns must be in not later than the 10th of the month to insure insertion.

Articles must be written on one side of the paper only. Noms de plume may be used, but every article must be signed with full name and address of the writer to insure insertion.

We shall be glad to receive articles on any subject of general interest to the fraternity.

All communications are subject to revision or rejection, as the Editor may deem proper.

The Editor does not assume responsibility for the opinions expressed by contributors in this department. C. H. SALMONS, Editor and Manager.

A Sign of Spring.

Today I heard a robin ;
His old familiar trill
Right through my heart went bobbin
Tho' cold as winter still ;
He tells me it is over,
And since he went away,
He lived in fields of clover,
And sported every day.

'Twas down in southern valleys,
Where sunshine lingers long,
And every songster rallies,
To fill the vales with song ;
While we are fighting blizzards,
And digging out the trains,
With cold and hungry gizzards,
And almost stagnant brains.

He tells of southern Brothers
In shirt-sleeves on the rails,
While our beloved mothers,
Amid the driving gales,
Would never know the darlings
They danced upon their knees,
Unless 'twas by their snarlings,
And efforts not to freeze.

There is a land of all lands
Beyond this vale of tears,
Where wreaths of choicest garlands
Are waiting engineers,
Who toil with brain and muscle
To keep old mills alive,
Through many a weary tussle
Of ceaseless drudge and drive.

From there no robins wander—
'Tis summer all the time;
Fond hearts ne'er drift asunder,
In that delightful clime.
I heard so from my pastor,
Long years and years ago,
Ere called to meet the Master,
Away from frost and snow.

—SHANDY MAGUIRE.

Trouble and Triumphs of Travel.

BY SHANDY MAGUIRE.

[Continued from March JOURNAL.]

I went to the station in the afternoon and asked for a lower berth of the Pullman ticket agent. "I have nothing but upper berths," he replied. That was bad news, and I drew back from the window to think upon a plan of procedure. He looked like a man who hated himself, and with good reason. He was old, crabbed looking, uncommunicative and sour as a crab-apple in his conversation. He had been reading a paper as I approached, and I had no right whatever to disturb his Royal Nibs, a poor crawling plebeian like me, or to come between the wind and his nobility. He was no bureau of information gabbler, who would steer you for Kalamazoo if you desired information how to get to Oshkosh. He was simply an autocratic berth dispenser. I watched him till he laid down the paper, and had at him again. The time arrived. He yawned, which indicated bile knocking about in his stomach, and I stood at the window and tried him again. "Standing in front of a window all day, in drafts, and answering all manner of questions, is about equal to pulling the stroke oar in a slave galley; and I always have a heart full of sympathy for the man who is obliged to earn his daily bread in such a way."

He fired a glance of his half closed eyes at me, hung in the wind for a second or two, and said:

"If old Job had the job, he'd never be noted for his patience."

He nibbled the bait and I played to land him.

"Indeed, your allusion is a happy one. There are many sufferers in this world who have internal carbuncles, principally on their hearts, and must keep a smile wreathed on their faces to please people, just as you are obliged to do here, no matter how you feel."

"That is true. Where did I understand you to say you are going?"

"Los Angeles."

"Are you alone?"

"No, sir."

"Lower 9 is held to Trinidad until 8 o'clock. If it is not applied for, you may have it."

"Many, many thanks. Half a loaf is better than no bread. If I succeed in getting it, it will mean two nights. Am I right?"

"You are."

At 8:05 the berth was mine. At 10 the train left for California without any change to there except a change of beds after the second night out, but I borrowed no trouble.

The first business in order, after entering a sleeper, is to note who are your fellow travelers, and try to discern some of "our own folks" amongst the Philistines, if any are to be found. Neither was it a crowded traveling caravansary, about fifteen all told.

All the bipeds had to get into the smoking room while berths were being gotten ready, so as to let the ladies have the vacant seats. I sized up faces, but could not recognize anybody. After a few moments I saw I was being watched by a strapping looking young fellow on the weather side of 30; and after a spell, he came alongside and handed me his card; it read, "F. J. Bryant, Lafayette, Ind."

"I think," said I, "that I have seen your comely looking phiz before, but a deceitful memory fails to inform me where; am I right?"

"Yes," he replied, "we met in Atlanta and other places."

"Are you going to Los Angeles?"

"I am."

"Why are you so late?"

"Waiting for passes."

"Put it there," I said, extending my hand, "I am a passenger in the same canoe."

After a chat, we retired as we were passing through Joliet.

Ere saying "Now I lay me down to sleep," I related some experiences I had in the place in October, 1887, during the Chicago Convention. That was the year, and Chicago the place, of the founding of the Ladies' Auxiliary into a grand body. In those days, before women be-

came legislators, to help along the interests of our order, they used to go sight-seeing daily. On one of the days we were furnished a special train for them to Joliet to see the prison of the state, and also to see the town. There were 166 ladies and but three or four men, of whom I was one. We were all brought into the chapel of the prison, where we were given instructions by the superintendent, and emphatically told that there must be no conversation whatever with the inmates. We were then marshaled in pairs, Mrs. Perry, wife of the Chairman of the Committee of Arrangements, and myself leading. As we advanced a few paces from the official, I got my handkerchief into the shape of a gag, and was asked by my marching mate what I intended doing with it. True to my instructions of holding my tongue, I pantomimed its use. She gave me the laugh. We entered the prison proper the next instant, and witnessed one of the sad sides of human nature. After having been treated exceedingly courteous by our guide in our rounds of the prison and when again in the chapel, the ladies were paid a deserved compliment for their obedience to the request to hold their tongues.

The next morning being the Sabbath, we were gladdened by a most beautiful day. We arrived in Kansas City on time, and having half an hour there we had a brief view of a part of the town. After the train again started, Fred Bryant said to me, "There is a delegate on this car."

"Who is he, and did he also have to play the waiting game?"

"His name is Billy Sanderson. He is a Wabash man, from St. Thomas, you can ask him the remainder. Here he is."

We had a shake and a chat, and an inquiry if western water agreed with me, or would I like it diluted; to all of which the proper replies had been given, and we went together into the smoking compartment. As I was standing, during a lag in the conversation, I heard immediately behind me a voice saying: "Will you permit an old chum to have a shake of your paw?"

"Hello! McGovern. How are you!"

"Tip-top. How are you?"

"The same. Are you alone?"

"No; my wife is outside."

"I am right glad of it. You need never be ashamed of her company. She has the stamp of genuine womanhood on her handsome face, and the only surprise is how you caught her; for, like myself, you must have been crowded into a corner when beauty was being dispensed."

Gentle reader and fellow-tramp, you will discern that we're rapidly growing into a condition to win the praise of President Roosevelt, on account of the increase of our family. Besides those already mentioned, there was Miss Lape, whose father used to be Superintendent of Motive Power of the Santa Fe, and a companion, another charming young lady, whose name has escaped my memory, making seven so far; and as a certain lady, the mother of eleven children, once said in reply to her husband's inquiry, in my hearing, if the youngest was to be the "baby":

"I don't know, Jack. God is good; we may have more."

We had an appetizing dinner at Topeka; and after we again got in motion we were formed into a family group, expatiating on the beautiful views we were getting from our car windows of the fruitful farming lands of Kansas. The magnificent roadbed we were getting whirled over came in for its share of encomium, as did the stations and their tasteful surroundings.

When the shadows of the trees were lengthening that evening as the sun was sinking below the horizon, Brother McGovern directed our thoughts into a religious channel, saying that such a gorgeous sunset was a welcome omen of good luck sent us from the Throne of the Deity, and we should return thanks for such favors. He then, in a voice of much sweetness, began singing the following words to a well-known air:

How glorious the sun is declining,
The sky is with splendor ablaze,
The scenes we behold are refining,
And filling our hearts full of praise.

Oh, beautiful land we skim over,
Abundantly fruitful today,
May heavenly gifts o'er you hover,
And prosper the dear Santa Fe.

Then, in unison with the singer, every one in the group burst out in perfect harmony in the chorus:

And prosper the dear Santa Fe,
All over its whole right of way,
May engines and cars
Speed along without jara,
The same as we're running today.

The great Rocky Mountains we're nearing,
The foot-hills shall soon be in sight,
And now the bright sun's disappearing,
Dear Kansas we bid you good-night!
Some hundreds of miles in the morning
Our train shall have shortened its way,
And sunshine again be adorning
The sights on the fine Santa Fe.

Chorus:

The sights on the fine Santa Fe,
Through every hour of the day,
Rock ballast and ties
Are the best 'neath the skies,
In use on the fine Santa Fe.

Berths were made up soon after, and a refreshing night's sleep was our portion. The next morning we had an increase to our family. Brother Pound, of Div. 156, Birmingham, Ala., with his wife and young daughter, joined us. The object of his visit to Los Angeles, as near as I could make out, was to endeavor to secure the next convention for his home town in the sunny South.

How he did expound on the beauty of Birmingham! This side of Paradise there was no other such place; and the realms of fact and fancy were to contribute their choicest rewards to be conferred on all who'd help to get it there. The Division could not have sent out a more enthusiastic advocate. He extolled the town and gave it all the virtues ever catalogued. He certainly did his duty to his constituents, but Hiner had the whip hand, and he was helped to crack it, too, by a few silent toilers, unheard of yet by him, who did it for old acquaintance' sake.

Still later on this same day we had another increase to our family—Bro. and Mrs. H. C. Davis, of Denver, and their

two sons, one about 15 and the other about 17 years old, making our number fifteen, and here we are—some of us, but not all, as the remainder are not yet out from dinner. We are at Las Vegas, and Fred Bryant is the button pusher. I am the first on the left, looking like Shakespeare's sixth age of man "shifted into the lean and slippered pantaloons"; Old Sweetness next, one of the Davis boys next, Brother Sanderson next, then Brother Pound, Mrs. McGovern, Brother McGovern, Mr. and Mr. Davis.

(To be continued.)

I recall one instance in the long ago when the influence of the Brotherhood of the Footboard, as it was then called, won their first fight for an increase of pay on the New York Central, and it was not a hard fight, either. The Civil War had increased the cost of living, and the railroads had raised the rates on freight, and the Central was getting as high as \$130 a car for live stock from Buffalo to Albany, and the engineers thought they were entitled to an increase of pay. They were getting at that time \$2 a day and the firemen were getting just half, making \$60

GROUP IN THE SUNSHINE OF LAS VEGAS, N. M.

Early Days of Railroading.

• NIAGARA FALLS, ONT., Feb. 14, 1905.

EDITOR JOURNAL: It seems to me that if some of the old members of our Brotherhood would contribute short articles on the early days of railroading and the benefits accomplished by the B. of L. E., it would make interesting reading for both the old and the new members. In the early days the members, like the signers of the Declaration of Independence, had to hang together or they would hang separately, as Benjamin Franklin put it.

to \$62 a month for engineers and \$30 to \$31 for firemen.

I attended a meeting of Div. 18, of which I was a member, the night that a committee was appointed to go to New York and try to get an interview with Dean Richmond, who was president of the New York Central. The committee was composed of three of the oldest engineers—George Colborne, Robert Chapman, and Charles Wilson, afterwards our Grand Chief. He is now dead, but Colborne and Chapman are still living and in

good health. The committee were instructed to ask for an increase of 25 cents a day, if satisfactory to the committee from Albany and New York. I think P. M. Arthur was on the committee from Albany, but am not certain. However, the committees got together in New York and were received by Mr. Richmond. Brother Wilson acted as the spokesman. He told Mr. Richmond that the cost of living had gone up, that they had to pay war prices for everything they needed, and that as the road had advanced their rates of freight, they, the engineers, asked for an increase in their pay.

Mr. Richmond asked if they represented the engineers' organization. Brother Wilson replied that they did. Mr. Richmond then asked how much the cost of living had advanced. Brother Wilson took his pencil and figured the cost of living, taking a basis of five in a family and the increase in house rent, beefsteak and clothing, and then asked Mr. Richmond if he did not think they needed an increase.

Mr. Richmond then asked them how much of an increase they wanted. Brother Wilson said 25 cents a day. Mr. Richmond said: "Why, that isn't enough. I will make it 50 cents a day, and the same increase will apply to the firemen in proportion to their wages. The committee thanked Mr. Richmond and retired to their hotel, and after a conference they decided to go back and tell Mr. Richmond that inasmuch as he had treated them so liberally, they would not take pay for Sundays, only when they ran their engines, as they were not often required to run Sundays, but were always paid for the day.

Mr. Richmond again admitted them, and Brother Wilson told him what the committee had decided on. But Mr. Richmond said: "No, I will pay you for Sundays, so that we can use you when we need you, but will try to give you every Sunday off when possible. I think the increase is just, and I will not decrease it one cent."

That is the kind of a man Dean Richmond was; and the road prospered under his management and grew rich, and Com-

odore Vanderbilt never could get hold of the Central while Richmond lived, and when Richmond died the engineers lost their best friend, and every locomotive was draped in mourning from one end of the road to the other.

I remember boarding a special train at Rochester. The train was made up at Albany, and I met P. M. Arthur for the first time while on his way to Mr. Richmond's funeral.

Dean Richmond now sleeps in a marble tomb in the old cemetery at Batavia, and near it stands a granite column with the statue of Capt. William Morgan, the man who, after joining the Masonic organization, published a book revealing all their secrets, and who disappeared and never was heard of afterwards; and the beams of the setting sun fall with a mellow light on Richmond's tomb and cast a shadow over Morgan's statue. Richmond recognized the new organization, and Morgan, after joining the older one and getting its secrets, gave them away to its enemies and mankind.

Well, judge between the two men. The name of Dean Richmond will last as long as the Brotherhood or its last member survives. Fraternally yours,

W. H. H. WEBSTER, Div. 328.

Politicians to Make Through Rates.

EDITOR JOURNAL: At the present time, when there is so much being said and written regarding a law authorizing the Interstate Commerce Commission to make freight and passenger rates for the railways of this country, I thought that a few lines from an engineer as he sees it from his standpoint might set the railway employees of this country to thinking, and perhaps bring them to realize that this is a matter of vital importance to us all, and that we should do anything and everything in our power to influence legislation and try to prevent the enactment of this law. There is no reason why we cannot make our influence felt if we go at it in the right manner.

Regardless of the fact that we are enjoying a period of commercial and indus-

trial prosperity, which in a great measure can be attributed to the excellent service that the railways are giving to the producers, manufacturers and business men of the country, there are a great many politicians that are advocating the passage of this law. They have conceived the idea that there is a wave sweeping over this country demanding it, and if they do not fall in line it may affect them politically, and in order to serve their own selfish ends are willing to see right and justice pushed to one side.

The railway employees comprise 14 per cent of the voting population of this country, and I believe that the time has come for us to rise up in our strength and show our determination in protecting our own interests, instead of promoting the interests of politicians who advocate unjust legislation adverse to railway interests in order to secure votes.

The prosperity of the country depends largely on transportation rates, and should be left in the hands of experienced men in this line, instead of being put in the hands of politicians that would handle the matter with the view of making political capital.

On account of having had able men to handle these matters, they have made it possible in the last twenty years to lower the average freight rate from $1\frac{1}{2}$ cents to $\frac{3}{4}$ of a cent per ton per mile, and at the same time they have increased the facilities, affording comfort and safety to their patrons, although the cost of operation was thereby increased proportionately.

A very large per cent of the railway men employed in train service in this country have always stood for a protective tariff, knowing that it meant higher wages to all classes of labor "aside from use," and fully realizing that at the same time it raised the prices of commodities, which meant more expense to us in the cost of living. We stood for it because of the good that our great big army of working men would derive from it on account of the protection given the manufacturer, thereby enabling them to pay higher wages to their employees. By the enactment of the proposed legisla-

tion, it would so change the laws that the railways would have nothing whatever to protect their interests and it would mean but one thing for the employees, and that is more hardships and privations, and I feel that now we have the right to appeal to all classes of labor to aid us at this time, and I believe that they will be ready and willing to help us. I can conceive of no reason why the railways are not entitled to some consideration and protection, as well as the manufacturing interests. It would be grossly unjust to make a law that would almost wholly put the management of the railways in the hands of the politicians and did not provide for the making and adjustment of the employees' wages. If there is any class of labor that should be protected, it is the man employed in train service on our railways. His dangers, privations and hardships are many; his work is very arduous and on account of having to be away from home a great deal of the time, his expenses are heavy. No matter how inclement the weather or what the conditions are, when the time is up he has to go. I believe that the railways of this country have as good and intelligent a body of men to operate and handle their trains at the present time as could be desired, and for the interest and safety of the traveling public, it is up to the people of this country to see to it that conditions are not changed by embarrassing the railways to that extent that it will not be possible for them to deal with their employees justly, and by so doing drive the good men from the service instead of drawing them into it.

What we want to keep in mind all the time is that all the agitation on railway rates is always for lowering them. Nobody ever wants a commission given power to raise them. The rate per ton per mile, as I have shown above, has steadily decreased. Sixty per cent of the entire operating expense of the railroads is paid to its employees and it is the first element of expense to feel adverse conditions in the way of reducing the number of men employed. It is our business to see that our position in the matter be

thoroughly understood. Low rates will mean fewer men employed and there is nothing within the power of the railroads that can prevent this.

Because of this, it is our business to act promptly and unitedly and do all that we can to persuade Congress against conferring power upon a commission to fix rates.

Fraternally yours,

FRANK S. RODGER, Chairman,
C., M. & St. P. Ry.

Why a Young Engineer Should Join the B. of L. E.

EDITOR JOURNAL: Why should a young engineer join the B. of L. E.? This question is often asked of the old engineer, and of late the query has become quite frequent for obvious reasons. I admit that it surprises me, for you know by men's work should they be known, and certainly no set of men have ever done any better work for men of their kind nor for humanity at large than have the members of the B. of L. E.

From the very inception of the order it has stood for all that was good and noble in man. It was founded on truth, and truth lives just as surely as a lie dies because it is a lie. If a monument were erected to the memory of the founders that towered to the skies it could no more than do them justice. From a moral standpoint no estimate can be put on their work; from a financial point of view imagine the amount of good that has been done by the \$13,000,000 paid by our insurance association to our helpless Brothers and their families.

In the years gone by the public pictured the engineer as a great big fellow always with a greasy cap and a big silver watch chain, very profane, the frequenter of the saloon and the gambling room. It took some time to blot this picture out, but it has been done. The modern, up-to-date B. of L. E. engineer stands for all that is good and true in life, and right here I want to say that I know of no trade, calling or profession where so many good qualities are demanded of a man as are demanded of the engineer of today.

He must be sober, temperate and reliable; of undoubted courage at all times, accurate in judgment and with nerves of steel. The man who dissipates or is immoral cannot fill the bill nor can he be a member of the B. of L. E. Every member of that organization may feel proud of the past record. We know what has been done and the future looks more than hopeful. We have been very fortunate in getting and keeping at the head of the organization great, big, level-headed men who were in their work with their whole heart. They have carried us on and on to our present standing in the labor world.

Men reap as they sow. There was good seed sown in the past and the young engineers of today are reaping the harvest,—a harvest of good wages, peace and contentment. If he is the right kind of a man he is assured of fair treatment by railway companies throughout the country. The fact that he is a member of the B. of L. E. adds to his prestige as an engineer. For the railway officials know that a man must have many good qualities that go to make a successful engineer before he will be admitted to the order.

No man can afford to stand still or to lose ambition. To lose ambition is to lose hope. The man who does not wish to advance will most certainly go backward. The fireman of today must prepare himself to be the engineer of tomorrow and to take up and carry on the work being done by the engineers of today. He cannot shirk in any way without distinct loss to himself. To accomplish anything worth while men must work together as a unit. No diversion of any kind is possible. The great good accomplished in the past was done by the united effort of the many engineers and no one else. To them all the credit is due.

And you, the young engineers, may show that you appreciate it by getting in line and taking your share of the labors and honor, as soon as you are eligible. And when you do become a member, never do anything that will in any way lower the dignity of the engineer. Have faith in your fellow man. Remember

that he is as sincere as you are; that he is just as honest. Be a man in all that the word implies.

There is an old legend that tells of the spirits of dead warriors who would meet daily in the halls of Valhalla and there around the festive board account the deeds they did in the other world. It seems fitting to me to apply this to the engineers whose deeds of valor while here on earth would have entitled them to a place at the "festive board."

Day by day, my Brother, you and I are drawing closer to that last trip from whose bourn no traveler ever returns. Let us all, then, do all the good we can while here; assist each other in every way. To the young engineer I say, join the B. of L. E. at once and live up to its teachings. It is your duty to yourself, your family and to your fellow man.

WILLIAM R. BRANNON.

Division Addresses Semi-Annually.

WINSLOW, ARIZ., Feb. 12, 1905.

EDITOR JOURNAL: Having been a delegate to our last convention, and interested in having our Division addresses printed semi-annually, I feel as if some of the Brothers were treading on my toes when they find fault with the act.

When senators, congressmen or state legislators represent the people, they usually go the limit in expenditures. There are exceptions occasionally where a representative of the people (politically), or the body as a whole, are economical, with a saving to their constituents. When this occurs, the act is heralded and approved by the public as evidence of exceptionally good morals.

The Los Angeles Convention passed an act saving \$4,500 per year to their constituents, and judging from the remarks of some of our Brothers, "the public is wrong in their views on this subject."

Our JOURNAL should be considered from a business point of view also. It must be plain to every Brother that a business with an unnecessary expense of \$4,500 per year is not assured of continued success under all or unfavorable conditions.

I contend that all the Division addresses are read not oftener than once a year by the majority of members. Then why print them twelve times a year? Printing them twice a year is a liberal allowance, and if any of our Brothers have a preference for that kind of literature, there is nothing to prevent them from cutting the addresses out of the JOURNAL, carrying them with them, and reading them 365 times a year.

Some of our Brothers may deem it unnecessary to have \$4,500 in the Grand Division treasury. The convention reduced the charity claims from a liberal amount to an exceedingly moderate allowance to claimants, in order to hold the total amount within a conservative limit of our funds; besides, the Indigent and Pension Fund comes in for consideration here.

Furthermore, a portion of this \$4,500 in money paid in the form of Grand dues—Grand dues paid by some old Brother who possibly may be in straightened circumstances, or some deceased Brother who leaves a widow and children. They have a legitimate interest in that money. If any of our Brothers want to get rid of the money, I say pay it to the old Brothers or widows; they most certainly are entitled to their percentage.

Furthermore, I question the moral right of any member to waste the money as advocated. If we have too much space for reading matter, cut it down.

Talk about a referendum vote! I am in favor of a referendum on all public matters. I introduced a resolution on referendum at the St. Paul Convention, which was passed up with a smile by Brother Hays as "too long to read." But if the last referendum vote is a sample of what we can do, I am not in favor of the B. of L. E. having a referendum vote. It is getting too near the departed.

The only legitimate reason I can advance for the Brothers finding fault is the "Woodman, spare that tree" sentiment versus Progress; or vanity in wanting to be advertised as local officials, which very few read, and which can be read just as often when printed semi-annually.

H. HEIDE.

In the Sixties.

ROCHESTER, N. Y., March 6, 1905.

EDITOR JOURNAL: I was much pleased to see an article in the March JOURNAL written by Bro. W. H. H. Webster, now American Consul on the Canadian side at Niagara Falls.

He spoke about the two engines borrowed from the Michigan Central by the New York Central, one being the "Salamada," the other was the "Babylon." I don't think my old fireman, Herman Balway, now living at Syracuse, and myself will ever live long enough to forget the trip we had with her. Our usual trip was running from Niagara Falls east on direct road and the old Auburn road west.

By some mistake we were not called to go out the next morning on the old road on our engine 347, but Harry Watky was sent in our place. We went up to the office and saw the Master Mechanic, Mr. Watky, and explained matters, and asked him what we should do. He told us to take the "Babylon," which was down at the depot in charge of Alfred Wright, hooked on to the train, ahead of five engines, which was to take the train out as soon as the New York Mail from the East arrived. I delivered my message to Mr. Wright and the look he gave me I never will forget. He said, "This is the third time I have been driven off different engines this morning." I took the engine, but refused to run her ahead on account of her being the lightest one in the lot. I appealed to the station master, Henry Wait, but it did no good. It was snowing and blowing fearfully, and no one wanted to take the responsibility of the train by going ahead in such a storm. But in order to get my engine at Rochester I consented to run her. We started with 130 pounds of steam, and every time she exhausted, she dropped 5 pounds. We hadn't gone over a mile before she was down to 40 pounds. The fireman, one of the best that ever stepped on the deck of an engine, was struggling hard to keep up steam, but it didn't do any good. I dropped the injector off and that didn't

help her. The other engine was snorting and cracking, and we were going along a good clip, with ten coaches and virtually a dead engine ahead. Things began to look desperate and I realized the fact that it was absolutely necessary for the welfare of the train and the passengers to keep steam on her or stop and cut her out. I saw I couldn't use steam and keep up pressure enough to whistle in case it was necessary, so I shut off steam entirely and put on the blower. I kept it on all the way to Jordan, which was the first stop, then she popped off. I also kept the oil blowers on, to prevent the cylinders cutting. I rang the bell to start, but the conductor said the other engines were short of steam. He complimented me on having steam, but I said the fireman was entitled to the credit.

We started again, but had to shut the steam off and resort to the blower. I managed in that way to keep the steam up to 130 pounds, all the way over the road. It was a Godsend to us all that I had the steam to whistle at Clyde. There was a large passenger train just ahead of us, pulling into the station. We had no air brakes at that time and I had to put her in the back motion to help stop it. It was the remark of the conductor and others, how well the "Babylon" was doing. Well, I let them talk.

When we got to Rochester they wanted only four engines to go to Buffalo. They wanted the best steamers and Geo. Lingham took it for granted that the "Babylon" was one of the best; so they decided to take her, and I was pleased to give her up. He was the regular engineer on that train, and I claimed at Syracuse that it was his place to go ahead. I wanted to get even with him and get the "Babylon" near home, so she wouldn't come back; and that was the way we got rid of the "Babylon." Fraternaly yours,

E. P. SHAFFER, Div. 18.

Be Prompt in Every Duty.

PHILADELPHIA, PA., Feb. 18, 1905.

EDITOR JOURNAL: In the January JOURNAL, page 33, we read these words: "This is not poverty, neither is it willful

neglect; it is simply carelessness with compound interest," and it is an inducement for us young fellows to go and do likewise. I have always been under the impression that I retained my membership in the B. of L. E. by being prompt in paying my dues and obeying all the laws pertaining to the same; but "Collector" in his article has shown that there exists all through the Brotherhood a class of men who are determined to give someone all the trouble possible to receive from them the dues that belong to the Division. I, for one, am ashamed of the condition, and I wonder what the result would be did the railroads they work for pay them in an I. O. U. Their howls would be heard from "Greenland's icy mountains to India's coral strands," so to speak. The G. C. of A. and their paid chairman's lives would be tormented by their howls of distress because their supplies of living would be shut off in a few weeks; for my experience has taught me that generally where a man is making good wages, and is behind in his dues, he is behind in all things. There are some exceptions to such cases, through sickness, and so forth, which every Division, no doubt, reaches out the helping hand to; but such cases as "Collector" has written about, should not have a helping hand and the only way to deal with those who are careless is to strictly apply the law, which you will find on page 76, January JOURNAL, in regard to the life insurance.

If I were the collector I would not ask one man for his money, except those who live out in some place where there might be a possibility of him not having received his JOURNAL. Take Philadelphia, or any other terminal; is there any excuse for a member not knowing what the assessment is per month; even if he does not receive his JOURNAL, is there any excuse why he does not know by what day it must be paid, to keep beneficial, and if he is not in a position, through any cause, to be able to pay it, is it not his business to hustle about it and not the collector's? I would not pay one of them, because I have known of too many cases

where the collectors never received it back. So, if I had been having the trouble so many collectors have been having by the evidences on these two pages, I would notify all members that on and after a certain month I would be governed by the law. "Oh," says one, "if you did, it would break your insurance up." Would it? If so, let us try it, and you will find the result will be, if it is worth thinking about at all, a great deal more interest displayed in how to be reinstated than the collector now has to use to collect it.

Our Divisions and our insurance can no more meet their obligations when our members are not prompt than the members can meet theirs, when the railroad pays are not prompt; and I believe so many of our members have become careless because we have permitted them to become so and the greater fault is ours, and it will not be an act of injustice to them to get them out of it, but will be an act of justice to the association to do so. Many of them never read the laws possibly, and seldom read the JOURNAL, or they would not depend on some one else to attend to their affairs.

Come, boys, stop your willful neglect, or it may cost your wife and baby at your death the price of your policy.

Fraternally yours,
C. B. NIXON.

Going the Wrong Way Without Knowing It.

TORONTO, CAN., March 7, 1905.

EDITOR JOURNAL: In the JOURNAL of February, page 118, "Indicator" says, "there are two cases on record where engine and train have been traveling backward while enginemen were under the impression that they were traveling forward."

Having personal knowledge of one more case, which may be of some interest to your readers, I will tell about it.

The engine was a Portland, 4½-foot wheel, 26-inch stroke, and was considered by engineers who had run it as "slippery." The run was a short one, but with heavy grades, and at this time with but

little ballast, and consequently grass, weeds and thistles grew in abundance. The engine had not been to shop for general repairs for a long time and was in bad condition, deep grooves in tires of driving wheels, and every one who ever ran an old engine with two flanges, knows what it means on good rail; but in this case, after running some weeks in dry weather over the grass, thistles, etc., the rail was badly "gummed," and one night when there was no moon the rain came down slowly and moistened up the gum on the rail until it was like grease. The headlight was not in working order and as the sand was dirt and had been reported as "no good," everything looked exceedingly "dark" for climbing the hills. The engineer, who went by the name of "Old Ben" by all train hands, told the conductor we could never get up those hills, even with this light train of coach, baggage, two "way freight" cars, and two cars of coal; but orders were for coal to go sure; so Old Ben started out slowly, the drivers slipping every foot of the way, or all the time, with as little throttle as could be used. When the first heavy grade was met more care and longer strokes were used, and Old Ben thought we were doing very well. The engine was slipping all the time, but it seemed to run, so that he was making very good headway; but by accident, the fireman, whom we will call Bob Yarnold, got sight of some object in the darkness and said, "Say, Ben, do you know we are going backwards?" "Impossible," cried Old Ben, looking out into darkness and rain, Bob holding the torch to see if driving wheels were working forward, and *they were*, but engine and train were traveling backward. They had been making headway up the hill, but as the rain wet up the gum from the weeds which had been accumulating on the rail, the movement ahead had come to the stopping point, with no jar to indicate it, the slipping continuing, but the train sliding backward.

The reverse lever was thrown over in a hurry, while Bob held the torch to see when train arrived at first switch, where coal was "set out" in siding, and a new

start was made with the lightened load of two light cars and two coaches, and Old Ben made the terminal 18 miles distant, 1 hour and 30 minutes late.

Of course, the matter had to be reported, and in a few days on came the Master Mechanic to investigate. He came into the roundhouse, not speaking to any one, not even taking a look at the grooves in driving wheel tires, but made a bee-line for the sand heap, and taking up a handful, examined it and threw it down, saying, "That is not sand, that's limestone," and told the engineer, "I will soon send you two cars of sand, and I don't think you will have any more trouble with your light trains and engine going backward when you *think* you are going forward," putting a considerable stress on *think*, as though the engineer was not telling the truth.

Others have thought the same, saying it is only a case of willful lying. Others say it must be that there was too much whisky; but as Old Ben was a temperance crank, this was not the case.

Is it not strange that a man who had worked for many years as fireman and engineer on all sorts of trains and finally eight years on a passenger train, having all sorts of luck as other engineers, in snow, breakdowns, runoffs, etc., yet his name was never on the fire sheet, had worked under several different officials, never had any trouble with them, one of them for 12 years, and never got a cross word from him. Old Ben left the road after 30 years, honorably, and yet this man today will tell you he never thought for a moment the train was going backward until told by his fireman.

How any engineer could possibly be attentive to his engine and have engine and train come to a full stop and start backwards and not know it, is a little strange, but as "Indicator" says, "Circumstances and human beings can combine to cause results which, were they not facts, would be considered by the most broadminded and experienced individuals to be absolutely impossible."

Fraternally yours,

B. L. SWEET, Div. 174.

Reduce Number of Delegates.

EDITOR JOURNAL: I have been reading an article in the February JOURNAL, and if your space will permit I would like to say a few words on these lines. The article I refer to is by C. B. Nixon, and he advances the idea of reducing the number of delegates to the convention to one hundred, and, as I read his article, this idea is advanced in one way, to "set a good example for our General Committee of Adjustment." Brother Nixon does not take into consideration the fact that it is dollars to doughnuts that every one of the hundred delegates whom he advocates sending to the convention to make the laws for 50,000 members will be the chairman or a member of some Board of Adjustment, who will be supposed to set a shining example for himself.

We are given an idea of the voting capacity of the hundred delegates,—“one vote for every hundred, three-quarters for seventy-five, one-half for fifty, and one-quarter for twenty-five,”—but no idea of how this vote is to be taken in the convention.

Even if a law could be made for the selection of the hundred delegates, I can conceive of no way of handling them on the floor of the convention without a big waste of time and the services of several mathematical experts at every session of the convention. While this idea might apply to a Board of Adjustment where, to quote his own figures, 3,500 engineers might be directly concerned, I should consider it both impractical and impossible to carry it into one of our biennial conventions.

My idea of lessening the cost of our conventions would be to reduce the time the convention is assembled. Let the measures which are brought before the convention be first put before the Subdivisions and discussed by the Brothers, and the results sent to the Grand Office. Empower the Grand Chief to call the Committee on Constitution and By-Laws together in season to consider, classify and arrange the same, cause them to be printed, together with the recommenda-

tions of the committee, and a copy given to each delegate at the opening of the convention. This plan would not only insure the careful consideration of the hundreds of resolutions brought before every convention, but would leave the committee on the floor of the convention to act on other important measures brought before the delegates.

The Los Angeles Convention convened May 11th. The Committee on Constitution and By-Laws were ready to make their report at the afternoon session of May 28th. The greater part of this time could have been saved if the above plan had been in effect.

Of course, it must be understood that a delegate can introduce any measure at any time, provided he have the consent of the delegates, and the above plan would not bar any important resolution from being brought before the convention. but would insure the bulk of the resolutions being ready for the action of the delegates at the opening session, if it were deemed advisable to bring them forward at that time.

If the time the convention is assembled can be reduced one-half, then the expenses of the delegates will be reduced in like proportion.

Now, a word as to the number of delegates. I believe it for the best interests of the Brotherhood to have as near as possible every Division represented at our conventions. The Brother from the small Division, even though he may be located at the farthest point from the convention, may be the very man needed at some critical point in the proceedings. As to transportation, even if the railroads refuse it to our delegates, if we reduce the present expenses one-half we can well afford to pay the fare to and from the convention.

It is a well-known fact that a dozen or less members in every Division are the real workers; then let us have all the Divisions and all the workers we can. If you have a big, unwieldy Division, split it up and give everybody something to say for the good of the order, and possibly you will keep them interested enough so they will attend the Division meetings,

and make it unnecessary for some Brother to come out in the JOURNAL and tell us what the Grand Chief said in 1869. Rather let us look forward to what the Grand Chief is going to say in 1969.

Fraternally, W. J. BOOTHBY.

Easy to Find Fault with Delegates.

NEW YORK, March 7, 1905.

EDITOR JOURNAL: It is better to be a "has-been" than a "never-was" delegate to a convention of the B. of L. E. The former realize the duty and responsibility attached to the honorable calling of representing a Division in convention. It is easy for the latter, having never passed through the trying ordeal, to see the imperfections in the laws enacted for the government of Subdivisions. It is not reasonable to expect that all the laws or the work done by the Grand body while in session would please every mind or suit each individual. I do not quite coincide with every move and law adopted by the Los Angeles Convention, but would it have been any different if you or I had been one of the delegates? There can be but one answer, and that is No. It is easy to find fault with those who were delegates, and to say unkind things of them, accusing them of "tomfoolery" and exceeding the authority invested in them. Some have expressed disappointment that the name of some Brother friend of theirs had not been brought before the convention as a candidate for Grand Office, because he was not a delegate to the convention; others have said unkind words of delegates who were elected to fill Grand offices, accusing them of electioneering for themselves, retarding the progress of the convention. What man is there in the rank who would not ask his friends to support him for a Grand office? The convention, in its judgment, considered it necessary and beneficial to create Grand offices and elect Brothers to fill them who were intelligent men, and if a Brother is guilty of no greater crime than asking his friends to support his candidacy for an election to office in his Division, or his friends among the delegates to support him for an office in the

Grand Division, he will have a "clear title," and the "right of way" over all obstacles to the "mansions in the skies." We should ever remember that the Grand Officers and the delegates comprising the convention are our Brothers, and officers and delegates by the good-will of a majority.

Mr. Gladstone once said to the House of Commons, that legislators were simply registers of public sentiment. This in a degree might apply to the delegates in convention. They are simply registers of fraternal action for the whole membership, and I believe they endeavored to act according to the dictates of their consciences for the best interest for all concerned; therefore, if they failed in every little detail to comply with our ideas, let us not be over-exacting. Delegates attending conventions uninstructed must use their own judgment upon certain laws as they are proposed. There is no other course left for them to pursue but to vote for or against, and if the measure adopted is not agreeable to the membership it can be taken up in the Divisions, acted upon, and the delegate for the next convention instructed how to vote upon it, providing they desire the measure repealed.

"Let each content in our place to dwell,
And envy not our Brother;
For any part that is acted well
Is just as good as another.

"For we all have our proper sphere below,
And this is a truth worth knowing;
We will come to grief if we try to go
Where we were never made for going.

"There are very many pleasant things,
As many pleasant tones,
For those who dwell by cottage hearths
As those who sit on thrones.

"If you have tried and have not won,
Never stop for crying;
All that's great and good is done
Just by patient trying."

J. PUFFENBERGER.

Reduction of Representation.

KENOVA, W. VA., March 8, 1905.

EDITOR JOURNAL: For years there have appeared in the JOURNAL articles from many Brothers upon the same subjects, namely: Reduced representation at conventions, permanent and central location

of Grand Office, insurance, and non-attendance at Subdivision meetings.

These four questions have had many advocates appealing for a change—to depart from old customs and adopt methods as befit our present needs and demands that will insure progressiveness and security.

For the first, a reduced representation at our conventions is essential and a necessity.

The second, a permanent home for the Grand Office, centrally located, at which our conventions could be held under a reduced representation, would save an immense amount of money to the Brotherhood, and our advancement would be certain and sure.

The third, our insurance is unsatisfactory to many; continued complaint is an evidence. The endowment plan, or a \$1,000 policy that would mature within a given time, in addition to our present plan would be appreciated. You can draw your own conclusions as to the good \$1,000 would do many of our Brothers who reach the age limit. We all contribute to enrich other insurance companies, and I do not see why the scope of our insurance cannot be enlarged.

The fourth question is the important one. Therein is the cause of all our trouble. It, truly, may be called the root of all the evils complained of.

Subdivisions should be officered by unselfish men, who are capable of advising, strong enough to stand by their convictions, judges of human nature, competent to handle the inexperienced and indifferent and educate and train the members to have confidence in themselves and, above all, an abiding faith and full confidence in the Brotherhood, for therein lies their salvation. It is also the duty of officers to so conduct their meetings that members will look forward to meeting day and all strive to reach the register first. This can be accomplished by a strict compliance with the laws and a little ingenuity and judgment. As soon as the members come to a realization of their positions, the obligations they are under to the order, to their families and themselves, the "certain element" referred to by

Brother Freenor will disappear from the conventions and the "wheels of progress" will revolve smoothly, without jar or pound, as the flat wheels, bent axles and leaky flues (these four questions and this certain element can be termed as such) would be removed.

The public must look upon these charges and criticisms that appear in the JOURNAL as an exposure of our weakness as a Brotherhood, as a reflection upon our delegates as to their integrity, loyalty and efficiency,—men whom they look upon as worthy of every trust and confidence imposed, who will keep a sharp lookout for the protection and safety of the B. of L. E. as they will for the passengers who ride upon the trains while they are in charge of the engines.

Give us a convention of progressive Brothers reduced to half the present number, composed of Freenors, Nixons and Bolivars, with W. S. Stone at the head, and the success of the B. of L. E. is assured and a certainty. REUBEN.

Endowment Fund Not Approved.

MISSOURI VALLEY, IA., March 6, 1905.

EDITOR JOURNAL: Some of the Brothers favor a change in our insurance laws in order to reduce the cost and also benefit the old members. Brother Freenor, of Div. 272, is in favor of an endowment fund and in order to raise this fund he would have each member deposit \$20 for each certificate he holds, which would mean \$20 to be deposited for each \$1,500 of insurance. The member holding a \$4,500 certificate would be required to deposit \$60, which would, I think, cause trouble in the order.

I am of the opinion that the B. of L. E. made a mistake when they adopted the insurance feature. Our Brotherhood was first organized as a labor organization and it should have been nothing else. I think the order would be better off today if it had never gone into the insurance business. There are about ten or twelve expelled every month for forfeiting their insurance.

I do not believe in compulsory insurance; if a member desires insurance

let him take out old line or join some fraternal insurance organization, which is cheaper and better than what has been offered by the B. of L. E. But as the B. of L. E. has been in the insurance business so long, it is too late to repeal the law compelling the members to take out and carry at least one policy. Our conventions so far have failed to agree on any plan which would reduce the cost or better the plan first adopted by the order.

If Brother Freenor has a better plan than the one now in vogue, let it be presented to the next convention for consideration.

The trouble with our conventions in such matters is that none of the delegates, or very few of them, know but very little about life insurance; and where there are so many delegates it is difficult to decide on such matters as life insurance. I think it would be a good plan if the next convention would appoint a special committee to take up the insurance question and report at the convention in 1908. There is not time enough for a committee to make a report during the sitting of a convention, as it would take months of study; besides, insurance statistics would have to be gone through thoroughly in order to adopt some plan that would prove satisfactory.

If the endowment clause should be adopted in order to benefit the old members, as suggested by Brother Freenor, the year of expectancy will have to be fixed; that is to say, when a member becomes sixty years of age he should receive his insurance.

Brother Freenor has it figured out that if the endowment plan is adopted, it would raise a fund of about one million dollars, which could be loaned at 5 per cent, which would make an income of \$50,000 to pay off the policies of old members to that amount each year.

I do not think this money could be loaned on good security, such as government bonds, for more than 4 per cent, and it is risky business for the B. of L. E. to go into money loaning by taking real estate securities. We do not want to get too many "irons in the fire." We are in

the insurance business now and find it a difficult problem, so I think we had better be slow about adding on the money loaning business. The B. of L. E. cannot afford to try any experiment, as it might prove to be very expensive.

GEO. H. CONNER.

Lukewarm Members.

HILLYARD, WASH., Feb. 22, 1905.

EDITOR JOURNAL: In looking over the JOURNAL I noticed a letter from one of the Brothers entitled "Lukewarm Members," and I heartily commend it.

These lukewarm members are the worst drawback to the B. of L. E. that we have to contend with. I sometimes think that they must have more confidence in their officers than I would like to place in them. I have known men to pay their dues from month to month, their insurance the same, and never come near the Division to find out where this money was going to or whether their insurance was being sent to the insurance department, and live along from day to day as though they were half dead and had no ambition whatever.

The Brother speaks of living up to the constitution. Why, you say anything to one of these Brothers and they think you want to deprive them of some of the liberties they have acquired by being an American citizen. They do not stop to think that the B. of L. E. has got for them all the comforts they enjoy, which are a great many more than working for \$2.00 a day.

Now, boys, turn over a new leaf and have enough interest to look in the JOURNAL and see when your Division meets or see if you can't learn the number of it so you can tell some member from across the continent what Division you belong to.

I have met members on my travels who would say, "I am not posted. I have not been up to the Division for a year or more." I feel like saying, "You ought not to belong." Such men do not deserve the benefits of a schedule, and yet these are the very members who have the most fault to find about the way company uses them. Such Brothers ought to think how

little their lack of interest in Division affairs entitles them to when they want help from it.

Fraternally yours,
JOHNNY.

Non-Attendance.

ALTOONA, PA., March 11, 1905.

EDITOR JOURNAL: I see in the March number of the JOURNAL replies to "Boli-var's" idea of non-attendance from "Flat Wheel," of Div. 599, and "A Member of Div. 206." I wish to correct a misunderstanding between "A Member of Div. 206" and myself regarding the expulsion of members for non-attendance. I do not advocate the expulsion of any member so long as he pays his dues and insurance assessments, and keeps his mouth shut about things of which he knows nothing, especially those pertaining to the handling of grievances, etc. There are a number of members who cannot spare the time to attend a Division meeting, but have plenty of time on a Sunday afternoon to go to other places, and then wait on the street corners until the loyal men ("Bill, Bob and Andy") return from the Division meeting to ask them what was done, and why in the heavens they didn't act on such and such a grievance. Please note that these self-same Brothers are the very first to make a motion to vote out money to any person seeking aid, whether loyal or not, and are the very last persons to pay their dues. When they do so, it is, as it were, at the point of the sword.

Div. 287 has nearly 260 members, and unless the F. A. E. has sent out a general non-attendance notice, or some scandal arises to create an excitement, you can count the members at each meeting on your fingers and toes. Our Division should have an attendance of at least one hundred members at each meeting. I presume that this Division is like some others—"their treasury is sort of run down on the heel." That being the case, would not 100 good members who attend the meetings and pay their dues be better than 260, the majority of whom never come near the meetings or pay anything?

I do not wish to be misunderstood, as my argument is exactly this, viz: Create

an interest in the meetings that will arouse the dormant element to a sense of their obligation and cause them to attend the meetings without resorting to coercive tactics. Discountenance any tale of woe unless it is presented to the Division in writing, and is a real grievance.

We must remember that the Pennsylvania Railroad Company, which gives us employment, has rights which must be respected, and the sooner we cut out these "petty personal" grievances, the sooner we will prosper and be able to pay our honest debts.

I would like to meet Brother "Flat Wheel" and shake hands with him, as he hits the nail square on the head when he says, "We should turn our Division meetings into a training school." Let each Chief Engineer appoint an instructor one air brake, one on signals, one on rules, and one on the general conditions existing on our respective railroad Divisions. Select a subject for discussion for the next meeting, appoint your instructor and devote at least one hour for the discussion and argument of same. I think this would create an interest and put new life into the Division and increase our attendance and our treasury as well.

Some Brothers may think that I am a chronic kicker against grievances, but such is not the case, for a real grievance presented in a legal way should be pushed to a finish.

In my experience since 1896 Div. 287 has presented about six real grievances, viz: Carrying of oil cans, etc., to be paid for overtime, to be paid from the time responsibility is assumed until relieved from duty, shorter hours of service, increase of wages, and unjust suspension of Brothers Ameigh and McCoy, all of which have been satisfactorily adjusted. All others have been money voted out for nothing. Our Division spent about \$200 in trying to devise a schedule of existing conditions, etc., something that we do not need, as we are employed by the largest railroad company in existence, under the best officials that ever were appointed by any corporation. We have as good conditions existing here on the Pennsylvania

railroad as can be found anywhere in the civilized world.

I will stop before I am flagged.

Fraternally yours,
"BOLIVAR."

Are We All Doing Our Duty?

MEMPHIS, TENN., March 7, 1905.

EDITOR JOURNAL: As one who had the pleasure of meeting our Grand Chief at a recent date, I wish to express my feelings as they were before meeting him and now. We say that by chance or accident the proper man will appear, that our race has had leaders from time to time history reveals, and always some one from somewhere springs up at the proper time. I am happy to feel that in our present Grand Chief we have "the man of the hour." May it not be the good spirit of him whom we all loved so well that guides him and makes us feel that we have the right man in the right place?

Now, Brothers, what are we doing to assist him? Have we done our part? I know I have not, and I see from the JOURNAL that there are many others. Our JOURNAL is, and should be, our poster. Do we read it and profit thereby? No, we do not, and I fear I am not alone. Do we assist and carry our share of the burdens as each of us should? No, we do not. Do we attend our meetings as often as we can? No; here lies the great stumbling block. To accomplish an object united effort is absolutely necessary. There is a tendency amongst us to allow a few to do all the work, and if what they do does not suit, a great howl goes up from those who hardly ever attend a meeting, often charging that they have done it all to suit themselves. I'm not going to stand for it; I'll withdraw. I am not going to pay out my money for nothing—and in many cases those knockers could not work themselves into a Division room. Ask some why they do not attend meetings, and of all the excuses you ever heard they have. One very popular is, "Oh, Brother So and So attends to all the business. I don't see that I can do anything."

I am so glad this new light has sprung

up amongst us. Let us listen to him, follow and encourage him in this progressive age. Yes, we may say in the age of new ideas, we need his ways of doing business. I am ashamed of myself, and I know every right thinking Brother should be of our indifference shown, when he sent broadcast to us those important questions to vote on. I know a cold chill must have run all over him as he read the returns. We must assist—each and every one. Let us all share the burden and what we will accomplish is beyond our imagination. It is time for us to make up the lost time and make amends.

Some of us have never been placed in charge as leader. No one but those who have, knows the satisfaction and pleasure it gives to know that those he represents are firmly back of him. If we thought of this I am sure we would not give cause to feel that in our ranks is any indifference. Let our good order be for what it stands—Brotherhood of Locomotive Engineers, and not, as some seem to think, a Businesshood. I hope that God will give our Grand Chief strength and a long life to lead us on and on to limitless success.

The trouble is not with the Order, but amongst ourselves. Results are what we want, and must have.

I was at one time asked by a manager, "Please give me your rules for such great success as an engineer." I was so surprised I hardly knew if it was me or some one else he spoke to, but seeing no one, I managed to get enough courage to reply. I'll tell you in my next letter what I told him.

I believe that through our JOURNAL, if some of our old heads would only tell how they managed to stay and get old in the service, we youngsters, if we only would, could profit immensely. It is not hard to hold a job, and as long as we hold one we stay off a promotion. Constant promotion will overflow the market in engineers. Those are thoughts we should consider, and the country would not be full of engineers out of work. The age limit would cut a small figure and the doctors would not feel for broken bones.

This is my first attempt to write an ar-

ticle for our JOURNAL, and I hope you will pardon my nerve; but our Grand Chief told us to do whatever we could, that we may better ourselves; hence this letter.

SIDETRACK, Div. 23.

Endowment Fund.

FOND DU LAC, WIS., March 6, 1905.

EDITOR JOURNAL: The good things regarding the endowment fund in connection with the B. of L. E. Insurance have not all been said yet, and I am here again with more. Lackawanna is interested, but is skeptical as to its adaptability. Yes, we have the best insurance of its kind, and my plan will improve on it. That is my opinion, and I champion an opponent of my view by citing his. I have written my plan, and what is a remarkable coincidence is that Brother Nixon and I write almost on the same subject at the same time, without me knowing him or him knowing me; nor has there been any correspondence between him and me. Read his article and mine in the March number, pages 210 to 212, inclusive.

Now, I have still more to offer, and that is this—that all can join this fund with the stipulation of my article in March; that is, holding a certificate in good standing by giving a note for \$20 on each certificate, and pay interest on same at the rate of 5 per cent per annum, which will be \$1, unless he feels able to pay the amount in cash; then the association to let at interest, the interest only to be used to pay policy holders, the amount of note to be deducted when claim is paid by the association. In that way you would only pay the interest, which would be \$1, \$2 or \$3 per year, all owing to how many policies you carry. That would give us \$50, or thereabouts, to pay off the oldest policy holders.

Now, don't you think that would help our insurance? I donate more than that annually to non-members, and don't miss it. You can see that it would eventually cheapen our insurance, because when this fund would once be established the interest from it will do the balance.

As to reducing expenses at our conventions, nothing will accomplish anything

except a direct vote and instructing the delegates, and should be after the plan outlined in my article in March. Further, I believe a centrally located convention city, where our Grand Officers can be located, would be of immense benefit and help reduce expenses.

With best wishes for success to our valuable JOURNAL, made so by the excellent work of Brother Salmons, I am,

J. F. FREENOR, Div. 372.

Missouri Legislative Board.

SEDALIA, MO., Feb. 7, 1905.

EDITOR JOURNAL: On page 118, of the February JOURNAL, I note a little article under the heading, "A Duty for the Legislative Board," signed "A Brotherhood Engineer." I have been trying since the 16th of November, 1904, to get the vote of the Subdivisions of the State of Missouri in compliance with Section 1, page 67, of our Constitution and Statutes, relative to forming active Legislative Boards. So far I have received the vote of thirteen out of twenty-seven Divisions in the state in nearly three months. I have written to all Divisions, altogether twenty-seven letters. Some have not even acknowledged the receipt of them. To Divisions 107 and 597, of St. Joseph, Mo., I have written three letters each, relative to the question. Out of the six letters I have received one from 597, advising me who was their delegate to Legislative Board, under date of Jan. 5, 1905. Now, as my Brother writes from St. Joseph and does not sign his name, I presume that he is a member of one of the two Divisions located there, and also seems to be familiar with R. S. of M. 1899, Sections 2864, 2865 and 2866.

Now, Brother Editor, if you will please allow this to appear in our JOURNAL for the purpose of advising my St. Joseph Brother what has been going on and what we would like to do, and trust that our St. Joseph Brother may be able to get into action so that altogether we may get in condition to bring about a cure of some of the evils our St. Jo. Brother complains of.

JOHN LAYBOURN, Chairman,
Missouri State Legislative Board.

Shorter Hours--Sunday Rest.

ST. LOUIS, Mo., March 4, 1905.

EDITOR JOURNAL: While the air is rife with the question of rate legislation, and while the time is opportune for us to act on the question of shorter hours, are we going to sleep and let the opportunity pass? Is it possible that it is of so little concern to us, and are we to pass on through life knowing no Sunday or holiday, living in overalls and eating cold lunches? The President of the United States has recommended to Congress that our hours be shortened, all for what—for the safety and welfare of the railroad man and the traveling public. I fear we do not fully realize the value of President Roosevelt as a friend and benefactor, a man fearless and determined in his convictions, a man of the finest human feelings, and a fighter from the word go. Doesn't he look it? And so when we have such a man to champion our cause, why not act? I am not advocating that we can adjust matters so that we may go to work by the whistle and quit by the whistle, but conditions can be very much improved in our favor. Some men are on a three-hour run and some are on a thirty-three-hour run, and that is unjust and unfair.

An engineer's life is short at best these days of hundred-ton engines. We are well organized, yet the individual engineer is about as completely disorganized as he can be. He sleeps, eats and works at the will of others, and let me say that the Brothers who are arguing for better attendance at Division meetings have the cart before the horse. An overworked engineer is not coming to the meeting, and if he does he is of little use there, and glad when it is over with.

And now I would like to see the Brothers lay aside their gloves and *noms de plume* and let us know what measures, if any, will be taken. It is a foregone conclusion that we cannot afford to take shingles from our own roof to support those who wish to reduce rates. But are we justified in pushing our demands for the adjustment and shortening of hours?

GEO. A. CLARK.

Railroad Employees' Home.

HIGHLAND PARK, ILL., March 1, 1905.

Communications for publication must be written on one side of the paper. Noms de plume are always permissible, but to receive consideration must be signed by the full name and address of the author, and addressed to the Editress, MRS. M. E. CASSELL, 927 Dennison Av., Columbus, Ohio, not later than the 8th of the month.

The Editress reserves the right to revise, reject or use matter sent in, governed entirely on its merits.

The Brighter Path.

Let's journey where the path is smooth,
And not through ragged stubble;
Let's try to think that on ahead
There is no bridge of trouble.

Let's journey where the skies are blue,
And where the sun is shining;
If any cloud shall dark our way,
Let's find the silver lining.

Let's hold to hope, although we tread
Through paths where thorns are growing;
Beyond are fields of restful green,
Where roses fair are blowing.

Let's listen not to idle tales
That poisoned tongues are bringing;
Let's lend our ears unto the songs
That joyous birds are singing.

Let's not be burdened by a care
Of dreaded, unseen sorrow;
Let's do the work we have today
And bravely face tomorrow.

Let's try to light the weary load
Of sorrow-laden mortals,
And by our love, help them to find
The way to Heaven's portals.

FRANCES.

Good Cheer.

In the course of our lives there must be many times when thoughtless words are spoken by us which wound the hearts of others, and there are also many little occasions when the word of cheer is needed from us and we are silent. There are lives of wearisome monotony which a word of kindness can relieve. There is suffering which words of sympathy can make more enduring, and often even in the midst of wealth and luxury there are those who listen and long in vain for some expression of disinterested kindness. Speak to those while they can hear and be helped by you, for the day may come when all our expressions of love and appreciation may be unheard. Imagine yourself standing beside their last resting place. Think of the things you would have said of them and to them while they were yet living. Then go and tell them now.

GUIDE, Div. 35.

The Other Side.

MADAM EDITRESS:—I have waited for some time to see an answer to the wail of our Sister from Canada, but not having heard from a more able source, I shall have to say a few words in explanation of the queries from our worthy Sister—from my standpoint. If the Sister will go carefully over the roster of delegates that attended the last session of Grand Division at Los Angeles, she will find that out of 266 Divisions represented, there were but five Sister representatives from Canada, and this covered all Divisions of the G. I. A., located in Canada at that time.

Notwithstanding the fact that some of these Divisions had been instituted for years, and that Canada had been honored by having had an elected Grand Officer for half the number of years the G. I. A. had been in existence, there was very little interest shown in advancing the cause of the G. I. A. in that locality. Now I consider every member of the G. I. A., if she be a true and loyal Sister, has an incentive to work for the good of the Order, whether she is a Grand Officer or merely a private in the ranks. And when

it comes to a question of recompense—and Sisters are interested only as far as may be covered by the almighty dollar—then we may not look for much enthusiasm, and the Order would soon cease to exist.

It is true there are a few Grand Officers who receive salaries, but if we are capable of estimating the amount of work done by them we will understand that money cannot be the only incentive.

Take our Grand President, for instance, who must be prepared to go whenever and wherever called upon. Her journey may reach from ocean to ocean, but she must be ready to sacrifice her own pleasures and conveniences at all times to meet the demands of her Sisters. It may be to adjust a real or fancied grievance, to organize a new Subdivision, to attend a school for instructions, or a union meeting, but always with one thought and one grand purpose in view—the good of the Order.

I believe in equal rights and justice to all, and believe that Canada should be visited by Grand Officers, but would suggest the better plan would be to appoint a time for this visit, and extend an invitation. I am sure that any Sisters visiting in Canada could be assured a cordial welcome. Still, it is in my opinion a breach of etiquette to make a formal visit without an invitation.

The way we do on this side the line is to club together and appoint a time, then invite those we desire as our guests. And I am sure if the Sisters in Canada should select some point on which to concentrate and let their foreign Sisters know they are expecting them, there will be no occasion to resent the indifference of the Sisters, or their lack of international courtesy. No great object was ever accomplished by waiting for something to turn up. If we sit down and wait for others to give us some incentive to work we will be groveling at the foot of the ladder all the time and never climb any higher. We should strive to attain eminence, not by pulling others down, but by lifting ourselves up.

The fact that a vote was taken with the

result that we give to Canada one of our most complimentary offices was a courtesy of which they should feel proud. And when we consider that Canada, with her few representatives, succeeded in capturing one of our honorary Grand Offices, it proves the interest taken in her by the Sisters who conceded her this privilege, and that there was no lack of consideration for Canadian Divisions. Also the Sister should congratulate Canada on having secured such a capable and efficient Grand Officer as our worthy F. A. G. V. P. has proven herself to be, and from whose efforts in successfully harmonizing the interests of those eligible to membership in Canada we hope to produce many more delegates to the next convention. And we also hope the grand work she will have done in Canada will be a great incentive to her Sisters, to give her a helping hand and a word of encouragement and good cheer. You know, Sisters, it is so easy to sit back and watch the faults and failings of others, and they always look so much greater when we are in a state of grievance ourselves. But if we could only lay aside this spirit of fault-finding and unfairness, and look through the windows of charity and unselfishness, we would see that nothing is due us except what we strive to attain by our own efforts. Let us not condemn others for supposed failings, but rather lift them up, and by so doing elevate ourselves to a higher standard. The sunshine of life is made up from small things, and courtesies of a trivial nature are the ones that strike deepest in a grateful and appreciative heart. Life is too short to waste in misunderstandings. We should realize that the great secret of success in any enterprise is always to look forward toward higher and better conditions, and never backward in vain regrets.

Let us take up the march for progress in spirit and in truth, and plant our banner wherever there is a Division of the B. of L. E., and if we work hand in hand to accomplish this great result we will be international in our purposes, and loyal to our principles. Adieu until we meet again.

MINERVA.

History of Helping Hand.

July thirteenth, eighteen hundred ninety-one,
Our Division was organized in the city of Clinton;
In selecting a name for this jolly little band,
We all agreed upon the one proposed of "Helping
Hand."

On the charter then we placed twelve names and
no more,

After which we were organized by Sister Mary
Orr.

Five of the original charter members still remain,
Three left us at one time, but soon came back
again.

Our membership grew from this I am told,
Until we had sixty-seven enrolled.
Then came a time when about twenty-three
Called for their cards, both kinds you see;
Two have been called to the other shore,
So that now our list numbers just forty-four.
We started a sewing bee to make a few dollars,
Pieced quilts, made aprons and all kinds of col-
lars.

We met twice a month at a Sister's to sew,
With needles and thread, and gave ten cents to go.
This small sum each one was expected to pay,
To buy the material to work on next day.
The faithful few worked with nothing to mar,
Until we had articles for a bazar,
Cards were played, lunch served and everything
sold.

And fifty-four dollars in our coffers were rolled.
The new year has come, our officers elected,
And each one in her place will now be expected,
Because the Inspector, as you surely remember,
May come any time from May to December.

On January twelfth we boarded the train,
To assist in forging a link in Champaign.
Sister Murdock organized, and her work was well
done.

Assisted by Division eighty-six and also ninety-
one.

The work was all given that same afternoon.
At night came the banquet—not any too soon,
For the Brothers were hungry; and we know that
at least

Forty couples sat down to partake of the feast.
After all were refreshed, and officers installed,
We danced the quadrille, which a good Brother
called.

Sister Murdock enjoyed the sport in all ways,
And partook of the lunch with the Chief, Brother
Hays.

Too soon the night ended, and good-bys were said,
Yet in memory will linger the time that has fled.

Each Sister gives a nickel on every meeting day;
We put it in our mite box, to use in some good
way—

To buy the pink carnation—our order's chosen
flower—

To send to loved ones who are ill, to cheer the
lonely hour.

A new piano now we want (the secret I will tell),
For we have a good musician—her name is Sister
Shell.

With this end in view, we gave another ball
On the fourteenth day of February, in the K. of P.
Hall.

We learned this was the birthday of our dear
Grand President,
And to her an invitation we then most gladly
sent.

The Sisters marched together, with four Marshals
at the head.

The drill was very pretty; the music fine, they
said.

The young and old both gaily tripped the "light
fantastic toe"

Until two in the morning, when it was time to go.

Dear Sister Cassell, if you're kind, perhaps we'll
come again,

If for this in the JOURNAL we do not look in vain.
A MEMBER, Div. 86.

Unkind Words.

Unkind words may be forgiven, but
long years go by and they are not for-
gotten. We who spoke and they who
heard may desire to have them drop out
of remembrance, but they come back to
thought again in spite of us and hinder
love. How brief the gratification of their
utterance! How indelible their record
on the heart!

"It doan' pay to do much talkin' w'en you' mad
enuff to choke,
Kase de words dat stings de deepes' am de ones
dat's neber spoke;
Let de other fellow wrangle till de storm am
blowed away,
Den he'll do a pile ob thinkin' 'bout de things you
didn't say!"

There is a great deal of truth in this
homely little rhyme. It is said that "a
soft answer turneth away wrath," and
every one of us who has tested the saying
knows its truth. Many times, however,
it is wiser to omit even the "soft answer"
and keep still until the tide of anger has
turned and is ebbing away. No matter
how great the provocation, do not give
way to feelings of revenge and hatred;
meet a sharp, undeserved, unwarranted
retort serenely; keep still. You can do it,
and the second time will be easier than
the first. There will not be many times,
because as you gain a more perfect poise,
as thoughts of good-will and kindness
come to be second nature to you, you will
surely find that you receive exactly what
you send out. This is not speculation,
dear friends,—it is a truth that each one
of you may test.

FRANCES.

Commendation.

DEAR EDITRESS: What is the matter with Conemaugh Valley Div., 89? It never speaks to us through the JOURNAL, and I suppose the Brothers and Sisters all over this broad land think it is dead or gone out of existence. This is to be deplored, as we know it is still in line.

Its members have the ability to write, but I presume they are afraid of the waste-basket, so at the risk of being told to mind my own business I will tell what I know, in hopes that they will wake up and tell the rest.

In the past seventeen months they have initiated sixteen members, and held a union meeting last fall, which was largely attended by Sisters from a distance. They have given liberally to charity, and held a festival, at which they cleared a good round sum of money. They have also had several social meetings, where we all felt at home and had a good time. They have a good set of officers, who are working hard to increase their membership.

We feel proud of our Auxiliary, and the great good it has accomplished here, and trust it will continue to grow and prosper until every engineer's better half is enrolled under its banner.

ONE OF THE BOYS.

Such words of commendation should be gratifying to our sister Division, for it shows to us that this Division must be living up to our principles.—EDITRESS.

The Locomotive's Call.

Over the hill by a sparkling rill
Is a cottage quaint and small,
And a maiden fair is lingering there
By the leafy maples tall,
Watching the swerve of the distant curve,
Her sweet eyes the truth confess,
For brave Jack Greer is the engineer
On the Limited Express.

"O-o-o, O-o-o, Ooo, Ooo! I'm coming, Lou!"
She knew that whistle well,
Crossing the shade of the dewy glade,
Through the green and wooded dell.
With handkerchief raised she steadily gazed,
For he'd watch, she rightly knew;
Then swiftly it whirled o'er her sunny curls
Ere he vanishes from view.

"O-o-o, Ooo, Ooo! My darling Lou!"
She hears from the distant glen;
The sweetest lay his lips could say,
Her Jack, the prince of men.
And listening now, "O-o-o, Ooo, Ooo, Ooo,"
Comes floating o'er hill and dale,
Its meaning she knew, "I love you Lou,"
She had oft been told the tale.

"Ooo, Ooo, Ooo! Farewell, my Lou!"
But never a tear she shed,
He would come back o'er the glistening track,
There was nothing to fear or dread.
"O-o-o, O-o-o!" How faintly through
The mountains its echoes resound,
And distance was naught when her Jack she
thought
Had his hand on the throttle sound.

"O-o-o, O-o-o, Ooo, Ooo! Meet me, my Lou!"
And a light in that cottage clear
Gleaming over the hill, sends a happy thrill
To the heart of the engineer.
They meet at night when the moon shines bright,
That maiden and lover tall,
Where fond vows are made without the aid
Of the locomotive's call.

MARY ELLA LAWRENCE.

A Visit to Atchison.

At an early date in January our President, Sister F. A. Hurlburt, received a letter from Div. 233 inviting our Division to attend their installation of officers Jan. 17. The invitation was accepted and a committee of three, consisting of the President, Vice-President and Insurance Secretary, procured transportation, and on the morning of January 17 Sisters Hurlburt, Christy, Ellsworth, Johnson, Cookson, Pickett, Fitzpatrick, Boyer, Naughton, B. Hurlburt, Addison and Master Clement Fitzpatrick met at the depot and took leave of absence from our city for one day en route to Atchison, Kan. We arrived there on time and were met at the depot by a committee and were escorted to dinner to which we did ample justice, as I suppose most of us were in such great haste that we had not breakfasted for fear of getting left, having to take the early train. We then registered, and providing ourselves with toothpicks sallied forth to the hall. There we met all or most all of the dear Sisters (also the new baby, Master Geo. Buford), and we were truly glad to be with them again. We had a very nice visit of two

hours and then had the pleasure of seeing their work, which was done in a thorough and beautiful manner. Great credit is due their past officers for the manner in which they have conducted their Division, and I must say something of their pianist. She is certainly up to date, and music is so much help upon all occasions. There were also present some wives of the B. of L. F. and others, one, a belle of K. O. K. (Miss Eda Ferguson), visiting Sister Buford.

We are very proud of Div. 282, as I, accompanied by Sisters of Div. 150, organized them two years ago. After closing lunch was served, and such a lovely lunch, and the way our Sisters did eat! Please, Atchison Sisters, don't think we had been fasting for the occasion, for we had not. And now, Sisters of 282, we are real proud of you as we feel you are more closely related to us because we organized you, and in the manner you conduct your work and Division and your sociable and entertaining ways, all of which will be a lasting memory to us all. We also extend thanks to General Superintendent Mr. E. A. Gould, and Master Mechanic Mr. Wm. Naughton, of Mo. P. R. R., for our transportation.

MRS. I. L. ADDISON, Sec. Div. 150.

Study Club Program for April.

Quotations—Current events.

"A noble effort never dies. What though we fail, its fire will give desire in others' hearts to rise; and kindled there, it still will live.

We never die; for every deed that we have wrought will

Still remain—for good or ill, and sow the seed in other lives of joy or pain."

6. Express the best thought on some good book you have read the past year. Entertainment.

"Suppose we think little about number one; Suppose we all help some one else to have fun." (Day in charge of a member.)

The most delicate, the most sensible of all pleasures consists in promoting the pleasures of others.

Love and Fidelity.

The reading of the good times of other Divisions prompts me to let my pen slide for Div. 188, Jackson, Tenn.

The year 1904 was a sorrowful one for us. In May we lost everything we had by fire—all our paraphernalia and our piano. These we soon replaced, but our greater loss was in the taking away of our good Sister Tate, who had been our President for six years.

We started out in 1905 with love and fidelity as our guide. With these two principles for our watchword, we should accomplish much. Love laughs at philosophy and sends theories to shelter. It makes poverty beautiful; it conquers selfishness; it is victorious over sorrow, and far better than all, it conquers sin. So to love is given credit for bringing humanity the greatest happiness. So let us say we love the G. I. A.; we love to go to the meetings, and we love to work for it, and see what love will do for us.

I must not forget to tell you of the clipping party we held at Elks' Hall, January 17. Strings were stretched around and across the hall from which suspended paper bags and packages of various sizes, which contained some useful as well as pretty little articles. We charged 10 cents per clip, and 10 cents admission. The refreshments were served free, which consisted of black coffee, sandwiches and wafers. After spending an evening full of enjoyment, we returned to our homes,

delighted with the nice little sum we had realized, which we were glad to add to our treasure.

New members are coming in quite often, we are glad to say. After our initiation and order of business, we usually serve refreshments and have a pleasant time socially.

At our last meeting we presented Sister Rose Smalley with a Bible, as a token of our appreciation. She has been our Treasurer since 1895, being always unanimously re-elected.

I can scarcely remember when I joined the G. I. A., but in 1896 I joined the V. R. A. I hope the time will not be long when every one in Div. 188 can say, "I have joined the V. R. A."

This is my first attempt to write, so I fear if I don't stop just here you will never want to hear from me again.

DELILAH.

Notice.

There will be a School of Instruction held under the auspices of Div. 133 at Pittsburg, Kan., on April 19 and 20, in I. O. O. F. Hall. Our Grand President has consented to be with us, and we extend a cordial invitation to all neighboring Divisions to come and meet with us.

Div. 133.

New Divisions.

DEAR SISTER EDITRESS: While others have been writing of new Divisions organized, and social doings of older ones, there has been no scarcity of social enjoyments in this city. On Dec. 10, Div. 612, B. of L. E., was made sponsor for an Auxiliary which will be known as Vandalia Div. 345, G. I. A. The honor of organizing belongs to Mrs. Mary Mead of Sunlight Div. 289, she being the organizer for this system, assisted by members of Div. 4, who turned out *en masse* for the occasion, exemplifying the ritual work and doing all in their power to instruct the new Sister Division. The privilege of selecting a name was given to Sister St. Clair, and the name of Vandalia was chosen by her as most appropriate, which was unanimously adopted by the new Sisters.

There was a reception given in the evening, one of the features being the installation of new officers. After this a program was rendered, consisting of instrumental music, songs and short talks for the good of the Order by those present.

Refreshments were served during the evening. There were 150 plates laid, and nothing was left undone in this line as well as other enjoyments of the evening. The party dispersed about midnight, and every one felt a good day's work had been performed.

The world cannot produce a nobler, braver army of men than the Brotherhood of Locomotive Engineers, and we, as their faithful, loyal helpers, should give them our best thoughts, and strive to make the social side of their lives as pleasant as possible, to offset the toil and dangers that surround them when absent from home in the discharge of their duties; to give encouragement to the aims and purposes of the B. of L. E.; to assist them by lending a helping hand in time of affliction and trouble is the object for which we are banded together. And as our light has not been hid under a bushel it has become well known that the most interested and thoroughly alive of B. of L. E. Divisions are those which have an auxiliary, not the ones "in name only," but a real wide-awake, whole-souled, genuine helper, who strives by unselfish and charitable motives, to live each day in the knowledge of having a worthy object in view, and having espoused the cause of the B. of L. E., let us live to the fulfillment of our purpose. As a pleasant home must be harmonious, so the home of our Auxiliary must be in harmony to succeed. Each Sister must remember to do unto others as she would wish others to do unto her, and a close observance of this golden rule will bring its own reward. And with kindest wishes for the prosperity of Vandalia Div. 345, and the hope that the officers and members will strive to cultivate the grand principles of our Order in their daily lives, and ever be found loyal to their obligations as Sisters, is the earnest wish of

Yours in F., L. and P.

MRS. HARRY ST. CLAIR.

SISTER EDITRESS: Since writing you we have formed a few more links in Canada. It was my pleasure to respond to a call from Belleville in December to organize a "Loyal" Division of the G. I. A. to the B. of L. E. in that city. We started with sixteen members with the charter open for two weeks, as one or two ladies who expected to be with us were detained through illness. The ladies of Loyal Division were fortunate in being able to fill all offices with bright, capable women. I expect this Division to grow in numbers and to help the good work along. Their very name inspires confidence in their action.

On January 18, I proceeded to Richmond, Quebec, where we organized with twelve members. Here, again, we left the charter open for a short time in order to give some of the ladies who live out of town an opportunity to come in. The ladies of Richmond take the work up readily, and I feel sure we will have in them a band of willing workers.

On returning to Montreal, where the ladies were in readiness to make a grand start, we organized on January 25 with thirty charter members.

Mount Royal Division will, I believe, in a very short time, come up to, if not outdistance any Division I have yet visited. Starting as they did, with a full set of regalia, and with the idea of going through all the work and doing it right, they will very soon be in full working order. I feel that, as organizer, my most grateful thanks are due to all these Brothers and Sisters for their kindness extended to me. Nothing could exceed the courtesy extended to me on all occasions. With the very best wishes for the success of these Divisions and the hope that Canada will soon have a Division in every railroad center, I am yours sincerely in F., L. and P.

A. A. SPROULE.

SISTER EDITRESS: There is an old saying that all things come of those that wait, and certainly it has proved true in this instance, as the Auxiliary is a substantial fact in connection with Div. 89, B. of L. E., situated in that grand old City of Montreal, the largest city

of the great Dominion of Canada.

After many years of talking, and trying for, it has at last come, and what's more, it has come to stay, and Mount Royal Div. 348 is justly proud of its fine Auxiliary, which closed its charter with a membership of thirty-six names, the charter being left open only two weeks.

The entire work of soliciting and correspondence was done by Mrs. Harry Wheatley, and nothing was left undone to make it an entire success.

Mrs. Fred. A. Sproule, Fourth Ass't G. V. Pres., of Toronto, our Grand Officer for Canada, conducted the organization, after which she proceeded to install the officers.

Mrs. Sproule then instructed us in our work, and spoke to us as Sister to Sister, words that will not soon be forgotten, and we feel sure will bear fruit in the future, for several came to her after and said how her words of counsel did them good, that they never realized before what it meant to be a Sister in our every-day life.

When our organizer came to us we had everything necessary, our full regalia, badges, etc., even our officers elected, which gave the Grand Officer more time for instruction.

In the evening the new Auxiliary gave an informal "At Home" to the engineers of Div. 89, and they certainly let the Brothers see they were capable of running their Auxiliary.

The chair was taken by the President, Mrs. Harry Wheatley, and after a few words of welcome to the Brothers and friends present a short but select program was rendered. Mrs. Sproule was then asked to address the audience, which she did in her gracious and pleasant manner. She took the four pillars of our Order as the foundation of her speech, and spoke words so earnest and true of the great work all around us, and the good we could do banded together as Sisters, the influence we could have over a weaker fellow-creature, also the great help the Auxiliary would be to our husbands and sons, in helping them to do unto others as they would be done by, and how the Auxiliary Sisters must see to it that our husbands attended their Division meetings.

And as Mrs. Sproule stood before us in her dignity and grace, how proud we all were of our own Canadian Officer. We all felt Mrs. Sproule was the right woman in the right place, and when we realize that there is no remuneration in this work for Mrs. Sproule, leaving her home at all times and seasons, it gave us a glimpse into the deep soul of love she has for her fellow-creatures, and put us on our mettle to do all we could for each other in the future, bearing and forbearing. Several of the Brothers then spoke a few words to us congratulating us on our splendid organized Auxiliary, and wishing us all success.

One pleasant feature of the evening was a presentation to Mrs. Sproule of a case of solid silver coffee spoons with spray bouquet of pink carnations from the Sisters of the new Auxiliary, as a small token of their love and appreciation for the work she had done for them.

Mrs. Sproule had not the slightest idea there was a present on the wing, and her surprise and delight was most refreshing to the Sisters. In thanking them she told the Brothers they could never convince her that the Sisters in Montreal could not keep a secret.

Dancing was then indulged in until midnight when substantial refreshments were served, after which the company soon left for home, feeling they had spent one of the pleasantest evenings ever enjoyed, and glad they were members of Mount Royal Div. 346, G. I. A. to the B. of L. E. PRES. DIV. 346.

THE afternoon of January 12, 1905, witnessed the organization of Supreme Division 344, of G. I. A. at Champaign, Ill., Grand President, Mrs. W. A. Murdock, of Chicago, officiating. We had 27 charter members and elected the following officers:

Past President, Mrs. E. Clifford; President, Mrs. M. Isbell; Vice-President, Mrs. Bessie Howard; Secretary, Mrs. Margaret Hays; Treasurer, Mrs. Minnie Graney; Insurance Secretary, Mrs. Edith Fernald; Chaplain, Mrs. Alta Scott; Guide, Mrs. Esther Henderson; Sentinel, Mrs. J. W. Irwin; Musician, Mrs. Elizabeth Arie; Marshals, Mrs. Mary Turner,

Mrs. Georgiana Gillen; Pillars, Mrs. Olive Gray, Mrs. S. C. Scudder, Mrs. Fannie Sabin and Mrs. Fred Dunlap.

We were very ably ushered into the mysteries of the order by the assistance of members of Helping Hand Div. 98 of Clinton, and Strawberry Queen Div. 91 of Centralia. After the organization ceremonies were over, we were met by the Brothers and escorted to the Southern Hotel, where we were refreshed by a five-course supper, there being 80 plates served.

In the evening we had public installation at B. of L. E. Hall, and as soon as this was disposed of the hall was cleared and the evening was spent in dancing and general enjoyment, not excepting a treat of ice cream and cake.

Mrs. W. A. Murdock was presented with a large bouquet of pink carnations by the Brothers and a silver meat fork by the Sisters. Chief Engineer P. L. Hays presented the Division with an orange-wood gavel.

At our regular meeting January 26, Brothers of Div. 602 presented us with a beautiful new desk, and on March 1st Strawberry Queen Div. 91, of Centralia, sent us a Bible and drapes for the Marshals, for which we thank them very much. We also received a new trunk for our regalia from Brother J. Graney, and our charter nicely framed from Bro. P. L. Hays. C. C. G.

Division News.

THE ladies of the G. I. A. Club of Clara Barton Div., 237, Ogden, Utah, have very enjoyable times twice each month, when they meet at the home of a Sister and spend the afternoon in social chat and other amusements. The hostess always serves delicious refreshments. It has been the pleasure of the writer to attend gatherings at the homes of Sisters Freeman, Forrest and Lomasek. Sickness in my family kept me home from Sisters Veasy and Noble.

These gatherings are for the good of the order as they promote greater sociability than we could find by simply meeting twice a month in the Division room to transact our business. We have seventeen or eighteen members and as each member has her turn it does not make much work and is a very great help to the order. On one occasion we met and found that Sister Hinley could not be with us owing to the fact that a young engineer had arrived there a few days before to take up his residence. We very promptly went to the florist's

and ordered a beautiful bouquet of carnations and ferns sent with our congratulations and compliments of the G. I. A. Club.

Friday night, January 20, at the home of Brother and Sister Arthur McKellips, the members of Divs. 55 and 237 and a few friends were entertained right royally. Brother and Sister Neesly assisted the host and hostess. A number of games of high five were played, prizes being carried off by Sisters Lindsay and Staples and Mrs. Treasure Jackman.

The gentlemen's first prize fell to our esteemed Brother, John Forrester, consolation to Mr. Tom Jackman, while the booby was drawn for by Brothers Bogart and Lindsay, the latter cutting high, drew a very funny prize. I will not say what it was, for I don't think any of the boys have ever been there, consequently they would not know what it meant.

An elegant luncheon was served, and by the way Brothers McKellips and Neesly waited on table one would almost know they had served their apprenticeship at Delmonico's in New York or Boome in Utah. (?) The guests were treated to some very nice music, both vocal and instrumental (piano), which it is needless to add received the applause merited.

Brother B. E. Chapman presented Sisters Neesly and McKellips with handsome souvenirs and appropriate verses of the occasion.

It was early (the next morning) when we took our departure, all expressing a hope that we might live to enjoy many more such delightful evenings together. M. H.

RED RIVER VALLEY Div., 247, Grand Forks, N. D., has been quiet in the past, but we have decided to make ourselves known through the JOURNAL.

We enjoy reading of our sister Divisions and think they perhaps will be glad to hear that we are a flourishing Division with a membership of twenty-five.

A short time ago Sister Secord gave a measuring social, which proved a success socially and a neat sum of money was the result. Sister Secord and her husband are both elocutionists of no little ability and you may know by that that we had a fine time.

We made up Xmas boxes and sent to our B. of L. E. motherless ones and to others where sorrow had come into their homes.

The G. I. A. members were entertained recently by Sister W. F. Andrews, our retiring Secretary, in honor of Mrs. Frank Nicholson, of Hood River Valley, Oregon. Music, refreshments and genuine hospitality all tended to make the afternoon delightful.

In the future we expect to hold our sewing circle at each others' homes once a month. We want to be sociable and not let our interest lag.

A SISTER.

J. H. OHLHAUSEN Div., 80, Mauch Chunk, Pa., held a very successful School of Instruction on November 7 and 8. Sister Murdock, Grand President of the G. I. A., accompanied by Sister Smith, of Philadelphia, Grand Organizer and Inspector,

were present, and there were representatives present from ten different Divisions. Everybody seemed to enjoy the meetings, and much valuable information was gained. Dinner and supper were served in the hall by the ladies of the Auxiliary.

A reception was tendered Sister Murdock in Zellner's Hall, East Mauch Chunk, on the evening of November 7. Rev. A. J. Wright, Pastor of Memorial Presbyterian Church, East Mauch Chunk, presented Sister Murdock with a clock, made of coal, representing the anthracite coal regions of eastern Pennsylvania, in behalf of J. H. Ohlhausen Div., 80. Div. 257, B. of L. E., very kindly furnished the hall and music for the reception, for which we extend our hearty thanks. While here, Sister Murdock was entertained at the home of Past-President Sister Riley.

A farewell party was held for Sister Morrison, who was preparing to move to New York. The ladies of the Division presented her with a handsome rocker, as a token of their regard. Supper was served, which every one relished. Games and vocal and instrumental music were enjoyed by all present.

Lack of space forbids our going into any details about "Nellie's Chicken Coop" and "Riley's White Horse," although our genial President says all readers of the JOURNAL would be interested in them.

Sister Liggett entertained the members of the Auxiliary and their husbands at her pleasant home on Broadway. Everybody enjoyed himself, so much so that great reluctance to leave was manifested by some of the ladies, especially Sisters Willis and Fink.

You have not heard anything from us for some time, but you must not think from that that we are a dead order; on the contrary, we have a large and flourishing Division, constantly increasing, and working together in perfect harmony and love. COR. SEC., Div. 80.

THE tenth anniversary of Communipaw Div., 201, Jersey City, N. J., was celebrated in a fitting manner on the evening of February 18, to which celebration the members of Divs. 157 and 601, B. of L. E., were invited, with their families, Aux. 201 having members from both Divisions. The celebration was attended by prominent railroad men from all over the state. Representatives were present from Easton, Phillipsburg, Somerville, Dunellen, Roselle, Point Pleasant, Newark and Elizabeth. Mrs. George Jackson, President of Div. 201, delivered an address of welcome and introduced Bro. Charles Schroll, a member of Div. 157, as master of ceremonies.

The program included piano selections by Miss Mary Schroll; Joe Edmonds, eccentric comedian; Miss Mary Orthen, soprano solos; H. D. Wylie, Hebrew impersonation; Joseph Murphy, illustrated songs; Lester Dygert, Henry Wesp and T. E. Stevens, stereopticon views and lectures, and W. F. Markham, recitations.

The celebration was held in our Division room, and it was pretty well crowded. Refreshments were served after the entertainment, which were

pronounced excellent by the Brothers. The decorations of the hall were beautiful.

After spending an evening full of enjoyment we returned to our homes, hoping to attend many anniversaries of Div. 201. S. L. TUCKER.

THE year 1904 was very successful for Jewel Div., 231, Milwaukee, Wis. We put \$112.30 in the treasury, and used \$28.20 for charitable purposes. By the faithfulness of each Sister, we hope to have 1905 far surpass 1904.

The officers for 1905 were installed on January 11, and plans were at once formed to give a surprise party on our retiring President, Sister Mayberry. Our plans matured, and Thursday evening, January 19, was one of the most pleasant we ever spent. They say women cannot keep a secret, but Brother and Sister Mayberry can tell you differently. During the evening, Sister O'Keefe, our President, presented a very beautiful chair to Sister Mayberry, in appreciation of her good work during the past year. Cards were played and refreshment served, and the evening proved a very enjoyable one.

MRS. F. BUCHANAN, Cor. Sec.

MRS. W. E. HOYT Div., 125, St. Paul, Minn., gave an open installation of officers at Odd Fellows' Hall on Friday evening, January 6. The guests of the occasion were members of Divs. 274 and 323, G. I. A., and Div. 150, B. of L. E., and their families. Mrs. James Haley, S. A. G. V.-P., assisted by Mrs. E. E. Olds, Marshal, installed the officers. Mrs. Sullivan presented Sister Haley with a beautiful bouquet of roses on behalf of the Division, after which Sister Haley welcomed the guests in a manner which gave all present the feeling that fraternity entered largely into all of our lives and contributes much to our social well-being and happiness. Mrs. Smith spoke of the necessity for insurance, and the advantages to be derived from insuring in our own order. A fine musical and literary program was given, after which refreshments were served. CORRESPONDENT.

AGAIN I claim space in our JOURNAL to tell of some of the social functions given by Unity Div., 13, East Saginaw, Mich. On Jan. 12, 1905, we held a public installation with the B. of L. E. and families as our guests. Our officers were installed by Sister Mrs. James Hinds as installing officer, and Sister Mrs. Charles Elberts as marshal of the day. After this 85 sat down to a sumptuous banquet served by the ladies. Dancing was then indulged in until a late hour.

With the usual good attendance and hearty cooperation of officers and members, we look forward to a prosperous year. We will initiate two new members at our next meeting, and several others have signified their intentions of joining us.

On March 9 we are to give a musical and literary entertainment from which we hope to replenish our treasury. E. R. G., Sec'y Div 13.

AS WE are always glad to hear from other Divisions, we trust others will be glad to hear from

Div. 74, located at Boone, Ia. We have a membership of fifty-three.

Feb. 10 was the fourteenth anniversary of our organization. Each year on this date we invite the Brothers and children to supper and a social evening. Plates were laid for 120 for a 6 o'clock chicken pie dinner. The evening was spent in a social way, the young people favoring us with two short plays, music and recitations.

We have had the pleasure this winter of being entertained by two sister Divisions, Robert Quayle, of Clinton, Ia., and Belle Division, of Belle Plaine, Ia. But with our pleasures come sorrows. In the last year we have been called upon to lay two of our Sisters to rest. Fearing I have already said too much, I will bring my letter to a close.

CORRESPONDENT.

AS OUR Sister and Brother, Mr. and Mrs. Jos. W. Johnson, were going to leave soon for their new home at Meridian, Miss., the Sisters of Div. 295, Neodesha, Kan., and their husbands planned a very pleasant surprise by walking in on them, about thirty in number. The evening was spent in playing games, and refreshments were served by the Sisters, which all enjoyed very much.

Sister Johnson being the President of Div. 295, the Sisters surprised her with a Past-President's pin, in appreciation of her past noble work. The pin was presented by Sister R. Jett in a few well-chosen words, which Sister Johnson appreciated very much.

At a very late hour the guests, with many regrets, departed, bidding Brother and Sister Johnson farewell and wishing them success in their new home. MRS. M. W. LANSDOWNE.

THE ladies of Climax Div., 28, Erie, Pa., held a valentine party at the home of Sister Swartzfager. A musical program was given by Mrs. O'Brien and Mrs. Irvin. At 6 o'clock dinner was served. The tables were beautifully decorated with carnations and ribbons of the Auxiliary's colors.

Before departing the hostess was presented with an elaborate Japanese dish, at which the presentation speech was made by Mrs. M. Fitzgerald. The guests departed at a late hour, wishing their hostess happy returns of the day. A MEMBER.

A PUBLIC supper was served by Div. 155, Nashua, N. H., Saturday, March 4. An important item on the bill of fare was the clam chowder, made under the direction of clever Sister Goodwin, ably assisted by Sisters Clarkson, Batchelder, Hardy and Morey. Other members made themselves useful by being attentive to the wants of their patrons.

An attractive program was prepared and presented by the entertainment committee, consisting of Sisters Tigbe, Warren and Travers. Vocal and instrumental music and readings were well rendered, and received merited applause.

The young people participating were Ethel Thomas, Grace Copp, Gertrude Whitworth, Gladys Collins, Ralph Clarkson, Gertrude Batchelder, Virgil Marean, Annie Tigbe and Hazel Warren.

The audience was delighted with the phonograph selections by Mr. E. W. Swett, a B. & M.

brakeman, to whom the Division feels much indebted.

The whole affair reflected credit on the several committees, and we hope it may be one of many to replenish the treasury of
Div. 155.

SINCE I have been appointed correspondent for Star Div., 50, St. Louis, Mo., for the ensuing year, I will endeavor to give the Sisters some items of interest.

We have taken in several new members since the first of the year. Our enrollment now is about 35, of whom 30 are insured.

On January 11, the officers were installed by Sister May, assisted by Sister Sweet, of Mrs. Harry St. Clair Division, East St. Louis.

After the meeting refreshments were served, and I assure you we all did ample justice to the good things served.

The 16th of February we gave a euchre, which was a financial success. We had a very good time, and numerous as well as valuable presents were carried home by those present.

We have in project at this time a masquerade ball for the near future. We expect it to be a social as well as a financial success, if our committee can make it so. We know they are earnest workers, and that they will do all in their power.

This is my first attempt to write for the JOURNAL, and if this article finds space in your columns I will let you hear from our Division again.

Yours in F., L. & P.,

COR. SEC.

PARDON Div. 101, Missoula, Mont., for appearing again so soon, but as one Sister wrote, we have something out of the ordinary to report. About six weeks ago, the Sisters undertook to put the play entitled "The Deestrick Skule" on the stage. We had a merry time getting in trim, and when we were finally ready with our parts and costumes we represented the ideal schoolgirl of fifty years ago. Some of the best local talent of the city was secured, and jovial Engineer Joe Beebe was half the show all by himself. We had thirty characters in all, and they all did well and deserved the praise they received. The Opera House was full, and our door receipts were \$157.25. Our expenses were small, and we realized a good sum for our efforts.
MRS. M. L. CASE, COR. SEC.

IN looking through the columns of the magazine I don't think Div. 169, Birmingham, Ala., has ever been heard from. Our intentions were good, but each has left it for the other to do, and in this way no one has written. We have noted the progress and good time had by our sister Divisions, and while we haven't been heard from we have not missed any good times ourselves. I will for the first time give a small account of what we have been doing. We have a large and prosperous Division and all are hard workers. We have given quite a number of entertainments which were a great success, one a valentine party given at Sister Wheeler's beautiful home in which about 60 guests gathered. Euchre and finch were the special attractions and a flower guessing contest, the lucky ones receiving some pretty prizes,

and at the close a buffet luncheon was served, after which the guests and members took leave of Sister Wheeler thanking her for their nice time and her hospitality.

Then we gave a euchre and finch for the benefit of the Virginia mine sufferers, the prizes being donated. We cleared about \$35, which will be sent to them. We have been very busy since the first of the year working for the good of the order and its elevation. Wishing all sister Divisions a prosperous year, I remain,

Sincerely yours,

A MEMBER OF DIV. 169.

G. I. A. Voluntary Relief Association.

TOLEDO, O., April 1, 1905.

To Division Insurance Secretaries, V. R. A.:

You are hereby notified of the death of the following members of the Association, and for the payment of these claims you will collect 75 cents from each member carrying one certificate, and \$1.50 from each one carrying two; providing, however, that no one be assessed on a certificate, if the application for same was dated later than February 28, 1905.

ASSESSMENT No. 204.

Died Feb. 16, 1905. Sister Mary S. Harbridge, aged 51, of Div. 112, Philadelphia, Pa. Cause of death, hæmoplegia. Carried two certificates, dated March, 1892, and January, 1899, payable to Wm. A. Harbridge and John Berry, husband and son.

ASSESSMENT No. 205.

Died Feb. 28, 1905. Sister Margaret F. Drohan, aged 51, of Div. 313, Ludlow, Ky. Cause of death, lung trouble. Carried two certificates, dated May, 1895, and September, 1896, payable to children.

ASSESSMENT No. 206.

Died March 4, 1905. Sister Elizabeth Anderson, aged 52, of Div. 165, Chicago, Ill. Cause of death, endocarditis complicated with nephritis. Carried two certificates, dated June, 1901, payable to B. W. Anderson, husband, B. W. Anderson, Jr., son, and Myrtle Shepard, daughter.

ASSESSMENT No. 207.

Died March 4, 1905. Sister Ethelinda Coolman, aged 86, of Div. 78, Meadville, Pa. Cause of death, infirmities of old age. Carried two certificates, dated January, 1893, payable to Maurice M. and Charles R. Powell, sons.

Members will pay their Insurance Secretaries on or before April 30, or be marked delinquent, and in order to reinstate must pay a fine of 10 cents on each certificate besides the delinquency. Insurance Secretaries must forward to General Secretary and Treasurer not later than May 10, or stand delinquent till remittance is made.

Assessment No. 207 will be paid from the Assessment Fund.

Members in good standing Feb. 28, forty-nine hundred and one in the first class; and two thousand and forty-one in the second class.

MRS. GEO. WILSON, Pres. V. R. A.

M. L. ROBERTSON, Gen'l Sec'y and Treas.

Train Handling.

BY R. H. BLACKALL.

The following are points that may well be borne in mind by the experienced as well as the inexperienced in handling freight trains with air:

Know how many cars there are in the train, how many air brakes, how many are working, the tonnage, and that the piston travel has been examined. Perhaps you can't get all of this, but get as much as you can. The more you expect the more you get.

Know that the main reservoirs are drained, that the brakes on the engine and tender are working properly, and that the pump is doing its work.

If the train is to be let down a grade, try to pick out a suitable spot in the road before you get to the grade, in which to make a running test.

Make heavy reductions and keep the retainers "charged."

Make frequent applications and keep the train-pipe pressure as near the maximum as possible.

In releasing brakes always use full release position and leave the handle in this position as long as possible without recharging. If handling a long train, place the handle in release position and finally return to running position if in danger of overcharging. After leaving it there a few seconds, again place it in release position momentarily to release the head brakes which have probably reapplied due to a slight overcharge. After returning the brake valve handle to running position the second time, all brakes will probably remain off.

If a light application of the brakes has been made and it is then desired to make a release, it is, if possible, desirable to make a reduction sufficient to make the total fifteen pounds, if the train is a long one. This practice will greatly reduce

the number of stuck brakes as it accomplishes the same effect, as far as releasing is concerned, as carrying a higher main reservoir pressure. Many trains are stalled, or wheels are slid, because the brakes are applied with a light reduction and an effort made to release without without first making a further train pipe reduction.

If it is desired to make a release with a long train, when the speed has been greatly reduced, use the reverse lever to keep the slack from running out. The straight-air is the best with which to do this, but the reverse lever is a substitute if a release must be made without first bringing the train to a standstill.

If you get a poor handling train remember that an overcharge where the grade lets up may help you out where the grade becomes heavier. The overcharge can do no harm to the cars if they are loaded. It is only necessary to look out for the drivers in case a hose should burst, or it should be necessary to make a very heavy reduction. These can be protected by the judicious use of a little throttle.

Don't be afraid to call for help from the crew if there is any doubt about your ability to control the train with the air "A live coward (?) is better than a dead hero."

If the brakes are holding a little better than desired, do not try to kick off a few. You may get too many off and overdo the thing.

If you want to save time in getting water at a crane don't make a release and drag the train along for six or seven hundred feet. Get the slack bunched and make a heavy reduction, stopping as quickly as possible. Then cut off and run up to the crane with the light engine.

When cutting off from a train to set off a car or get water, always leave the brakes applied on the train when cutting off. By so doing it will be impossible to start the train when recoupled unless the angle cocks are properly turned. This does not refer to times when you expect to leave the train for some time. In such a case the train should be held, if on a

grade, by hand and a test of the brakes made when recoupled.

Don't figure on having the crew run the train with hand brakes and depend on you to stop the train if necessary. This may work in some cases, as where it is not necessary for all the brakes to be applied to control the brakes by hand, but you may be surprised if you have to stop quickly in response to a flag. With a hand brake applied, followed by the application of the air, the gain will be the difference between the power of the air as compared with that of the hand brake. If the brakes worked "opposite" the air would apply with a high power momentarily and then leak off through the leakage groove. If the brakes are properly maintained the air will do the work and it is better to have the control in the hands of one person. "Many hands spoil the broth,"

If a train stopped by air starts hard, take the slack and start gently. A train that it is brought to a standstill by the use of brakes is always harder to start as the shoes are hugging the wheels and need to be jarred free.

The first thing to be done, after tipping over a hill, is to reduce the train-pipe pressure sufficiently to obtain an accurate idea of the holding power of the brakes, and charge the retainers.

A two or three-pound reduction on a long train is throwing away so much air, as this amount of reduction will not be sufficient to force the pistons in the cylinders out beyond the leakage grooves and the brakes will not apply.

On a train of average length an eight pound reduction will give a cylinder pressure of approximately ten pounds. It takes about five pounds of this amount to compress the brake cylinder release spring; most of the power in excess of this amount is taken up in friction in the brake rigging, and very little braking power is obtained for the original reduction of eight pounds.

Twenty to twenty-five pounds reduction applies the brakes in full. If the engineer continues to deplete the pressure in the train pipe this pressure will be less

than that in the auxiliary reservoirs and brake cylinders and any back leakage will represent so much loss in braking power. It is this leakage which causes a continuous discharge at the train pipe exhaust port of the brake valve if the brakes are fully applied and a further reduction is then made.

If an angle cock is closed it is manifested if not too far from the engine by the train pipe exhaust being short in response to a given reduction as shown by the gauge.

To test for train-pipe leakage make a train pipe reduction and place the brake valve on lap. Do not place the brake valve handle on lap without first making a reduction, as by this method the feed ports in the triple valves are not closed and the volume to be reduced is the combined volume of the train pipe and the auxiliary reservoirs. With the reservoirs cut off the train pipe leakage will manifest itself much more quickly.

QUESTIONS AND ANSWERS.

Q.—A. S. G.—Can you tell me what would make my brake work the way it did the other day? The engine has the automatic brake, and the straight-air brake, too, and I was using the straight-air. I had put the automatic brake valve on lap and was releasing the straight-air, when all of a sudden the exhaust stopped and the brake stayed set. What I would like to know is what made the release stop while the straight-air brake valve handle was in release position.

A.—The action described was probably due to a leak in the train pipe. With the automatic brake valve on lap, the train-pipe leakage was not being supplied, and this leakage caused a response of the triple valve on the engine. The movement of the triple permitted auxiliary reservoir pressure to enter the pipe leading to the brake cylinder. When the pressure on the automatic side of the double check valve was slightly in excess of that on the straight-air side, the check shifted and shut off the passage from the brake cylinders to the straight-air brake valve. This caused the release of the brakes to cease, as you described.

Had you placed the automatic brake valve in release position momentarily, the triple piston would have been forced to release position and the brake would have released.

Q.—F. D.—We had a little discussion as to the best way of testing a train for train-pipe leakage, and would like your idea as to which you think the best way.

A.—The best method is to make a 7-pound reduction and place the brake valve on lap position; then watch the black gauge hand to note the fall in pressure per minute. This reduction represents the result that will follow the application of the brakes. The method sometimes followed is to place the brake-valve handle on lap without first applying the brakes. By so doing, the leakage in both the train pipe and auxiliaries is indicated by the gauge. This is not what is desired, as it does not represent the conditions that will exist after the brakes have been applied and the triples have moved out sufficiently to close the feed ports of the triple valves and have separated the train pipe from the auxiliary reservoirs. The leakage will apparently be much less when making the test by the latter method, as the volume will be very much greater and the leakage would necessarily have to be increased to indicate a condition that would result with the former test.

Some engineers watch the operation of the pump to tell the condition of the train pipe as to leakage. This has the same objection as the second test. It is also objectionable as no two pumps will necessarily do the same amount of work for a given number of strokes, and a difference in the length of the train would make a radical difference in the idea gained by the number of strokes the pump made to maintain constant pressure.

Q.—H. D. V.—What is the matter with an air pump when it makes a quick and then a slow stroke, and almost stops when it has reached the end? Is there anything to do on the road to get a pump going when it acts this way? I had one that did this the other day, and didn't get a chance to see what was the matter after I left her at the end of the run.

A.—The defect which causes this action is a stuck discharge valve in the air cylinder, or a partly closed passage between one of the discharge valves and the pipe connection to the main reservoir.

The stuck discharge valve difficulty could be rectified if you had time to take out the valve cage and clean it. If you do not have sufficient time to do this, you might put some oil into the air cylinder. The oil might soften up any dirt which is causing the valve to stick, and get better results during the remainder of the trip, but this practice can only be considered as a temporary relief. When the pump acts as described, it is almost invariably necessary to remove the cage, and clean same, before the pump will make even strokes.

Q.—F. D. W.—I notice on one of our new engines that they have a new kind of triple valve on the tender. It is a plain triple valve, but is like the one used on the engine. What is this used for? Is there any difference in its operation?

A.—The Westinghouse Company manufactures only two kinds of plain triple valves for use on engines and tenders. These supersede the ones formerly used. The two types now used are known as the F 46 and the H 24. The former is used in connection with cylinders having a diameter of twelve inches or greater; the latter size is used with cylinders less than twelve inches. Both of these triples are used on either engine or tender, according to the size of cylinders employed. They are also used on the engine to operate both the driver and truck brake, the size of the driver-brake cylinders determining the kind of triple valve to be employed.

The use of the two kinds of triple valves not only reduces the number of kinds of triple valves carried in stock, but simplifies the piping as well.

Q.—T. H.—The engine I run slides the drivers if I take the piston travel up where it ought to be. Is there any way you can tell me of to figure the braking power without knowing much about the subject of levers that are used?

A.—Multiply the long end of the lever attached to the piston by the power act-

ing on the piston and divide the product you obtain by the length of the short end of the lever, the length, in each case, being taken from center to center of the pins and fulcrum.

To find the power acting on the piston, multiply the inside diameter of the cylinder by itself, and multiply this product by the decimal .7854. Multiply this product, which is the area of the piston, by the pressure acting on the piston when the brake is fully applied. This pressure is figured as fifty pounds with a plain triple valve.

The result of the above will be the braking power on one side of the engine, and this multiplied by two will be the total braking power. Divide the total braking power by the weight of the engine on the drivers when ready for the road, and this will give you the per cent of braking power. For a simple engine, this should be 75 per cent; for a compound engine, it should be from 45 to 50 per cent.

Q.—G. F.—If a man is handling an air train of 75 cars, and wants to be sure to get all the brakes on, how much train-line reduction should he make?

A.—Not less than ten pounds. With a fifty-car train not less than a seven-pound reduction should be made if it is desired to obtain all of the brakes.

Q.—F. H. J.—I understand that freight cars are braked at 70 per cent of their weight when empty, and the percentage of braking power to the whole weight when a car is loaded is reduced to something like 20 per cent. Is there any way that the braking power can be raised when the car is loaded?

A.—Patents have been gotten out on numerous devices to take care of this point, but none of the schemes presented have contained sufficient merit to warrant their introduction after trial. To have a device of this nature a success, it must be so constructed as to perform its functions satisfactorily. It must also be of such a nature as not to interfere with the brakes in use at present, as well as to have all of their good points.

The means of obtaining greater train

safety on heavily loaded trains at present consists in raising the train-pipe pressure. This provides a means of stopping more quickly in case of necessity, and provides a greater leeway for a slight loss in pressure at each recharge when descending short but heavy grades. This is of little aid, however, when the grades are both long and heavy, since a point will finally be reached where all of the extra pressure will have been lost. Where these conditions exist, it is necessary to shorten the trains to permit a quicker recharge. The tonnage that can be handled is increased on some roads by raising the percentage of braking power, but this cannot be said to be the general practice; 70 per cent is the usual braking power.

Q.—M. A.—I would like a little information on the following. I had a train the other day that was all right, as far as I could see, until we came to the hill. The brakes seemed to take hold all right when I first applied them after coming over the top of the hill, and kept the speed about right for two or three miles. I struck a flag about this time and made another reduction to stop, but the brakes didn't respond to the reduction as I expected them to. The speed didn't seem to pick up very much, but it didn't slow down, and I had to blow for brakes and the crew stopped me. I would like your idea of why this was.

A.—From your description, we judge that you made but one application of the brakes from the time you "tipped" over the hill until you came to the flag, two or three miles from the top of the hill. The following is probably responsible for the action described:

The original reduction you made was sufficient to check the speed of the train, and the leakage in the train pipe was sufficient to cause what leaks existed in the packing leathers in the brake cylinders to be fed. The speed of the train remained practically constant, but your pressure was gradually being reduced, with the result that when you desired to stop, your pressure had been depleted to such an extent that there was not sufficient to apply the brakes with a force that would stop

the train. It was probably a fortunate thing that you were flagged, for the pressure might have been depleted to such an extent that the train would have been out of your control by the time you found it necessary to blow for brakes.

This is one of the things that is likely to happen to engineers where the handling of trains by air is in its infancy. It simply means that after the first reduction the leakage is running the train until such time as it is out of the control of the engineer to stop entirely. It should always be borne in mind that all of the packing leathers in the brake cylinders leak more or less, and an engineer should not attempt to make long runs without recharging. A point should be made of keeping the train-pipe pressure as near the maximum as possible at all times. Make frequent recharges, and make comparatively heavy train-pipe reductions to obtain a high brake cylinder pressure, and then permit the retaining valves to bleed the cylinder pressure down slowly while the recharge is being accomplished. As the saying is, "keep the retainers charged."

The trains in which the leakage is only sufficient to maintain a constant speed are the treacherous ones. The ones with the bad leaks will apply the brakes quickly when a reduction is made and the brake-valve handle returned to lap, thus making it necessary for a release to be made to prevent the train from coming to a standstill. While bad train pipes are not at all desirable, they will, in many cases, keep a beginner in the air brake art out of trouble, for the bad leak will compel him to handle the train in a manner that will necessitate frequent recharges.

Q.—W. M.—Can you tell me why it is that they don't use a reducing valve in the air signal system that will charge up the signal pipe quicker? It seems as if the signal would work better if the line charged up quicker.

A.—There are two or three roads that have equipped a few engines with reducing valves that would accomplish a recharge more quickly. This is not a general practice, however.

The objection to a quick recharge is that a sudden increase of pressure tends to destroy the suddenness of the reduction, made by pulling the discharge valve. In long train service, especially, the signal valve is likely not to respond.

If the signal pipe is recharged quickly, it is necessary for the pressure on the two sides of the signal valve diaphragm to equalize by the close-fitting stem of the signal valve before the signal can be operated. Failing to do this, a reduction of pressure in the signal pipe may not effect a response of the signal valve and whistle.

MEDALS FOR RAILROAD HEROES

A bill, introduced by Representative Mann, has just passed the House and Senate. This bill provides for suitable bronze medals of honor for heroes, and its aim is "to promote the security of travel on railroads engaged in interstate commerce, and to encourage the saving of life."

The first section of the bill authorizes the President to have prepared "bronze medals of honor, with suitable emblematic devices, which shall be bestowed upon any persons who shall hereafter, by extreme daring endanger their own lives in saving, or endeavoring to save, lives from any wrecks, disaster or grave accident, or in preventing or endeavoring to prevent such wreck, disaster or grave accident, upon any railroad within the United States engaged in interstate commerce." The bill provides further that awards shall be given only under careful regulations.

The President is further authorized to issue to the winners of such medals "a rosette or knot, to be worn in lieu of the medal," and provision is made for renewing this rosette or knot whenever it shall have been lost or made unfit for use without fault of the owner.

Engine Failures.

J. W. READING, DIV. 286.

GRAND RAPIDS, MICH., March 8, 1905.

The competent engineer reports to the roundhouse foreman any defects liable to give trouble, and if in the opinion of the party in charge the engine is all right for

another trip, there is only one of two things for the engineer to do, and that is to go out or lay off. Of course, he might quit, but he would consider that poor policy; and to get a lay-off so late in the day would hardly be probable, so it becomes almost a matter of necessity for him to violate the old rule of "in case of doubt, take the safe side." Our model engineer, however, endeavors to be on the safe side; at least, as far as his own personal interests are concerned. He does not fail to make his report in writing; nor does he fail to keep a duplicate copy of it, being particular to get date, number of engine and train, and any other information that might be of use.

As a matter of convenience, if not of necessity, the practical engineer always carries with him a small hand satchel, divided into two compartments, in one of which he keeps an extra collar, handkerchief, towel, brush, comb, memorandum book, scratch tablet, time book, pencil, etc.; in the other part will be found a few small tools, such as calipers, dividers, thread gauge, small flat file, three-cornered file, two-foot rule, wire-cutting pincers, small monkey and alligator wrench, and any other small tools, not too weighty and bulky, which in the engineer's judgment might be of great service in some kinds of work. The engineer in question has often found that the kind of tools named were of great convenience in certain kinds of difficulties. He knows of the time and labor saved in the matter of duplicating bolts and nuts by having the rule, calipers and thread gauge; and has found the dividers almost indispensable when a gasket must be cut, the other small tools mentioned often being of equally as much service in certain kinds of work.

The practical engineer believes in the old adage, "In time of peace prepare for war," and for that reason notes down in the memorandum book, heretofore mentioned, any circumstance occurring which at some future time might be the means of helping out when the question of his integrity or ability might be at stake.

This engineer has found the scratch

book of great value to the company at times in the matter of throwing off notes to the sectionmen, notifying them of bad places in the track, cattle in the right of way, fires, etc., and of no little convenience to himself should he want to drop off a message to an operator.

Many more things might be said of the value of the small "grip," but I think it sufficient to say that it does not weigh much, nor does it take up much space, and the engineman who formulates the plan of carrying one will soon get accustomed to it, and it won't be long before he would as soon think of leaving his home or his engine without his hat as without the small hand satchel.

Our model engineer and his fireman thoroughly understand each other. The stoker has not only been given careful instructions, but the reasons why such and such methods are best, and are intelligently explained. This engineer takes his fireman into his confidence, and seldom has trouble with him; in fact, he never has, if the fireman is gifted with a liberal amount of good, hard, common sense. The engineer expects his fireman to be on duty not later than himself, in order that time enough may be had to see that all supplies needed are procured, that lubricator, cans and lamps are filled, and all firing and other tools are not missing.

The fireman has been taught the necessity of continually keeping an eye on the amount of water the boiler contains. He is expected to use good judgment in the amount of coal used and the manner of putting it into the firebox. Experience has taught the engineer that best results are obtained by having the fireman pump engine around terminals and way stations, continually keeping the water level as high as good working conditions will permit, and governing the amount of coal used by the amount of water; good, level-headed judgment being expected to prevent so much coal being used that "pops" are continually being lifted, or that water and fire get down so that it is necessary to wait for both before pulling out of a station.

Everything being in readiness, the train is gotten under motion, the engineer working his engine as close as his time and conditions will permit, no water being fed into the boiler until the steam indications are right, or at least until a close cut-off is established, unless it should be a heavy grade with a poor steaming engine, in which case water is not allowed to get below a safety limit.

After leaving a station, it is the practice of our model engineer to work the injector on his side of the locomotive. If the weather is extremely cold, the fireman's instructions are to occasionally, say once in every thirty minutes, start his injector, let it feed a few seconds, then close it; close overflow valve, then pull the steam ram open quickly and allow steam to blow back for a few seconds, which heats the water in the hose and suction pipe. This crew has fully demonstrated the fact that the water in the suction and branch pipes will not freeze inside of an hour after the process described. The fireman understands that it is his business to keep his injector in condition between stations, and the engineer to perform a like duty while the fireman pumps engine when switching or lying on sidings. This engineer, whom we find striving to be a leader and who wants to be at the head of the procession, has found it poor policy to have one injector continually out of service; in fact, he has several reasons why it should not be done. First, if a heater is made of one of the injectors, steam must be wire-drawn through the throttle, which eventually cuts away the seat and valve; overflow valves not steam-tight are also channeled out; the tank hose is rapidly rotted away, and last but not least, when this injector, which has been a continuous heater for weeks, perhaps months, is needed on short notice there is almost sure to be trouble, and it is not an uncommon thing to have it fail entirely.

By investigation, our engineer has discovered that where water is continuously fed into one side of the boiler, the lime and dirt deposits fill that one side, while the flues around the opposite check are

comparatively free from sediment; and inasmuch as good circulation is necessary for free steaming, it becomes evident that the boiler with the feed water deposits all on one side steams less free as this one-sided accumulation increases; and how about the contraction and expansion of the flues where they are covered some distance from the check chamber on one side of the shell of the boiler and quite free from lime and mud deposits on the other? Our engineer has given this matter much thought, and adopted the plan of feeding boilers as described, and when it has been his good fortune to have an engine regularly consigned to himself results have exceeded his anticipations.

One other reason, and a very important one, why the fireman is not allowed to do all the pumping is, that should a new fireman be sent out, one with very little experience, the duty of feeding the boiler will devolve on the engineer, and as it is but human to forget, water may get dangerously low, if nothing more serious occurs.

(To be continued.)

Electricity—Dynamos.

BY EDWARD A. GRISSINGER, E. E.

As shown in the preceding paper, the simplest dynamo consists of but one coil in a two-pole field. This coil when rotated gives a current varying from zero to a maximum, and so on. To make the current direct, a two-part commutator was shown. For practical purposes, a dynamo generating a current which varied through such a wide range would be of no use. The voltage must remain constant. In order to accomplish such, the number of commutator bars must be increased, which means that the number of coils wound upon the armature is also increased. In direct-current armatures, there are usually as many parts to the commutator as there are groups of coils in the armature circuit. The earlier forms of direct-current dynamos possessed but two field poles, but modern machines from the smallest sizes up have four or more poles. With such number, the speed of the machines

has been materially reduced and other advantages gained, such as better mechanical arrangement of parts, higher efficiency and improved appearance. Eighteen hundred and 2,000 revolutions per minute used to be common speeds, whereas 400 and 500 revolutions were rare. At present, speed runs as low as 75 revolutions per minute for large sizes. The smaller sizes are made for different speeds, going as low as is necessary for direct connection to modern engines.

The simplest form of dynamo shown in the preceding paper was also the oldest form in that a current could be generated by virtue of the permanent magnetism of the fields—for in this case the two poles were those of steel magnets, which had been given their magnetism from some other source. The voltage of the machine, therefore, could not be changed readily, except by varying the speed. This type of dynamo is called a *magneto-electric machine*. In this form of machine the magnetism of the field is sure to diminish slowly by age, and is also liable to be weakened by hard usage. However, the form survives and has its largest use in telephone work, next to which every lighting company and others employ a magneto for testing purposes. Another serious disadvantage of such a form of dynamo is the fact that permanent magnets can never exhibit and retain anything near the magnetism that can be given soft iron and steel by separate excitation. On this account magneto dynamos are much heavier for a given output and correspondingly bulky.

The next move in the development of the dynamo is referred to as the *separately-excited* type. The magnetism is given to the field from an outside source, such as a primary battery or another dynamo, etc. This form of machine is illustrated in Fig. 1.

For convenience of illustration, I will confine myself to the two-pole form. In this cut I have substituted a commutator of more parts than shown in the simple form, and it will be noted that the field magnets have been drawn to resemble the horseshoe form. This is practically the

same thing as a regular bar type of magnet bent round upon itself. N and S are the poles of the field, the lines of force passing from right to left. A A are the brushes which are shown connected to an outside circuit, which circuit may include lamps, motors, etc. The direction of rotation is assumed to correspond to the movement of the hands of a watch, and the direction which the current will therefore take is shown by the arrows. B B represents the field coils in this case, through which a current is caused to pass from the battery C. The passage of this

FIG. 1.

current through the coils at once forms an electro-magnet, precisely as was shown in a previous article covering that subject. The poles of this electro-magnet are N and S. This electro-magnet produces, therefore, a field of force which passes through the armature, D. When the latter is caused to revolve, its conductors wound upon it cut those lines of force, and a current of electricity is at once induced in the circuit of the armature and that to which the brushes are attached. That current will be generated at a certain pressure or electromotive force, which latter will depend upon the speed of the

armature in revolutions per minute, the strength of the magnet field or the number of conductors or groups of same wound upon the armature. The latter quantity is constant in any given machine, and, therefore, to vary the voltage it would be necessary to vary one or both of the other factors. As it is usually impracticable to have a source of motive power of variable speed, recourse is had to the method of varying the strength of the magnetic field. This can be accomplished, and is done in every form of dynamo now built by inserting a *resistance box* in the field circuit. This is shown at E. A resistance box is made up of a number of coils of wire, which coils are separated and insulated from one another. They are connected in different ways, but in general have an end coming to a button on top of the box over which may slide a contact arm. This arm is moved by hand when it is desired to change the voltage of the machine. The movement of the blade over the contacts cuts in or out more or less resistance, which increases or decreases the amount of current which can flow in the circuit in which such resistance is connected. Varying the amount of current flowing through the coils of an electro-magnet alters its magnetism accordingly. The common name for a resistance box is *rheostat*.

It was not long after the advent of the second form of dynamos that it was found possible to make dynamos self-exciting. The simple and practiced methods of accomplishing this result are two in number: (1) The entire current generated by the armature is caused to pass through coils wound upon the field poles, thereby producing a magnetic field in the familiar way. This forms a *series dynamo*. (2) Only part of the current generated by the armature need be carried through the field coils. These coils are not connected in series with the armature, but are in *shunt* relation to it. Such coils are called *shunt* coils and such a dynamo a *shunt-wound dynamo*. The field coils in this case have a larger number of turns of wire carrying a small current, while in the case of a *series dynamo* there is a smaller number

of turns of wire, but a stronger current. The product of the number of turns of wire times the amperes of current flowing through the turns is called *ampere turns*, and it is the ampere turns which govern the strength of the magnetic field. For a given strength of the latter, any increase in the number of turns of wire on a field pole, or any other electro-magnet, means a corresponding decrease of current necessary to flow, and vice versa.

In Fig. 2 is shown a series dynamo and

FIG. 2.

the path the current takes. N and S are the poles, as before, B B the field coils, A A the brushes, D the armature, and F the main circuit. This is the simplest of the self-exciting types of generators. At this point it may be asked how it is that such a machine is self-exciting. When any generator is built, a current from some external source is sent through the field coils for a few minutes, then cut off. The effect has been to magnetize the fields with a separate current, and when the

latter is cut off the field will retain a certain small magnetization, which is called *residual magnetism*. It is, indeed, a very small percentage of magnetism that remains, and this is independent of the kind of iron. After the fields have been separately excited, the generator will ever afterwards "pick up" of itself when set in motion and gradually attain full magnetization of fields, and consequently full potential.

The series dynamo, as shown, has but one circuit. They are not as sensitive to "picking up" their voltage as a shunt dynamo—usually requiring full speed and resistance less than usual in the field circuit. In contradistinction to the shunt dynamo, they also require that the outside or main circuit be closed, because there being but one circuit the dynamo will not be able to show any voltage unless that circuit is closed. Series-wound machines have the great objection of a tendency to reverse the polarity of their fields, because of a backward flow of current, which can occur in electro plating or charging storage batteries. If such a dynamo is operating arc lamps in series with one another, the addition of a lamp will add to the resistance of the circuit and correspondingly diminish the power of the machine. This can be neutralized to a certain extent by means of a rheostat. If a lamp is added to the circuit of the dynamo, cut out some resistance of the rheostat, and so on. If the lamps were not in series with the armature, but in parallel with it, as shown by the dotted circuit, then for every additional lamp the resistance of the circuit is decreased, and the current will increase around the field so that the rheostat would need to be cut in, inserting enough resistance to keep the voltage down. Such poor properties of regulation make the series dynamo an undesirable machine. When the same style of winding is used for a motor, better things can be said.

The shunt-wound dynamo is shown in Fig. 3. In this form it will be seen there are two circuits, a shunt circuit and a main circuit. The former applied to the field only, while the latter passes to the lamps, motors, etc. It is endeavored to

illustrate that the shunt winding on the field is of small wire and a large number of turns, as against the reverse condition in Fig. 2. The symbols in the cut have the same reference as before. Wherever there are two or more paths for a current to go, it will divide itself in proportion to the resistance of the different paths. In the case of the shunt dynamo, the shunt-circuit resistance is the same all the while, unless the rheostat is in use, but the resistance of the main circuit will vary

FIG. 3.

with every change of load. Every variation of such resistance will cause a change in the proportion of current flowing in the two circuits. But we have seen how any change in the current circulating through the field coils changes the strength of the magnetic field, and hence the voltage; consequently, we must resort to the rheostat for hand regulation in order to maintain a uniform voltage. In the shunt dynamo, if lamps or other devices utilizing current are connected in multiple or

parallel in the main circuit, the addition of a lamp will decrease the resistance of the main circuit. This will divert some of the current from the field winding, because of the change in the relative resistance. Therefore, the magnetism of the fields will drop a little, since less current is flowing through the shunt. If the lamps are run in series the resistance of the main circuit is increased for every lamp added, and because of this more current will flow through the shunt, there-

FIG. 4.

by strengthening the field magnetism and increasing the power of the dynamo. To obtain regulation, the rheostat must be employed, and worked by hand when necessary. A shunt dynamo will "pick up" its voltage with greater ease than a series machine, and is less liable to a reversal of polarity of its field poles.

Some separate circuit self-exciting dynamos have been devised, but as they have never been developed on a practical basis it is unnecessary to illustrate them here.

In each of the forms of dynamo depicted, it is noted that they are not automatic in their regulation. Such of the latter as can be had must be by hand through the medium of a rheostat. Certain combinations of windings have been devised, however, which give first-class automatic regulation.

In general, we may say that a dynamo is made to supply current with steadiness to lamps for lighting. With the exception of street lighting, lamps are always connected in parallel. Street arc lights, with but few exceptions, are run in series. In the former method of multiple running, a dynamo must develop and maintain a constant pressure. In the series system of lighting, a variable pressure is brought about by a varying number of lamps, but there must be a constant current. In other words, if a system of street lighting employed fifty arc lights, each requiring fifty volts and nine and a half amperes, then if they were run in series the voltage of the generator would have to be 2,500 and the current generated by the dynamo nine and a half amperes (as each lamp requires only such current strength). If, however, the lamps were connected in multiple, the voltage of the machine would need to be but fifty (not counting for line losses, etc.), while the amperage would have to be 475. The product of number of lamps, strength of current and voltage of the generator will, it is noted, be the same in each case, requiring the same amount of horsepower, with one exception. Assuming the area of distribution to be the same, the line copper will need to be much heavier in the case of the fifty-volt generator and line losses will be more than when the lamps are run in series and a 2,500-volt generator employed. With heavier external losses the output of the dynamo will need to be increased, and consequently more horsepower developed to accomplish the same result.

In Fig. 4 is shown the arrangement of field coils in the circuits of a *compound wound dynamo*, which is the modern form of direct current dynamo affording automatic regulation for circuits requiring constant pressure.

Work for Shorter Hours.

COVINGTON, KY., Feb. 12, 1905.

EDITOR JOURNAL: I have been forcibly impressed with some articles from the pens of Brothers in the columns of our JOURNAL of late, relating to the long hours of service. Especially the article of Bro. Simmons in the February number, as it so thoroughly explains the conditions as they exist on our road at the present time.

We are running a class of piston valve engines in through freight service, weighing 3,000 tons, over a practically level division. It takes on an average of twenty hours to make the run, necessitating the practical pooling of engines.

Owing to the fact of men being unable to go back on their engines after reaching the home terminal, and being on duty about 48 hours for the round trip with only four to eight hours rest—our road being like all others, short of power—it is, of course, necessary to turn the engines and send them right out again as soon as flues are cleaned and they are cooled up and watered, to say nothing of repairs which seem to be an after consideration.

Perchance you may see a sleepy looking inspector following the engine around the ash pit, with his hammer tapping here and there. If he pronounces engine able to go back a crew is ordered and the engine is returned at once, regardless of any report the engineer has made on the roundhouse repair book. In case Mr. Inspector discovers the absence of some important organ, such as driving wheel, eccentric strap, driving rod or piston, or hostler is unable to get engine hot on account of leaky flues, engine is ordered in house, which is the signal for trouble. Soon the trainmaster calls up the roundhouse foreman over 'phone and asks how soon an engine can be had for No. 84. The reply is that there is nothing in but 693 and she is in house for repairs. Then the trainmaster exclaims: "Oh, h—! What are we to do? Train is made up and yard blocked?" Then you can just bet the 'phone wires are kept pretty warm between offices of superintendent and master mechanic.

Now, under such conditions, where is

the remedy? To my mind, there is but one remedy, namely, shorten the hours of service. For instance, we will submit a few figures which may be a little more convincing to some of the more skeptical.

Ordinarily one of these engines will make about eight days per week handling 24,000 tons for the company, or four days each for the two engineers. This gives each engineer \$28.80 straight time and \$13.60 for overtime. A total of \$37.40 per week, or in round numbers about \$150 per month.

For a service of eighty hours per week, suppose we had twelve hours for a minimum day. On freight this same engine could make twelve days per week and allow a margin of twenty-four hours at intervals between trips for repairs, thereby prolonging the life of the engine. This arrangement would also give each engineer six days per week \$35.70 and no overtime for seventy-two hours' service.

Show me the engineer who would not prefer the latter or short hour system for the difference of the paltry sum of \$1.70 per week, considering the fact that his service had been reduced eight hours?

You will note by the present arrangement, the engine has handled for the company 24,000 tons at a cost of \$74.80. By adopting the short hour system, she would handle 36,000 tons at a cost of \$71.40.

In view of these facts, why do railroad companies insist on the long hour service when the facts prove so conclusively the greater amount of service obtained from their engines, thereby largely increasing the revenues, not to speak of the great saving in fuel and oil?

What say you, Brothers? Have the long years of never-ceasing overtime so numbed your sensibilities that you have lost all respect for self, family, home or society? Have you descended to the level of the Russian slave, or do you imagine yourself but a part of the machinery placed in your charge? Have you no other duties to perform save those of working, eating and sleeping? Have neither family nor society any claims upon you? Do you not wish to improve your minds by having a few spare moments to indulge

in some good reading or a chance evening to accompany your family to church to hear the Word of God?

I wish to say to you, Brothers, wake up and make every effort in your power to have the hours of service reduced and you will find that the ills of our calling will diminish tenfold.

Especially do I make this appeal to the lax or lukewarm members who did not even take interest enough in this all important question to register their vote when they had the opportunity. Will not some of these come to the front with their views, through the columns of our JOURNAL? If they are satisfied with the long hours of service, they may be able to bring out some of the good points in its favor, that some of us on the other side of the wall have not yet discovered.

I, for one, think it a great pity that so small a per cent of a grand total of a membership of 48,000 saw fit to register a vote on this all important question.

Fraternally yours, DUCUT.

Common School vs. College Education.

LOS ANGELES, CAL., March 5, 1905.

EDITOR JOURNAL: Press dispatches recently published in Coast papers state that about 200 students from polytechnic schools filed applications for positions as firemen and engineers on a leading eastern railway system, where a strike was expected.

Many of the papers had editorials on the effect this would have on the firemen and engineers. Some claimed this opened up a new and lucrative position for polytechnic graduates, explaining the advantage to railways of engineers trained by this method versus the bad practice of present method of training engineers in the cab in the good old-fashioned practical way. The high wages that an engineer receives for his services, the pleasant and healthful life in the cab, were treated in detail as further inducements to college graduates to seek for such positions. Many of our firemen and engineers think they can see danger to our calling from this source; but some of us old fogies cannot see any danger to the engineers' side of the ques-

tion; and to show that there is no danger ahead for the young man that circumstances deprive of a polytechnic course, if he is willing to do hard work and hard thinking, is ambitious to become a good fireman, and while working for wages, learns that good honest work is what counts and gives him the stamp of the true and independent man, who knows that the better he performs his work, the harder it will be to fill his place, it brings the only sure way to succeed under the strict discipline of railway service, and if this is practiced insures his promotion.

Technical education is an advantage in any calling, if along the lines necessary in a particular calling. In the selection of young men to learn to fire a locomotive, the young men who received the technical training on the science of railways and the locomotive in all its details, all other things equal, would have the advantage on the start. On oil-burning and locomotives equipped with mechanical stokers they would probably find the work to their liking, but would they stand the hard test that the average fireman has to stand on his way to promotion as an engineer? He must stand this test as a fireman, as it is the only way he can gain the practical knowledge he must possess to become a successful engineer. Very few would graduate before their twenty-fifth birthday, and up to this time would be strangers to hard work. Nine out of ten would soon get over their early ambition to startle railway managers with their exceptional records as up-to-date engineers on the Limited, and join the (already too large) number looking for soft jobs.

Now, let us take the intelligent young man who received only a high or common school education; this he should have. At eighteen, circumstances made it necessary for him to go to work when he leaves school, learning a trade or at what he can get to do. He does not look on hard work as only fit for fools and men of limited education. Menial does not belong to any work well done, from his point of view. He is mentally and physically qualified for a fireman, secures a position as fire-

man, and is ambitious to succeed. His experience since he left school taught him that manly effort, the respect and confidence of his fellow-workers are necessary for his success, and that good work will be appreciated by his superiors in office, and in due time bring about his promotion to the position of engineer. He is sent out with a patient fireman and engineer and from them learns proper size to break coal, that shoveling coal on and off deck instead of putting in firebox does not keep up steam, learns when to shake grates, open and close dampers at proper time, an

job and proves himself worthy of the place, we must see that he has a theoretical knowledge of his duties. First, explain combustion; how he can tell by the color of smoke and flame when the coal he puts in is giving the best results; the effects of putting in coal too soon or too late; to put coal where it is wanted on grates; the number of shovels of coal at each fire best suited to work engine is doing; the effect of having too much green coal on the grates when engine is shut off; how fire should be when engine is starting train; that by doing a little hard thinking

COLORADO & SOUTHERN NARROW GAUGE ENGINE NO. 64.—Equipped with the driver brake on all four drivers. Height of frame, 12 inches; length of brake shoes, 12 inches on the first, second and fourth drivers; length of shoe on third driver, 10 inches; height of brake shoes from the rail, two and three-quarter inches. This is the class of narrow gauge engine which was involved in the Johnson discussion by the Supreme Court. See page 115, February number.

acquaintance with ash-pan and front end cinder hopper, learns that the smoke stack was not made for the sole purpose of emitting black smoke so dense as to shut out the sunshine from the right of way, how to keep a fairly level fire, how to take and give signals, his duty to lamps, oil cans, etc., and he is ready for a trip alone.

He is now up against the practical thing, and if he intends to stay with the

about the advice he gets will reduce the number of trips between fire-door and tender and keep goose eggs off the fuel record of his engine. Impress on his mind the advantage of systematic work; that the company pays for co-operation of fireman and engineer for economical management of their respective engines and has a way of finding out why they don't get it. Call his attention to a good book on

combustion. Tell him he must master one subject at a time (scientific books should not be read like novels) to get any benefit out of it. I once loaned a young fireman such a book. He brought it back in two days and said he had been all through it. I told him that two engineers and myself spent our leisure time for three months on it, and then did not get all we needed. His answer was that we were slow and not up-to-date; our records were good because we had good firemen. I admit we had good firemen; those who would not try to do good work did not care to fire for us. Of course, our best efforts had nothing to do with our records, but to be on the safe side an engineer should do his best. We teach him the use and abuse of lubricants; in short, train him in every way we can to be a better engineer than we are.

With these advantages in his favor, the fireman should be a better engineer than we were when we were promoted.

When a fireman has been firing over two years he should learn how to do rough sketch drawing, and how to read drawings. It is just as easy to learn as to learn to play billiards, and more profitable than associating with kings or aces. A man cannot be a good draughtsman unless he gives it his whole attention; but we can learn to make a rough sketch to scale and read drawings, and it is time well spent. This fireman has learned both theory and practice in the proper manner, each at the proper time; and learned to keep tab on what he knows by good, sound, common sense methods; observation while firing, together with what he has been told and read has enabled him to understand what is required for the successful movement of trains and the best training his memory can get.

His training will enable him to keep his head in emergencies; this is partly due to the fact that he was not top-heavy at the start and did not have to learn to work—a hard lesson for some young men to learn.

I want it understood that I am not opposed to higher education, but for the fireman and engineer a college course is not necessary. The story of the Irish widow telling the blacksmith who was teaching

her son the trade, "not to learn Mikey too fast or too much or he would be a fool instead of a good blacksmith," would fit many cases. Experienced firemen should not be barred from securing employment where their personal conduct and ability are O. K.

I want every engineer to do all he can to make good engineers out of good firemen, but to waste no time on the man who smokes cigarettes and is trying to master valve motion before he can carry a decent fire. The man without character to make a man and the man who occasionally opens that saloon between his nose and chin, should have no place in railway service. (Mistakes of good men no example to work by.)

In another article I will take up the technical engineer versus the old-fashioned kind—providing this is not rejected.

R. W. KELLY, Div. 662.

Air Brake Safety Valve.

Bro. Frank B. Morrison is the patentee of the safety valve herewith illustrated and described as follows:

In Fig. 1 the valve is shown open and in normal position. In Fig. 2 the piston is closed, shutting off the escape of air from the line. A represents the usual angle cock; B the cut-off plug extended into an extension chamber below this plug being hollow and carrying the piston 7, which

normally rests in position shown in Fig. 1. When the train line is connected up, the valve and angle cock open as in Fig. 1, and piston 7 is not affected by emergency application or recharging of train line. The auxiliary reservoir 1' is fed from the air line A' through groove 10 alongside cut-off plug B. This auxiliary reservoir will carry air at the same compression as the air line. Should hose connected at A' burst or be broken by train separating, the air confined in the auxiliary chamber 1' has no vent or escape and the instant the break occurs and the balance of pressure is distributed this confined air in the reservoir forces the piston 7 to its seat, as shown in Fig. 2, instantly closing the es-

collisions or wrecks, which now often follow.

When the air hose is coupled up and pressure equalized, piston 8 drops open automatically by its own weight.

The Successful Engineer.

SEYMOUR, IND., March 6, 1905.

EDITOR JOURNAL: The successful engineer, one who works on a single track road with twenty-four scheduled trains daily, and eight to ten other trains, consisting of sections and extras, with all classes of engines from small eight-wheel engines to consolidated and compound, pulling 2,100 tons over a very uneven track with eighteen of these trains first-class passenger trains, is the one who sees that his engine is in the best possible shape before starting; that he has the necessary supplies and gives his engine a thorough oiling before starting, with oil heated to suit different parts of the engine. A drop of cold oil on guides, links and all open metal is better and lasts longer than a large supply of oil heated to a high temperature. To bearings protected by packing, oil should be used that will reach bearings quick enough not to allow bearings to begin to heat before oil can reach them on account of being chilled. With engine properly oiled before starting it takes a very small amount for the trip and will require something out of the ordinary to cause heated bearing; and with air pump and air apparatus O.K. you may feel confident that you will have a successful trip, so far as the engine is concerned, your train throughout in a condition to furnish the necessary stopping power, and you have all things correct.

In handling the train my idea is to use the lever and throttle where the engine will do the work the best, maintaining full boiler of water and steam pressure. If you have spare time at meet points, remedy any little defects you see and make it a point to always be ready to move so as to use every minute of time, and quite often five minutes on the first part of a run means hours on the last. At water stations be ready when tank is

caping air from the line and preventing the sudden and powerful setting of the brakes which now follows when such accidents occur. The portage leak from the air line through passage X around the piston and out to the atmosphere at X, Fig. 2, makes service application of the brakes on broken section and brings to a slow stop. This leak at X on the section next to the engine is overcome by the air pump keeping the air supply in the line and the engineer runs away with his section of the broken train having the brakes under perfect control. This control on his part of the broken train and the setting of the brakes on the rear section, when broken away, prevents any

full. Adjust yourself to a system of running, then the dispatcher can figure what you will do. When they learn your way of running, your layouts will be lessened from that point.

If you find another engineer in trouble on the road, assist him; if you catch him doubling, cut off your engine and shove him out, if necessary, though you have to double; keep him moving. It is better for you to be delayed than both. If you are meeting a train, say at top of a hill, and he comes doubling, go with your engine and get his rear end. It saves time for both your trips. Note and report all defects in a plain way. Consult with foreman in charge explaining to him the defects and how engine performs. Be sociable and lend a helping hand where you can for the benefit of your associates and the company you work for. A good turn will always be remembered.

GEO. B. CRAIG, Div. 39.

What Was Wrong With the Engine ?

PHILIPSBURG PA., March 6, 1905.

EDITOR JOURNAL: As each month brings to us a copy of the excellent and enjoyable JOURNAL, I have been hoping to see some questions of some happenings of the locomotive. I have read so many articles on the air brake and solved so many questions asked by different Brothers, that I have come to the conclusion that I have become somewhat of an expert in answering any question pertaining to the air brake.

It seems somewhat strange that the locomotive is left to itself and to care for itself. Few questions are asked any more about its failure to perform its duty. Some of the old firemen are as sure that they know all about it and are so sure that they have death to meet with, and think but little of the troubles that they will have to contend with when they are called upon to run one.

Question after question upon the air brake has been asked in the JOURNAL and it seems that to know them is all that is necessary to make a fireman a full-fledged engineer, without knowing the most necessary points of the locomotive and its failures.

Some years back I met with an accident and it did not only puzzle me, but the entire class of engineers, master mechanic, road foreman of engines, and in fact, everyone connected with the motive power. I never thought after I had ciphered out the nonplus how easily the best of us could be confounded, either in the air brake or on the locomotive. For reference, I will give you this question, and hope some Brother will make some reply in the next JOURNAL.

What could possibly be wrong with your engine if it began to go lame by degrees and finally just so bad that it would not move itself after coming to a stop—say there is nothing wrong with the eccentric or eccentric rods, links, hanger, rocker arms, valve stem, valve seat, valve yoke, steam ports, exhaust ports, steam nozzles, piston and piston head, side or main rods, boiler, stack, or in any way with wheels or machinery, or too much water in boiler. Where would you look for the trouble? Yours fraternally,

T. S. KEATING, Div. 467.

Con Troller Badly Mixed.

BELLE PLAINE, IA., March 2, 1905.

EDITOR JOURNAL: Please allow me space to call that good Brother's attention who composed that comment on page 252 of the March JOURNAL, signed "Con Troller," that he is either very badly mixed up or he had a bad dream. In the first place, he claims all this engineer had to do was to take down the front section of side rods and proceed. Now, who ever heard of or saw a three-wheeled connected engine with the knuckle joints in the front section of side rods? Besides, he did not state as to whether there were solid ends on the main and side rods, which would make it necessary to remove main rods to get down the side rods.

Now, this good Brother instead of standing up on the bank and criticising this engineer to his fellow passengers, ought to have gone and given him a little bit of his knowledge and good advice, and taken hold and helped him, instead of airing out that Brother's ignorance in the JOURNAL.

I can call to mind one time when I was riding over one of the trunk lines and the engineer opened his primatic blow-off cock and it stuck open, and he being a large man could not get under his engine very well, and his fireman got a little rattled and failed to shut it off quick, and the train being between stations, it was necessary to act quick. I hopped under there and with a quick twist of the wrist, shut the cock at once. That was better than telling some passenger how it should be done; and in a minute we were on our way rejoicing.

Out here in the Middle West there is none of that so-called strife between the engineer and fireman.

Now, Brother, that is what the B. of L. E. is organized for; to help its members all we can, and if a Brother makes a mistake of this kind I don't think the JOURNAL is the proper place to air it out. This sounds very much like some young start-up trying to down an old man.

S. L. DUNLAP, F. A. E. Div. 526.

Con. Troller not a Brotherly Critic.

BOSTON, MASS., March 5, 1905.

EDITOR JOURNAL: Referring to an article in the March JOURNAL, signed Con. Troller, regarding breakdowns, I was very much surprised to hear a Brother criticise an engineer for making a mistake in disconnecting his engine.

Now, Bro. Con. Troller, have you never made a mistake in your railroad career? If you have not heretofore, I think you have made one now. You say the forward end of the side rod was bent so it struck the guide yoke on a three-wheel connected Rhode Island engine, and that all that was necessary was to take down the forward side rods on both sides. Are you positive that was all that was necessary? Any mogul I have ever seen, and I have seen a good many, where main rod is connected to middle pair of drivers, the knuckle joint is back of main pin, and such being the case, how could the forward side rods be taken down without taking the back ones down also?

Now, Bro. Con. Troller, in conclusion, I will say you did not do a brotherly act

in standing on a bank telling passengers all you knew and all the engineer in trouble didn't know, when you saw him taking down main rod, and you say you told the passengers that the engineer would have to put it back again. Why did you not come down off your "high horse" and impart your knowledge to the engineer instead of to the passengers? It is very evident that you do not believe in the Golden Rule.

Trusting, Brother Editor, you will give this space in the JOURNAL, I am,
MEMBER, Div. 439.

Automatic Fire Door.

ALTOONA, PA., March 10, 1905.

EDITOR JOURNAL: Wishing to be of some slight service to an old and worthy member of Div. 287, I kindly request you to publish the following account of an automatic fire door, which was invented and patented by our old reliable friend and Brother D. A. Reagan, of Div. 287. This patent bears the date of February 28, 1905, and is termed, "A device for automatically operating the fire door of any locomotive or firebox of every description and kind."

The labor of the fireman is decreased as the door opens and closes automatically, and can be made to open to any degree required. But one shovel of coal can be thrown into the firebox at a time, and while he is preparing another shovel of coal the volume of oxygen passes into the firebox, when the door closes and ignites them.

This prevents the continuous rush of cold air into the firebox, which is the case when the fireman leaves the door open too long. It also prevents the sudden contraction of the staybolts and firebox, as well as prevents the sudden rush of cold air which causes the flues to leak.

The door is operated by a small motor about the size of a steam gauge, and Brother Reagan has the privilege of adopting any means more suitable to the different styles of fire doors, either working up or down, sliding open, or swinging open, and is operated by a small lever conveniently located for the fireman or engineer. He also has the right to devise

any means for automatically operating the fire door.

All things considered, there should be a great saving of fuel and labor to the fireman.

Brother Reagan has made many other useful inventions, some of which never were patented, but are in use on the Pennsylvania Railroad at this day.

Brother Reagan is an old member of Div. 287 and his charitable hand is well known to many residents of the mountain city.

This is wholly unsolicited by Brother Reagan, as I was prompted by the belief that a few words of recommendation from his own Brothers might be beneficial to him. Fraternally yours,

R. WINEBRENNER, F. A. E. Div. 287.

Due to Care in Starting Pump.

OTTAWA, CAN., March 2, 1905.

EDITOR JOURNAL: In reading over Mr. Blackall's air brake paper or pump failures, I notice his special reference to broken piston rods and loose nuts on air end. On our road we have only had one case of a pump failure in twelve months on sixty engines due to broken piston rods or loose nuts, and a case of a hot air cylinder is almost unknown.

We attribute our success to the care in starting the pump, and the absence of racing to supply train line leakage. We handle all kinds of trains from five to seventy cars, pumps 9½ and 11 inches.

Fraternally yours,

W. S. BLYTH, Div. 469.

Long Hours.

HAGERSTOWN, MD., March 9, 1905.

EDITOR JOURNAL: I have seen in this month's JOURNAL that a member of Div. 85 was kicking about two longer hours before overtime starts. I certainly am glad that some one has started the ball rolling in regard to long hours. I hope it will keep on rolling until it reaches a destination, and the matter is taken up and we see what can be done. When I read it, I thought that if he has a kick coming, what have we got?

We run large engines which haul fif-

teen hundred ton trains 70 miles for \$2.80. It does not make any difference whether we are out 12 or 24 hours; it is the same pay, and no overtime allowed. We are often out on the road 24 hours. I have just come in off of a 26-hour trip, and the trip before was a 25-hour trip, with only six hours rest, which is not safe for the company or the men. It was almost impossible for me to stay awake. No man is fit for duty in the condition that I was who has any responsibility on him. It could have been very easy for me to fall asleep and run by a meeting point in the condition I was, which has often been the case. I hope that the Divisions will all get together and see what can be done in regard to long hours.

LONG HOURS, Div. 283.

Equalizing Discharge Valve Stuck.

LITTLE ROCK, ARK., March 7, 1905.

EDITOR JOURNAL: A member of Division 366, at Glenn's Ferry, Ida., in the March JOURNAL, doubts that in case the equalizing discharge valve sticks down on its seat and fails to work, whether the brake valve would be operative. I seldom write anything for this department, but concluded to answer the communication.

On the lower end of my run there is no mechanical help. If there are any running repairs the engineer has to do them. One day I took my brake valve apart to clean and oil it. In replacing the discharge valve piston I was careless in putting it in and got the ring cocked, making it stick hard and fast. I did not discover the mistake in time to remedy it, so that I braked the 147 miles to Little Rock with the emergency part of the brake valve, having a short train and having used the old three-way cock for years, had no trouble in making good stops. On arrival I questioned the brakeman if he experienced any difference in the stops from those on former occasions. He replied he did not.

I reported on arrival that I could not make a service application, and to examine the preliminary exhaust port. On the return trip the next morning the same condition existed as the day before, and I used the emergency again. Arriving at

the end of my run I took the brake valve apart and found the difficulty, which was discharge valve stuck.

The emergency part of the brake valve acts on the principle of the old three-way cock, entirely separate and independent from the equalizing and discharge valve by the direct application and exhaust port, and the direct application and supply pipe being brought together by the large cavity on the lower service of the rotary valve, thus making an opening between the train pipe and atmosphere.

Fraternally yours,

ROBERT HERIOT, Div. 183.

We have received eight replies to the above question, all practically arriving at the same conclusion, but these letters contain 2,500 words, making a repetition that would not benefit the reader but rather dishearten, because of the repetitions; so I give a brief of each, trusting the Brothers will see the necessity and justify it.

Bro. E. M. Murphy of Div. 139, says, "If the Brother wants a practical demonstration, let him put a plug in the service exhaust port and put valve in emergency."

Bro. R. W. Kelly of Div. 622, suggests the same demonstration.

Bro. D. O. McKellips of Div. 161, gives the subject much thought and a full explanation—the effect of a stuck valve and why the brake will work in emergency—and calls the Brother's attention to page 81, Westinghouse Air Brake Instructor.

Bro. C. Wilkes of Div. 328, covers the ground well and suggests in making reductions in emergency position, that care be taken in lapping the valve when brakes were applied to the amount required.

Bro. O. T. Owen of Div. 11, says that it is not only possible to set brakes with equalizing piston stuck fast to seat, but by using care and a little judgment, an excellent job of braking can be done.

Bro. Jas. W. Barton of Div. 282, writes at length, telling why brake will work if valve is stuck, and in relation to best books, wonders if our Brother who asks the question is in possession of R. H. Blackall's Air Brake Catechism.

Bro. H. E. Smith of Div. 178, says the equalizing piston has nothing to do with

an emergency application, as the air passes around the equalizing piston, etc.

Bro. W. G. Marshall of Div. 262, also says the equalizing piston has nothing to do with the emergency application and deals at length with the subject, and in answer to his Question No. 2—if train-line is charged to 70 pounds, main reservoir to 90 pounds, with 25 pounds reduction, what part of train-line connections retain 70 pounds—Brother Marshall says yes, in emergency valve chamber and triple valve, held there by check valve; but the other writers have not paid much attention to the proposition, and some think it a catch question, and at least, with little importance.

While we regret that we feel that it is absolutely necessary to condense this matter so as not to tire the reader, we feel that each one who has taken the trouble to write, has demonstrated his good will toward the JOURNAL, and in writing has benefitted himself, as every one does who writes, and we hope our necessities in this case will not tend to retard further communications from them. THE EDITOR.

Train Rights.

JERMYN, PA., March 9,

EDITOR JOURNAL: I have been looking for the obituaries of Brothers Lenahan and Standrod, but not finding them in the March number, have concluded some one else has put them right in time to save their necks.

Why do you think 32 is a superior train? Instruction says southbound trains have right of track, and 32 starts from southern terminal; also explain how Second No. 31 got a station ahead of First No. 31. Why should 32 hold main track at all? Orders do not say so nor rules give her right to.

The order got mixed up on starting point for train 32 either by myself or the printer, but it matters not. In this country we always take an order as it reads.

Brother Lenahan does not agree with me on Brother Blasdel's order. Brother Lenahan says extras running in opposite directions have equal right. It may be so in Illinois, but not here. What would

you do if Extras 517 and 576 had both arrived at Teton at once, both had main track till dispatcher told one of you to take siding and pass?

Suppose you received this order: "Train 32 will run in advance of time A to B, keeping clear of Extra 467." What would you do?
C. L. HOYT, Div. 468.

MINCO JUNCTION, O., March 7, 1905.

EDITOR JOURNAL: In answer to Brother Lenahan, of Div. 32, would say that the order received at A, that First and Second No. 3 had right over No. 6 A to M, would let First and Second No. 3 run from A to M, regardless of No. 6. No. 6 would have to take siding and clear No. 3's time.

Order No. 2, which stated that First and Second No. 3 would meet First No. 6 at L, does not mean any more than it says in black and white. No. 6 should take siding at L and First and Second No. 3 have a perfect right to go on to M for the Second section on their right of track order.

I am not satisfied with the answer to the question I gave in the January number of the JOURNAL, page 72, and would like to hear from some more of the Brothers in reply to it.

I am like Brother Lenahan, I have a fixed opinion myself and will give reasons for same, if there is any misunderstanding about it.

Hoping to hear more discussion on this subject, I remain,

GEO. W. LANCHE, Div. 360.

GARRETT, IND., March 4, 1905.

EDITOR JOURNAL: In answer to the inquiry as to who was right from Aurora, Ill., in the March number of the JOURNAL, will say if they are under the Standard Rules, engineer on First No. 3 is right. There is no mistake about that.

A right of track order simply reverses track rights, as are specified in orders. If engineer on Second No. 3 had been on Second No. 6, leaving M with orders that First and Second No. 3 has right of track to M over No. 6, he would proceed to a keeping off time of No. 3. Where engineer on Second No. 3 got mixed is in the rule that a train may consist of one or

more sections; that is just the point. It would make no difference how many sections there were on No. 6, they are all No. 6; and order out at M that No. 3 has right of track over No. 6 from A to M, makes it perfectly safe; therefore, engineer on First No. 3 is right.

GEO. SHAFER, Div. 153.

HOUSTON, TEX., March 7, 1905.

EDITOR JOURNAL: Replying to Brother Lenahan of Div. 32, relative to the execution of train orders on trains 3 and 6 between A and M, will say that the engineer on train First No. 3 was right in proceeding to M after First No. 6 had arrived at L, and, of course, the engineer on Second No. 3 should have gone also without further orders, provided they are working under Standard Rules.

The first order gave First and Second No. 3 right over all sections of No. 6, as no sections were specified as to No. 6. The second order specified that they would meet First No. 6 at L, which did not include any other section of No. 6; hence, after meeting First No. 6, they had a right to proceed without further orders.

E. M. MURPHY, Div. 139.

WINNIPEG, MAN., March 9, 1905.

EDITOR JOURNAL: In answer to Brother Lenahan of Div. 32, as to who was right and who was wrong, I will say that engineer of First No. 3 was right, as his orders on leaving A gave him right over No. 6, A to M, and his order at K only gave him a meet on the first section of No. 6, without taking away his right to track on order he received at A; therefore, he had a perfect right to go to M, for the second and all following sections of No. 6; and as these orders were addressed to both sections of No. 3, the engineer of Second No. 3 should have gone to M after meeting First section of No. 6 at L.

FRED W. ULLYOT, Div. 76.

BLUEFIELD, W. VA., March 9, 1905.

EDITOR JOURNAL: In reply to Bro. Jas. Lenahan of Div. 32, relative to which engineer was right, I would say that the engineer who went to M without further order was right. Fraternal yours,

E. A. BURTON, Div. 448.

CLEVELAND, OHIO.

CHARLES H. SALMONS, - Editor and Manager.

Address all matter for publication—Correspondence, Technical and Link Departments, changes in Division Addresses, Special Notices, and address of Outside Subscribers to C. H. SALMONS, S. G. E., Editor JOURNAL.

No reading space will be sold for advertising purposes under any circumstances.

All money matters should be addressed to W. B. PRENTNER, F. G. E., 307 Society for Savings Bldg. Send New York or Chicago draft, Express money order or Postal order, but never send personal check. Also send the name and address of all members Initiated, Reinstated, Transferred, Expelled, Suspended, Withdrawn and Deaths to the F. G. E., as per Section 16 of the Statutes.

Changes in Address of the JOURNAL and orders for Division supplies should be addressed to D. EVERETT, T. G. E., 307 Society for Savings Bldg.

Advertising Department matter and all correspondence relating thereto should be addressed to W. N. GATES, 409 Garfield Bldg., Cleveland, O.

APRIL, 1905.

Strike on the New York Interborough.

We have been asked to present the facts relative to the strike of the employees on the Interborough and Elevated Roads in New York on March 7, so there may be a general understanding of the subject, and while we feel the necessity of compliance, it is anything but a pleasant task, for it is a record of hasty, ill-advised action, without either the knowledge or consent of the Grand Chief, illegal in every phase and in which there is a most regrettable evidence of indifference to obligated duty, as well as indifference to the welfare of our organization as a whole by breaking faith with a contract made in conjunction with the Grand Chief Engineer, aided by the influence and good name of the whole order, making a grievous break in our word of honor, upon which rest our contracts with nearly all the railroads of America, Canada and Mexico. Hence it is to us a serious subject in which mingle sympathy and duty—sympathy for any who have been misled, and duty to point out the wrong and the law for its punishment in the interest of justice, to sustain our character as a

class of men whose word is to be relied upon, and to do our utmost to prevent a recurrence of a breach of faith, which in the nature of things reflects upon all members of the B. of L. E.

It seems more than passing strange that a body of men like that of Division 105 whose contracts have all been made with a Grand Officer at the head of their committee, each member having in his possession a copy of our law which he obligated himself to obey, should forget that obligation to the organization, and his obligation to the employing company, knowing, as every one must, or at least could have no excuse for not knowing, that their act of going on a strike as they did was in violation of Sections 17, 18, 34, 35, 36, 37, 39 and 40 of the law for their government, all inserted for the purpose of keeping faith and living up to all contracts until they are abrogated by due process of law. Sections 17 and 18 apply directly in this case. Section 17 says, "It shall be the duty of the Committee of Adjustment on any system (or road) to exhaust its efforts to effect a settlement of any difficulty (or misunderstanding) that may arise between the management of the system (or road) and members of the B. of L. E. before sending for the Grand Chief Engineer. Failing, they shall notify the Grand Chief Engineer of the facts in detail, and may call upon him for assistance."

Section 18: "Receiving such call the G. O. E. shall give it precedence over all other business and shall visit such system (or road) and use all honorable means to prevent trouble between members and their employers."

The other sections noted prescribe expulsion for the individual member, member of a committee, the whole committee, and that any Subdivision failing to carry out the laws enacted by the G. I. D. (National Convention) shall have its charter suspended or recalled.

The laws for the protection of contractual relations are the most elaborate and stringent of any in our constitution, and their contents are best known by our members. The law is so strict that even the Grand Chief Engineer would violate its

spirit and intent if he went to a manager's office alone, and discussed the question of wages and conditions; a third and interested party must be present.

So excuses for violation of contracts are not easy to find, and especially so with the members of Division 105, for on September 18, 1902, their committee met the company headed by our deceased Brother A. B. Youngson, Ass't Grand Chief, and obtained conditions for them that they could have secured in no other way, \$3.50 for nine hours work and all other conditions in harmony with it, and on Oct. 28, 1903, owing to dissatisfaction with the physical examination, Brother T. S. Ingraham, F. G. E., representing the Grand Office of the B. of L. E., and J. J. Hanahan, G. M. of the B. of L. F. for the firemen, settled the controversy. Following this came the settlement at the opening of the subway lines, when a new contract was made covering all the lines, subway and elevated, and at this time Grand Chief W. S. Stone headed their committee, resulting in a contract signed on Sept. 8, 1904, to hold good until Sept. 8, 1907, *except that the Grand Chief Engineer of the Grand International Brotherhood of Locomotive Engineers only binds the International body or Division thereof for the period of two years from the date hereof, unless the third year be ratified by said International Brotherhood of Locomotive Engineers.*

The Grand Chief being called away by sickness of his mother, Assistant Grand Chief E. W. Hurley was assigned to the duty of completing the contract, which is signed by the following:

Interborough Rapid Transit Co., by E. P. Bryan, Vice President.

Grand International Brotherhood of Locomotive Engineers, by E. W. Hurley, Ass't G. C. E.

For Division No. 105, by W. L. Jencks, C. E. of Div. 105, E. J. Rozelle, Acting Secretary.

The Brotherhood of Locomotive Firemen, by C. A. Wilson, F. V. G. M.

Lodges No. 149 and 155, B. of L. F., by Harry B. Pinney, Chairman, Edwin R. Wells, Secretary.

Amalgamated Association of Street & Electric Railway Employees of America, Manhattan Div. 332, by Geo. E. Pepper, President.

With the above noted contracts made by and with the international organization, which every one benefited by it knew, there could have been no lack of knowledge of the correct procedure, which would have saved both their membership and the reputation of the International B. of L. E. involved in it.

As to the demands made upon the company and rejected by the officials, no report has ever been made to the Grand Chief, hence we can only quote as gleaned from the press. The *Railroad Gazette* says:

That the present physical examination now in force against motormen and other employees shall be eliminated and a practical road test substituted instead; above to take effect Jan. 1, 1905.

A day's work for motormen and other trainmen to be nine hours or less; motormen's mileage not to exceed 100 miles a day.

Relay for motormen, when headway is less than six minutes, should be allowed at southern terminals, loop or no loop.

All road work on trains, with or without passengers, shall be done by qualified motormen.

For all employees, excepting tower switchmen, nine hours shall constitute a day's work, with time and a half for overtime.

Tower switchmen, eight hours or less to constitute a day's work, with one day off duty a month with pay; time and a half for overtime.

Ten per cent increase in pay for all employees, excepting motormen.

In addition to the above, the amalgamation seems to include conductors, guards, station agents, ticket choppers and colored porters, while the motormen's demands seem to have been confined to a nine-hour day and 100 miles or less for a day's work, and this in face of the fact that the company demonstrated plainly that they could secure all the men they wanted at \$3 and 10 hours, immediately preceding the contract made on September 8, and that motormen on the surface cars worked longer hours for about one-half of what they secured under that contract.

It is evident that the strike leaders felt sure of winning; and knowing that in all likelihood there would be no strike if the

heads of the National orders were called in, not only did not advise with them, but kept positive instructions received from them from the men. But from the record of strikes in New York and Brooklyn during the past ten years, there would not seem to be much on which to base a confidence so great as to make them feel that they could afford to ignore their international organization, as all did, for of the eleven strikes, two were successful, two compromised, and seven were failures.

The first intimation that an ultimatum had been given the company and that a strike was likely to occur came from Mr. Ralph M. Easley, Chairman of the Executive Committee of the National Civic Federation, who had been using his best efforts to prevent a strike, and on receipt of this telegram at 4 P. M. on the sixth, one was immediately sent by the Grand Chief to Brother Jencks, Chairman of the B. of L. E. Committee, and one to Assistant Grand Chief E. W. Hurley, then in New Haven, to go on to New York immediately. Brother Hurley sent a telegram to Brother Jencks at 7 P. M. that he would be in New York at 11 P. M., Grand Central Hotel, but it seems that neither of these telegrams was read to the men and the committee did not go to the Grand Central Hotel until a strike was declared for 4 A. M.; so it will be seen that the efforts of the Grand Officers came to naught, and the organizations and the law governing them were ignored, and evidently purposely, and nothing was left for the Grand Chief Engineer to do but to put the law in force and recall the charter of Div. No. 105, not a pleasant duty, but a necessity under the law made for the government of all members of the B. of L. E. There is no path of safety for the Brotherhood of Locomotive Engineers except that of duty, to do as we pretend, and do whatever we promise.

We hope that this may be the last time we shall ever have occasion to record indifference to obligated duty, which always carries with it in a greater or less degree injury to all members of the order and disaster to the locality where it occurs.

Character and Loyalty.

There are people who oppose any form of union which has for its purpose a voice in the conditions under which its members shall serve; but it is a principle which has been demonstrated as necessary because a few men in power can make mean conditions, and good men who are competitors must conform to the conditions fixed by the few. In no service have conditions been more improved than in railroad work through organized effort, and with great moral and educational benefits, without injury to the employer. Every engineer who stops to think must realize the benefits he enjoys by virtue of the work of the B. of L. E. during its forty years of incessant effort, conducted on lines of equity, demanding just conditions and entering into contractual relations in which both parties bind themselves to live up to and within the conditions involved. Without united effort these conditions could not have been obtained. Our whole forty years has been a school in which we have learned that character was the greatest essential to success, and have made law which, if lived up to, would leave none in our household who lacked a reasonable amount of character. If the law is carried into effect, one may not retain membership who drinks to excess, who keeps a saloon or deals in intoxicating liquor, who willfully injures the property of his employer, who defrauds a member, who deserts his wife or his children, or conducts himself in an unbecoming manner which brings discredit upon the order, and, above all, he must possess sufficient loyalty to adhere strictly to the conditions involved in the contracts made by it until the contract is annulled by due process, as outlined in our law.

While a member may not take the place of a member of any organization involved in a legally organized strike sanctioned by its Grand Officers, when any factor of members break away from the law of our own order, violating the obligations made by the organization, there should be no misconception of duty and

no hesitancy on the part of the loyal member to step into the breach and fulfill all the requirements of the contract until it is canceled by rightful negotiations.

Our lamented old leader, Brother P. M. Arthur, has said hundreds of times, "We demand nothing we would not concede were conditions reversed. We have never had a controversy we would not willingly submit to arbitration if we could not agree." We have won confidence by integrity and great success by reasoning together—settling our differences peacefully by virtue of the strength of members with character, which means the performance of obligated duty, and there should be no question as to the loyalty of the members of the B. of L. E. keeping the faith, and in doing it maintain our honor and preserve the good name and the usefulness of the organization.

Strike Breakers and the Student.

The New York Clothing Trade Bulletin says, "The strike breakers used by the Interborough Company for trainmen were raw youths, old men, toughs, foreign social scavengers, and for motormen the rejected of other roads, mostly."

If this is true, and we presume it is in a large sense, the Columbia University students' education must have been perverted by their professors, or they are not very choice of the company they keep. The papers say, however, that hundreds applied for place not for money, but to assist in breaking the strike on principle. While the strike was illegally organized, if these students are so ready in this case they probably would be under any other conditions. The strike breaker needs no introduction to organized labor. The opponents of organized labor give them a name they think sounds better than scab, and it does; but every man in or out of organized labor knows that they are hired henchmen to do anything demanded of them if there is money enough in it; their moral principles are measured entirely by the dollar. The students may be honest in believing

they are doing something honorable because it has been a part of their education in an institution which caters to the opinions of those who have helped to endow the University. That is quite natural for the professors; but will these students when they enter competitive life follow these principles? If he become a minister, will he hear God's call to preach among the poor, or hear the one where the salary is largest? If a lawyer, will he refuse to become the defender of a known criminal, or will he take the case and charge an amount of fee in harmony with the magnitude of the crime committed for his effort to defeat justice? If a physician, will he stand alone making such price for his service as seems suited to the condition of those treated, or will he join the association to fix prices and to chase the scab doctor they call quacks? There is no doubt they will be actuated by personal interests and join their fellows in self protection. They will then realize if they are honest men how inconsistent they were in being so ready to lend themselves always to one side of a question regardless of its merits.

We hope the day will come when professors of colleges, however endowed, will recognize that to make education common, to elevate the character of the citizen, and to make him of any commercial value to the community, he must be decently housed and decently paid, and that they will cease preaching the doctrine that it is an honor to assist in crushing the poor who are struggling for these betterments and better citizenship.

LINKS.

A UNION meeting of Brothers employed on the Rock Island System will be held in Trenton, Mo., at 9 A. M., Wednesday, April 26, for the good of the order, when it is hoped all who can will be present and participate in the deliberations, the educational features, and the social touch which go with such meetings. Div. 471 extends a cordial invitation to all.

Fraternally yours,

E. B. VANAKIN, F. A. E. pro tem.

THE fourteenth quarterly meeting of the Brothers of the B. & O. System will be held in the Opera House, Millvale, Pa. (Bennett), on April 18 and 19, under the auspices of Div. 452. The Grand Chief expects to be present, nothing intervening to prevent, and as these meetings in the past have been largely attended, Div. 452 naturally desires success for this one, and extends a cordial invitation to all, with a hope that this meeting may be the best attended and most important of all in the good that comes from it. Come, Brothers, and get in social touch and absorb the lessons of right duty that makes for the welfare of all.

Fraternally yours,
T. G. HENRY, Chairman.

BRO. N. W. DUVALL, member of Div. 365, Louisville, Ky., reports that a man calling himself Thos. B. Miller, has a B. of L. E. traveling card, and on examination he was found to have the correct work, stating that he was running between Altoona and Harrisburg, Pa., and desired to have a check cashed. Being a stranger he asked that his check be endorsed, and the check drawn for ten dollars on the Indiana, Pa., First National Bank was endorsed on the back, Thos. B. Miller, Jas. O'Neil and Albert Snyder; Miller got his money, but check was returned, no account in bank, and the two Brothers who were endorsers had to reimburse the bank. The number of the Division granting the card was forgotten so we are unable to find whether the card was a forgery.

The check transaction is evidence of fraud, and it is reasonable to suppose that his name is not Miller, and we hope the next Brother approached will be sure to get the number of Division on card, and be able to give us a good description of the man, so he can be apprehended.

We, however, want to call attention for about the twenty-fifth time to the law, Section 106, page 45, Statutes. No honest Brother wanting aid can object to waiting until a telegram from his Subdivision corroborates his own statements when he is among strangers, and if this law is complied with there will be little opportunity for the dead-beat and fraud to get

favors or money from members of the order. Let every member comply with Sections 101 and 106 and frauds will be hunting some other fields in which to ply their trade.

EDITOR.

BRO. H. W. BETHEL has been appointed a traveling engineer of the G. & S. I. R. R. including Columbia, Laurel and Silver Creek branches. Brother Bethel is a member of Div. 552, and has been chairman of our Adjustment Committee for several years. All are convinced that the company has selected the man for the place.

B. J. D., Div. 552.

BRO. C. M. WEATHERS, member of Div. 532, was appointed Road Foreman of Engines for First Division of the Atlantic Coast Lines and its branches from Richmond, Va., to Savannah, Ga., in January.

The Brother is fully able and qualified for the position and the company has made a good selection, showing our ranks are not forgotten if we prepare ourselves to merit it.

W. J. MCALLISTER.

BRO. A. J. PROLE, of Div. 449, who was promoted last spring from General Foreman of the S. A. L. shops of Americus, Ga., to Master Mechanic of the Fourth and Fifth Divisions with headquarters at Savannah, Ga., has again been shown the appreciation the company has for his ability by being transferred as Master Mechanic to the Third Division of the S. A. L., with headquarters at Atlanta, Ga.

The Brothers of the Fourth and Fifth Divisions regret very much to give Bro. Prole up, but feel that the company has made no mistake and are proud of his upward move and wish him every success.

F. A. E., Div. 449.

THE twenty-first anniversary of Div. 250 will be held in Sunbury, Pa., on the 17th and 18th of May. Some of our Grand Officers and a number of distinguished Brothers, including "Shandy Maguire," have promised to be with us, and a royal good time is expected, and we hope all the Brothers and their wives that can possibly attend will come and help us make it a day of pleasure long to be remembered. We will do our best to

make it worth your coming. Will give program in May number.

Fraternally yours,
J. F. WALLS, Sec'y Com.

BRO. LEVI KAYS, of Silk City Div., 521, has resigned the position of Road Foreman of Engines on the N. Y. S. & W. R. R., to accept a more lucrative position with the D. & H. C. Co., at Wilkes-Barre, Pa.

On leaving the service of the N. Y. S. & W., Brother Kays was presented with a very beautiful watch charm by the engineers and firemen, who regret very much to part with Brother Kays as an official and friend, and we hope that success will crown his every effort in his new position. J. W. M.

WARREN S. STONE, our Grand Chief, was in Kansas City on February 21. Several members of Div. 81, Kansas City, Kan., met Brother Stone at the hotel. They then called upon Mr. Brinkerhoof, superintendent of the Union Pacific, with whom they had a very pleasant talk.

In the afternoon Brother Stone addressed a meeting composed of both Kansas City, Mo., and Kansas City, Kan. His address was very interesting and helpful, and if followed by the members of the Brotherhood, we would have one of the greatest labor organizations in the United States. Our Grand Officers alone are not able to make the organization, but must have the support of every member.

Brother Stone, accompanied by several members of Div. 81, left on the evening train for Ellis, Kan.

Yours fraternally,
J. L. SIMPSON, F. A. E.

DIVISION 886 has moved its Division headquarters from Amory, Miss., to Magnolia Hall, 3d Ave., Birmingham, Ala., and holds meeting on the 1st and 3d Sundays at 10 A. M.

D. H. BADGLEY, F. A. E.

GEORGE WASHINGTON'S birthday was celebrated by the Sisters of G. I. A. Div. 128 in the hall of Div. 11, when the Brothers and their wives were entertained first by giving a dinner, and in the after-

noon by a social chat and card playing; at 6 o'clock we again sat down to a sumptuous lunch. When the tables were cleared away the real pleasure commenced in the way of music, recitations, speeches and dancing. Before we were aware of it Old Father Time had registered 11 P. M., when with hearty handshakes and good-byes and with a wish for a reoccurrence of the pleasure we enjoyed on this day and occasion, we separated for our homes.

Fraternally yours,
WM. M. BLYTHE.

BRO. J. M. ASHLEY of Div. 256, has been appointed Road Foreman of Engines of the new division of the S. A. L. Railway between Birmingham, Ala., and Atlanta, Ga., with headquarters at Atlanta, Ga. Brother Ashley has been a member of Division 256 for the past ten years, and has been a member of the Gen'l B. of A. for the past three years, and his services have been particularly satisfactory to the Division and Brothers on the fourth Division of the Seaboard Air Line Ry. Brother Ashley has been a very successful engineer for eighteen years, keeping abreast of the times, and the members of Division 256 are convinced that the Company has selected a man who will give satisfaction to the men and achieve results for the Company which will be satisfactory to them also, and while we shall feel the loss of Brother Ashley from the Committee of Adjustment and lose to a certain extent his words of advice at our meetings, still it gives us pleasure to have one of our Brothers selected for so important a position as the one Brother Ashley has been appointed to. This being a new division with new men will make it quite hard for him for a while, but Brother Ashley has the gift of getting along, and we, one and all, wish him success.

Brother Ashley was our Delegate at Los Angeles. J. W. URQUHART,

Member Div. 256, Savannah, Ga.

WE UNDERSTAND that many members of the B. of L. E. will attend the convention of the Knights of Columbus, to be held in Los Angeles the first week in June. As the Brothers here would like to know

the exact number who will attend, we would be pleased to have them write Div. No. 662 early in May, as we want to meet as many of the Brothers as possible on their arrival here; and we may have something more in the May JOURNAL.

Fraternally yours,

R. W. KELLEY.

WARREN S. STONE Div. 672 was instituted in Memphis, Tenn., on Saturday afternoon, Feb. 25. This Division was organized with 31 transferred members from Division 386, who are running between Memphis and Amory, Miss. Five men were initiated into the mysteries of the B. of L. E. in a beautiful and impressive manner by our worthy Grand Chief, W. S. Stone, and other prominent Brotherhood men of Divisions 23, 502 and 225.

This Division starts out under the most favorable circumstances and should, in a short time, double its membership, as each and every member has pledged himself to work for the success of a Division named in honor of a man we feel proud to have as the Chief Executive of the Grand International Brotherhood of Locomotive Engineers

At 7:30 P. M. a reception was held in Elks' Hall, under the auspices of Divisions 21, 23 and 672, and G. I. A. Divisions 322 and 159. This hall was appropriately decorated with ferns and mottoes emblematic of the order. The music was furnished by Saxby's Orchestra. The program consisted of speeches, solos and monologues.

Bro. S. W. Tate acted as master of ceremonies, and introduced the speakers in a pleasing manner, the opening address being made by Mr. H. H. Litty, attorney at law, formerly a locomotive engineer, in which he welcomed Brother Stone to our city. This was followed by an able address from our Grand Chief. Mr. Johnson, President of the Merchants' Exchange, made a very interesting talk, in which he spoke of the advantages of Memphis as a convention city. Then came Mr. T. H. Arnold, who gave some very humorous and pathetic recitations; several songs were rendered in a very acceptable manner, as well as specialties given

by the Hudson family and Montgomery twins.

During the evening Mrs. J. D. Ryan, on behalf of Success Div. 159, G. I. A., in a few well chosen words, presented the C. E. of Div. 672 with a handsome Bible. The C. E. was caught unawares, but managed to express thanks for himself and the members for such an appropriate gift.

The closing speech was made by T. H. Hiner, T. G. A. E., in which he invited all present to the banquet hall, which had been tastefully arranged by the members of Chetolah Div. 322, G. I. A.

The contributions of cakes and salads from the two Divisions of the G. I. A. were much appreciated, and the manner in which the supper was served reflected great credit on the members of Div. 322, G. I. A.

Brother Hiner mentioned the fact that among other good things to eat we had a fruit cake baked by Bro. R. C. Brennan, a "Frisco" engineer, who wanted every one to have a piece. Bro. H. H. Smith jokingly remarked "that if Brother Stone ate a piece of this cake he would be laid up in a hospital for a week with a case of acute indigestion." However, he looked better the next day, after having eaten his share of the cake.

There were visitors present within a radius of 800 miles; besides, several General Chairmen, viz.: E. A. Shipley, Frisco; Myer Hurley, Santa Fe; Humphrey Roberts, I. C.; D. W. Thompson, of the L. & N.

On Sunday afternoon, the 26th, a union meeting was held in Kirschner Concert Hall, I. O. O. F. Bldg., Bro. Thos. Tate of Jackson, Tenn., presiding. Matters of interest were discussed by several members and General Chairmen of the different systems represented.

Grand Chief Stone and Ass't Grand Chief H. E. Wills, gave us some advice that set us all thinking, and we felt that the visit of these two Grand Officers will be the means of more activity and interest in matters connected with the B. of L. E., and also aid us in living up closer to the Golden Rule and the mottoes of our order.

We will be busy in Memphis for the next year, making preparations for the 1906 Convention, and will endeavor to make it such a success that the delegates will feel that they did not make any mistake when they voted for Memphis at Los Angeles. D. L. FORSYTHE, Div. 872.

A SURPRISE party and banquet was given by Mrs. W. E. Futch at her home, 853 Hough ave., Cleveland, O., March 11, in honor of the 45th birthday of her husband, Bro. W. E. Futch, President of the L. E. M. L. Ass'n. The guests were all from the Grand Office of the B. of L. E. Covers were laid for nine, and the hostess did credit to the occasion. In the center of the table was a large glass vase filled with an immense bouquet of beautiful flowers. The vase stood upon a square piece of a mirror, which was surrounded by forty-five illuminated wax candles, representing the age of her husband, and the menu was of the very best. Deloss Everett, Third Grand Engineer, toastmaster of the occasion, in a happy speech congratulated Mr. Futch on the passing of the forty-fifth mile post of his history. Warren S. Stone, Grand Chief, responded to the toast, "The Brotherhood of Locomotive Engineers," in a very happy manner. He was followed by E. W. Hurley and M. Cadle, Assistant Grand Chiefs, then M. H. Shay, treasurer of the association, and Charles H. Salmons, editor of the Brotherhood of Locomotive Engineers' JOURNAL, and last by M. Harris and Edward Richards, representing the employees of the Grand Office, all of whom spoke in the highest praise of the efficiency of Mr. Futch as an officer. The gathering had a twofold purpose. One was to celebrate the forty-fifth anniversary of his birthday and the other to pay a tribute of respect to a hero, who has inscribed his name high upon the roll of fame in the history of this association. When the Brotherhood of Locomotive Engineers was in session at its sixth biennial convention, May, 1904, at Los Angeles, Cal., it was tendered an excursion to Playa del Rey Beach, a famous bathing place on the Pacific coast, and one of the bathers, E. A. Montague, of Albany, N. Y., unfortunately ventured out too far and became exhausted, when the cry for help was heard, "A man is drowning." Mr. Futch was not one of the bathers, but he immediately rushed to the beach and went to the rescue of the drowning man. Then began the struggle for life or death, which resulted in Futch landing his associate safe on the beach. The convention on their return to Los Angeles appointed a committee to draft a set of resolutions to be presented to Futch in commemoration of his splendid and heroic deed. The resolutions were hand-

somely engrossed by Geo. Brice, of the Speucerian College, and Warren S. Stone, Grand Chief, on behalf of the donors, in an appropriate address presented the same to the hero. The next surprise was the presentation of a large reclining chair to Mr. Futch by his fellow Grand Officers, which was handsomely done by E. W. Hurley, Assistant Grand Chief, of Boston, Mass. The only thing to mar the pleasure of the party was the absence of William Prenter, First Grand Engineer, who was ill, and H. E. Wills, Assistant Grand Chief, who was out of the city. After the banquet the remainder of the evening was spent in listening to several piano solos rendered by the hostess, Mrs. Futch, and her daughter Ethel, and a recitation entitled "Capital and Labor," by D. Everett. D. EVERETT.

DIVS. 156, 432 and 436, B. of L. E., of Birmingham and Avondale, Ala., had as their guest on Wednesday evening, Feb. 8, Assistant Grand Chief Engineer, Bro. H. E. Wills. This being the first Grand Officer to visit the South in several years, much enthusiasm was shown, and at a special meeting called for 7:30 o'clock, all three of the Divisions were well represented. The large auditorium in the City Hall building in Birmingham was tastefully decorated and every courtesy possible was extended by the city officials for the occasion.

Bro. Wills was accompanied by our General Chairman, Bro. J. T. Whiddon, and was met at the depot by a special committee who escorted him to the Hotel Hillman, where arrangements had been made for him previous to his arrival.

The secret meeting was called to order at 7:30 P. M. by Bro. G. F. Garrett, Chief Engineer of Div. 432, in the chair, who, after making a short address as to the object of the meeting, introduced Bro. Wills.

Bro. Wills outlined the new work of the Grand Office and gave us much valuable information relative to our work, which was thoroughly appreciated by all who were fortunate enough to be present.

Two very pleasant hours were spent in listening to our distinguished guest, after which he was escorted to the parlors of the Hotel Hillman, where he was met by the members of the Ladies' Auxiliary to the B. of L. E. and several prominent citizens who were invited to meet our guest, among whom were Hon. W. M. Drennen, Mayor of Birmingham; Rev. Dr. Staggs, Pastor of the Presbyterian Church; and Hon. Eli P. Smith, of the Birmingham News.

After an informal reception in the parlors, the banquet hall was opened to us, where spreads for one hundred and fifty

guests were laid. The large, spacious hall was beautifully decorated with palms, ferns and cut flowers, each lady being presented with a pink carnation. The menu was served in six courses, under the personal supervision of the genial proprietor, Mr. Knobb. During the entire evening, music was furnished by the Callman orchestra and many beautiful selections rendered.

Bro. Thos. M. Pounds was toastmaster for the evening and, as usual, filled the chair with much credit, first introducing Mayor Drennen, who, in a short but very impressive address, paid the organization of the Brotherhood of Locomotive Engineers a beautiful tribute, and gave its members just credit for the present conditions both socially and financially of our city, better known as the "Gate City of the South."

Bro. Wills was next introduced and in language beautifully spoken, gave much information in regard to our grand and noble order, which was listened to with profound interest. Bringing out many beautiful illustrations, he urged the ladies to use their influence with their husbands in manifesting more interest in their Divisions.

Addresses by Dr. Staggs, Mr. Smith and others followed, and the evening will long be remembered as being most pleasantly spent, and we trust that in the near future we will have the pleasure of having more of our Grand Officers meet with us, as it tends to awaken more interest in our work and profession, and we extend to all a hearty welcome. Rest assured that we never get too busy, but that we can do honor to our guests.

Yours fraternally,
J. S. MAY, Div. 432.

GRAND RIVER VALLEY Div. 286 having been assured that one of the Grand Officers would be with us on Sunday, March 5th last, efforts were made to get the news to all our members and the results were somewhat surprising. Our Assistant Grand Chief, Bro. M. W. Cadle, was on hand as per agreement, and when the meeting was called to order, we probably had a larger attendance than we ever got out at one of our regular meetings before. After the general routine of the Division's business matters was transacted, we were given a splendid address by Bro. Cadle, who consumed something over an hour in his explanation of the work, and what was good for the general benefit of the order. His advice to those Brothers who are frequently delinquent in the matter of paying their insurance assessments promptly, was most appropriate and right to the point. Grand River Val-

ley Div. has a membership of about 200, and it is seldom we see more than twenty or twenty-five members at our regular meetings, and we believe that Bro. Cadle's "scorching" on the lack of interest shown by the Brothers who continually absent themselves from their Division meetings will result in lots of good.

In the evening a banquet and reception was tendered our Assistant Grand Chief, followed by a short musical program, an address by Bro. Cadle, and brief talks by some of the Brothers and Sisters present. The musical program consisted of a piano solo by Mrs. Ella Kelly; violin solo by Miss Rilla Andrews, with Miss Hazel Clements at the piano; piano solo by Miss Georgia Graney; song by Miss Iva Reading, with Miss Laura Moshier at the piano; and recitations by Miss Beatrice Richmond.

The evening was a most enjoyable one and personal thanks are due from every Brother to the Ladies' Auxiliary for their splendid effort, and also to the daughters whose talents helped to make the evening one long to be remembered.

J. W. READING.

HEALTH ASSOCIATION, of Div. No. 53, B. of L. E., Jersey City, N. J., which we believe was the first one in the field with this kind of Indemnity Insurance, reports a membership of 173, from whom was collected during the year ending Dec. 31, 1904, \$4,888.50; paid out to 57 members sick and disabled during the year, \$4,548.50; cost to each member for the year, \$30.

This association has had years of experience and years of success, and any Division desiring to establish weekly indemnity or a health association will do well to write to Bro. Chas. Metz, Secretary and Treasurer, for their constitution.

MINNEHAHA Div. 180, Minneapolis, Minn., has an Indemnity Insurance with \$15 a week payments, which cost the members from January, 1904, to January, 1905, but \$2.25 each. While we consider that we had a very fortunate year, we think it an excellent thing, and vastly better than can be had in any old line company, and as there is much discussion on the various phases of the subject of insurance in the JOURNAL, believe this kind of insurance would be a good thing for every Division, but better for Divisions having a membership of 40 and upwards.

Fraternally yours,
C. E. BARTON, C. E., Div. 180, 1234 Mary Place.

BRO. JAS. CHATEM, 167 Robert St., Toronto, Can., member of Div. 70, who lost

an arm through the fireman moving his engine, has a summer resort for sale, located at Island No. 139 on the river St. Lawrence, $1\frac{1}{2}$ miles east of Gananoque. There is a cottage, a grove and garden, and good fishing ground—a nice place for rest, recreation and to live. Any one interested will please write, addressing as above.

Div. 61, Boston, Mass., held their regular meeting in their hall, Sunday, March 12, which was largely attended, every seat being filled. After the regular routine of business was dispatched and four new Brothers had been added to our Division, the committee on the new hall reported that this would probably be our last Sunday meeting in our old hall, as we should occupy our new quarters on the first day of April, and should celebrate the event in conjunction with the Sisters of the Auxiliary by a "house-warming" on the evening of Saturday, April 1. It is intended to have refreshments, a "coon" show by the Sisters, and a generally good social time by all. Everybody come.

In regard to our old hall, it may be said that it may be with some feeling of regret that some of the older Brothers will leave it, as it has been the home of Div. 61 for nearly thirty years, and to them it may seem like leaving old associations and home ties behind, but the change was made imperative by a lease of the whole building for business purposes.

The committee in charge of securing new quarters have worked faithfully and successfully in providing a new hall, much better in every way, and should be complimented on their efforts and success.

The new hall is just as near, if not nearer, the Boston North Terminal, being No. 164 Canal street; up only one flight, much larger, cleaner, and easier of access than the old one. No dark, steep back stairs to climb; in fact, there are two halls, one large and another smaller for suppers, entertainments, etc., with kitchen and toilet rooms, making when furnished and fitted up an ideal home for "Old 61."

We hope to see all the Brothers and Sisters possible at the "house-warming," and as our next regular Sunday meeting will be on April 9 we hope to see our new home filled by the Brothers.

During the meeting the sick committee reported most of the sick Brothers as improving, and particularly gratifying was their report that Bro. "Bill" Batchelder, who had been to the hospital for an operation on his eyes, had passed through the operation well and that it had been successful, and the physicians thought he would be better than he had been for years. Glad to hear it, "Batch."

The meeting adjourned about 1 o'clock, in order to enable many of the Brothers to attend the fifteenth anniversary celebration of Div. 439, of Boston, to which 61 had been invited.

It may be added, that owing to the continued sickness of Brother Bucknam, Corresponding Secretary, the writer was appointed to fill that position, and by him any news for the good of the order is solicited and will be forwarded to the Editor of the JOURNAL. My address is N. H. B. Wardwell, 88 Cambridge St., Lowell, Mass., or B. & M. R. R. Engine House, Lowell, Mass.

Yours for the cause,
N. H. B. W., Cor. Sec., Div. 61.

THE Washington's Birthday celebration and ball given by Bellevue Div., 447, B. of L. E., at Bellevue Opera Hall, was a perfect success in every particular. The attendance was large, the music all that could be desired, and the company was entertained in a splendid manner.

Over fifty couples participated in the grand march, which was led by Mr. and Mrs. J. D. Cook, who took the dancers through some intricate evolutions without a tangle. The number participating in the grand march tells nothing of the attendance, for there were over three hundred present. It was a really enjoyable gathering and there was nothing that marred the pleasure of any one, and the gayety was continued until a late hour.

At about 10:30, when the orchestra was playing the opening bars of a pleasing waltz and the dancers had caught the rhythm of the piece, something happened. Engineer Jimmy Jones rushed onto the floor, swung a green and white light, the orchestra came to an abrupt stop, and everybody thought the train had struck a landslide. Then it was forcibly announced that a lunch would be served on the stage during the evening. The conductor signaled the orchestra and the dance continued.

The hall was nicely decorated with bunting and flags, and the committees took special pains to see that none of the guests were slighted and that all enjoyed themselves.

Among the out-of-town guests were Mr. and Mrs. Charles Wilcox, Peru, Ind.; L. Hanon, of Lorain, and Mr. and Mrs. E. C. Carter, of Cleveland.

The success of the affair was due to the work of the following committees, who had it in charge:

Arrangement—C. E. Sliter, E. S. Cloud, J. W. Jones, D. G. Obey, T. P. Whalen, M. T. Ocker, G. A. Mullen, J. Grussey, James Furlong, H. I. Phipps, Chairman.
Door—Thomas Peters, W. W. Farley,

J. Quinn, William Gardner, P. McGushin, A. E. Ooker, Joseph Fritz, H. H. Hunt, J. A. Swartz.

Reception—S. E. Kern, N. Bryson, C. F. Long, M. L. Swift, George Schachtele, D. Stetler, A. O. Street, William Myerhoff, M. O. Grubb.

Floor Director—J. D. Cook, assisted by C. S. Fox, B. Fullerton, Jay Fritz, B. J. West, John Adams, C. E. Grubb, J. M. Lynch, Joseph Miller, J. W. Beltz, John Dressback, M. D. Kirby, J. H. McClain, E. E. Carter, J. Schachtele — *Bellevue Paper*.

ON THE evening of February 17, the members of Div. 196, B. of L. E., McComb, Miss., entertained their wives and a number of friends with one of the most delightful social events of this season.

The arrangements were in the hands of Bros. J. H. Reagin, J. J. Jackson and J. H. Fuqua, and the result was a decided success in every way.

Bro. J. H. Martin presided, and after a few happily chosen remarks introduced the Hon. F. H. Lotterhos, the speaker of the evening, who delivered an exceedingly interesting address, which was listened to with marked attention by every one present.

A splendid band furnished choice music throughout the evening, and the various items on the program were thoroughly enjoyed, a recitation by Miss Fuqua deserving special mention.

The ladies offered a prize to the gentleman who could trim a hat the neatest and quickest, which was won by Bro. J. H. Martin, who should seriously consider the advisability of hanging out his shingle as a first-class milliner.

Bro. J. H. Reagin took the booby prize, with a hat trimmed in such a fearful and wonderful manner that the most appropriate place to exhibit it would be in a dime museum.

The ladies then entered into a spirited contest as to which of them could saw wood the best, and the first prize was awarded to Sister Calhoun, who showed a muscular development of which an athlete might be proud. Sister Mixon brought up the rear end and was awarded the booby prize.

At 10:30 P. M. all sat down to a splendid banquet, the tables literally groaning under their load of good cheer. The whole affair was a decided success in every way, and each one left hoping it was the forerunner of many other similar meetings.

A. M. S.

NORTHERN TIER DIV., 69, Grand Forks, N. D., found at the beginning of the new year that we had grown rusty and wish-

ing to "brush up" a little, we decided to turn over a new leaf. Since that time we have had better meetings with a larger attendance and more interest is being shown. Our last meeting was a banner one with 36 members present and four for initiation.

About 5:30 there came an alarm at the door. Our worthy Guide, Bro. Joe Murray, answered the alarm. On returning he looked somewhat excited and informed Brother Chief there was a committee of ladies from Div. 247, G. I. A., desiring admittance and a word with the Chief Engineer. As this was the first visit from the G. I. A. ladies, no time was lost in admitting them, for fear they might change their minds. Our worthy Chief, Bro. F. A. Catlin, proved himself quite a hero, not knowing what designs the ladies might have on the boys present, welcomed them on behalf of Div. 69.

Sister Johnson responded to the welcome and said that she had always heard that the way to a man's heart was through his stomach, and she thought with their presence and the odor of coffee that came through the door when they were admitted, that if the Brothers would retire to the dining hall they would try to find out if what she had always heard was true or not.

After partaking of the supper so thoughtfully and carefully prepared, we returned to the Division room and tried to think of some way to show our appreciation more fully than by devouring everything in sight, when one of our quick-witted Brothers suggested that a new "spring hat" would please the ladies. No sooner said than done. A black hat was selected and trimmed profusely with "silver" trimming. Sister Yowell, as treasurer of G. I. A. Div., 247, not liking the hat returned it, but accepted the trimming on behalf of Div. 247, in a very gracious manner.

After an hour of social chat we departed to our various homes, agreed that—

"A lass is good and a glass is good,
And a pipe to smoke in cold weather;
The world is good and the people are good,
And we're all good fellows together."

Y.

THE employees of the Cairo Division of the Big Four gave a farewell reception in honor of the retiring Superintendent, Thomas Reynolds, in the Elks' Hall, Mt. Carmel, Ill., on the night of February 28, to show their appreciation and express their sentiments to the most popular man that has ever filled the position of Superintendent on the Cairo Division.

The hall was beautifully decorated for

the occasion and a large U-shaped table, adorned with pink carnations, occupied the center of the room.

On arrival at the hall, Mr. Reynolds, accompanied by Mr. J. V. Kennedy, Trainmaster, Mr. D. J. Mullen, Master Mechanic, and Bro. Wm. Burns, Chairman of the evening, took their places at the head of the table, and together with the 200 employees present, proceeded to partake of the bountiful repast prepared by Caterer C J Cummins and served by his corps of waiters.

After luncheon, Chairman Brother Burns introduced Mr. J. V. Kennedy, who gave a very interesting talk on railroad men in general and reviewed the work of Mr. Reynolds for the past six years he has been on the Cairo Division, referring in particular to his broad views in all transactions and his ever ready hand to his fellow man in distress. He concluded his remarks by presenting Mr. Reynolds with a handsome diamond stud, as a token of the high esteem in which he is held by the employees, and expressed the wish that his future might be as bright and as free from clouds as the jewel he had the honor to present.

Mr. Reynolds responded with a short address, thanking the employees for the hearty support they had accorded him during his stay on the Cairo Division, and wished them success in their future undertakings.

Short addresses appropriate to the occasion were made by the following men: D. J. Mullen, M. M., W. D. Browning, E. F. Eichhorn, Bro. H. W. Baldwin, J. Williamson, J. T. Watkins, John Keenan, M. Henley, C. Craig, H. Bushire, Jos. Nadin, Geo. Wright, C. E. Roebuck, J. Rodgers, D. J. Bonner, A. Reeves, Henry Milhorn and H. A. Cooney.

The music was furnished by Prof. Kyle Foster. During the evening Messrs. A. E. Habberton and E. F. Eichhorn entertained the party with clever character sketches, instrumental and vocal numbers.

After extending a vote of thanks to the lodge of Elks for the use of the hall, the assembly adjourned at 11 P. M., singing "Auld Lang Syne."

M. C. DAVIS, F. A. E. Div. 400.

THE Brothers of Div. 141 are feeling quite elated over the success of their annual ball given on February 22, 1905. It is getting to be considered quite the event of the season, and deservedly so, for neither time nor expense is spared to make it so.

Brothers Kinney, T. Pearson, Kinkade, Hamilton and W. J. Pearson were appointed a committee on arrangements and

deserve great credit for their faithful work. Springer's orchestra of Salina furnished music for the occasion, and to say every one was pleased with it, is putting it mildly.

The grand march was led by District Foreman Merrill and wife, Supt. Vick Roy and wife, followed by our Grand Chief W. S. Stone and Mrs. Thos. McMahon, President of the Ladies' Auxiliary, the engineers following, and 65 other couples following.

Bro. Joe Cadden, of Beloit, was there and seemed to enjoy himself as he always does, also Brother Thos. Henchey, of Salina, Bro. J. L. Simpson and wife of Division 81, and Brother Hall, of Cheyenne Wells, were present.

Grand Chief W. S. Stone came on the morning of the 22nd. He could stay but the one day, but we enjoyed every minute of it. The ladies of Div. 212, G. I. A., served a turkey dinner (composed of tree climber "turkeys" as explained to our Chief by Brother Chapman) in the Grand Army Hall to all engineers and wives. Plates were laid for eighty and the tables fairly groaned under the weight of good things to eat, for the ladies of 212 are thoroughly acquainted with the only sure way to a man's heart.

A reception was held before the dinner to give the Brothers and Sisters an opportunity of meeting the Grand Chief. Brother Stone has a wonderful power of winning all hearts by his pleasant, unassuming manner, and the Brothers can not be with him long without feeling that he has their interest so much at heart that he is a Brother in every sense of the word.

The Brothers held a secret session all the afternoon and if every member present was not benefited by Brother Stone's words of advice and warning, they are not worthy to belong to the B. of L. E. We only wish we might have his helpful presence oftener.

ONE WHO WAS THERE.

ON Wednesday evening, February 22, a beautiful home wedding was solemnized at the home of Bro. and Mrs. C. F. Edrington, when their daughter, Miss Ella Edrington and Mr. Claud Wilson were united in marriage.

The parlors were handsomely decorated with palms, ferns and flowers, a feature of the decoration being a large wedding bell suspended from a richly decorated arch, under which the ceremony was performed.

Rev. T. Y. Ramsey, of the Winfield Memorial M. E. Church, performed the rites, using the ring ceremony.

Mendelssohn's Wedding March was reu-

dered by Miss Grace Edrington, and the bridal party entered in the following order:

John W. Casey and Miss Minnie Edrington, Clarence Wiley and Miss Lena Bemberg, followed by the bride and groom.

The bride wore *peau de soi* trimmed with point lace, with full bridal veil, and carried an arm bouquet of bride roses.

The bridesmaids wore silk tissue over taffeta, and carried arm bouquets of roses.

After congratulations a dainty wedding supper was served, the guests being waited upon by Brother Edrington, who seemed to be as young as the groom.

The young couple were the recipients of many beautiful gifts.

At a late hour all departed, after having spent a most enjoyable evening.

A GUEST.

BRO. HIRAM MYERS, formerly member of Div. 36, Newark, O., was employed by the B. & O. between Newark and Chicago Junction for some fifteen years, but was eventually transferred to Baltimore, Md., to the service of the Pennsylvania Railway, and to Div. 52. Brother and Mrs. Myers have been traveling together many years, and they concluded to celebrate their wedding day; and that they have many friends is evidenced by the following from a Baltimore paper, which says:

A pretty wedding anniversary was celebrated by Mr. and Mrs. Myers at their home, 2143 Jefferson Place, on Tuesday evening, February 14. Thirty years ago they were married at Fostoria, O., of which state they are both natives, but moved to this city about fifteen years ago. The residence was profusely decorated with American Beauty roses and pink carnations. A number of handsome presents, including cut glass, silver, china and linen, were received, also a beautiful silver water service, given to them by the Ladies' Auxilliary. Invitations to the Brotherhood of Locomotive Engineers and the Ladies' Auxilliary, of which they are members, were extended. Those present were Mr. and Mrs. F. Hall, Mr. and Mrs. J. Smith, Mr. and Mrs. N. Smith, Mr. and Mrs. F. Rollman, Mr. and Mrs. George Role, Mr. and Mrs. H. Plummer, Mr. and Mrs. J. Plummer, Mr. and Mrs. W. McDade, Mr. and Mrs. J. Malin, Mr. and Mrs. W. Long, Mrs. Brom, Mr. and Mrs. G. Reamer, Mr. and Mrs. G. Geisey, Mr. and Mrs. Harry Free, Mr. and Mrs. H. E. Morrison, Mr. and Mrs. Eugene Coleman, Mr. and Mrs. E. Dick, Mr. and Mrs. A. Andrews, Mr. and Mrs. J. Rider, Mr. and Mrs. Charles Metcalf, Mr. and Mrs. Reiley, Mr. and Mrs. J. Shafer, Mr. and Mrs. J. Pierce, Mr. and Mrs. F. Brockman, Mr. and Mrs. M. Brockman, Mr. and Mrs. S. Bergan, Mr. and Mrs. Fifer and daughter, Mr. and Mrs. L. McCaully, Mr. and Mrs. A. McCaully, Mr. and Mrs. B. Comthwall, of Washington; Mr. and Mrs. Asken, Mr. and Mrs.

Richardson, Mr. and Mrs. Zimmerman, Mr. and Mrs. Raglin, Mr. and Mrs. W. Perry, Mr. and Mrs. W. Hubbard, Mr. and Mrs. G. Fry, Mr. and Mrs. A. J. Cooler, Mr. and Mrs. J. Hitchcock, Mr. and Mrs. Frank Murphy, Mr. and Mrs. Henry Castleberg, Mr. and Mrs. J. Jones, Dr. Clarence Dotan, Mr. and Mrs. H. T. Cole, Mrs. Maggie Holland, Miss S. Rannels, Miss Girtle Andrews, Miss Ella Metcalf, Miss Elnerie Smith, Miss Florence Kelso, Miss Fifer, Miss Girtle Plummer, Mr. Eugene Coleman, Jr., Mr. Robert Bowman, musician; Mr. John Free, musician; Mr. Stanley Colgan, Mr. W. Andrews, Mr. Perkins Coleman, Mr. John Favorite, Mr. Elmer Cornthwaite, of Mount Washington; Mr. and Mrs. O. C. Moore, Mr. and Mrs. G. Ingen, Mr. and Mrs. N. Grafton, Mr. and Mrs. George Gracey, Mr. and Mrs. W. Taffy, of Mingo, O.; Mr. and Mrs. H. M. Ingen, of Chicago; Mr. A. Ingen and Mr. and Mrs. H. Ingen, of Mingo, O.; Mr. and Mrs. J. Lee, of Bellaire, O.; Mr. and Mrs. Albert Rolf, Mr. and Mrs. Watters, and Mr. and Mrs. Kelly, of Zanesville, O.

I AM a member of Div. 480, Cincinnati, O., and I am happy to say that after several years of hard struggling our Division is getting along fine. We have been about at a standstill for several years, but now we are having from one to four initiations every meeting. We have fine officers, and plenty of money in the treasury.

On Sunday Bro. Frank Gibney and myself went down from Columbus to attend the meeting and it was nice to see such a well-filled hall instead of a bare quorum, as it used to be. We are organizing a Mutual Benefit Association in our Division.

T. B. AREHART.

WE are in receipt of Carew's Standard Time Book for Railroad Men. The book is gotten up by Bro. R. S. Carew, a member of Div. 360, and is the result of knowledge of needs gained by experience and gives a full record of each trip and tells how to guard against and correct errors in time. The book can be had for 25 cents by addressing R. S. Carew, 21 E. Tremont street, Massillon, O.

THE gross earnings of thirty-nine roads for the first week of March were \$7,899,292, against \$6,642,700 for the first week March 1904, an increase of \$756,592. Thirty-three roads show increases and six decreases. Since July 1 the roads referred to above earned \$280,056,605, an increase of \$12,414,866 over the \$267,641,739 reported for the corresponding period of last year. For the longer period thirty-one roads show increases and eight decreases.

—United States Investors.

W. J. SHOWALTER, a Washington correspondent, says: One of the most consistent advocates of legislation in Con-

gress looking to the betterment of the condition of the laboring classes is Senator Thomas S. Martin, of Virginia. It was through his instrumentality that the Kean resolution to investigate the question of railroad rates was so extended as to include an investigation to ascertain the advisability of enacting a national employers' liability bill, which would do away with the old common law doctrine of fellow servants, behind which the railroads get to avoid paying just claims for damages growing out of injuries sustained by employees in discharge of duty. This investigation will undoubtedly result in a Federal liability law, and it will prove a great boon to railroad employees.

Another piece of legislation of interest to labor, secured by Senator Martin, was the provision that mechanics in United States Navy Yards shall be entitled to short annual leaves of absence with pay, thus placing them on the same plane with Department employees.

THE members of Div. 598, B. of L. E., and Auxiliary Division 302, Richmond, Ind., gave their second annual ball on Feb. 22, and it was one of the most successful functions of the winter. Not only did the affair net the organization of Locomotive Engineers a handsome sum, but the arrangements were so perfect, and they were carried out with such a nicety that the several hundred guests were loud in their praises.

Odd Fellows' Hall was bedecked with flowers and palms and the National colors were conspicuously displayed. Suspended from the balcony at frequent intervals and also from the chandeliers were the regulation lanterns, half of them green and half red. Back of the orchestra was a perfect fac-simile of the head of a locomotive, from the pilot to the tip of the stack. It was "No. 598," and was the favorite of the evening.

The guests began to assemble early, and before 9 o'clock, the hour for the grand march, it seemed as if dancing would be almost impossible, so great was the crush. The gallery as well as the floor was filled with a throng of happy people. Dancing occupied the attention of the old and the young until a late hour, when luncheon was served in one of the other halls in the building.

One of the features of the dance was "the moonlight waltz." At the announcement of this all the lights were turned out with the exception of the lanterns, and the music began one of the most dreamy kind of waltzes. Suddenly up in one corner of the room there appeared a moon, which soon arose and shone full-orbed over the scene. The imitation was

perfect and the dance received several encores. Kamp's full orchestra furnished the music.

The committee in charge of the annual dancing party performed its duty well, and to them is due the success that was achieved. It is evident, however, that next year the engineers and their ladies will be compelled to rent the Coliseum in order to give accommodations to their friends. There is no question but that the Coliseum could be literally filled with dancers and spectators, for the Brotherhood members are popular, and their efforts always bring them the most cordial support.—*Local Press.*

SPECIAL NOTICES.

The traveling card of Bro. P. W. Montgomery, member of Div. 251, has been lost in San Francisco. If presented, please take up and forward to Bro. E. H. Colip, F. A. E. of Div. 251, Raton, N. M.

Wanted—The addresses of Ellis and Eri Bliss, who were born at Cottage Hill, near Chicago, Ill. in the fifties, and are said to have entered railroad service in Michigan, at least one is supposed to have become an engineer. It will be to their interest if either will correspond with John C. Peirsol, Monroe City, Mo., who is the attorney for an unsettled estate.

Bro. George Hans, member of Div. 48, when last heard from was employed in Mexico, on the Mexican Central Railway. His good wife not hearing from him for nearly three months, and her letters to others remaining unanswered, she is greatly worried. Will any one knowing of him please write her and relieve her anxiety? Address Mrs. George Hans, 115 S. Ewing Ave., St. Louis, Mo.

Will any one acquainted with Hank Comfort, an engineer running between Dunkirk and Hornellsville, N. Y., about the time of the war in the 60's, please write his son, Bro. H. E. Comfort, member of Div. 69, 1100 University Ave., Grand Forks, N. D.

Members of the Following Divisions will correspond with the F. A. E. of their Divisions immediately:

<i>Division—</i>	<i>Division—</i>
80—E. E. Lawrence.	326—W. L. Hammond.
451—C. G. Franklin.	

OBITUARIES.

[In accordance with the action of the Ottawa Convention, no resolutions of condolence, obituary letters or poems will be published in the JOURNAL. All deaths will be listed under obituary heading only, with cause and date of death.]

La Grande, Ore., Feb. 8. Mrs. Almira M. Carpenter, mother of Bros. D. E., U. S. and Ray C. Carpenter, members of Div. 362.

West Chester, Pa., Feb. 4. Bro. Harry C. Walters, member of Div. 51.

Marshall, Tex., Feb. 20, engine going through a bridge, Bro. W. J. Spaulding, member of Div. 219.

Brinkley, Ark., Feb. 22, pneumonia, Bro. W. B. Austin, member of Div. 554.

Moran, Kan., Feb. 12, engine turning over, Bro. C. W. Phelps, member of Div. 177.

Chicago, Ill., Feb. 12, pneumonia, Herbert Lundean, son of Bro. P. G. Lundean, member of Div. 458.

Parsons, Kan., Feb. 12, injuries received from engine turning over, Bro. C. B. Willard, member of Div. 179.

Seattle, Wash., Feb. 6, killed, Bro. Robert E. Love, member of Div. 399.

- Alexandria, Va., Feb. 21, pneumonia, Bro. H. H. Downs, member of Div. 317.
- Cloverport, Ky., Feb. 9, Bro. Jos. E. Buckley, member of Div. 485.
- Mattoon, Ill., Dec. 18, 1904, Bro. John Granger, member of Div. 37.
- North Platte, Neb., Feb. 12, Bro. Warren Lloyd, member of Div. 88.
- Pottsville, Pa., Feb. 12, 1904, Bro. M. Address, member of Div. 90.
- Pottsville, Pa., March 19, 1904, Bro. T. H. Parker, member of Div. 90.
- Chicago, Ill., Feb. 8, Bro. E. G. Crandell, member of Div. 96.
- Abbotsford, Wis., Feb. 27, rupture, Bro. F. L. Chase, member of Div. 80.
- Marquette, Mich., Feb. 15, Bro. Jacob Williams, member of Div. 94.
- Momence, Ill., Feb. 25, injuries received in wreck, Bro. Geo. Graves, member of Div. 100.
- Meridian, Miss., Feb. 24, Bright's disease, Bro. Edward Maxwell, member of Div. 156.
- Hamden Junction, O., Feb. 22, pneumonia, Bro. Barney Gullum, member of Div. 65.
- Grand Rapids, Mich., Feb. 24, killed, run over by his train, Bro. Albert Garman, member of Div. 286.

LOCOMOTIVE ENGINEERS' MUTUAL LIFE AND ACCIDENT INSURANCE ASSOCIATION.

Official Notice of Assessments 796-799.

SERIES F.

OFFICE OF ASSOCIATION, ROOM 803, SOCIETY FOR SAVINGS BUILDING, }
CLEVELAND, OHIO, April 1, 1905. }

To the Division Secretaries L. E. M. L. and A. J. A.:

DEAR SIRS AND BROS.—You are hereby notified of the death or disability of the following members of the Association:

Four Assessments for payment of these claims are hereby levied and Secretaries ordered to collect \$1.00 from all who are insured for \$750, \$2.00 from all who are insured for \$1,500, \$4.00 from all who are insured for \$3,000, and \$6.00 from all members insured for \$4,500, and forward same to the General Secretary and Treasurer.

Members of the Insurance Association are required to remit to Division Secretaries within thirty days from date of this notice, and the Division Secretaries to the General Secretary and Treasurer within ten days thereafter, on penalty of forfeiting their membership. (See Section 25, page 80, of By-Laws.)

Secretaries in sending remittances will send same to and make all drafts, express money orders or postoffice money orders payable to M. H. SHAY, General Secretary and Treasurer. Secretaries located in Canada will please remit by draft or express money order. We will not accept packages of money sent by express, unless charges have been prepaid. The JOURNAL closes on the 18th of each month. Claims received after that day will lie over until the succeeding month.

NINE NATIONS

Now Use Liquozone. Won't you try it—Free?

Millions of people, of nine different nations, are constant users of Liquozone. Some are using it to get well, some to keep well. Some to cure germ diseases, some as a tonic. No medicine was ever so widely employed. These users are everywhere; your neighbors and friends are among them. And half the people you meet—wherever you are—know someone whom Liquozone has cured.

If you need help, please ask some of these users what Liquozone does. Don't blindly take medicine for what medicine cannot do. Drugs never kill germs. For your own sake, ask about Liquozone; then let us buy you a full-size bottle to try.

We Paid \$100,000

For the American rights to Liquozone. We did this after testing the product for two years, through physicians and hospitals, after proving, in thousands difficult cases, that Liquozone destroys the cause of any germ disease.

Liquozone has, for more than 20 years, been the constant subject of scientific and chemical research. It is not made by compounding drugs, nor with alcohol. Its virtues are derived solely from gas—largely oxygen gas—by a process requiring immense apparatus and 14 days' time. The result is a liquid that does what oxygen does. It is a nerve food and blood food—the most helpful thing in the world to you. Its effects are exhilarating, vitalizing, purifying. Yet it is a germicide so certain that we publish on every bottle an offer of \$1,000 for a disease germ that it cannot kill. The reason is that germs are vegetables; and Liquozone—like excess of oxygen—is deadly to vegetal matter.

There lies the great value of Liquozone. It is the only way known to kill germs in the body without killing the tissue, too. Any drug that kills germs is a poison and it cannot be taken internally. Every physician knows that medicine is almost helpless in any germ disease.

Germ Diseases.

These are the known germ diseases. All that medicine can do for these troubles is to help Nature overcome the germs, and such results are indirect and uncertain. Liquozone attacks the germs, wherever they are. And when the germs which

cause a disease are destroyed, the disease must end, and forever. That is inevitable.

| Goitre—Gout | Variocœle |
| Gonorrhœa—Gleet | Women's Diseases |

All diseases that begin with fever—all inflammation—all catarrh—all contagious diseases—all the results of impure or poisoned blood.

In nervous debility Liquozone acts as a vitaliser, accomplishing what no drugs can do.

50c. Bottle Free.

If you need Liquozone, and have never tried it, please send us this coupon. We will then mail you an order on a local druggist for a full size bottle, and we will pay the druggist ourselves for it. This is our free gift, made to convince you; to show you what Liquozone is, and what it can do. In justice to yourself, please accept it to-day, for it places you under no obligation whatever.

Liquozone costs 50c. and \$1.00.

CUT OUT THIS COUPON

for this offer may not appear again. Fill out the blanks and mail it to The Liquozone Co., 458 464 Wabash Ave., Chicago.

My disease is

I have never tried Liquozone, but if you will supply me a 50c. bottle free I will take it.

NUMBER 5.

The Portland Fair.

TACOMA, WASH.

EDITOR JOURNAL: The "Lewis and Clark Centennial and American Pacific Exposition and Oriental Fair," which is the official name of the exposition to be held at Portland, Oregon, from June 1 to October 15 of the present year, will far surpass anything of its kind ever held on the Pacific Coast. It will be the first Fair ever held west of the Rocky Mountains, receiving the support of the United States Government. The amount appropriated by the Government is \$475,000. The Fair will be international in its scope, but the products and industries of the states

of California, Oregon, Washington and Idaho will be most prominent.

This centennial will celebrate the one hundredth anniversary of the exploration of the Oregon country by an expedition commanded by Captains Meriwether Lewis and William Clark, and planned by President Jefferson.

These two men started on their tour leaving St. Louis, Mo., in May, 1804, making the mouth of the Columbia River their objective point. They fought their way through three thousand miles of then unknown country, ascending the Missouri River from the point of its junction with the Mississippi to its source; then crossing the Rocky Mountains till

MOUNT HOOD, OREGON.

they struck the head waters of the Snake River, following it to its junction with the Columbia, then down this mighty stream to where it flows into the Pacific Ocean, reaching this point November 15, 1805. It is doubtful if they would have accomplished the trip but for the aid of the Indian woman Sacajawea, who accompanied them on their journey, acting as guide and interpreter. In honor of this heroine there has been erected a bronze statue amid the beautiful flower gardens that adorn the Fair Grounds.

After spending the winter exploring the

the stupendous strides of advancement and the marvelous transformation of this country within the last hundred years from a primeval state to what it is today, it almost staggers belief. It makes us ask the question, "Will there ever be an end to the advancement of mankind? Will the impossible ever be reached in every direction of human endeavor?" And if such a time does come what will become of the human race? For my part, I regret that my birth was not postponed a thousand years, but that being impossible, I have the consolation that I was not

BIRD'S-EYE VIEW OF PORTLAND, OREGON.

country surrounding the mouth of the Columbia River, they started on their return trip in March, 1806, reaching St. Louis late in the fall of the same year, being gone almost two and one-half years.

This expedition resulted in the acquisition of the Oregon country by right of discovery, which extended the domain of the United States to the Pacific Ocean, constituting what is now known as Washington, Oregon, Idaho and parts of Montana and Wyoming. This territory is the only land ever acquired by the United States through discovery.

When we think of the achievements, of

born a thousand years ago. While we cannot look into the future, we have the pleasure of looking into the past. On the wide plains the buffaloes roam no more and what a few years ago was a wild frontier, is now a land of happy homes. Where the members of the Lewis and Clark expedition listened to the dismal howl of the wolf and coyote now can be heard the merry voices of children on their way to school, and the war whoop of the Indian has long ago been replaced by the shrill cry of the locomotive. Who can estimate the part the railroads played in this development? It is doubtful if

this land could have been subdued at all but for them. Who can estimate the part accomplished by the railroad men? Every railroad man, in my opinion, is an advance agent of progress. Wherever the locomotive goes the wilderness disappears, the forests are felled, the savage man departs, the wild beasts flee, and civilization comes and abides. To fittingly commemorate these marvelous changes inspired the people of the Pacific Northwest in the preparation of this exposition which every American should share.

Portland, the Exposition City, is a city of about 125,000 people. It is

meets the eyes. Tributary to the city is the fertile Willamette Valley where prunes and grapes grow as abundantly as they do in California. In the distance can be seen the Cascade Range of mountains with several snow-covered peaks, lifting their summits to the sky. These peaks were once volcanoes, but long ago became extinct. Mt. Hood, which is located about 60 miles southeast of Portland, receives the most attention because it is in the state of Oregon, but looking to the northeast over into Washington, Mt. Adams and Mt. St. Helens present a grand sight. Mt. Hood reaches a height

CENTRAL PARK, LEWIS AND CLARK EXPOSITION.

situated on the Willamette River, twelve miles above its confluence with the Columbia and 118 miles from the Pacific Ocean. It holds extensive commercial intercourse with the whole world. Ocean vessels of all nationalities can be seen on the water front at all times of the year and during the Fair several warships will be anchored in the harbor. It has 163 miles of street railways, fine paved streets, imposing buildings, schools, churches, hotels, and is up to date in every way and compares favorably with any Eastern city of its size. The city is beautifully located. One may look in any direction he chooses and a landscape

of 11,225 feet, narrowing to a point at the top and rises above the mountain range like a great white pyramid. Beholding it in the gray dawn of the early morning it stands out dark against the sky, but as the full light of day falls upon it it becomes white with dazzling snow. There are times again when the atmosphere becomes lazy, obscuring its base and the entire mountain range, but the air being clear higher up, this great white peak can be seen apparently afloat. Then in the evening when the sun is sinking down to rest, the snow becomes tinged with a scarlet hue, but immediately upon the sun sinking below the horizon it changes

from crimson tinted snow seemingly into a mountain of alabaster. The same is true of the other snow-clad peaks. Portland receives her water supply from a stream fed direct from the ever melting glaciers upon this peak. The climate is of an even temperature. In climate, of course, like people and everything else in this world, the ideal cannot be found, but it comes much nearer being ideal on the Pacific Coast than in any other part of the United States that I know of. As a rule the summers are cool and dry and the winters mild and damp. There are warm days, of course in summer, but it never becomes sultry or the heat oppressive. No matter how warm it becomes during the day the nights are always cool enough to necessitate sleeping under blankets. The visitors to the Fair will not be troubled with wilted collars, neither will they have to resort to shirt-waists for comfort. Windstorms here are unheard of; neither does the flash of

lightning or the roar of thunder but rarely disturb the normal serenity of this peaceful land. The winters are chilly and rainy, but snow and ice are seldom seen. The surrounding hills and distant mountains are densely covered with evergreen timber. There are also various kinds of evergreen ferns, bushes, vines, shrubs and moss that grow almost everywhere, keeping the earth covered with verdure the year round. This moss also clings to the limbs of trees that shed their leaves, giving them a leafy appearance. So, although the weather is often cold enough to be disagreeable, the world always looks fresh and new as though it had just been made. The birds do not migrate, and the bluebird and bluejay, while they are the same size they are in the Central and Eastern States, possess a much richer plumage.

The Exposition Grounds are located on the outskirts of the city, adjoining the principal resident district. They cover

COLONNADE ENTRANCE, LEWIS AND CLARK EXPOSITION.

FORESTRY BUILDING, LEWIS AND CLARK EXPOSITION.

an area of 402 acres, 220 acres of which is a natural body of water known as Guilds Lake. I doubt if the site could be more picturesque, being composed of hill and dale and grassy slopes, neighbored on one side by lofty hills covered with virgin forests, consisting chiefly of fir. Then looking toward the other side, a view can be had for sixty-five miles in which valleys, rivers and mountain ranges can be

seen; also the summits of snowy peaks over a hundred miles away. In one portion of the grounds is what is known as Centennial Park, a natural woodland, where are growing many varieties of trees and shrubs just as they were in the native forest.

The main entrance to the Fair Grounds is at the corner of Upshur and 26th streets. The gates are equipped with

AGRICULTURE BUILDING, LEWIS AND CLARK EXPOSITION.

self-registering turnstiles, which will admit a person when he drops a half-dollar (commonly called in this part of the country four bits) into the box, while a separate stile will admit children who drop a quarter, or two bits, into the box. This device was adopted from St. Louis. It not only reduces the cost of operation, but saves people the trouble of buying tickets. As paper money is seldom seen on the Pacific Coast, it will be easy to procure the necessary halves and quarters.

On entering the Fair Grounds at the main entrance, the first building to meet the eyes is a circular pavilion of artistic design known as the Public Shelter. Just

the highest point on the grounds is the Forestry Building, its deep brown bark in strong contrast with the white walls of the others. The buildings to the right and in the same row with the Forestry are the Agriculture, European Exhibits, Liberal Arts, Oriental Exhibits, Mines and Metallurgy, Fine Arts, Machinery, Electricity and Transportation. Going on beyond this row of buildings until the brow of the hill is reached where the "Grand Stairway" leads down to the lake, all of the main buildings can be seen, also the Government Building, which is located on a peninsula which extends out into the lake. This peninsula is connected to the mainland by a highly ornamental

ORIENTAL BUILDING, AND FORESTRY BUILDING.

beyond it to the left is the Administration Building, and the Fire Department Building to the right. The second stories of these two buildings are joined together by the Peristyle, which curves around gracefully from one building to the other. It consists of an ornamental balustrade, lined with flag poles and rests on a double row of Ionic columns. On the façade are inscribed the words, "Westward the course of empire takes its way," of which the Fair itself and the city of Portland are exemplifications. Passing on further can be seen the first row of the main exhibit buildings, their walls of a rich cream color. On the extreme left and occupying

bridge, known as the Bridge of Nations. On one end of this bridge is what is known as the "Trail," which bears the same relation to the Portland Fair that the Midway did at Chicago and the Pike at St. Louis. Crossing the bridge after night will be like passing through a fairyland, not only on account of the various attractions located on each side, but in addition the lake will be submerinely lit up by thousands of electric lights placed beneath the water.

The building that will in all probability attract the most attention on the Fair Grounds is the Forestry Building. It is an immense log palace; a new departure

in exposition structure and of typical American design. The logs forming the base of the building are six feet in diameter, some of them being 52 feet long and weighing not less than 32 tons. The building is 206 feet long by 102 feet in width and its extreme height is 70 feet. In its construction two miles of five and six-foot fir logs, eight miles of poles and tons of shakes and cedar shingles were used. The galleries which overhang the main entrances on each side of the building are supported by colonnades of immense fir trees 30 feet high and 6 feet in diameter. The interior as well as the exterior of the building will be an exhibit of the forest products of Oregon and Washington. One of the special features inside will be a fir tree or log from Clatsop county, Oregon, which is 12 feet in diameter at the butt, 8 feet at the top and

will be the Fisheries Building, especially the salmon industry, together with specimens of live salmon in tanks and dead ones in glass jars, salmon eggs, and salmon fry and methods of salmon hatching. The exhibit will show how the salmon are canned and how they are preserved by cold storage.

The salmon is a peculiar fish, being adapted by nature to life in fresh and salt water. They spend their youth in the fresh waters of the upper Columbia and other rivers of the Pacific Northwest and their tributaries, which are cooled by glacier and spring-fed streams. When they are a year old, being then from four to six inches long, they migrate to the sea. Four years later they return to their native rivers, spawn and die.

When the salmon return to the rivers in the spring and latter part of the sum-

EUROPEAN EXHIBITS BUILDING.

100 feet long. There will also be the various woods in all their finished forms. Supporting the roof inside are 52 gigantic pillars consisting of fir and cedar trees 40 feet high. All of these immense logs and trees still possess their bark unbroken. To stand inside the building amid these great pillars reminds one of being in a great cathedral, besides giving one a feeling of awe and inspiration. Yet I do not think these trees possess the imposing sight they do as they stand in the forest aisles with their trunks bare for a hundred feet or more straight and perpendicular with their branches of equal length widening out as they rise and tapering again to a point at the top, as though trimmed and shaped by a hand divine. Many of them are synonyms for symmetry and grace.

Another attraction to Eastern visitors

mer, they come in great numbers or schools. It is this incident that makes the salmon industry profitable. They come back in such numbers that the fishermen catch them literally by the thousands.

Investigation has proved that of the eggs which the salmon lay, over 80 per cent are eaten by trout and other fish. Artificial propagation is therefore necessary in order that the supply of fish may be maintained. For this purpose there are a number of hatcheries in the states of Oregon and Washington operated by these two states and the United States Government.

There are a number of different varieties of salmon, among them being the chinook, blueback, silversides, dog steel-heads and sockeye. The chinook salmon is the most valuable of the species, also

the largest. Their average weight is twenty pounds, although it is not uncommon to find them weighing from thirty to forty pounds and a few attain the weight of eighty-five or ninety pounds. During the spawning season these fish can be seen often by the hundreds in the clear water of all the mountain streams and as far from the ocean as Idaho and British Columbia, streams so shallow that the backs of the fish can be seen above the surface of the water. Then again, they can be seen lying dead often by the hundreds along the banks of these streams, giving one a touch of pathos to behold. It is claimed, although I don't know how true it is, that on account of these fish being accustomed to the salt water for so

Russia, while she had no exhibit at St. Louis, will have an elaborate display at Portland, but in all probability she will be outdone by her rival, Japan. Of the foreign exhibits the Oriental will predominate. In fact, the Oriental countries alone have already absorbed all the space in the building originally set apart for all foreign exhibits; consequently, the building erected for liberal arts has been given to the European exhibitors and a new building is being erected for manufacturers and liberal arts.

Sundays, the Exposition will be given up to religious services and discussions on charitable, social and scientific topics. It will be the aim to have the religious institutes addressed by the leading men,

GRAND STAIRWAY TO EUROPEAN AND ORIENTAL EXHIBITS.

long, on returning to the fresh water it causes their flesh to decay in spots, which can be seen on the fish after they have been in the fresh water for some time and finally death ensues. Nature, while she is always working with equal force perpetuating and destroying life, seems to be cruel to the salmon, indeed, causing them to sacrifice their lives to perpetuate their species.

Another point of interest to Eastern visitors and a special feature of the Fair Grounds will be the Experimental Gardens and Model Farms, showing the methods and ways of irrigation by which much of the arid land of the West has been transformed from a dreary waste into a blossoming Eden.

not only of every Christian church, but of the Mohammedan, Buddhist, Confucian and other Oriental faiths. The gates on Sunday will not be opened until noon. All buildings except the Fine Arts, Auditorium and those of similar nature will be closed throughout the day and all machinery will be stopped.

It is the intention of the different railroad orders of the Pacific Northwest to have a railroad men's day at the Fair, and if possible to have the Grand Officers of the various orders there on that day. Div. 277, B. of L. E., at Portland, with the assistance of the other B. of L. E. Divisions throughout the Northwest, are endeavoring, and will no doubt succeed, in securing headquarters at Portland.

where they can entertain any B. of L. E. members who visit the Fair. Any Brothers visiting the Fair during the coming summer will no doubt have extended to them every hospitality and courtesy possible.

Besides visiting the Fair, visitors can take advantage of many enjoyable side trips out from Portland, such as a trip to the summit of Mt. Hood, or a trip by boat on the Columbia River, either going up through the gorge where many waterfalls can be seen, some of them having a fall of over eight hundred feet, until The Dalles is reached, or going down the river to the Pacific Ocean, where one can walk on

Crumpled shirt and dirty jacket
May beclothe the golden ore
Of the humblest thoughts and feelings—
Satin vests could do no more.

There are springs of crystal nectar
Ever welling out of stone;
There are purple buds and golden,
Hidden, crushed and overgrown.
God, who counts by souls, not dresses,
Loves and prospers you and me,
While he values thrones the highest
But as pebbles in the sea.

Man, upraised above his fellows,
Oft forgets his fellows then;
Masters, rulers, lords remember
That your meanest hinds are men—

EXPERIMENTAL GARDENS, FROM CENTRAL PARK.

pebbled beaches, hear the sound of the surf and listen to the "music of the waves." There are also various other trips that can be taken. While Portland and the Oregon country are interesting indeed, yet in no way do they surpass Tacoma or the Land of Puget Sound.

JOHN WHITEFORD.

A Grand Old Poem.

Who shall judge a man from manners?
Who shall know him by his dress?
Paupers may be fit for princes,
Princes fit for something less.

Men by labor, men by feeling,
Men by thought, and men by fame,
Claiming equal rights to sunshine,
In a man's ennobling name.

There are foam-embroidered oceans,
There are little reed-clad rills.
There are feeble, inch-high saplings,
There are cedars on the hills;
God, who counts by souls, not stations,
Loves and prospers you and me;
For, to him, all vain distinctions
Are as pebbles in the sea.

Toiling hands alone are builders
Of a nation's wealth or fame;
Titled laziness is pensioned,
Fed, and fattened on the same;

By the sweat of others' foreheads,
Living only to rejoice,
While the poor man's outraged freedom
Vainly lifted up his voice.

Truth and justice are eternal,
Born with loveliness and light,
Secret wrongs shall never prosper,
While there is a sunny right;
God, whose world-heard voice is singing
Boundless love to you and me,
Sinks oppression with its titles,
As the pebbles of the sea.

—B. of L. E. Journal September, 1867.

Margaret's Mission.

BY W. R. ROSE.

The day was warm and the landscape, touched up by the sun's bright rays, had a look of mellow beauty. But Margaret Blaine had no eye for nature just then. Her thoughts were busy elsewhere. The hour and a half ride on the suburban train gave her time for a deliberate review of the events that had led up to this journey.

When she met Edward Blaine she was a kindergarten teacher, and they had boarded at the same house. She knew that he had admired her the instant his gaze rested upon her face, and it was not long before his lips confirmed this knowledge. That was a happy time. But was it not all a happy time? All save for one cloud.

She was an orphan and quite dependent on herself. He was dependent on himself, too, and had been for several years. He had a father whom he briefly mentioned and of whom he did not care to talk. She fancied that father and son had quarreled and that Edward had broken away from all parental restraint. It was natural that she should think that Edward must have been right in the matter. Edward, in her eyes, was all that was frank and honest.

And so the course of true love ran smoothly, because they truly loved each other, and there was none to say them nay.

The wedding was a very simple ceremony. They went to the house of the pastor, whose acquaintance Margaret had formed in the mission work, and there in the presence of his wife they were united. They had a little dinner all by themselves afterwards, quite an extravagant dinner, Margaret had declared, and then they went away to a quiet resort on the seashore, and were gone just two days. Edward was a struggling electrical engineer, and a two days' vacation just at that time was all he dared to take.

"You'll find me a very selfish fellow before you know me much longer," he

had said to Margaret as they turned back toward the city. "I realize that it was selfish in me to marry you before I could give you a home. I had no right to ask you to share my hardships. It was beastly selfishness, but I just couldn't wait, my dear."

"What a tender conscience it has," laughed Margaret, as she furtively thrust her fingers into his strong hand. "But we'll manage to worry along on bread and cheese, and hope. Our ship will come in some time."

"You mean our electric motor," Edward had interposed. "But, really, my dearest, I'm quite serious when I say that perhaps it would have been better if I had waited until I could give you the luxuries, or even the comforts you deserve."

"What!" Margaret had cried. "Regrets already? There, there, smooth those wrinkles out of your forehead. Don't let me think I am the cause of them so soon. I knew just what to expect when I married you, dear. I am not the victim of your designing scheme. Don't look so cross, or people will think we have been married for years."

Edward's brow had cleared, and his smile had come back.

"All right, little woman," he had said, "let it be a seven-by-eight suite in an up-town flat, and bread and cheese, and kisses, and hope. What's the odds so long as we're 'appy.'"

They had both laughed and then a little silence had fallen on them.

"Edward," said Margaret, presently, "tell me something about your father."

A little cloud had crossed his face at this request.

"That's the one subject on which I would rather not talk," he had answered.

"But I am sure," Margaret had persisted, "that he would be glad to know that you are happy."

Edward had shaken his head.

"No," he had said, "he would not be glad."

"But does he not need you, Edward?"

"No, my love."

"Is he poor, Edward?"

"Yes, in all that makes life worth living."

There was another brief silence.

"I was thinking," Margaret had said, with her clear gray eyes fixed anxiously on Edward's face, "that if he is poor and friendless we ought to make a home for him."

Edward had looked at her with such a queer expression.

"You have a good heart, my dear," he had said with a little smile, "but what you suggest is quite impossible."

And there the subject had been dropped.

So Margaret and Edward had gone to housekeeping in the little suite in the up-town flat and were quite happy. Margaret brightened the rooms wonderfully with the simple materials that were at her disposal, and out of their limited income she fed Edward and herself in a plain, yet satisfying manner. She dressed herself neatly, too, and they had their simple amusements—frequent rides on the suburban cars, and occasionally the enjoyment of some particularly good play. And they were really very happy—although Margaret believed at times that the thought of his father still worried Edward.

One day Margaret had had a caller. There was a low rap at the door of their little suite, and when Margaret opened it an elderly man had pushed in. He was gray and wrinkled, with a keen eye and a grizzled mustache, and he walked with a heavy cane.

"Is this Edward Blaine's home?" he had abruptly asked.

"Yes," Margaret had replied.

"Is he at home?" And then, without waiting for a reply, he had added: "May I sit down? I am tired."

Margaret had placed a chair for him, and he had seated himself, with a little growl of relief.

"So you are Mrs. Edward Blaine?" he said. "How old are you?"

To this astonishing question Margaret had replied that she was twenty-three.

The old man had growled again and said: "You don't look twenty," and then had stared at her very sharply, indeed. Presently his eyes roamed about the apartment.

"Are you happy in this coop?" he had suddenly asked.

"Very happy," Margaret had replied.

At this the visitor growled once more and said he wouldn't wait. And after he had gone Margaret had found a \$50 bill lying on the floor under his chair, and she had run out into the hall and looked for him, but he had gone. So she put the bill carefully away, expecting he would return for it. But she said nothing to Edward about the call, because he would worry and perhaps blame her for admitting the eccentric stranger.

It was a few days after this that Edward had received a letter that seemed to depress him very much. And Margaret had found the letter where it had fallen from Edward's pocket, and, there being no secrets between them, she had read it.

The letter was from Edward's father, and it had made Margaret's heart heavy. He spoke of himself as a sick old man, alone and without friends. He asked Edward to humble his pride and let the past be forgotten. It was only a short

letter, but it touched Margaret's sympathy deeply.

She did not speak of it to Edward. She felt that his cause for resentment against his father must be deep indeed to resist that plea. And then she made a sudden resolve. There was a return address on the outside of the envelope. The place mentioned was but an hour's ride from the city. If Edward's father was alone and in want she would go to him, and perhaps be able to supply his more urgent needs. She had a little money saved up, and she took it with her. She could go on the early morning train and be back in the afternoon long before Edward returned from the factory. It was the first secret she ever kept from him and it troubled her a little.

But in case he should return before she did she left a little note for him. It bore these words: "Edward, dear, I have gone to see your father. Will be back this afternoon. Margaret."

If she got back first, which she was quite sure to do, she would destroy this note and Edward would be none the wiser.

So now she was swiftly nearing the town where Edward's father lived, and some of her fine courage was rapidly leaving her. Was she doing wisely? Perhaps, after all, Edward's father was quite undeserving.

Then she plucked up her courage again. No matter what he was, if he needed help she would do her best to give it him. If he was quite beyond her limited means of relief, she buoyed her mind with the thought that she would have done her best, and could return to Edward with a clear conscience.

When she alighted from the train she determined to ask the station master to aid her.

"I want to go to the home of a Mr. Blaine," she said. "Can you direct me?"

"Mr. Jasper Blaine?" said the station master, briskly. "Here, George."

A tall man in a coachman's livery stepped forward.

"Passenger for you, George," said the station master.

"This way, miss," remarked the uniformed man, and before Margaret could protest she was hastily helped into a waiting carriage and the coachman had closed the door.

She concluded this must be a public conveyance and that the station master was the coachman's confederate in picking up customers. But where was he taking her?

It was a brisk half-hour's drive and then the carriage entered a massive gateway and rolled up a winding drive. A moment later it stopped and the coachman opened the door.

Margaret saw that the carriage was standing beneath the porte-cochère of an imposing residence.

"Wait," she said, "there must be some mistake."

"This is Mr. Jasper Blaine's, Miss," said the coachman. "Step right in, please. The master's room is the second door to the right." And mounting to the box he drove rapidly away.

Margaret reflected that she could at least ask her way if she stepped within. She entered the hall. The second door at the right stood open. Margaret paused on the threshold.

The room was a library, with heavy furniture and many books. In an easy-chair an old man was sitting with one foot propped on a cushioned stool. The old man was reading a book, but as Mar-

CAPE HORN, ON THE COLUMBIA RIVER, OREGON.

garet halted irresolutely he looked up.

"Come in," he said.

Margaret slowly advanced, and lo! it was the old man who had called upon her in the flat! As she neared him he suddenly flung down the book.

"An envoy!" he cried. "Good. Come near and sit down, my dear."

But Margaret had halted.

"Pardon me, sir," she said, "but I have been misdirected. I am seeking a man by the name of Blaine, and through some misunderstanding I have been brought here. Perhaps you will kindly set me on the right road."

The old man pointed to the chair that was nearest him, and Margaret reluctantly seated herself.

"Didn't the man who sent you give you directions where to go?" he asked with his keen eyes on her troubled face.

"No one sent me, sir," she answered.

"That's very strange," he murmured.

"I only know," Margaret went on, "that the man I seek lives in this village. I came upon his address quite by accident. It may not be complete, but I fancied that in so small a place I would have little trouble in finding him."

"And may I ask why you are seeking this man?" he inquired. His voice was gentle and his look kind.

"I understood that he was in need," Margaret answered, "and I meant to help him if I could. Can you aid me to find him?" She arose as she spoke.

"Sit down," said the old man and Margaret obeyed. "What led you to believe that this man Blaine was in need?"

"From something my husband said," replied Margaret. She rebelled at being catechised in this fashion. But he was an old man.

"And what did he say?"

"He said that the man I seek was poor in everything that makes life worth living."

There was a little silence.

"Anything else, my dear?"

"I saw a letter that this man wrote to my husband," replied honest Margaret. "It fell from my husband's pocket and he does not know that I read it. In this letter the man spoke of himself as friendless and alone."

"Yes," said the old man softly and nodded his head. "And your husband knows nothing of this visit?"

"Nothing," replied Margaret. She added with a faint smile, "I ran away—but I left word where I was going."

There was another brief silence.

"And your husband has never told you the truth?"

"Sir!" cried Margaret.

"He has never boasted of what might

have been? He has never alluded to any sacrifice he may have made? Never talked of riches that were his for the asking?"

Margaret was a little alarmed at this speech.

"No, sir," she answered. "Never. Why should he?"

"Was there ever such a boy!" growled the old man. Then a faint smile crossed his rugged face. "Listen, my dear. There was once a hot-headed old father who quarreled with a self-willed son. They differed about the son's vocation, and they differed about the girl the son should marry. And the boy went his way with bitter words. He was proud and he struggled on alone. And the old man nursed the wrath in his foolish old heart. And one day the father received a brief notification from his son that he meant to marry. In his anger he wrote back that if he married without his father's consent he would be disinherited. But bad promises are easily broken. The old man began to hunger for his only child's presence. His proud old spirit broke. He found where his son lived, and one day he called, as if by accident, on his son's wife. Then he went back and humbled himself in a letter. He hoped it would bring his boy home. He sent his carriage every morning and every afternoon to meet him." He paused. "Do you begin to understand, my dear?"

She did begin to understand. Her face paled. She stood up.

"I—I want to go back to Edward," she said. "I have made a great mistake."

"No, no," said the old man quickly. "I took you for an envoy. You must remain as a hostage. He'll come fast enough when he misses you. Take off your pretty hat, my dear, and give me your hand."

She couldn't resist his pleading tone.

"And now, my child," he said, "go to the desk there and bring me the folded paper you will find in the right-hand drawer."

Margaret did as he bade her, and he tore to fragments the document she handed him.

"There," he said with a sigh of relief as he tossed the bits of paper into a waste basket, "that's off my mind. And now, my dear, let us improve our acquaintance while we wait. I want to show you about your new home. I want you to see the rooms I have chosen for you. And we can talk about Edward as we look."

It was in the library that Edward found them. He paused in the doorway as Margaret had done. The old man was in his easy-chair, looking down at the young wife with a tender smile. She was on a

low stool at his side, reading aloud to him in her clear, sweet voice.

For a moment they did not hear Edward. Then the old man looked up.

"Come in, my son," he calmly said. "She is here and quite safe." And Margaret looked up with a glad little cry.

But Edward hesitated.

"My son," said the old man, softly, "will you accept a compromise?" He stretched out his hand. "We were both wrong."

Edward strode forward.

"Father!" he cried.

"My boy!"

And the hands of the two men met in a firm clasp.—*Cleveland Plain Dealer.*

ONEONTA GORGE, CASCADE MOUNTAINS, OREGON.

Blue and Gray.

"Oh, mother! what do they mean by blue,
And what do they mean by gray?"
Was heard from the lips of a little child
As she bounded in from play:
The mother's eyes filled up with tears;
She turned to her darling fair,
And smoothed away from the sunny brow
Its treasures of golden hair.

"Why, mother's eyes are blue, my sweet,
And grandpa's hair is gray,
And the love we bear our darling child
Grows stronger every day."
"But what did they mean," persisted the child;
"For I saw two cripples today;
And one of them said he fought for the blue,
The other he fought for the gray."

"Now he of the blue had lost a leg,
The other had but one arm,
And both seemed worn and weary and sad,
Yet their greeting was kind and warm.
They told me of battles in days gone by,
Till it made my young heart thrill;
The leg was lost in the Wilderness fight,
The arm on Malvern Hill."

"They sat on the stone by the farmyard gate,
And talked for an hour or more;
Till their eyes grew bright and their hearts seemed
warm,
With fighting their battles o'er;
And, parting at last with a friendly grasp,
In a kindly, brotherly way,
Each called on God to speed the time
Uniting the blue and the gray."

Then the mother thought of other days—
Two stalwart boys from her river;
How they knelt at her side and, lisping, prayed
"Our Father who art in Heaven:"
How one wore the gray and the other the blue,
How they passed away from sight,
And had gone to the land where blue and gray
Are merged in colors of light.

And she answered her darling with golden hair,
While her heart was sadly wrung,
With the thought awakened in that sad hour
By her innocent, prattling tongue:
"The blue and the gray are the colors of God,
They are seen in the sky at even,
And many a noble, gallant soul
Has found them passports to Heaven."

—Charles W. Morr

A Love Story from Real Life.

They are on the way home after the theater. The drama has satisfactorily settled the fate of the romantic hero and heroine. It was a peculiar sentimental play with all the frills.

Harry—Are you sure your wrap is warm enough? The wind is sharp on the front seat of the trolley car.

Mayme (resetting her back comb and giving him an upward glance out of the corner of her eye)—I'm all right. I think it's lovely out here. Do you know, your

profile looks exactly like the leading man's. Wasn't he fine?"

Harry—Well, maybe he was, but it seems to me he made himself a lot of trouble trying to tell Anita he wanted to marry her. Why, he might just as well have come out flatly with it in the first act instead of throwing on so much "dog." I'll bet she was disgusted with him.

Mayme (with wide-eyed seriousness)—Oh, no! A girl likes to feel that a man is willing to spend time and pains convincing her that he—he loves her. She doesn't like to have him ask her to marry him in the same tone of voice he'd use to ask a clerk for a postage stamp, I can tell you.

Harry—That's the way with women. They don't care whether there is anything back of it all, just so a fellow curls his mustache and makes eyes and twaddles poetry. I—

Mayme—I never said anything about a mustache, and you know it. If you think your underhand jabs at Charley Davis are going to do you any good, you're mistaken. And it might do you some good, too, if you'd cultivate your mind with standard authors instead of reading the sporting page of the daily papers and letting it go at that. I'm sure I thought the hero's proposal tonight was just beautiful.

Harry—No doubt. It must have seemed real natural to you—after having Charley Davis mooning around as he has been the last few months. Of course, a common, ordinary man who can't talk like a 25-cent novel has no attraction for you.

Mayme (with a detached kind of interest)—Oh, I don't know about that—only I confess I do have a weakness for an even temper. I never could stand a cranky disposition.

Harry—Thank you. I suppose you don't take into consideration the fact that you're doing your level best to—to make me mad. I actually get indignant, Mayme, to think that a girl as—as nice as you goes in for that sort of thing.

Mayme (sitting very straight)—What do you mean?

Harry—You know—the Charley Davis game—like the play tonight. I suppose if I scrambled around on my knees and waved my hands at the moon—where is the moon, by the way? There she is, just above the brewery there—you'd listen. If you'll sit sideways and twist your neck around, you can get a full view of fair Luna, and maybe you'll feel better. I'll do my best. Here goes: O most adorable of women, idol of my heart! This tiny hand—

Mayme (snatching her hand away)—For goodness sake, Harry Curtis, have you gone crazy? I—

Harry (warming to his task)—That isn't your cue. You shouldn't interrupt. Cast down your eyes and look coy, can't you? Under thy lattice, love, I trembling wait. Every heart-throb—

Mayme—Oh, please, please! I know the motorman will hear you, and he'll think you really mean it.

Harry (with pained expression)—Let him. Let the whole world listen. Am I ashamed of this devouring passion, this love rooted in the very depths of my being? Life has taken on new tints of pearls and opal and rose since first I met you, and was drowned in the blue lakes of your eyes. I—

Mayme (dabbing her eyes with a wisp of a handkerchief)—Oh, yes, yes, anything!

Harry (leaning back with a suspicious return to sanity)—All right. I was just trying to please you, Mayme. A fellow will do most anything for a girl when—when—

Mayme (subdued and a trifle shy)—When what?

Harry (suddenly low-voiced in order to foil the interested motorman)—When he loves her. I'll tell you the rest when we get home.

Mayme—Oh! Harry?—*Philadelphia Inquirer.*

Mayme (bewildered)—Oh, stop, stop it! Wherever did you get hold of such stuff! Do be sensible.

Harry (leaning forward and gazing blankly into the cable slot)—She spurns me. These outpourings of my fevered heart she casts away. Ah, little one—

Mayme (almost in tears, undecided whether he is "guying" her or has really lost his mind)—Do be quiet till—till I get home, Harry, won't you? I never saw you like this.

Harry (with sudden calmness)—Will you promise to listen to what I've got to say in cold, plain English then, if I quit now?

Love in Springtime.

When spring sweeps blithely down the world,
In covert whistling, in leaf-bud curled,
The sky hath laughter, the brown pool thrills,
And cloud-shadows purple the wakening hills.
O sing, ye winds, in the vibrant pine;
O sing, ye birds, and your song be mine!

For love wells up in my sleeping heart,
And tenderness blooms, and sweet tears start,
With the joy of my love. The spring beats strong
In my blood, till it throbs with a rhythmic song.
O sing, my heart, as the wind-harp sings,
Thou race-harp, tuned by a thousand Springs!

—Edna Kinsley Wallace.

A Mortal Love Story of Ancient Days.

When Queen Semiramis reigned in Babylonia there dwelt in the capital city a girl named Thisbe. In all the realm there was none so fair as she; and yet few knew of her great beauty. For her parents kept her carefully at home and seldom was she allowed to go beyond the wall that encircled the garden of her father. But in this garden she spent her time, and here she worked and played and dreamed all through the long spring and summer of her fifteenth year.

The wall about the garden was high and thick—too high for her to see over and too thick for sounds to penetrate from the world outside. But on one side she knew there was another garden, and often she wondered if another lonely maiden wandered there, plucking and pruning her roses, watching the clouds in the blue Babylonian sky, dreaming her dreams. So it was on that side of the garden that she lingered most, where she felt an unseen, unheard but sympathetic companionship. Often Thisbe searched for a place where some chink in the rough masonry would allow her to peep through into the mysterious garden on the other side; but the wall was strongly built and there seemed to be no flaws or holes in it.

But one day as she sat in a shaded corner where a gnarled old olive sent its crooked roots into the very stones, she imagined she heard a sound from the other side. It was more like a sigh than a word, but in the summer-noon stillness of the place it was strangely as if her own name had been whispered in her ear. She turned her head and listened, and the voice was clearer. "Are you Thisbe?" it said. And though the tones thrilled her and half frightened her, she answered "I am Thisbe!"

All through that long summer afternoon she stayed under the olive tree listening to the voice and answering eager questions. The voice belonged to Pyramus, who was the son of her neighbor. He too was forced to spend his days in the garden, and he too had often sought to know his fellow captive on the other side. And so as the days passed by they came to know each other well, this boy and girl, though neither had yet seen the other's face. But at the place where they had met they picked and tore at the wall until at last one day they had opened a little hole and could look into each other's eyes.

Of course they loved each other; what power could have averted such a natural state of things? And as the autumn came, stronger and stronger came the wish to meet face to face without the cruel bar of the intervening wall. They

did not dare to tell their parents of their love, for Thisbe knew that she was being kept for another whom she had never seen. And so they did what boys and girls have always done and will always do, in spite of walls of stone or walls of stern parental rule—they arranged a secret meeting.

Beyond the city gates there was a well-known place called the Tomb of Ninus. Few ever visited it by night, for it was at the edge of a lonely wood, but all knew where it was, since it was a famous mausoleum. Near the tomb was a cool spring and over the spring leaned a white mulberry tree. Under this tree the lovers were to meet as soon as night had fallen. And they pressed their lips to the wall in farewell, promising that the next kiss should be a sweet reality.

It was scarcely dark when Thisbe stole from the house that night. She was wrapped in a heavy veil that none might know her, and fear and love combined to quicken her feet as she hurried through the city gates, across the open fields and toward the trysting place. The moon looked from behind the clouds as Thisbe reached the tomb and shone on the rustling leaves of the white mulberry tree. When she came to the spring Pyramus was not yet there, so she drew her veil closer about her and shrank back into the shadow. And scarcely had she seated herself when a lioness came to the spring to drink!

When the frightened girl caught sight of the great beast she arose in terror and fled into the forest. Her heavy veil impeded her steps and she cast it aside. Then she ran on until at last she found a hollow rock, into which she climbed and lay trembling. But she might have saved her haste, for the lioness did not pursue. The animal had just slain some ox or sheep and her jaws were dripping from the slaughter. When she had slaked her thirst she walked slowly into the forest. Thisbe's veil lay across the path. The lioness paused in idle curiosity, sniffed it and pulled it about as a playful kitten might, tossed it aside and went her way.

In the meantime Pyramus had reached the fountain. He called Thisbe's name, but she was too far away to hear his cautious tones. Then his eyes caught the great footsteps in the trodden sand and the color left his cheeks. He turned and traced the lion's tracks until he finally came upon Thisbe's veil. He stooped and picked it up—it was torn and on it were great stains of blood!

Then it seemed to Pyramus that all was over. He told himself that he had led Thisbe to her doom—he had told her to come to this place, where she had been slain by wild beasts. His grief was more than he could bear, and in a wild burst of

anguish he drew his sword from its sheath and plunged it into his breast. "Let my guilty blood mingle with the pure torrent of thy life, O Thisbe!" he cried as he held her veil against his wound and sunk to the ground. And as he lay there gasping out his life Thisbe stole forth from her hiding place and found her lover.

On her knees by his well-nigh lifeless form she called his name, and before he died he opened his eyes and saw her face to face. It was the first time they had ever met so! He smiled into her eyes and closed his own forever, and she reached out her hand and clasped his sword. And so they found them when the morning dawned—dead in each other's arms who had never embraced in life. And so they kept their tryst!

But the berries on the mulberry tree were no longer white. They were stained with the blood of Pyramus and Thisbe; since that night they have always kept that crimson hue.

Why is it that the world's greatest love stories are those that end in death? The names of Pyramus and Thisbe must ever call to mind those other ill-starred lovers whom all the world loves best—Romeo and Juliet, Othello and Desdemona, Abelard and Heloise, Tristan and Isolde—their name is legion! Modern novels and plays must "end right" to be successful, but in real life these things do not always end right. "And they lived happily ever after" is a pleasant ending, but not always true. "And they died for their love" is what makes these old stories immortal.—*Edwin Meade Robinson.*

A Serious Joke.

During the Civil War several northern soldiers were talking together one day just before the advance on Corinth. A tall, raw recruit stepped up to them with a bundle of soiled clothes in his hand.

"Do you know where I could get this washing done?" he asked.

Two of the group were practical jokers. A bright thought flashed into their heads. "Oh, yes; we know!" they said. "Just go up there with your bundle," pointing to the headquarters of General Grant, "you will see a short, stout man"—describing the general—"who does washing. Take your bundle to him."

The recruit walked off in the direction indicated. He gained entrance to headquarters and stood in the general's presence.

"What can I do for you?" asked General Grant.

"I was directed here by a couple of soldiers. They told me that you did washing, and I have a bundle here."

General Grant probably enjoyed the

situation, but his imperturbable face did not relax. He simply asked the question, "Could you identify those men again?"

"Yes, sir."

"Very well; you shall have the chance."

Turning to an orderly, he directed him to call a guard, go with the recruit to where the jokers were standing ready to enjoy his discomfiture and let him identify them.

"Take the men to the guard house, give them this man's bundle of clothing and make them wash it thoroughly. See that the work is well done."

The general was obeyed to the letter.

Revenge.

I.

I'd like to be the man who puts my things in type each day,
I'd like to have him do my work—or try to, anyway;
I'd mix his rhymes and jokes all up—I'd twist his metered line—
I'd spoil a lot of it, I know, as he spoils some of mine.

II.

I'd like to be the fellow, too, who reads proof on my stuff;
I'd like to have him writing things—I'd change them quick enough!
I'd stick in words and fix them as I think they ought to be!
I'd make him look like thirty cents, just as he does me.

III.

I'd like to be the editor, who lets my work go through;
I'd like to criticize his work—I'd mutilate it, too!
I'd fix it up to suit me, in the way I think is right;
I'd make his things look foolish as he does the things I write.

—*Cleveland Leader.*

A Bachelor's Trip.

A bachelor is not usually credited with a knowledge about the proper treatment of children, but sometimes they step in where angels fear to tread. A confirmed specimen, who is pretty well on in years and not very fond of children, went to see a married sister the other day, and found her trying to amuse her little boy, aged five years.

Not long after he arrived she stepped out of the room to attend to some household duty or other, leaving him alone with the child. The latter eyed him dubiously for some minutes. He was a spoiled child if ever there was one, and had no idea of making promiscuous acquaintances. The bachelor tried to make the little one laugh, but all he got for his antics was a sour look.

Finally, without any warning, the child burst out crying. Here was a quandary, to be sure. He didn't dare to pick the boy up and soothe him. His attempts in a verbal line were dismal failures. What should he do? Finally a thought struck him. He looked at the crying youngster, and the crying youngster looked at him through his tears. He was evidently much pleased with the impression he was making.

"Cry louder," said he.

The child obeyed.

"Louder yet," urged the bachelor.

And a yell went up that would have done credit to an Indian.

"Cry louder still," insisted the man, and the boy did his best to obey.

"Louder!" fairly howled his uncle.

"I won't," snapped the infant, and he shut his mouth with a click, and was quiet for the rest of the day.—*London Tit-Bits.*

Physical Mysteries.

Are you aware that you are a sort of perambulating metal mine? Man, and, indeed, nearly all kinds of living animals—has in his system a considerable quantity of iron. It is found in the most important organs, and there should also be a good deal in the blood, says *London Answers*. Babies possess a fairly large stock of iron, nearly three times as much, comparatively speaking, as adults. Then in your bones there is a very large quantity of that metallic base of lime called calcium, while phosphorus is also present in the bones in so large an amount that they are the main source of the world's supply of that valuable article. Stranger still, there is in the human body quite an appreciable amount of arsenic. What there is of this poison is concentrated in the thyroid gland, and a small quantity is also to be found in the skin, hair, nails and also in the bones and brain.

There are lots of odd things about our human frames which even doctors and other men of science have only lately discovered, and of which the average person is quite unaware. Few people know, for instance, that when we go to sleep the whole body does not sink into insensibility at the same moment.

According to the research of the French physiologist, Cabanis, it is the muscles of the legs and arms which lose their power first. Next those which support the head, and, thirdly, the muscles which sustain the back. So, too, with the senses. The sense of sight sleeps first, then the sense of taste and next the sense of smell. Hearing goes fourth, and last of all the sense of touch. Probably you imagine

that your pulse beats with the same rapidity. This is quite a mistake. Your pulse varies with the temperature. There is a regular, annual rhythm which may be represented by something like a regular curve. Most curious of all, the annual rhythms of the pulse in men and women are quite different. A man's pulse beats more strongly in winter and fades to a minimum in summer. Woman's pulse, on the contrary, displays a winter minimum and a summer maximum. Behind the bridge of your nose is a little cavity in the skull, the origin of which appears to be unknown. It probably was a gland consisting of two tiny lobes joined together, and is named the *sella turcica*.

Physiologists believe that this is the remains of a sixth sense which was of practical value to our antediluvian ancestors. But whether it enabled them to see in the dark in the days before they possessed fire, or helped them to find their way through trackless forest as wild beasts can today, or what other purpose it may have served, we do not and probably never shall know. There is an unsolved mystery in the ear of every human being. The functions of certain portions of the inner ear are not understood, but merely guessed at.

Within the ear are three small globe-shaped protuberances. These have their inner sides covered with small cells, each of which contains a tiny hair surrounded by a fluid. When you move sharply the hair follows the motion, while the lymph naturally follows less rapidly. Thus, the hairs are bent in a direction opposite that of the movement, and by means of delicate nerves the irritation thus produced is telegraphed direct to the brain. It is supposed that by means of these hairs swimming in lymph the sensation we call dizziness is caused when we rotate rapidly, as in dancing. It is also believed that seasickness has something to do with the same phenomenon. It has been noticed that some persons, when suffering from ear diseases that have destroyed parts of the inner ear, have found it difficult or impossible to maintain their balance when standing upright with eyes closed. It is, therefore, possible that these peculiar ear organs contain some inexplicable sense not generally classified as such—the static sense, or the sense of balance.—*Ex.*

A Gentleman.

The word "gentleman" has had various meanings. Originally a gentleman was a member of the *gens* or Roman family, and being such was, in many instances, a man of superior refinement and culture. His manners were gentle compared with those of the rude barbarian. Back

to ancient Rome we must go to understand the expression "it takes three generations to make a gentleman." The man-mitted slave could not become a gentleman or man of family; neither could his son or grandson, but his great-grandson might. A few hundred years ago the term was applied in England to a man of wealth and leisure if not of education, and this meaning still survives in the minds of many in the British Isles. Americans understood the term in its best sense, but recognizing how often it was misapplied allowed the word to fall into disrepute. This was evidenced years ago in New York by the substitution of "men" and "women" for "gentlemen" and "ladies" over the entrances to ferryboat compartments. Despite the misuse of the word, however, people have a pretty correct estimate of what a gentleman should be.

Some there are who claim to be gentlemen because of the family prestige, wealth or educational advantages they enjoy. None of these accidents, nor all three, suffices to make a man a gentleman if he is lacking in character. The aristocrat may be a snob, the millionaire a boor and the scholar a pedant or worse.

What then makes the gentleman? A certain nobleness of soul, training and heredity. Early our notion of a gentleman was largely obtained from the following lines which still stick in the memory:

'Tis not the gently, graceful gait,
Well-made clothes well put on;
A talking of the rich and great
That makes the gentleman;
But 'tis the heart in danger true,
The honor free from stain,
The soul that scorns the vain,
Taking the world but at its due,
That makes the gentleman.

—*Notre Dame Scholastic.*

Foreign News Gleanings.

BRITISH UNIONS IN 1904.

The membership of trade unions tends to expand in years of improving trade and to decline in periods of diminishing employment. In a year like 1904, it is not, therefore, surprising to find that the membership of all trade unions fell from 1,925,000 to 1,902,000, or rather more than 1 per cent. In spite of this fall in membership the total funds in hand for the one hundred principal trade unions at the end of 1904 was the highest on record, namely, \$22,750,000, or over \$20 per member. This state of trade union funds is largely accounted for by the fact that in 1904 there were no serious disputes, the total amount expended in dispute pay being \$860,000 only. Against this is to be

set an increase of \$400,000 in unemployed benefit. This is a form of insurance against unemployment much practised by the older trade unions in this country, and in 1904 over two and a half million dollars were paid under this head by the one hundred principal unions to their members. The expenditure on other friendly benefits was even greater than on unemployed benefit, the amount being \$4,000,000. Thus, while the expenditure on strike pay was less than 10 per cent of the total expenditure, unemployed and other friendly benefits accounted for over 68 per cent.

At the end of 1904 there were in existence 1,166 trade unions, with a total membership of 1,902,308, as compared with 1,190 unions with 1,924,809 members at the end of 1903, a decrease in membership of 22,501. In the building trades (excluding laborers) the decrease amounts to 1.4 per cent, a falling off arising mainly from the unions which do not pay unemployed benefits; in the mining and quarrying group it amounts to 0.5 per cent; in the metal, engineering and ship-building trades to 0.1 per cent; in the textile trades to 1.1 per cent, and in the transport trades to 0.5 per cent. Over three-fourths of the total membership of all the unions is found in the above five groups of trades. The next largest group, however, comprising builders and general laborers, a section generally much affected by bad trade, shows a decrease of 9.8 per cent.—*British Labor Gazette.*

RAILWAY ELECTRIFICATION IN ENGLAND.

That there are grave dangers of the changes from steam traction to electricity resulting to the great disadvantage of railway employees is forcibly shown by the circular which has just been issued by the Metropolitan District Railway. Needless to say, the usual tactics have been observed. The circular was sent to the men individually, with a request that it be signed and returned at once. Fortunately, the men are fairly well organized, and instead of doing this meetings were called and the new conditions discussed, and counter proposals put forward. This is a distinct and great advantage, and whatever the final result it is sure to be better than can possibly be achieved by the men agreeing to the terms put forward individually. Certain it is that these terms emphasize in a marked way what the change means. It is the usual result. Improvements in machinery or method are nearly always made at the expense of the men. It may be that in some measure such a result cannot be avoided, but no impartial observer can deny that the new terms proposed by the District Railway are unreasonably harsh, and the re-

ductions much too sweeping, both as regards wages and reduction of staff. Instead of the present staff of drivers, firemen and guards, three classes of men are to be employed—"motor men," corresponding to the present engine drivers; "conductors," whose position will resemble that of the guard, and "gate men," who will attend to the gates of the cars, and may be likened to the underguard of the existing system. The "motor man" is to receive 7d. an hour at first, rising by ¼d. annually till in the seventh year the wage will become 8½d. An engine driver, with six years' satisfactory service who qualifies as motor man, will begin with the maximum figure. On a basis of 60 hours a week these wages are £1 15s., rising to a maximum of £2 2s. 6d. But the present wages of engine drivers are £2 2s. for beginners, rising to £2 16s. for an experienced man working full time. In the case of "conductors," of whom two will be employed on each train, there is a requirement that all must be able to pass as "motor men." Thus, although the wage is lower, the company will require the same qualifications as in the higher grade service. The wages for the conductor will be 5d. per hour, rising by ¼d. increments to 6d. in the fifth year of service—or 25s. a week, rising to 30s. The present guards get from 32s. to 34s. a week. The "gate man" in the new service is to have 4d., rising to 4½d.—or £1 to £1 2s. 6d., against the 23s. to 29s. earned by the present underguards. Assuming that the men of long service, the great majority, are placed on the maximum scale, the weekly reduction of wages will be as follows:

	Weekly Loss of Wages.
Motor men	13s. 6d.
Conductors	4s. 0d.
Gate men.....	6s. 6d.

And this although the conductor must qualify as a motor man or engine driver before he can be appointed at all!

The large majority of the men have been employed from 25 to 35 years, and great indignation has been expressed at the proposed reductions. The men have held several meetings and decided not to accept these conditions without a protest. They have appointed a deputation to meet the directors, as reported elsewhere, and decided to put forward the following counter proposals:

1. That owing to the great responsibility involved in the general working of the motors, two men be employed in the motor compartment.

2. That the rates of pay for motor men be as follows:

1st year.....	8d. per hour, 6s. od. per day
2nd year.....	9d. " 6s. 9d. "
3rd year.....	10d. " 7s. 6d. "
Leading motor men.....	10½d. " 7s. 10½d. "

3. Conductors' or motor men's assistants:
 1st year..... 5½d. per hour, 4s. od. per day
 2nd year..... 6d. " 4s. 6d. "
 3rd year..... 6½d. " 4s. 9d. "

4. Gate men:
 1st year..... 4½d. per hour, 3s. 4½d. per day
 2nd year..... 5d. per hour, 3s. 9d. "

5. That nine hours constitute one day. Each day to stand by itself. Eight hours per day for overtime. Time and a-half for Sunday duty, which shall stand alone, and that a week's pay of six days be guaranteed. And that, in the event of its being necessary to come on duty twice to complete one day's work, those duties shall be undertaken by the junior men, the senior men working the early and late shifts respectively.

6. That all trainmen be granted an annual holiday on the same basis as that granted to the traffic department at the present time.

7. That all men of long service receive on retirement a small pension or grant from the company.

8. That it be requested that a staff train be run morning and night between Bromley and Hammersmith for the purpose of conveying men to and from their homes.

These proposals seem to us much too modest in view of the fact that the men live in London, and that the company is seeking to compel them to reside in certain districts where rents are high.

The circular issued by Mr. John Young, the general manager, says:

Each trainman will be attached to one of five depots, viz., Mill Hill Park, Parson's Green, Cromwell Road, Whitechapel and East Ham, and will take the duties (day's work) worked from his depot in rotation. For his own convenience, he will naturally reside as near his depot as practicable.

At present the work is so arranged that the men can live at Hounslow, Harrow, Hammersmith, Putney Bridge, East Ham, and other inexpensive suburbs. The idea of a man being required to live "as near Cromwell Road as practicable" is ludicrous. It would mean either sweltering in an unwholesome mews or paying a rent many times over what he could afford. The eighth proposal, as outlined above, is intended as an alternative to this drastic and pernicious proposal. The conditions as a whole are much worse than those in force on other lines, but their greatest hardship consists in the reductions which they impose on old and faithful workmen. We venture to say that the rates per hour are such as would not be offered to workmen in any other occupation—except agriculture. Four pence per hour, as offered to the gate men, is simply a sweating wage, and 4½d., which the men propose, is very little better. It certainly cannot be considered a living wage in London.

One of the most important questions of all is the proposal to employ only one man on the motor, and to make conductors qualify for the work. Neither on the Central London, the City and South

London, the Great Northern and City, or the Great Western is this the case. There two men are employed, the assistant being paid a less rate, and being in the same position to the driver as a fireman on a locomotive, with the exception that he has no firing to do. This proposal to entrust the charge of the motor to a single individual arises out of a new invention which, with grim humour, has been called the "dead man's handle." It is a phrase which deserves to live. The "dead man's handle" is a supplementary spring handle which has to be continually depressed by the driver of the new electric train. If he does not keep it depressed it rises and actuates a brake which brings the train to a sudden standstill. By the use of this invention it becomes possible to entrust the charge of the motor to a single individual, for, if the driver becomes indisposed and relaxes his hold on the "dead man's handle," the train stops automatically. This invention seems to have impressed the Board of Trade, but it is full of danger both to the man and the public. Never before has it been known for the Board of Trade to entrust the care of a train to one man, nor does it seem reasonable to rely upon such a device for safety. It will be seen that the motor man must keep his hand upon this handle continuously while the train is in motion, and such an effort, however slight, is bound to have evil results to nerves and physique. We are also informed that in some circumstances the man is liable to shock from the electric current, which may have other consequences of a serious nature. We trust, altogether apart from the question of the effects on the employment of firemen, that the men will adhere to their first clause that two men shall be employed on the motor. The nature of the work and the multiplicity of the signals alike demand such a condition. A motor-driven train is not a tramcar, and should not be compared thereto, nor the conditions of tramwaymen imposed. We hope the men will stick together and support the deputation they have elected. It is to be hoped also the directors will meet them and consider the counter proposals put forward by the men in a sympathetic spirit.

A MEDICAL VIEW OF LONG HOURS.

The influence of long hours and underpay upon the health of their employees is seldom given attention to either by railway companies or any other employers, and while the workmen's medical adviser might be conscious of the fact that overwork or lack of suitable nourishment may be the real cause of their patients' illness it is not often that the medical man will

be candid enough to tell them of the underlying trouble. That is left to the despised agitator. When such corroboration is obtainable it is all the more valuable, and the *Medical Press*, speaking on the subject of long hours of railway men, says:

The hardships and grievances of railway employees, such as overwork, underpay, and incidental risks to life and limb, are not brought before the public with the same degree of prominence that is accorded to other dangerous occupations. At a recent meeting of the A. S. R. S. Dr. McNamara, M. P., showed, from the Great Eastern figures for October, 1903, that of 1,291 engine drivers and firemen, 84 per cent had worked at various times during the month more than twelve hours at a stretch; 320 worked more than 15; 56 more than 16; twelve more than 17; and 2 more than 18 hours. Among signal men a similar stress of work is recorded. Considering the great responsibility of each of these men, it is a matter of some surprise that such a state of things should be allowed to go on. It has more than once happened that a signal man has been found guilty of an "error of judgment" after some terrible accident had taken place, whereas if the truth were known, it would probably be found that this official was suffering from sheer fatigue and nervous exhaustion. Long hours of duty with inadequate intervals must sooner or later cause the strongest constitution to break down, and such a condition of things clearly constitutes a "standing menace to the safety of the public." The public are looking forward to the increased facilities for travelling offered when the London Underground Railway is electrified, and to extension of electrical railways throughout the kingdom, but if cleanliness and speed are to be purchased at the expense of cutting down the wages of the railway men, and of rendering it difficult for them to obtain their meals under healthy surroundings, such an event had better be postponed.

A UNIQUE STRIKE.

Italian railway men have discovered a new and very effective method of calling attention to their conditions, and instead of striking and leaving their work they are carrying out the rules and regulations to the extreme letter, exasperating the travelling public and reducing the working to a state of paralysis. It seems that the employees presented a petition asking for ameliorations which it is said would have involved an expenditure of £4,000,000 annually. The Cabinet has presented a Bill to Parliament granting part of the requests, but establishing severe penalties for those among them who instigate, promote or direct strikes. It is against these measures that the employees have instituted their new policy. The *Morning Post* Rome correspondent says:

Now, for the first time, the men are observing every jot and every tittle of each section, subsection, and footnote of the railway code, with the result that efficiency is impossible. When, for example, the engine driver has turned on the steam for heating the carriages he declines to start until (in strict conformity with the letter of

the regulations) he has sent a man to ascertain whether every carriage is adequately warmed; to make assurance doubly sure a second emissary is despatched to check the statement of the first! The shunters, signal men, and others are all displaying similar zeal in the discharge of every minute particular of their duties. Every carriage must leave the station clean, so one dirty compartment means the retention of the whole train; every box or trunk must be properly labelled and must be of certain dimensions, and these rules must be carried out; at the ticket offices the clerks enforce without mercy the printed order that the traveller, who has usually scant means of ascertaining beforehand the exact amount of his fare, must present himself with the precise sum down to the last soldo. When every lira piece is wrung on the counter and every five-lire note is held up to the light to see whether it is genuine the result is simply chaos. Wildly excited passengers rage about the stations, invoking maledictions on the railway men, but the latter are unmoved, they have the sublime consciousness of having performed their duty—in conformance with the regulations.

The effects of this policy are simply disastrous to the traffic. Every train now leaves late; many have had to be suppressed; every line is disorganized; at any moment some tremendous smash may occur—strictly according to clause X, section Y, sub-section Z of the railway regulations. Meanwhile the battle has been extended to the Chamber of Deputies, where the Socialists are championing the cause of the railway men by obstructing public business. Italians have not forgotten the vehement obstruction practised at the time of the famous *decreto-legge* of the Pelloux Ministry five years ago; the same system is now being revived. But then the question at issue was merely political. Now the whole economic life of Italy is at stake: While this state of things lasts those are wise who avoid travelling on the Italian railways. Never was there such a strange burlesque as this, which the *Messaggero*, with its usual cleverness, calls "strict application of the rules," which Tacitus, long before railways, foreshadowed in the biting epigram: "That State is worst governed which has most laws."—*London Railway Review*.

The Diet of European Nations.

The following is a summary of the dietic habits of the rural population, the healthiest portion of the several European countries:

Belgium—Coffee, black bread, potatoes, vegetables, chicory, and sometimes salted meats.

England—Beef, pork, potatoes, vegetables, tea, cheese, beer, cider.

Ireland—Oatmeal, bread, potatoes, milk, beans, butter, vegetables.

Scotland—Oatmeal, bread, potatoes, milk, butter, coffee, tea, very rarely flesh.

Rhenish Prussia—Milk, soup, dried fish, grapes, potatoes, flesh only on the feast days.

Saxony—Bread, butter, cheese, soup,

vegetables, coffee, flesh only on the feast days.

Bavaria—Porridge, butter, milk, cabbage, potatoes.

Italy—Macaroni, bread, fruits, beans, peas and lentils, wheat, rice, grapes, wine. A very little flesh is eaten on feast days, but only in certain regions by the very rich.

Spain—Bread, vegetables, fish, fruits, flesh only occasionally.

Russia—Rye bread, cabbage, mushroom soup, wheat cooked with milk and oil.

Sweden—Potatoes, rye, oatmeal, barley, milk, salt herring, beer, no flesh food.

Switzerland—Cheese, milk, coffee, vegetables, soup, wine, very rarely flesh.

France—In the neighborhood of Bourgoigne meat is eaten but once a year. The peasants of Morvan eat meat twice a year; the peasants of Sardinia once a year; the peasants of Auvergne very seldom; the Bretons never, except rich farmers, who eat flesh on feast days.

We see from this table that European peasants, the hard workers, subsist almost wholly upon fruits, grains and vegetable food, a regimen which is highly economical, and by which they are sustained in good health. The peasants live to be much older than the aristocrats and crowned heads, who feast upon meats and the luxuries of courts.—*Health*.

Must Pull Together.

A large part of a man's life is spent down town, in the thick of the fight for business supremacy. He cannot succeed largely unless he surrounds himself with the best class of employees, and he can only insure their being faithful at all times to his interests by first being faithful to them, as men.

An employee should be ready to sacrifice himself for the good of the business, to work "overtime" if necessary, to manage on half pay, if necessary and possible, to put his shoulder to the wheel, to strive with all his might to make his efforts of the greatest avail. The employer, on the other hand, should be glad to see his men take it easy when the rush is over, should offer them little courtesies, and opportunities that come his way, should be glad to help them get ahead, should give them every advantage, and should make his appreciation felt in other ways than through the pay envelope alone.

It should be a case, at all times, of "tote fair." There are two ends to every load. Readiness at one end to bear the brunt must bring recognition of this readiness from the other end, if the load is to be nicely balanced.

Both must "tote fair."—*P. D.*

Correspondence.

All contributions to our Correspondence and Technical columns must be in not later than the 10th of the month to insure insertion.

Articles must be written on one side of the paper only. Noms de plume may be used, but every article must be signed with full name and address of the writer to insure insertion.

We shall be glad to receive articles on any subject of general interest to the fraternity.

All communications are subject to revision or rejection, as the Editor may deem proper.

The Editor does not assume responsibility for the opinions expressed by contributors in this department. C. H. SALMONS, Editor and Manager.

Invitation to Union Meeting at Riviere du Loup.

Once more in the pride of her coming

Our Summer steals tip-toe along;

The bees in our gardens are humming,

Our trees are all vocal with song.

And up from our hearts comes a greeting

For all, most fraternally true,

Who'll come to the grand Union Meeting

We'll hold here in River de Loo.

Come, boys, from each hilltop and valley,

Come, girls, in your virtue and bloom,

And join in our annual rally,

Away from all bread-winning gloom.

We'll give you a surfeit of pleasure,

Our meeting you'll never forget;

While quaffing joy's o'erflowing measure,

You'll all thank your stars that we've met.

We'll take you o'er bright sparkling waters

In steamships surprisingly grand!

As safe, with your wives and your daughters,

As if you were seated on land.

We'll give you choice boating and fishing,

And pleasure of every degree,

And show you some sights we are wishing

To have all our visitors see.

Come on! and kick care to the devil.

We'll meet you with banner and drum,

And fiddles and pipes—for the revel

We'll start just the moment you come—

And then for three days full of glory,

We'll cater profusely to you,

You'll all have a wonderful story

To tell of our River de Loo.

Come here from the prairies and cities,

And enter Canadian doors,

We'll greet you with musical ditties,

Our hearts and our homes they are yours;

Our citizens all shall assist us

To give you a memorable time:

Come on! do not try to resist us,

We ask you in prose and in rhyme.

All Canada joins in the greeting

We send to you lads in the States,

To come to this annual meeting,

Quebec has thrown open her gates;

We care not what flag's o'er you floating,

We're brothers and sisters all true,

With hearts in expectancy gloating,

To have you at River de Loo.

—SHANDY MAGUIRE.

Troubles and Triumphs of Travel.

BY SHANDY MAGUIRE.

[Continued from April JOURNAL.]

Another night was approaching. Our Pullman conductor was named Sam Myers, and he was a trump. He anticipated our every wish, and was unceasing in his attention. In reply to my request to remain in a lowly sphere, instead of ascending, he said: "It is not safe for you to climb. I fear you'll fall, and I'll have to keep you down. Move to lower 1 in the other end of the car."

This made the Davis family our nearest neighbors, they occupying the section opposite.

That evening we rolled into Albuquerque. It was the supper station, with fifty minutes of a stop to eat and visit a museum of Indian curios. The hotel is at the station, and is very attractive on account of its Mission style of architecture, which was a decided novelty to some of us. The building is 330 feet long by 190 feet wide, magnificently situated alongside the track, decorated in the numerous niches with potted flowers and brilliantly lighted. After supper we were entertained in the museum by the Indians in their dexterous employment. The males were not a success as scalp-lifters, judging them by their looks, and as for the females, their apparel would not figure very extensively as worthy of note at any of the receptions of the *protégés* of Ward McAlister.

That beautiful evening shall never be forgotten by me, neither shall the place where we were standing, while memory lives. We were nearly one mile higher than when at home. The moon was at its full, and owing to the rarity of the atmosphere looked at least twice its ordinary size in our Eastern clime. The air was deliciously balmy, and an enchanting silence prevailed, so as to let our undisturbed minds broaden out in praise to the

Great Architect of the Universe as we contemplated his works. My companion broke the silence, with her face aglow, as she said for the first time in I don't know how many years: "I feel so well I could walk twenty miles without any distress."

"Thank God," I exclaimed, "that I have heard you say for once in your life you are well."

During many a hard fought battle for bread since then my mind has wandered back to that evening and reveled in the luxury of memory, conjuring up the scene as compensation for the immediate ills which afflicted me. It is truly an oasis in the strenuous life I have led.

"Twas that friends, the beloved of my bosom,
were near,
Who made every dear scene of enchantment more dear,
Who felt how the best charms of nature improve,
When we see them reflected from looks that we love."

Albuquerque is a familiar name in my home town, as many a despondent one afflicted with lung troubles went there for health, and found it, too. I can never doubt its glorious clime as a panacea for all the pulmonary ills that flesh is heir to, after my delightful sojourn there of a few fleeting minutes.

This day was an endearing one. We gossiped long into the night, and when we broke up to go to our various berths, we were called back by Mrs. Davis and admonished to have some service of a religious nature ere retiring, in consideration of all the pleasures which we enjoyed.

"Can you sing any?" she said to Sanderson, who was nearest to her.

He replied: "Yes; I learned a hymn in my Sunday School days, and if all insist I'll give it."

Silence gave consent, and he began:

"Night's shades have descended,
The day's sights are ended,
The moon and the stars are adorning
The firmament o'er us,
And steel-way before us,
To guide us along until morning.

"All praise to the Giver;
O'er mountain and river
He sent us with speediest motion;

We thank Him sincerely
And send to Him dearly
Our heart's warmest throbs of devotion.

"All night He'll watch o'er us,
No danger before us
We'll meet with while peacefully sleeping,
And when the sun rises,
Again He'll surprise us,
And ne'er let us stray from His keeping."

The sentiments contained in the verses were appreciated by all, and as Sanderson sang in a fine voice, he made a decided hit and scored splendidly, to use a sporting phrase.

Another dawn; a new territory entered. The "dobey" dwellings, Greasers, Indians, and sweeps of red soil and slab-sided cattle left in their numerous crowds partly behind, but not altogether lost to either sight or memory. Rolling along to Winslow, Arizona, the breakfast stop, we were gazing at the brown earth and could not see a splotch of green to refresh the eye, except the pinion trees, and once in a long while a little patch of a kitchen garden, bottle-fed by irrigation. Our silent contemplation of the scene was broken by Sanderson asking Mr. Davis how the old crowbaits of cattle existed. "They lick the soil, then crawl under the pinion trees to dream of grass," he replied, and he was satisfied with the information.

Questions being in order, I was asked where the terrible desert was that I had so much to say about. I said: "We passed about 1 o'clock this morning where it is most to be dreaded, but don't despise the brown-looking outskirts we are passing through now. A stiff breeze of wind right here would make you flop on your knees at double-quick to offer up a fistful of prayers for protection from a sand blast. Note the way the whirlwinds are keeping their hands in by pirouetting all around us, with a thirty-mile-an-hour push in them. I guess you'd get desert enough. Look!" As I said the word, all saw a sight which is yet green in the memory of every one who responded. An old white horse, with his shaggy-looking hide holding his bones together, was reclining against a telegraph pole, slightly inclined from the perpendicular, with his old head drooping to his knees as

if he were having a farewell cry ere giving up the battle for grub, and he as dead as a door-nail. "That sight will tell you what the desert is when the sand is sweeping along and one can find no shelter but the lee of a telegraph pole."

Thanks to the old dead horse, I was absolved from all equivocation or argumentation of dangers to be met with in my desert stories, and I don't know but the old bundle of bones and hide was the means of my making capital by proving my anxiety to shield my love from all danger.

At Winslow, after breakfast, a chronic habit of kicking got me a present, which is perched before me as I am pushing the pen. I insisted that the "broiled chicken" served me was an old rooster that crowed a welcome to the advance guard of the 49ers, and Davis made my misery complete by purchasing a rooster of baked clay from the Indians on the station platform, gathering our family about him, and making a presentation speech as he gave the "dobey" chanticleer to me.

We took on an official's car at Winslow. It was immediately behind our sleeper, ours being the last car in the train until it was put on. We were somewhat late getting to Ash Fork, the dinner station, and there is not much consideration for the ordinary occurrences of life in a griping stomach. I was mentally wishing for the discarded backbone of the morning bird, when I was asked by Mrs. Davis if I'd like a dish of bouillon. I thought of the Dead Sea fruits "that turn to ashes on the lips," the sour grapes which the fox wished for and struggled for until made to desist by the shades of night descending, the vast body of water surrounding the tempest-tossed sailors as they are suffering from an uncontrollable thirst, and I said: "Madam, your sex is justly noted for its gentleness. The touch of kindness is in the hand of woman when pain and anguish wring the brow; her gentle voice soothes when the tornadoes of passion torment the masculine breast. Do not belie her tenderness by afflicting a poor, hungry wayfarer who could masticate a dead rat by asking him if he'd like a dish of bouillon."

"If you were as far gone as that you would not babble so much, and keep me waiting so long for an answer. Pound, McGovern, Sanderson or Bryant, would not hesitate. Once and for the last time I ask you—do you wish for a dish of bouillon?"

"Does a cat love cream? Does a duck love water? Does a ——"

The lady started off disgusted with my tardiness in replying, and I was obliged to sing out after her, "For the sake of our neighborly relationship if you are in earnest, please hurry back with the bouillon."

In a little while our end of the car, occupied by the Davis's and the Maguires, was the scene of a feast to make the gods hanker for an invite, and a penitent, trying to get skyward by way of fasting, toss his vows out through the car window and have at the feast. Some hours afterwards, Pound asked me, "How is it you stand in so good that you got such a swell lunch on the train?"

I replied, "You are suspicious and too inquisitive altogether. You remind me of a story I heard of two old rascals who were forty years without bending a knee to a father confessor, but at long last decided to return within the pale of the church, by going to confession together. On the night they went they kept examining their consciences, tossing up the rascalities of the forty years to the surface, to be ready to confess them, when all the puny, insignificant sinners would depart. At last Jack's chance came to go to the confessional. The good father listened to the articulated stream of infamy pouring into his ear for 45 minutes, and came out to get a few lungs full of fresh air, leaving Jack kneeling until his return. After about five minutes had elapsed, Jack whispered to Tom, "Where has he gone?"

Tom replied, "I don't know. Where do you suppose?"

"I'm afraid," said Jack, "he's gone out to call a cop."

"Now, you are a good deal like Jack. You are suspicious."

Dinner at Ash Fork, although somewhat belated, put us all again in the best of humor.

We were now rolling through Arizona rapidly. At every station we had the omnipresent Indians and the squaws endeavoring to find purchasers for their wares. Their English was far superior in both quality and quantity to our knowledge of the Indian tongue. They knew how to say "dimes" and "nickels" clearly and fluently. One bright-eyed, black-haired unwashed son of the plains

may have their beautiful features presented to the readers of the JOURNAL, I make the sacrifice. They can be seen on the right, with their faces aglow at the discomfiture of the avaricious rascal.

At Seligman we entered the Pacific division of time, which left our watches from York State three hours fast, provided we did not put them back. We were not much late. The atmosphere was delicious and the Coast Range of mountains were beginning to lift their haughty heads high up into the blue dome of the

SHANDY MAKING THE INDIAN POSE FOR A PICTURE.

was very persistent trying to make a sale of pottery to us at Seligman; failing in that, he wanted a nickel to let Fred Bryant push the button on him. He was too avaricious altogether in the opinion of our crowd, and turned his back on us in splendid Digger Indian dignity, until I about faced him, and held him in the first position of a soldier, while we were lassoing him with the kodak. It is not much to my credit to show my phyzog in the company of the red miser, yet in order that Miss Lape and her companion

heavens. Away to our right were the San Francisco peaks, snow-capped and awe-inspiring, although many miles away. We were rapidly passing through Arizona, and our next meal, God willing, would be eaten in California.

(To be continued.)

Diagnosing Bro. Freenor's Plan.

BARABOO, Wis., March 28, 1905.

EDITOR JOURNAL: I have always been much interested in the many different

BUCKING SNOW IN NEBRASKA, C. & N. W. R'Y. COURTESY BRO. G. H. CONNOR, DIV. 389.

articles in reference to the betterment of our insurance, but up to date I have not seen a plan that, in my opinion, would be able to stand the test of an insurance accountant. We must not overlook the fact that insurance is a business proposition and that when we go into business we must first have the money or at least the security, or we may expect to be denied the goods.

Brother Freenor seems very sincere in his idea or plan of endowment insurance, and asks the Brothers to just figure on his plan and be convinced. While I do not pretend to be an expert on insurance, I will present here a few figures on his plan for the consideration of our Brothers. The plan, as I understand it, calls for \$20 for each \$1,500 policy, which would make about \$1,000,000. Placed at 5 per cent interest would give an annual income of \$50,000 with which to pay off old policy holders. One million dollars capital at first thought looks like a large amount and \$50,000 per year seems quite a bit; but, Brothers, we must not lose sight of the fact that we have 42,066 policy holders with over \$80,000,000 worth of insurance in force as liabilities. We will admit for the sake of illustration that it would be possible to collect from every policy

holder and place the money at 5 per cent interest. Fifty thousand dollars would pay off thirty-three \$1,500 policies per year—a pretty nice investment for the seventeen oldest members (I say seventeen, for most of our old members have two policies), but how about the members say 2,000 down from the top, and the 40,000 below them; but you will say some of these Brothers will die, which is true. We will estimate that three-fourths of the oldest 2,000 die before being paid, then the last of that bunch would have to

live twenty-three years longer before receiving their money and you have all of the 40,000 that are alive still left. Of course, I understand the plan calls for \$20 from each new policy holder, which would in time increase the number paid off each year, but would never be sufficient in our lifetime to pay off our members at a definite age, or after having retained his membership for a stated number of years.

Why, Brothers, you all know that 5 per cent of \$20 is but \$1 per year, so you would therefore have to live 1,500 years in order to have your policy paid from the earnings of your own money, unless the interest is compounded and that cannot be done when it is paid out as fast as it accumulates.

STUCK IN THE SNOW, C. & N. W. R'Y. COURTESY BRO. G. H. CONNOR.

In order to get endowment insurance we must start in at an insurable age and pay the rate our age would require in accordance with the American table of mortality for our risk and in addition thereto a sufficient amount more so that if this money is placed at compound interest it will amount to enough at the end of a stated number of years to pay to us the face value of our policy. It seems to me if we would give the matter a second thought, we could plainly see that it is not possible to use the interest of our investment annually and at the same time have it accumulate for our use in old age, and that if we wish to use the interest annually we must of necessity have a large amount of money per capita in order to meet the requirements of paying off our old policy holders at a stated age.

I am a firm believer in endowment insurance and carry all of it I can pay for. I also know that any Brother who can pass a medical examination can get it as cheap as though he were working in any other occupation, for in the past four years besides running an engine, I have written in the neighborhood of \$100,000 worth of endowment insurance for one of the very best old line insurance companies, and most of it has been written upon the lives of railroad men.

After giving the matter a great deal of thought and talking with men much better posted than myself, I cannot see where our insurance can be changed to benefit the old members without giving the main part of the B. of L. E. a hard body-blow. Our old members have always got just what they have paid for and are still getting it. Our insurance is compulsory for new members and they have to pay the same rate as the oldest members, even though their expectancy of life is a score times longer, and in my opinion, if we undertake to load onto these young men additional expense to formulate a plan to pay off men who never contributed to that fund, we will find these fellows will be very reluctant about joining us, on account of the injustice it places upon them, when oftentimes they have fami-

lies of their own to support and perhaps an endowment policy they might not be able to keep up on an extra runner's salary, if a more expensive plan of insurance was compulsory in our order.

At our last convention the indigent fund was made a permanent law of the B. of L. E., which provides for a stipulated amount to be paid monthly to destitute and wholly dependent members, which, in my opinion, is the only way we should be expected to make donations for charity, for under this plan we help those only who are objects of public charity.

The great trouble with too many Brothers is they seem to think the B. of L. E. owes them something, which is entirely wrong. I will venture to say that there is not a man who belongs to the B. of L. E. today but what has received 100 per cent on every dollar he has paid into the order. I know I have and I have paid everything that has come along since February 1, 1888, and have never asked for nor received any special privileges either.

Brothers, remember ours is a labor organization and among other things we are combined together to obtain justice for ourselves in the way of treatment and a reasonable compensation for our labor, sufficient to not only provide comfortably for ourselves and family in health, but also enough so that some preparation can be made for old age. I believe in being charitable to the worthy needy. I also believe that self-preservation is the first law of nature, and if the B. of L. E. has provided the way and we have not taken advantage of it by being true, sober, just to ourselves as well as others, and lived a moral life, I cannot see where the order is in any way responsible for our condition, nor could be expected to furnish a home or finances for our support in old age; and I believe it is wrong to lead any one to believe that this can or will be done, for if we had many millions of money, we could not supply all who would ask.

Moral: Brothers, look out for your own finances.

Faternally yours,

HENRY H. TINKHAM, Div. 176.

The Size of It.

(Author Unknown.)

Up in the morning and work all day,
Just for the grub of tomorrow to pay;
Work tomorrow for the meat to carve,
Got to keep working or else I'll starve.
Work next day for a chance to sup—
Just earn money to eat it up;
Next day after it's root or die—
Habit of eating comes mighty high.

Next week, too, it is just the same—
Never can beat the eating game.
Working on Monday for Tuesday's bread;
Working on Tuesday to keep me fed—
Thursday, Friday, Saturday, too,—
Same old game, and it's never new.
Don't want to kick or make a fuss,
But blamed if it isn't monotonous.

MEMBER, Div. 84.

Spencer, N. C., March 6, 1905.

Agitation for a Union Prior to 1863.

ROCHESTER, N. Y., March 17, 1905.

EDITOR JOURNAL: It is generally conceded among the railroad engineers that Wm. D. Robinson was the first man who made an effort to start the B. of L. E. If he was, it wasn't generally known at that time that there was a meeting of engineers held at Sprague's Hotel, in the city of Rochester, about the middle of May, 1863, but there had been a meeting prior to that, east of Rochester, on what is now called the N. Y. C. & H. R. R., but it was kept very quiet out of fear that the company would find out what they were doing and they would get discharged. To prevent the company from ascertaining who the ringleaders were, they got a large sheet of paper and struck a circle and signed their names. Who they were or what they did after that I was unable to learn, but I have a vivid recollection of the meeting which was held at Sprague's Hotel, and can give the names of some of them who were there. Of those who have gone to their long home were David Perry, Hezekiah Glenn, Cyrus Kinney, Charles Thomas, Henry Case, Sanford Hartman, Joseph Hoffman, William Harrison, Joseph Harrison and others. The only one living besides myself whom I can recall is David Perry, who is 86 years old. He is hale and hearty, and looks very young

for his age. He commenced running in 1840.

William D. Robinson didn't attend that meeting, and I think he didn't know there was to be one. I think that Cyrus Kinney had more to do in getting the oldest engineers there than any one else, as he did most of the talking, and it was in his house where the charter members of Div. 18 were initiated; and we all did our share of smoking, drinking and telling how fast our engines could run, for they belonged to us at that time, but there has been a big change in 42 years and I think that the companies own them now.

No one called the meeting to order, and every one stood in fear of being discharged if he took an active part. At this time the N. Y. C. to Albany was divided into six divisions, and the engineers were discharged for the least provocation, without giving them the satisfaction to know what they were discharged for.

An engineer by the name of Blood was discharged, and he went to the superintendent, Wm. C. Young, and said: "Will you be kind enough to tell me what I am discharged for?" and he said: "You are discharged, are you? Well, that is conclusive evidence that the company doesn't want you." Mr. Blood was a nice man and a good engineer and no one could say aught against him.

From 1852 until the B. of L. E. started the engineers had a hard struggle, everything to contend with—small pay, long hours, and no one to appeal to for redress; but it was the hardships the engineers endured for ten years that brought the B. of L. E. into existence. At that time the superintendent and the master mechanic had trying times as well as the engineers. They saw that the time was coming when the company would dispense with some of them, and each one was trying to outdo the other in order to hold his job, and the one who could get the most work out of the men for the least pay was the best man. But the B. of L. E. has wiped out all those old contentions, but it required men with backbone to do it—men with energy, perseverance and determination to accomplish

what they undertook to do, and today we stand head and shoulders above any organized labor institution in the world.

We will give Brother Robinson credit for what he did, but its future success at that time depended wholly on the action that was taken by the old members. Do the younger members of today realize that fact and stop long enough to give it a thought? If they would, I think there would be more in favor of doing something for the old members, especially those who took an active part in starting their own Division, for their pay was small and expenses heavy.

If the Brotherhood wants to show any recognition for what the older members have done, let them grade them off from 63 to 68 years, giving those who have been in the order thirty-five years the preference, for they are the ones who helped build the foundation for the B. of L. E. to stand on; and our departed Grand Chief, P. M. Arthur, was one of them, being elected shortly after Grand Chief. He constantly advanced the interest of the order from year to year until it became one of the grandest and most respected institutions in America. To him we owe a debt of gratitude we only can repay by reverence of his memory.

I was glad to see an article written in the March JOURNAL by J. F. Freenor, which I heartily approve of, if he will exempt the members from paying the \$20 on assessment who have been paying for the last 35 years and are out of employment. Now, Brothers, don't get old; if you do, your turn will soon come to be placed on the retired list. After devoting your whole life since the B. of L. E. started, paying all dues and assessments for its welfare, you will be debarred the same as we are from holding any lucrative office. Is that brotherly love? If it is, I know I am getting my share. "Well," some Brother will say, "you're not in active service." With due respect to our Grand Officers, I will say they act for all the Divisions, why shouldn't we be allowed to act for our own? Then we would be on equal footing with them and in active service with them. Must we be

deprived of all the privileges we once enjoyed because we are getting old? If that is the case, then die young. Perhaps I have lived too long. I will be 77 if I live to the 5th of May. As long as the old members cannot take an active part in the Brotherhood, why should they be required to pay Grand dues when they can not be represented in the Grand Division? This is what our forefathers said was "taxation without representation."

Fraternally yours, E. P. S.

Pleasant Relations on the N. Y., O. & W. Ry.

NEW YORK CITY, March 30, 1905.

EDITOR JOURNAL: As I turn the leaves of the JOURNAL and read the letters published from different members of the B. of L. E. in reference to the harmonious relations existing between railway officials and members of the Divisions, I am prompted to write and ask permission for a little space to devote to the subject of the N. Y., O. & W. Ry. officials and the members of Div. 292, located at Middletown, N. Y., where the writer has the honor of having his name enrolled upon the roster.

In the first place, the Division is composed of men who are true and loyal to each other. Strife, factions, contentions and bitter denunciations are not heard among its members. If one of the Brothers is in trouble, he has the consolation of knowing that when he is greeted by another it is with the salutation of sympathy and a hearty shake of the right hand of true fellowship; and this is what makes the Brotherhood a reality.

The attendance at the Division meetings is as good as can be expected, aside from the writer, who, being out of town on meeting days, is often deprived of the pleasure of meeting with his Division.

Complaints against officers of the company are rarely heard, and there are scarcely ever any to be entertained. Whenever there is a punishment to be inflicted which seems unjust, but which seldom occurs, it is soon disposed of satisfactorily to all concerned. The grievances are so few that the local committee

almost forgot their responsibility of office, and when they are really called upon to go before an officer of the company it is readily disposed of.

The Division works harmoniously with the B. of L. F., O. R. C. and B. of R. T. members; in fact, it is a solid and perfect organization as a band of Brothers, all working together on peaceful lines with the officials of the company of the N. Y., O. & W. Ry. to the best interest of all. This relation is not alone confined within our home circle, but extends to a foreign Brother, who, wishing to pass over the road, is received with all the courtesy due him. There are no standing rules or orders issued by the officers of the company as to how we shall receive him. We are not supposed to turn our backs upon him and run away as though he was about to attack us like a wild beast when he wishes to present a traveling card. A Brother seeking a favor always has it granted, and when asked by one of us for an outside Brother, the officers of the company willingly oblige us. I cannot recall to mind a request made by the B. of L. E. or B. of L. F. for an advance in pay or a schedule of wages but what the agreement was approved and signed by both parties harmoniously, and, as far as was practical, lived up to. I do not believe that engineers or firemen, individually or collectively, are anywhere receiving kinder treatment from railway officials than is extended to the employees of the N. Y., O. & W. Ry. All of the young promoted engineers, as soon as they are eligible, join the Divisions. I do not know of one engineer who being eligible and running an engine within the jurisdiction of Div. 292 who is not a member of the B. of L. E. This I can safely say refers to the entire system.

Bro. M. J. Quinn, C. E. of Div. 292, to whom great credit is due for his untiring efforts, has successfully brought about this harmonious relation between the members, ever using his best influence to maintain this principle. He is assisted by Bro. Thomas Farrell, who is tall and graceful, with eyes as bright and blue as sweet violets, and a smile that holds the

members enthralled when he meets them, especially when he wishes them to settle their indebtedness to the Division. In the matter of finances he is keen, resourceful and determined, with just enough tact to make him a typical F. A. E.

It is this friendly co-operation and united effort between employer and employee, augmented by the appreciation of the former in the assistance of the latter, which has brought the road out of bondage, where it was but a few years ago, with only a right of way and two streaks of rust leading through the great Empire State, making it now one of the trunk lines, with stock on the market which all are trying to grab. I wish all Brothers employed on railroads were as well cared for by their management as are the members of Div. 292, on the N. Y., O. & W. system, where there is perfect, harmonious organization. Let us all strive for a revival of this kind, making strikes an impossibility. Yours fraternally,

J. PUFFENBERGER, Div. 292.

The Man Behind the Throttle.

There's a good deal being said
About the man behind the gun,
As if he was the only chap
That walked beneath the sun;
But let me speak here for the man,
The one sometimes forgotten,
The bravest of them, everyone,
The man behind the throttle.

He takes his stand, through rain or shine,
Without the slightest fear,
That makes one almost tip his hat
To the railroad engineer;
He pulls his cap tight o'er his head,
His watch he scans with care,
Peeps at his fire, looks at his gauge,
And then he tries the air.

We hear the shout, then, "All aboard!"
And the signal cord peals two,
When instantly the steam's applied
By the chieftain of the crew.
As the iron monster snorts along,—
It may be in the night,—
We people sitting in the train
Know nothing of his plight.

We grumble when the cars are cold,
We kick when they are hot,
We squeal when he is running fast
And growl when he is not.

We expect him to apply the steam
To suit the human race,
And the air brakes must be handled
Just to answer every case.

In order to maintain his speed
Of fifty miles an hour,
There's twenty things his eye must watch
And yet control his power.
A crossing he must not approach
Without a double toot,
And then despite all this, sometimes
His company has a suit.

He must look out for other trains,
And stick close to the clock,
And my, oh my, what grief there is
If he mistakes the block!
A loss of life there's sure to be
And public indignation.
And just as soon as he gets home
He finds his resignation.

I like the man behind the pen,
And the one behind the gun,
The man who fought at Valley Forge,
And also at Bull Run;
But here's to him with flying steed
That's cooped up in a bottle,
To me there's none can half compare
With the man behind the throttle.

H. DIAMOND.

When Engines Were Named.

TOPEKA, KAN., April 4, 1905.

EDITOR JOURNAL: When I received the February JOURNAL and saw the picture of Mr. A. S. Sweet, I recognized it at once, and it reminded me of the time I first commenced running a locomotive on the M. C. R. R., and I want to thank Brother Harkins for resurrecting that picture of the "Ruby" with George Roby and Tom Kent. I consider the whole picture a remarkably accurate one; the features of the men are so perfect as to be easily recognized by any one acquainted with them. The "Persian" that Tom ran was inside-connected. I afterwards had her for some months on the work train cutting down the grade just east of the shops. Sam Omlar, of Marshall, got me my job. He was a character. I had never seen a coal burner before and was a little timid about tackling the job. I recollect asking Sam to give me all the pointers he could. He said, "All right. Just get on and run her the same as you would a wood burner." My first trip was from Marshall to Mich-

igan City, and I think the "Vampire" was the engine. I worked there until the summer of 1876.

I see by the March JOURNAL that Bro. Harkins' article brought some letters from others of the old boys. Jimmy Reading has shown up. The last time I saw him I think was in Texas on the G. C. & S. F. His article brought to my mind other men and happenings. "Curley" Smith was on the Ft. W., J. & S. at the time he was, and his mention of the "Winds" called to my mind T. T. Parker, who ran one of them. He had a German boy firing for him whom he called "Bismarck." There was a tale on T. T. P. that one day the signal bell broke and he tied the bell cord to his left arm with instructions to the conductor to give it a light pull if he wanted to stop, and when they got out about Pokagon. I think the woodpile was back in the tank and Bismarck was back throwing it ahead when the conductor, baggageman and brakeman all got hold of that bell cord, and after pulling in the slack, made a combined pull on that bell cord, and when the fireman looked up Parker was hanging by one arm to the crosspiece in the cab with his feet dangling and kicking, and calling, "Bismarck, Bismarck," at the top of his voice. The conductor claimed he gave a light pull and getting no reply he pulled harder.

I had the "Warrior" as a regular engine for several years. I also had the "Rocky Mountain" on the Jackson & Niles Local. Brother Webster's account of his treatment by Al Priest was characteristic.

Reading these articles over, I am reminded of a number of old-timers there—John McCurdy, Jack Brown, Tom Faulkner, and on the J. L. & S. there were Bert Northrup, Pete Petrie, L. H. Short, and others.

In 1872 when the Saginaw and St. Louis R. R. was built I had the promise of a job there, and as I had property and my family in St. Louis, I made an attempt to go there, and asked Mr. Sweet if he would give me a letter. "Certainly," he said, and wrote one at once and handed it to me saying he hoped I would be successful.

I have that letter before me now. He wrote a splendid hand, and the letter is as clear and distinct as the day it was written, and signed with all the flourishes he always used.

I was back at work on the M. C. inside of a week and stayed there until 1876, when my "suspenders" were cut, along with a lot of others, principally on account of my connection with the B. of L. E.

Now, while I have got your attention, I want to say a word about my hobby. First, I want to indorse the sentiments of Brother Nixon in the February JOURNAL and of Brother Freenor in the March JOURNAL, and submit my plan. First, let us commence now to put in effect the recommendations of the Grand Chief in 1869, at least on that line; select some centrally located city, easy of access by rail, form a stock company, sell shares if necessary, and erect a commodious building for our offices, with an assembly room of sufficient capacity for our conventions. Inaugurate a plan of representation that will reduce the number of delegates to not over 200. My plan is by systems and on a mileage basis, each system or road to have a representative; on large systems one for each 1,000 miles or fractional part over 1,200 miles, two for 2,200 miles, three for 3,200 miles, and so on—these to be elected by and from the membership of the G. C. of A. and be paid by an equal taxation of all the members on the system. We would then have a body of representative men that would be easily handled and transact their business in a business manner, with credit to themselves and their constituents, and go home in less than half the time they now consume, at an enormous saving of expense. Eliminate from their program any and all entertainments that would necessitate the adjourning of the body. Allow no pay while delegates are absent from regular sessions.

Brother Freenor thinks his talk may sound harsh. It probably does to one who has not been there, but I want to say it is all truth and a condition that ought to be remedied at once.

I hope the membership at large will consider this matter seriously and take some

positive action at the next convention, and show themselves to be progressive and up to twentieth century ideas.

Fraternally yours,

H. G. RUST, Div. 284.

Progressive Condition of Div. 620.

MART, TEX, April 5, 1905.

EDITOR JOURNAL: Since the advent of Div. 620 we have existed under somewhat strained circumstances; but now I am glad we can announce quite a revival, having just initiated four of our most promising young men, with several more to follow.

We have had a goodly number of B. of L. F. runners who have hesitated to join the B. of L. E. on account of not being able to hold their membership in the B. of L. F. Some of those, in fact most of them, have decided to come in. Then again, this division of the I. & G. N. R. R. is new and unsettled and not a very desirable place to work. So some of the men who have come have not found it very smooth sailing and have left, causing new ones to have to come or firemen promoted, which has a tendency to hold us down. Of course, if we have them all, which we soon hope to have, we will not have a very large Division, but we expect to have one working in perfect harmony and following out the principles of the Brotherhood.

I have taken great interest in the JOURNAL this month, and I am very glad to see such interest manifested in the long hours men are kept on the road. We are having quite a taste of that here. Our hours are exceedingly long and we will gladly welcome the day when definite action can be taken to remedy it.

I trust that when a referendum vote is asked for again, the Brothers will be so awakened to the necessity of action that there will be a unanimous vote instead of just a majority.

I trust that those who are better writers and better talkers than myself will just keep agitating this matter and never stop until it has been accomplished.

Fraternally yours,

W. G. BAILEY, Div. 620.

Letter From a Retired Engineer to a Friend.

PLEASANT VALLEY, N. Y., March 2, 1905.

MY DEAR DAN: You will likely be surprised to hear from me, as I have written very few letters to you or anyone else during my lifetime. Did not have the time, or had too many friends, or too many children to engage my attention, or, perhaps I was well enough satisfied with the way the world used me and did not concern myself with the affairs of others. If that is selfishness, Dan, then I plead guilty. Perhaps I would not write you now but for the fact that I have been "retired from active service" and find time heavy on my hands. Yes, I was 65 last birthday, and received notice of my retirement on half pay three months ago. The boys gave me a blowout at the time. We had speechmaking and refreshments. Of course they gave the old man a good deal of taffy and (on the quiet, Dan) it didn't sound badly either. I confess I rather liked it. Dan, you will never know how much real good you have done in the world until you have been retired, and you will never know how extremely useless a man can be until after that event takes place. I will see that they give you a send-off when your time arrives. Hope you will enjoy it, and you will be surprised to be reminded of good deeds you have done in your day.

If you haven't done anything creditable in your life you may receive the compliment paid to a very bad citizen of our town who died some years ago. He was not only bad himself, but belonged to a family of no credit to the place, chiefly on account of their quarrelsome disposition, and as they possessed some fighting qualities and were extremely sensitive, as is frequently the case with such people, wise ones studiously avoided giving them offense. Now, it was the custom in that community in case of death to visit the home of the deceased, and upon being shown the corpse to say a prayer or make some complimentary remark regarding the departed one. Well, Dan, you never saw nor heard so much praying done in

your life over one man as was said over Dick Sheets in the couple of days he tarried with us. In fact, everybody prayed until Sam Kitchener arrived. Sam was ushered into the room where Dick lay, and as he gazed upon him realized the peril of his position, for to say anything uncomplimentary about Dick would be dangerous, as well as impolite, while to say anything really creditable would simply be a lie made out of whole cloth, and being a truthful man and having never learned any prayers he simply said, "Well, Dick was a — fine smoker."

Speaking of smoking reminds me of the time when you and I went job hunting in the West when we were boys. Of course you recollect that we landed in a little town in Ohio about supper time one day almost famished. I possessed the finances of the party which amounted to five cents, and you agreed to go up into the town to buy something to save our lives. Well, you returned in due time, but instead of cheese and crackers you came swinging yourself jauntily down the road smoking a cigar. I don't know of anything we needed that evening less than a cigar, and when you agreed to give me the "snipe" I thought it a pretty grim joke, or the "limit," as they say now, and I believe I impressed you in a rather forcible manner that I did not appreciate the humor of the situation. I have often relished the joke since and laugh to myself now as I think of it. I was a couple of years older than you then, which reminds me that it will not be more than that length of time until you will be a "has been" like myself. This retiring business may be all right when I get used to it, and I try to make myself and everyone else believe that I really enjoy it, but I can't say that I like it, Dan. Retirement for those who during their lifetime have cultivated a taste for art or ease may be all right, but to a case-hardened old fellow like me, whose whole time for the past forty years was spent in the service of a railroad company, who during all that time talked, or thought, or read little or nothing but railroading, it is a different proposition.

I can hardly wait for the arrival of the

dear old JOURNAL, and I read it and re-read it from cover to cover. It is the only railroading I do now.

I strolled down to the Union Depot today (don't go any place now, Dan, I simply stroll). I have no time card and little use for a watch, but anyway, I strolled down there and stood around like any idler would, gaping at things, and as I viewed them from a different position than formerly they really did interest me. I got there just as the Overland Mail pulled into the train shed. Jim Potts still pulls it, and when he stopped he spied me leaning against a baggage truck (I lean a great deal now, Dan), and without taking off his overclothes he came over to me and almost shook my arm off. It pleased me very much, and I felt flattered when in the presence of a number that were attracted by Jim's boisterous manner, he asked me if I thought it would improve the class of engine he was then running to give them larger eccentrics. Of course, Jim don't need any pointers from me about eccentrics, but being possessor of that rare instinct that marks the gentleman in any walk of life whether working in broadcloth or overalls, he appreciated the helplessness of my situation, and by his condescending manner afforded me a great pleasure. It is a refinement I cannot honestly claim, but I appreciate it in others none the less, especially in a big, bluff, rough and ready type of a man like Jim Potts. For the first time since the "blow-out" I really felt as if I was still of some consequence. When Jim and I parted I hurried home to tell mother, and she was pleased to hear of my morning's experience and to note how it cheered me up, and when Jim's two boys passed on their way from school she gave each a big apple.

After reading the paper one afternoon I tiptoed out into the kitchen and found mother washing my dinner pail. I used to come in about that time on my run, and she was going through the regular routine of work just the same as if I was working. I asked her what she was so busy about and she pushed the pail over where I could not see it, kind of ashamed

like, to be caught doing anything foolish, and I didn't let on that I knew she was washing the bucket. I said we ought to have a hired girl, as she was getting too old to be putting around the kitchen, but she said to me without looking around, "Land sakes, Jason, I do think you are getting childish. It wouldn't seem like home with a stranger in the house. You go down and fix the furnace, I think you men are awful foolish about some things." When I came back the dinner bucket was not to be seen, but mother was hustling about, busy as could be. She don't seem the same as before I was fired, or retired rather, and we are both lonesome for our children. They are all married, the nearest one living 200 miles away; we are going to visit the whole bunch soon, and as they are living in six different states, it will be quite a tour. All our girls married engineers, and that accounts for their being so scattered.

There was a time, you know, when an engineer went to bed all right and he might be out of a job when he woke up, but that is all changed now, and it is better for all concerned, I think. Our only boy, you know Ed, a big strapping fellow; well, you remember he went through a trestle with his engine at the time of the flood some years ago. Mother has never been the same since. Ed never got married, and though thirty-five years old at the time of his death, he was like a kid around the house. Mother drilled him as if he was a child, and he was as obedient as could be. Yes, she misses him, awfully. It is wonderful how attached a mother is to her boys, especially to an only son. Ed was wild enough in his time, but mother won him over by sheer force of kindness.

I went to the postoffice the other day and on the way saw Hank Lawson. He was retired about a year ago. He was standing on the curb looking out towards the lake with his hands behind his back, and he was rubbing and twisting them nervously. Hank always was a fidgety kind of a fellow, and he looked to me as if he was meditating suicide as he gazed out on the lake. so I thought I would

cheer him up. Hank's hobby, I knew, was valve motion. I first sneaked up behind him and, in a commanding voice said, "Move on," and upon my word, without looking around to see who spoke, he started off. Then I saw plainly the effect of being on the retired list for even one year, and I commenced to laugh. Then Hank, turning around, with a surprised look reached out his hand, and both laughed at the joke. We talked about the old days; went over and sat down on the steps of the postoffice and continued to talk. This was about 11 A. M. We soon drifted into a talk on engines, of course, and when valve motion was reached we were both working at short out-off, and going smoothly, taking no note of the flight of time until reaching a point upon which we disagreed. Hank's run left here about the same time mine did, and as his road paralleled ours for the first ten miles out of here we often had a race, but I beat him so regularly that I never broached the subject in his presence. But, as I said before, we disagreed. On Hank's road they set the eccentrics on passenger engines the same in the back and forward motion, while on our road they are set so the valves are blind in back motion, to prevent excessive lead when lever is hooked up going ahead. He contended their plan was the best and I stood for ours. Hank out with his pencil, and in a short time (can't say how long) had a note-book full of sketches of valve motion. He was having things pretty much to his own liking when I reached the point where in self-defense I was about to ask him if he ever experienced the pleasure of passing a passenger train on our road unless it was going in the opposite direction, when I suddenly thought better, and as graciously as I could told Hank I guessed he had the best of the argument, and you never saw such a pleased man in your life. Just then we heard the Limited go out. It leaves at 4 P. M. We had been talking railroad for five hours. We went home without calling at the postoffice and agreed to meet soon, as Hank proposed to talk the matter over again.

I thought mother would put me out at

my not coming home sooner, but she only said she was glad I found some one to entertain me, as I was getting to look so lonesome lately. She asked me if I got anything from the postoffice. I came the nearest in my lifetime to telling her a lie when I answered, "Not a thing." I believe, Dan, that idleness tends to produce moral weakness.

Well, the next time I meet Hank Lawson I will talk something else beside valve motion, or carry a lunch with me.

Regards from mother and me to yourself and family. Write soon.

Fraternally, JASON KELLEY.

Indiana State Legislative Board.

The General Assembly of the law enactors for the state of Indiana have adjourned and their acts will pass into history. As usual with these bodies, their sessions were more or less annoyed by advocates of different measures. The hirelings of corporate interests were there; the advocates of morality were there; men with personal schemes were there, and the briber was there. Representatives from the Trainmen, Firemen and State Federation were there; but where was the Brotherhood of Locomotive Engineers? Absent—because the law says that two-thirds of the Subdivisions of the state must vote in the affirmative before the board can be convened, and the Brothers were apparently careless and indifferent. So the secretary of the board did not get the necessary number until within three weeks of adjournment of the State Legislature. Then he and the chairman wisely decided that it was too late. Although the little band of lobbyists worked faithfully, they accomplished but little. They killed the Roemler Bill, which lawyers say would have run every labor organization out of the state. They also succeeded in getting the Erie Railroad management to agree to keep their Mother Hubbard engines out of the state; and they defeated the Garnishee Bill, which would have proven a curse to the poor laboring men; but they were not successful in their bills, which were as

follows: Fifty Car Bill, Requiring Three Men on a Train, the Mother Hubbard Bill, the Ash Pan Bill, the Automatic Bell Ringer Bill and the Weekly Wage Bill.

It appears to me on reflection that matters pertaining to these bills, if there is merit in them, could be amicably arranged by Federated Boards in Train Service interviewing their respective railroad officials. The Ash Pan Bill is a jet of steam running through a pipe from the dome into the ash pan. An engine can be equipped with this device for less than \$10, and it is expected to keep the ash pan clear of ashes, snow and ice, so that a man need not crawl under the engine except when there are clinkers in the pan. The engines of late build are hard to crawl under unless they are standing over a pit; and in case, for some unforeseen reason, the engine should be moved with a fireman underneath, his chances for escape are few; and the matter should be investigated and tested as to its merits.

As to the Fifty Car Bill, it seems to me that three brakemen are essential for signals, switching, breaking in two, doubling grades, or any unforeseen accident that is liable to occur. Had the other labor organizations done as the Brotherhood of Engineers did, we would have felt the power of Senator Woods, of Lafayette, and David M. Parry, also Frederick Matson, of Indianapolis. So, does it not behoove us to have our sentinels in the corridors of the State House during the biennial session of our Legislature? And furthermore, would it not be more in harmony with concert of action for our Legislative Boards to convene a couple of weeks before the Legislature does and outline their bills for their lobby, and send a copy to each Subdivision in their state for approval or rejection, and the bills that meet with approval from two-thirds of the Subdivisions in the state be placed in the hands of the lobby, the rejected bills to be destroyed? This will check serious trouble between lobbyists and Brother engineers in the State House, and give us more unity and force in our undertakings.

F. A. E., Div. 11.

Insurance Good Enough.

KANSAS CITY, MO., April 8, 1905.

EDITOR JOURNAL: I wish I were educated so I could put my thoughts in words intelligently and comprehensive enough for all to grasp. I am tempted each month on reading my JOURNAL to assail some of the writers in vigorous terms and have hesitated so far, and now I am throwing myself out on the tide and hope I shall make a successful landing.

First, Bro. Geo. Conner says it was a mistake to add the Insurance feature to this grand labor organization. Was it a mistake to go into the thousands of homes we have with two or three thousand dollars to place a dead Brother's family above want? Is it a mistake to give a crippled Brother incapacitated from railroad work \$1,500, \$3,000 or \$4,500? As for Brother Freenor's plan of endowment, I find no fault only this: It appears to me that the more we juggle with our insurance the more complicated it becomes.

I for one would be glad to go back to first principles of one policy \$3,000, insurance optional with member, and that would have its sad features, for the wife and children of the game-loving Brother would be left in poverty at his death.

In the '70s I was afraid our organization was doomed on account of the large number of expulsions each month. Our insurance was down to \$1,500, but praise our Father, right has triumphed and our order is bound to live. Our present policy of \$3,000 cannot be secured of a line company for three times the amount it costs now, and fraternal orders outside the B. of L. E. are raising rates, so the old man must quit. Don't do it any more, Brother Conner.

There is but one thing in life, says the man of 70; but one thing in life says the man of 40; but one, answers the man of 20. The man of 20 says it is love; the man of 40 says success; the man of 70 says it is rest. Bro. Geo. A. Clark is right. Give us more rest; give us Sundays. Yes, our lives are short enough. Examine your JOURNAL care-

fully and note the average life of our policies; they are not to exceed about seven years. Come again, Brother Clark.

Brother Craig, I can say with the young man who went to Christ with a question, "All these have I kept from my youth up. What lack I yet?" I have no more friends among the Brothers than the man who lay back resting while the doubler put away the head end of his train and went back after the rear end, and when I was accused by a little two by four official with trying to curry favor with the company by such work, I just quit doing such things.

Brother Dunlap's admonition is timely if he has run three-wheel connected engines and shut off that blow-off cock.

Con. Troller better be careful or we won't read your articles any more.

Fraternally yours,

OBSERVER.

Three Little Chisels.

In the Illinois Central Railroad Shops at Memphis, Tenn., a few years ago there worked an aged machinist, he had but little to say and seemed to spend much of his time in thought, and was regarded by his fellow workmen as "cranky." He was the owner of a fine set of tools which he always kept in his locker, and always refused to loan a single tool under any circumstances. Among his kit of tools were three little chisels that he had used constantly when needed since he was an apprentice thirty years ago. The chisels were all just alike, and were worn so short that he could only hold them between his fingers. Finally one day Sidney Smith, a young apprentice, happened to notice the old man at noon put the three little chisels in his pocket and go out behind the roundhouse, which was something unusual for the old man to do. Sidney's curiosity was at once aroused, and he at once determined to see what the old man's errand was, and wanted to know especially what he was going to do with the three little chisels.

The old gentleman near the scrap pile, behind the roundhouse, stopped and looked all around as though about to do something desperate that he did not want to be

known. He did not see Sidney, but Sidney saw him as he cautiously dropped the three little chisels down among the scrap iron and quickly walked away. It did not take Sidney long to make up his mind to have some fun at the old man's expense.

Of course, the old man was not aware that Sidney had a duplicate key to his locker; that fact known would have been sufficient cause for "something doing." Sidney at once formed a conspiracy among the machinists, and it was unanimously decided to put the three little chisels right back upon the shelf in the locker from which they had been removed and thrown away.

Imagine the old man's surprise when he returned from dinner, opened up his locker, and beheld the three little chisels in the same place upon the same shelf where he had always kept them until he had thrown them in the scrap pile.

The machinists were all watching him as he stood there silently gazing at the three little chisels. The old man did not say one word, but seemed to be much worried, and Sidney continued to watch him.

The next day at noon the aged machinist changed his tactics and threw the three little chisels in the cinder dump. He did not get out of sight before Sidney was in possession of the three little chisels, and put them right back from where they had been removed from the shelf in the old man's locker.

Behold the old gentleman's troubled expression when he returned from dinner, opened his locker and beheld the three little chisels again. He seemed to be lost in thought. The machinists who were watching him thought he was getting superstitious. The old man still kept silent, and Sidney continued to watch him.

That same evening when the old man was ready to go home he again got the three little chisels, put them in his pocket, first satisfying himself that no one was watching him; but Sidney saw him and followed him on his way home on Virginia Avenue.

He had to walk a foot log over a small stream, and there he dropped the little chisels into the deepest part of the water

and continued his journey home. Sidney was watching him, and as soon as the old man was out of sight Sidney stripped his clothing off, plunged into the water and was soon in possession of the three little chisels for the third time. He hastened back to the roundhouse and again put the three little chisels back upon the shelf that had been their keeping place for thirty years.

The old man came down as usual next morning to his work. He paused, looked at his locker suspiciously, and with a trembling hand cautiously opened it, peeped in and there lay the three little chisels. He stood there like a statue for five minutes; he seemed dazed and without the power of speech and unable to move. Finally, he slowly walked away, and during the remainder of his life the chisels were never again removed. The old man never mentioned the circumstance, and Sidney is still wondering what the old man's thoughts were concerning the three little chisels. P. O. RICKMAN.

Tuberculosis.

PHILADELPHIA, PA., Feb. 10, 1905.

EDITOR JOURNAL: In the January JOURNAL is a letter from Brother Gurney on the subject of "Tuberculosis," and which, if you will permit me space, I would like to answer and in doing so become the one sufferer personal. In his letter he gives much valuable information and Los Angeles people deserve great praise for what they have done to relieve and bury those unfortunates. Consumption has been given the name of the white plague, and there are not many places that are exempt from it. Thousands die each year, and while if you believe the papers of the cures advertised, it does seem queer that it is on the increase. The cause first, in my opinion, if it has not been inherited, is in being too lazy to draw a long breath, and secondly, a violation of Nature's laws and a disobedience to God's commands, for it certainly has been a dread disease all through time, if I believe my Bible: in Lev. 26:16—"For their disobedience I will appoint over you terror, consumption," etc.

The physician examines the man, he finds tuberculosis and in his terror he sends you somewhere to get rid of you and you go, which is the beginning of foolishness, for he whom I represent went, and after all the misery of being away from home, found that in a southern city fifty Yankees the year before had gone to their last home from this famed health resort, and he, not wishing to die there, went further south where the air was more balmy and dry and while there saw many unfortunates in just such a condition as Brother Gurney has stated. All they had in the world had been sold to try if it were possible in some strange place to regain their health. In many instances they died and friends at home looked after them. In many cases their friends came after them and brought them home after they had become so bad it was impossible for them to go home themselves. In other cases they died and the sweet charity of strangers gave them a decent burial. In so many cases all expressed a desire that if they had only gone somewhere else—Los Angeles, Denver, Texas—and so many places were mentioned. God pity them, he often thought, better by far had you stayed at home and there suffered and died among those who had known you all your life; and there in the South you can be in your grave as quickly as any place I know of on earth.

Now, take the advice of this sufferer and stay at home if you are suffering with this disease. Don't believe all the doctors tell you about it. A doctor said to a lady friend, "You must go to Florida or you will die." "Well, doctor," she said, "I have just so much money; I find it will cost so much money to keep me in Florida two months and if I go I will have no money to pay you." He scratched his head and said, "On second thought, stay at home, for I do not believe it would do you any good to go away at the present time;" and in all his travels he has yet to see the first man who has actually been cured and stayed cured of a genuine case of tuberculosis. Up north, on his return, he has heard that they are cured by bury-

ing them in the snow on the mountains and feeding them upon raw eggs and milk and he hopes it is true, for in all directions of the compass the disease prevails. In the South hundreds of negroes have it. Take his advice and stay at home, dress not too warm but warm enough, be particular to keep the feet dry, eat all nourishing food, nourish the body in every way you can. If you can stand raw eggs and milk all right, take them that way; if not, try the whites of eggs whipped fine with a little sugar and drink all your milk boiled and the last thing at night a good cup of warm milk. Eat everything that agrees with your stomach and if you are exhausted take good or common whisky, just as you please. The doctors say a man with that disease who drinks whisky is on his road to the grave, and I say that a man who has consumption is on the road to the grave anyhow; and while I am loath to recommend alcohol to anyone, he who is in that condition *must have a stimulant*; but there is danger which must be guarded against. While on his travels he has known of ladies whom their doctors had ordered milk punches for. After being down there a short time, it took about five punches to get them to the breakfast table. Five cups of good hot clam broth would have kept them alive, but do not eat many fish or oysters. In many cases these apparently feed the disease by increasing the cough. Be pleasant and cheerful with everybody and particularly with yourself. Sleep with the windows wide open. Go to work early in the morning; work every day that you possibly can, for you can rest assured the disease will knock you out every once in a while. Go out in all kinds of weather, using good judgment how best to protect yourself against it; bear in mind that you catch as much cold in the house as anywhere else, and to be happy fear God and obey his commandments.

These, Brother Gurney, are the reflections of one of those unfortunates, in the hope that some of his advice may be of benefit to others.

I, personally, turn to the latter part of

your letter, where you sympathize with us in having to hug the stove, and so forth. Bless your heart, my dear Brother, we do not want a place where it is all sunshine and flowers. We have snow now many feet deep. You can hug the shady side of the street, but, oh, what you have missed! We young fellows can run our cutters up to the door of our lady fair and tuck up alongside of her, after we learn to drive with one hand; and as we go, listening to the merry jingling of the bells, we forget it is cold, that it is winter, and more lies can be told in that blissful hour's ride than you will tell in twenty years. But, my Brother, the best part of your life has been lost.

Fraternally yours, C. B. NIXON.

Railroad Employees' Home.

Communications for publication must be written on one side of the paper. Noms de plume are always permissible, but to receive consideration must be signed by the full name and address of the author, and addressed to the Editress, MRS. M. E. CASSELL, 927 Dennison Av., Columbus, Ohio, not later than the 8th of the month.

The Editress reserves the right to revise, reject or use matter sent in, governed entirely on its merits.

Early Spring-tide.

BY PAUL BLAKE.

The year has changed ; three months ago
 'Twas Winter time ; the trees were bare,
 The fields were still enwrapped in snow,
 At night a white mist filled the air ;
 No song-birds fluttered through the hedge,
 The frost made bold the timid fox ;
 Long icicles weighed down the sedge
 Close gathered stood the shivering flocks.

But now along the river's banks
 There buds the creamy meadow-sweet ;
 And iris flags in glittering ranks
 Wave gently as the breeze they meet.
 Though 'tis but Spring, the soft south wind
 Blows warm as if 'twere pleasant June ;
 Come, hoist the sail ; we've left behind
 Cold Winter—Summer's coming soon.

Bad Boys.

When Major-General Crook died, in 1889, the fact came to light that in his youth he was considered a bad boy. While at West Point he stood low in his class, and was so frequently punished for infraction of the rules that he actually hated that institution—so much so that he never could be induced to revisit it.

Grant and Sherman were bad boys while at West Point, and Sheridan was so bad that he came very near being expelled.

All these bad boys afterward became historic, and were anything but "bad" men. How does it happen, then, that they were such "bad" boys? Does it not seem as if there is some mistake about the application of the adjective "bad"?

With too many people, especially instructors, a good boy is simply a dull boy, one who has not enough blood in his veins to make him lively, and not enough spirit to resent insolence or persecution.

The boy who is restive under absurd restrictions, who laughs in the wrong place, who resists unjust punishments, and will not admit that he is wrong when he knows that he is right, is promptly reported as a bad boy, and usually graduates at the foot of his class, if he is not expelled before examination day.

But such bad boys are not dismayed at the frowns of teachers, and the prophecies of well-meaning but ignorant friends.

Like Grant, Sherman, Sheridan and Crook, they grow up to be good men, with big hearts and great brains—men who are loved as well as honored.

Nobody claims that education is in any case a detriment to success, or that the studious boy is to be condemned, but we cannot fail to see that the noisy, hearty, bold and self-reliant boy, so unpopular at West Point, as well as in our colleges, is the boy who makes the biggest mark in the world when he grows into a man.

Study the character of your boys. Try to mold and not to break. Bear with their little oddities, keep near to their hearts, encourage their confidence and believe in their future, and nine out of ten will become all that you wish them to be—good and useful men.

This country is full of mischievous boys whose make-up is full of life and energy, and during their youth they will do many things to work off this surplus energy, that looks foolish and unwise to

older heads; but give these same boys a chance, and bear with them during this exuberant period of their lives, and many of them will be heard from in the future as leading men in every walk of life.

God bless the bad boys.

From Mexico.

MONCLOVA, MEX., March 1, 1905.

DEAR EDITRESS: Having promised the Sisters of Nokomis Div., 314, that I would let them hear from me through the JOURNAL, I will endeavor in as brief space as possible to tell you something about this part of Mexico. Although I have not been here long enough to have seen much of the Republic or even form a very favorable opinion of the place, I am told that one should not judge the whole Republic by this, as this is a very barren portion of Mexico and has a tendency to make the tenderfoot long for the States. And while we realize it is not the most fascinating place to live in in the world, we can have the consolation of saying it would be a good place to die in, as we could leave it with less regret than any place we ever knew.

We are located at Monclova Station (about three miles from the old City of Mexico), which is a quaint old city, and at one time was the capital of Mexico. It has perhaps a population of three thousand souls. The houses are constructed of adobe which is composed of mud with chopped straw mixed in to keep it from falling apart. This is moulded in blocks and laid in the sun until hardened sufficiently to lay with mortar. The houses are usually one-story. The roofs are of mud also, and as there is very little rainfall in this country they make a very comfortable dwelling protecting the natives from the heat as well as the cold. The better class finish their dwellings with a whitewash or cement.

There is very little effort made to grow trees or cultivate the ground as a scarcity of water makes it impossible. In the center of the city is the old church supposed to be two hundred years old. Constant repairs keep the church in fine

condition and it looks as though it would be good for several centuries to come.

The climate is fine. Have had some disagreeable days, but cold weather is very unusual I am told.

There is plenty of game and fine fishing farther down.

Business on the railroad is very dull at present and the engineer finds plenty of time to get acquainted with his family between runs. The railroad company has erected a fine brick hotel and it is run first-class and the proprietors not only give plenty to eat but have the best of service in every way and strive to make your stay here one continual round of pleasure.

The engineers of Sabinas Div., 637, gave their first annual ball in the hotel February 22. Never was the spacious ballroom the scene of more gayety than on that evening. The room was handsomely decorated with flags and bunting. The committee of arrangements spared neither pains nor expense to make the affair a success, and the many expressions of satisfaction received from all sides testified to the terminations that crowned their efforts. At 9:30 as the sweet strains of the Mexican orchestra of twenty pieces came stealing through the evening air, about one hundred and fifty couples headed by Superintendent J. Z. Waters and wife, fell into line as the grand march was announced. At 12 o'clock an elegant supper was served. The program consisted of 22 regular dances and four extras, and at 5 A. M. the orchestra struck up the last waltz to the familiar tune of "Home, Sweet Home," many regretting the affair was over, and upon leaving for their homes voted the engineers fine entertainers.

As I see more of Mexico I will write again. I would like very much to see a letter from Nokomis Division some time soon as that Division especially will always hold a warm spot in my heart, for I have spent many happy hours there with loving friends and Sisters. Wishing all success and happiness, I am,

Yours in F., L. & P.,
MRS. C. C. COULTER.

An Interested Reader.

PITTSBURG, PA., April 3, 1905.

DEAR EDITRESS: I have been reading the ENGINEERS' MONTHLY JOURNAL for some months and enjoy it very much. I am interested in the railroad man's welfare—and why shouldn't I be? I have a brother who is a passenger engineer, and has been a faithful railroad man for years. Some time ago I wrote for the railroad journals. "Mother" Jones, as she was called by the dear friends who knew her, was editress then. I have not heard from her for a long time.

I read the article, "The Value of Books," in the last number of the JOURNAL, and thought how true it was. What a pleasure it is to read and have good books! Every one should learn the value of books. It seems we could be supplied with a few books, magazines, etc., for at the present time they are within our means, and should be supplied for our reading. Children are fond of reading, and so are old people. I have a mother, 85 years of age, who reads and enjoys herself in that way. It is so much better to have the home furnished with bookcases, with good books by good authors upon the shelves for old and young to peruse, than to have them want for books and go elsewhere and get something not good for them to read.

Good books bring us a great deal of pleasure. No matter where you reside, any book or magazine can be sent to you. I do not know what Mr. Oliver, of Casanova, Va., handles in the way of reading material, but I guess we could all afford to subscribe and give a helping hand to a crippled Brother. When we are strong and well we become selfish and thoughtless, and now let us think this over. "The value of books!" What a grand thing it is to have good books! I am glad we are living in the present age, when there is so much to read and learn.

B. K. M.

The Songsters.

Div. 18, Saginaw, Mich., gave a musical and literary entertainment on the evening of March 9 to an audience of over two

hundred. The program was made up of vocal and instrumental music, recitations, dialogues, pantomime and tableaux. The committee sang a song composed by Sister Ellen Hinds, which was so well received that they had to respond to an encore with another selection by the same composer. We will send the words of the songs, hoping they may be sung by others with the same success:

SONG.

Good evening, dear friends, good evening,
We give you a warm welcome here;
We'll try our best to amuse you,
Though each one is quaking with fear.
We're banded together for duty
To our big, bold, brave engineers;
Oh! the wor'd couldn't wag on without them
And the love of the darlings, the dears.

Unity's the name of our Division;
In this there is strength, we all know,
With "Fidelity, Love and Protection"
Our "Honors" to each one we'll show;
Then "Harmony" comes in its order,
With "Charity" close on its heels.
Oh! we love to greet all the new members,
Down, down where the "Billy Goat" kneels.

There are Marys, Maggies and Rosies;
There are Jennies and Jessies and Nell,
Carries, Sarahs, Lillies and Esthers,
And too many others to tell.
We meet every first and third Wednesday
In our good Brothers' hall, right up here.
We were given the unlucky number,
But of "thirteen" we have no fear.

CHORUS.

To the G. I. A. ever loyal,
To the B. of L. E. ever true,
Our colors will stand out forever,
The purple, the red, white and blue.

ENCORE.

There are engineers in many lands
But none to me as 304 stands;
Some say they are queer, and somewhat slow,
But now let me tell you, that's not so.

They say too many unfair things
About our big, good-natured kings:
And all that's left for us to do
Is to stand up for them, wouldn't you?

When they go out with a drag of flats,
East or south on the railroad tracks,
I tell you what, 'tis something mean,
When that old engine, she won't steam.

From New Mexico to Chicago.

It has been some time since Div. 123, Raton, N. M., has contributed to the interesting pages of the JOURNAL and not because we are idle. Some of our Eastern Sisters will no doubt be surprised to know that this little town boasts of hav-

ing forty members. Only three mouths have passed and we have initiated eight members, but this is not what I wished to tell you.

We were informed that Sister Boomer and family would pass through our city on Wednesday evening, March 8, en route to Chicago, and as she was leaving New Mexico for good, we made hurried preparations to entertain her between trains, as other arrangements prevented her from stopping over.

Brother Colip, of the B. of L. E., Mrs. Colip, one of our members, also Worthy Matron of the Eastern Star, and myself, informed all of Sister Boomer's old friends to meet her, which they did and it looked as though all of Katon had turned out. Our guests were escorted to the Masonic Hall where the B. of L. E. had prepared a banquet. After all were seated around the festive board, order was called and Sister DeLong, in behalf of the G. I. A., expressed regret that Sister Boomer was leaving us, and presented her with a solid silver carving set and before she had time to respond, Mr. Donovan, representing the Eastern Star (of which Sister Boomer is Past Grand Worthy Matron), brought forth a set of silver ice cream forks. Sister Boomer was visibly affected by the unexpected gifts of love bestowed upon her, and thanked her friends for the remembrances, but was unable to respond in her usual able manner.

We had the pleasure of a few hours with Brother and Sister Boomer before they left for their new home, and many were the expressions of regret at their departure.

MRS. M. F. SMITH, President.

Minstrels.

The engineers' fine new hall at 164 Canal street, Boston, Mass., presented a merry scene on the evening of April 1, when the members of F. S. Evans Div., 99, gave a minstrel show.

The ladies, numbering twenty, marched to the platform, where the ceiling was artistically decorated, to the catchy music played by Miss Ella Treferen, pianist for the minstrels. The President of Div. 99, Mrs. Woodman, acted as inter-locutor, and made a fine center-piece. After the ladies were in position, Brother Wardwell, ever ready to lend a helping hand, rendered an original poem entitled, "Those Old Back Stairs," referring to the old hall that had recently been leased for the storage of the "ardent." Brother W. was loudly applauded, which was well merited. Twelve of the ladies were attired in white waists, pink skirts, low

shoes with pink bows, and eight in white waists and red skirts. The end ladies flourished their bones and tambo's in good style, and the singing, including solos, quartettes and chorus work, was finely rendered, and their dance steps well executed; all were obliged to respond to encores, receiving many floral tokens.

The usual number of jokes and hits were passed around, and well received by the Brother engineers. Miss Woodman very cutely gave a pickaninny dance, and Brother Abbott, Chief of Div. 61, sang in a pleasing manner "By-gone Days in Dixie." The ladies sang "Old Black Joe," one of the Brothers assuming the character of "Joe." Mr. Patterson finely rendered several selections.

Next in order was a cake-walk by five couples of the black faces. The cake was taken by Sisters Chase and Woodman, who shared it with Sisters Wilmot and Treferen, whose steps were A No. 1. Light refreshments were served to all in the banquet hall by Chairman Sister Talbot and her corps of assistants. It is no exaggeration to say that the show was a great success and enjoyed by all present numbering nearly 400, and the committee, with Sister Place as chairman, are to be congratulated on the result of their efforts.

INS. SEC., E. W.

New Divisions.

THIRD DIVISION IN NEW YORK CITY.

On March 8, Mrs. John Henney Div. 351, was organized with 21 of 23 charter members present. About 100 visiting members were present, representing fourteen Divisions, located at London, Ont., Philadelphia, Trenton, Jersey City, Hoboken, Union Hill, Port Jervis, Long Island, Brooklyn, Middletown and New York City. Div. 234, New York City, had the largest delegation, and to them was indebted for loan of regalia, etc., as well as for valuable assistance Sister Stedman acting Secretary, Sister Squires Marshal. Sister Elliott of Div. 264, of whose work we have had occasion to speak in terms of praise, presided at the piano.

With Sister Ross, Div. 215, Seilig, Div. 234, Butterfield, Div. 264, acting tellers, the following officers were elected: Sisters Doyle and Guide of 234 assisting; Pres. Mrs. Wm. R. Marley; V. P., G. D. Cook; Sec., G. Mornhinway; Treas., J. Callaghan; Chap., C. H. Squires; Ins. Sec., Jas. Bannar; Guide, W. Marley; Sent., G. Edwards. Installation followed, with Sister Donaldson, Div. 272, Chaplain, Squires, Div. 284, Marshal, whose excellent work received many deserving compliments. Pres. Marley made appoint-

ments as follows: P. Pres., P. Steinway; Musician, G. Hill; Marshals, James Ban- nar, P. J. Nagle; Pillars, J. J. Zellar, Maloney, J. R. Edwards, M. A. Hill, who were duly installed. At the close of the ceremony President Marley, in appreciation of services rendered, presented beautiful bouquets to Secretary Stedman, and Musician Elliott a silver bonbon dish to organizer. Ice cream and cake were served to a large number of guests. It was a pleasure to see the new as well as the old faces. Adjournment was made until the day following, when with the majority of new Division present, the entire work of ritual was exemplified. Pres. Marley's past experience will be of great benefit. Later reports give the encouraging news that several applications had been given out, and Div. 589, B. of L. E., had given substantial encouragement to its Auxiliary by donation of a handsome sum.

Loyalty of B. of L. E., loyal support of officers and members of each other, interest and punctual attendance will make the Division all one could desire. Meetings occur 2d and 4th Thursdays, 23d Ward Bank Building.

President Marley entertained and received calls from President Wheeler, Butterfield and Elliott of Div. 264, and Sister Seilig Div. 234 and family.

On the evening of March 9, in company with President Marley, Div. 351 attended the Fourth Anniversary of Div. 264 G. I. A., assisted by Vanderbilt Div. 145, B. of L. E. at Ebling's Casino. It was a privilege and pleasure to accept the invitation, tendered through courtesy of Sister Agur, Sec. of Committee. The reception committee and attentive ushers welcomed their guests most heartily.

An excellent programme was very much enjoyed, especially the vocal solos of Sister Elliott, and recitations and musical numbers on piano, mandolin and violin of the young Misses Cavanaugh, who were wonderful artists in their line. A large and happy crowd participated in the dance which followed. Several figures of the grand march led by Pres. Wheeler and floor director received applause. May each succeeding anniversary be as full of joy and happiness.

Word from Grand Secretary reached me in New York that all would be in readiness to organize at Fitchburg, Mass., March 14, Warren S. Stone, Div. 353, Auxiliary to Div. 191 B. of L. E., named in honor of Grand Chief; left New York March 11, entertained over Sunday at Ayer, Mass., by Sister Beverley, Sentinel Div. 155. A call was made on Sister Moss, also of Div. 155, and to both Sisters are indebted for courtesies shown.

Arriving at Fitchburg, March 13, was

welcomed by Mrs. Mulauey and an interested "crowd" of women who were to become members of new Division, and escorted to the home of F. A. E. Mulauey, at whose home I was entertained. A short time was passed socially, and a part of the evening was spent at the home of Brother Woodworth, C. E. of Div. 191. The day following dined with Sister Woodworth, who with her husband are members of the "Quyle Wood," named for car in which we were traveling companions to Los Angeles, where Sister Woodworth became a member of the G. I. A., since transferred to Div. 99, Boston, Mass.

The organization of Div. 363 occurred in the afternoon of March 14, 27 of the 29 charter members present; the ones absent were initiated the next meeting. Several of the ladies are wives of Brothers of Div. 312 residing at Fitchburg and Sterling. Fourteen of Div. 281, Greenfield, Mass., were present and filled the chairs. They kindly loaned regalia, staffs, etc., for the occasion. Sister Adams acted Secretary, Warren, Musician, Sister Beverley, Div. 155, Marshal of the Day and Installation. The following were elected: Mrs. E. J. Mulauey, Pres.; F. M. Harris, V. P.; J. H. Crowther, Sec.; C. S. Smith, Treas.; G. P. Muzzey, Chap.; F. L. Rowe, Guide; A. L. Fuller, Sent.; H. E. Parker, Ins. Sec.; Sisters Adams, Atwood, Ball Tellers. Sisters Davis and Gibbs otherwise assisting. Installation followed. Sister Hutchins Chaplain. President Mulauey appointed Sister W. H. Cone, P. Pres.; Musician, E. Brigham; Marshals, G. E. Bartwell, D. W. McLeod; Pillars, D. J. Bean, C. Shorey, J. M. Otis, C. E. Mason, and duly installed them.

Adjourned to partake of excellent lunch provided and served by local Division, after which visiting members left on early evening trains. Baskets for use of Guide and Sentinel were donated by Div. 281.

At 7:30 P. M. resumed work, all forms being exemplified. The new Division displayed more than ordinary interest, paying strict attention to instructions. With the unusually large charter membership, resolute endeavor and determination to succeed there should be "no such word as fail." It is some ten or twelve years since my first communication was sent. Div. 191, B. of L. E., calling attention of the Brothers to the subject of an Auxiliary.

We now feel that "patient waiters are no losers," and "all things come to those who wait."

F. A. E. Mulauey and wife with others have worked hard to bring this about. Success to Div. 353, whose meetings occur 2d and 4th Thursdays, G. A. R. Hall, where all members of the order will be welcome.

MARY L. COOK.

NEW DIVISIONS IN CALIFORNIA.

Pacheco Div., 339, was organized at Kern, Cal., on Friday afternoon, Dec. 16, 1904, by Mrs. Lizzie Armstrong, of Div. 106, assisted by the full corps of officers of Div. 104, who came in a body to be present at the organization, and exemplified the work in a very creditable manner, and also gave the new Division a pleasant surprise by presenting them with a ten-dollar gold piece.

In the evening a reception and banquet was given, which was largely attended, and was much enjoyed by all.

The next morning a tallyho ride was tendered the visiting Sisters by the Brothers of Div. 106, and a splendid opportunity to view the many points of interest in that vicinity afforded them.

In the afternoon we repaired to the hall to drill the new officers in the work, and so readily did they respond to instructions that we felt we were leaving the new Division in able and willing hands.

We left on the late evening train, after having spent a very pleasant hour at the home of Sister Murray, and bade good-by to our new friends with many expressions of love and loyalty, and taking with us many pleasant memories of our visit to Kern.

AT POINT RICHMOND.

Echscholtzia Div., 350, was organized at Point Richmond, March 9, 1905, and the meeting was largely attended by members of Divs. 106 and 156. The weather proved to be ideal for March, and the little trip across the bay was much enjoyed by all. We arrived at the place appointed for the meeting at 11 o'clock and found the ladies in waiting. The meeting was opened by singing "America" and a prayer by the Grand Chaplain.

After the work of organizing was finished we adjourned for luncheon, which had been spread in the adjoining banquet hall. It was done full justice to by all present, and the members of Div. 350 have earned a reputation as royal entertainers. The table was loaded with everything to tempt the palate, and between fifty and sixty were seated at the board, which was decorated with the beautiful golden poppy, for which the Division was named.

After the feast we returned to the Division room, when the officers were elected and installed and the ritual work exemplified by the officers of Div. 106, all being present but one, and the station being filled by Sister Carroll, of Div. 156. Undergood of the order, the Grand Chaplain in behalf of Div. 106 presented the new Division with a ten-dollar gold piece.

We closed the meeting just in time to

catch the 5:30 train, and parted amid expressions of good-will on all sides and with the promise of another visit in the near future. LIZZIE D. ARMSTRONG.

Insurance.

TOLEDO, O., April 6, 1905.

SISTER EDITRESS: I am pleased to find that attention is being paid to the V. R. A., and I would like to answer in full public and private letters, but time will not permit; however, I submit a few more facts, which will be helpful.

The monthly rating submitted at convention was as follows:

On each \$500—

Under 25 years.....	40c.
From 25 to 30.....	45c.
From 30 to 35.....	50c.
From 35 to 40.....	65c.
From 40 to 45.....	75c.
From 45 to 48.....	85c.
From 48 to 50.....	95c.

Age attained at birthday previous to date of certificate being used as the basis.

As a concession to those who are already members, it was suggested that they be assessed on age attained on joining, not age attained when the law shall go into force; and, to make further concession to those who joined at an advanced age before age limit was established, allow them to pay the same rate demanded of those who join between 48 and 50.

No member since reaching the age of 45 (I might almost say 40) has paid on an average the full cost of her risk, but, through the generosity of the younger ones, her beneficiaries have been assured full payments.

That a few new members die is true, but in making a fair estimate, we must remember that nearly 2,500 certificates were issued in 1902, '03 and '04, more than one-third the whole number extant. If the other two-thirds brought no more than twice the claims that these have, the V. R. A. would be accumulating a vast surplus for future exigencies. I have always advocated medical examinations, more and more strict, at each convention, and am pleased to refer to results as stated on page 233 in Transactions of Convention, 1902. No applicant is accepted till all questions are answered satisfactorily, and sometimes more questions are plied under the advice of Sister Wilson's physician. If the examination should be more scrutinizing, the delegates should make it so in 1906.

If a law could be adopted to pay but a certain part of the benefit when the member lives but a short time after joining, it would be just to the beneficiary and a saving to the treasury.

Some conditions surrounding the B. of L. E. are not like those we have to meet. Their younger members are more liable to be swept away by accidents than the older ones, hence, bring a heavier burden than our young members do. Then, the G. I. A. is not a labor organization. If it were, and the members were joining by the hundreds to raise the standard of their craft, and we should say to them, "If you join this respected body, you must, health and age permitting, take some insurance," our members would be greatly augmented by young blood.

Our delegates have several times voted against compulsory insurance, and the result is we had 12,000 members in the G. I. A. last May and less than 5,000 in the V. R. A., carrying less than 7,000 certificates.

I wish that our present plan would suffice for all time, but as it will not, it is our duty to adopt a better one. Study the laws of our competitors, and you will find that where all members pay the same rating, the benefit increases as the age at joining increases. Others adopt an age rating based on expectancy, and deduct from the benefit a fair amount for years of expectancy lived out.

All these plans have been evolved to secure justice, and no plan will perpetuate itself unless in some way the cost is honestly and justly distributed according to age.

There are two kinds of criticism, constructive and destructive. I have adopted the former, by suggesting a method to improve our present plan, which I know to be weak. In thus warning and advising I am placing the responsibility on you, my Sisters. Do not evade your duty, but study with a mind open to conviction, and do not allow your vote to be thrown in ignorance or prejudice.

Yours in F., L. & P.,

M. L. ROBERTSON.

A Young Member's Views.

Young in years, as well as membership, I wish to have a word to say in regard to our insurance. I am not in favor of the age rating. I for one hope to live to a good old age. I want to keep my insurance in the V. R. A. I have two policies I have carried for two years. Should the V. R. A. change age rating I will drop them before I get too old.

Live and let live is a real good motto. The old members have made our V. R. A. It is not fair to them, nor is it fair to the young generation. We will not all die young. It is to be hoped not, any way. I am very ambitious for the good of our order, our insurance especially. I have a mother that is a widow, carrying two policies in the V. R. A.; has carried

them for years. She could not and would not keep them were the rates changed. I trust all young members will think well over this subject so that we will hear some knocking from them as well as old members. Remember the Golden Rule, "You should do unto others as you would have others do unto you." We grow older each day we live and I hope as the days go by we can do just as well as the older ones before us.

Yours in F., L. & P.,
MRS. H. A. ELLIOTT, Div. 148.

Our Insurance.

I have taken considerable interest in the letters which have appeared in the JOURNAL regarding the insurance feature of our order, and while I have never before written a communication for publication the proposal or suggestion made by Sister M. L. Robertson, cutting, as it does, at the very foundation of our order—integrity—is a matter that I feel I cannot allow to pass without some expression.

Of course, there are always two sides to an argument, and I am willing to accord Sister Robertson the full credit of a conscientious desire for the good of the order in general rather than any one class, but in making her suggestion I do not think the Sister comprehended its full scope and the fact that it was practically a repudiation of justly-incurred liabilities. We surely do not wish to be classed among the bunco games of the country by, as one might say, advertising a free show and then charging the visitors to get out.

Every member who has joined the order has done so under certain conditions: she has fulfilled all the obligations incumbent upon her, has directly and indirectly contributed to its present success and high standing, and now to say that this faithful supporter who stayed by the order in its weakness should be denied the benefits for which she has paid is little short of highway robbery. There can be no warrant in fact for it and no serious attempt is made to show one. We are not in financial distress, our dues are no higher than they have been, the order has grown to its present strength and is still growing on the lines of its inception; why then should we seek to wipe off the rolls without recompense or apology many of the women who have been instrumental in building up this institution? Many of them are too old to join other insurance orders which they have every reason to believe will respect their contracts and yet by reason of that same age and its attendant general disabilities are unable to pay more than they have heretofore done.

Such legislation would be contrary to

all justice, decency and fraternal spirit and a blow at the integrity of the order from which it would never recover. If anything so radical should be carried out at this time, there will be no security for the future and the very ones who would advocate the change, might and probably will, find themselves at some future time in a class whose rights also are subject to confiscation.

The next proposition we hear will be probably the dropping of members whose husbands have left the road or at least making their dues prohibitive.

Why not? This idea of repudiation of honest contracts can work in more ways than one, and I think we would do well to leave all such tainted methods of "frenzied finance" to the Standard Oil-Lawson pirates.

If new rules are considered to be essential to the welfare of the order, let them apply to the future. Retroactive legislation will repel old friends and supporters and not attract any new ones who possess sense enough to learn an object lesson. There is a law among one of the Eskimo tribes of northern Siberia which requires the execution of people too old to work. Are we edging to steal a little Eskimo thunder? Very truly yours,

ANNABELLE BARBER, Div. 34.

Something to Think Of.

When H. L. Peters, of Oakland, Cal., engineer on the Shasta Express, met his death by an open switch, in all his engine books was found written these words:

To one whose beauty through each changing year is yet unchanged, and through whose eyes I have seen the light and the right; my light when all was darkness and uncertainty, and whose companionship shines with a gentle lustre for all that is good and bright, that shines ever for me in the paths of truth and happiness—my guiding star, my wife.

If every wife could mean this to the husband, how few regrets there would be and how much remorse would be spared if the dear one should be suddenly called away as Brother Peters was.

Of Interest to the Study Clubs.

The following report of the Fort Wayne Study Club will be of interest to all club members. This club was organized in December, 1903, and had for year ending May, 1904, 29 members, all Auxiliary ladies. Although they have a public library, it has been at times difficult to secure references for certain studies. The members of Friendship Study Club manifest a most praiseworthy energy in their work. We regret that they are not affiliated with the City and State Federations. This, however, will follow in good time. Mrs. Rhoda Yates is the Director and Mrs. Helen Carter the Secretary of this bright club.

Another report comes from the Study Club of Toledo. This club was organized in 1898. For the year ending May, 1904, it numbered 23 Auxiliary members and 14 others, making a total of 37. This club is a member of the City and State Federations, and is very active in philanthropic work, the vacation schools receiving a generous contribution from it. The Director, Mrs. Carrie Marsh and the Secretary, Mrs. Jane Utley, have done good work, and interest has not flagged during the year.

There are many clubs to hear from. Blank reports are ready for those desiring them. Send at once, as it will soon be time for the reports of 1905.

C. E. CUNNINGHAM, Chr. P. C.,
904 Wheeling St., East Toledo, O.

TOLEDO STUDY CLUB.

The G. I. A. Study Club of Toledo is made up of members from Divs. 57 and 294, with some ladies who are not members of the order.

Hoping some of our sister Divisions may realize how desirable a Study Club is when they hear what good times we of Toledo have, I am going to write of our meeting held on March 17.

We met with Sister Roney, President of Div. 294. The house was very prettily decorated in green and white, a beautiful Irish flag being displayed in the parlor. The meeting opened with the singing of "America" by the club. This was followed by a piano selection. After the reading of the minutes we had a vocal selection, "The Harp that Once Through Tara's Halls."

The roll-call was responded to with quotations from Irish poets, interspersed with piano selections and recitations. We had character sketches of Robert Emmet by Mrs. Bartlett, Daniel O'Connell by Mrs. Curtice, and St. Patrick by Sister Cunningham.

We were then favored with a very pleasing address on St. Patrick by the Rev. Father O'Brien, after which we all joined in singing "Come Back to Erin" and "The Wearing of the Green."

Sister Roney served dainty refreshments, in which the color scheme was still carried out. Souvenirs were small American flags tied with knots of green ribbon.

This was one of the pleasantest of many pleasant meetings held by our Study Club, and if only members of the G. I. A. would once become interested and organize Study Clubs, we think they would not wish to drop them.

Yours fraternally, C. B. J.

Union Meetings.

AT COLUMBUS, O.

The union meeting given under the auspices of Div. 52 at Columbus, O., on March 14, was a grand success.

The Grand Officers present were: Mesdames Murdock, Grand President, Cassell, Grand Vice-President, St. Clair, Grand Secretary, and Wilson, President of V. R. A. Sister Robertson, Secretary of the V. R. A., was expected, but could not come and it was a great disappointment to us all.

There were representatives from the following

Divisions: 1, 11, 12, 14, 20, 27, 29, 41, 56, 60, 62, 66, 76, 116, 167, 178, 192, 142, 219, 270, 279, 278, 291, 294, 503, 326, 331 and 52, making 28 Divisions.

The meetings held during the day were presided over by Sister Cassell, President of 52. The meeting took on the nature of a school and the ritual work was exemplified in every form.

In the afternoon Div. 52 gave the installation form introducing the beautiful work as outlined in the drill book. The thirty Sisters taking part were all dressed alike in white costumes with ribbons the colors of our order depending from the shoulder. They made a beautiful appearance and were applauded to a finish. At the time of the initiation form Mrs. Fisher was made a member of Div. 52, thus giving an added interest to the work.

At the close of the ritual work Sister Cassell called for remarks from the visiting Grand Officers introducing each in turn.

The remarks of Sisters Murdock and St. Clair were on the general growth and work of the G. I. A., and it was a real pleasure to hear them.

Sister Wilson read a letter from Sister Robertson pertaining to the insurance and made a good talk on the same subject which was of benefit to all.

The Brotherhood men of the city, and especially Div. 34, joined with us to have a grand rally in the evening at City Hall.

We were proud indeed to have with us upon this occasion the Grand Chief, Brother Stone, and his charming wife. Sister Stone also attended our afternoon meeting. An invitation had been sent out to all the railroad fraternities of the city and every seat in the hall was taken. Our Brothers had decorated the hall in a beautiful way and acted as a reception committee.

The meeting was called to order by Brother Humphreys, C. E. of Div. 34, who acted as Chairman, in an able manner.

The addresses of welcome were made by Sister Cassell in behalf of Div. 52 and Mr. Geo. Marshall in behalf of the city. Hon. E. F. Taylor made a very able address and was followed by our Grand President, Mrs. W. A. Murdock, who gave an interesting account of the work of the G. I. A.

Judge Hunter, solicitor for the H. V. R. R., made some remarks, and Miss Cora Humphreys gave a reading which was well received. The speeches were interspersed with singing by members of the Euterpean Ladies' Chorus, said chorus being the pride of Columbus.

One of the pleasing parts of the program was the fancy drill work given by twenty of the members of 52, led by Sister Cassell. It was a combination of the drills of Nos. 1 and 40 in the drill book, and was executed with great beauty and precision. Sister Wolf presided at the piano and the music was inspiring.

The crowning event of the evening was the introduction of Chief Stone, who made a splendid impression by his masterful address. Those of us who have been identified with the work so many years and who have mourned the loss of Brother Arthur so deeply, begin to feel that in Brother Stone we have found another "Elijah." His noble

words when referring to Brother Arthur touched our hearts and we know that the future is in good hands while a man of such splendid principles and Christian character is at the helm.

The entire fraternity of the city appreciated this chance of seeing and hearing Brother Stone, and we trust he will come again. We feel that this was a grand meeting in its entirety and wish to thank all who so kindly helped to make it a success. These meetings are beneficial and instructive and every one should attend them whenever the opportunity offers itself.

AT ERIE, PA.

On March 7, the Ladies' Auxiliary to the B. of R. T. held a union meeting, to which were invited the Ladies' Auxiliary to the O. R. C. and the G. I. A. to the B. of L. E. It was a grand affair. Every little detail was carried out to perfection, and a great deal of time, labor and money spent to make it a success. The hall looked like fairyland with its beautiful decorations. A nice program was rendered, consisting largely of talks for the good of the order by members of the various associations.

The ladies of the B. of R. T. Auxiliaries are holding these meetings in the different cities, which seems to be a step in the right direction. I think if many more would hold union meetings of the Auxiliaries it would bring about a more fraternal feeling among the families of the railroad people, and that a more harmonious condition would exist among them. Although being in different classes of railroad service, we should feel that our interests are identical, that our purposes are one. I hope the Sisters will think of this and lend a helping hand in this direction.

Yours in F., L. & P., CLIMAX.

Division News.

It is with no small amount of timidity that I beg to enter your sanctum and tell you and our sister Divisions something of the workings of Pansy Division, Cleburne, Tex. Our President has appointed me JOURNAL correspondent for the year, and I hope to be able to prove myself worthy of that office without tiring the Sisters or monopolizing too much space in the JOURNAL. Pansy Division is in a flourishing condition and being the largest Division in the Lone Star State, we feel somewhat "puffed up." Indeed we have some very good times, which do so much toward lightening the burdens that all of us have to bear more or less.

We commenced the year with installation of officers together with an experience social and invited the Brothers to participate with us in the fun. Each Sister had pledged herself to earn a dollar and to tell, in rhyme, the manner in which she earned it. The experiences of some were indeed funny, and Sisters Sheeler and Flood carried off the prizes for having had the funniest experiences and the best rhymes. Then followed refreshments and dancing, and it was impossible to

keep some of our staid Brothers quiet when the Virginia reel was announced.

Our latest social event was a private masquerade and surprise on Brother and Sister Moore. This, I think, proved to be the jolliest party we have ever had. It was a complete surprise and the costumes were so well designed that it took Sister Moore a good part of the evening to find out who her guests really were. It would take up a large amount of space to describe some of them, but I must tell you that only one Brother had courage enough to "fix up," and as a washerwoman, Brother Sheeler was immense. Here again Sister Sheeler won the prize, a turnip. And no wonder, for I heard that she actually tore up a comfort to make her costume. Our sedate Sister Febley, to the surprise of all, came dressed as Aunt Lucindy Rainwater, and so well did she represent that character that she, too, was awarded a turnip.

Now, Sisters, just a few more words before I close regarding the raffles which have become so numerous. Personally, I am not in favor of this plan of making money when taken outside of the city or town in which the Division is located. Do you think, when you stop to consider the money expended in getting it up, that it pays? I do not. Pansy Division had a raffle of that kind a few years ago and the money expended in preparing for it exceeded the returns by over one dollar. I have talked with other Sisters and never yet found one who favored this plan. I think if each Division would confine its money making schemes to its own town it would find itself better off financially. I hope that my lengthy paper will find favor with you.

CORRESPONDENT, Div. 194.

On March 24, a very pleasant time was spent at the home of Sister E. Wardle, on N. Second street, Missoula, Mont., the occasion being a social given by herself and Sister J. C. Anderson in honor of Sister F. J. Dormer, of Grand Rapids, Mich.

Sister Dormer and her son are on their way home from San Diego, Cal., where they spent the winter for the benefit of her health. Sister Dormer was a charter member of Div. 101, and is now a member of Div. 22.

Cards were the principal entertainment of the evening, after which a delicious luncheon was served. After lunch several musical selections were rendered by Professor Simpson, Miss Alice Brewer, Miss Janet Anderson, Mrs. Cuttler and others. The prizes were awarded as follows: Ladies, first prize, Mrs. Brewer; second, Miss Alice Brewer. Gentlemen's first prize, Mr. Sheedy; second, Mr. McDonald.

Those present were members and friends of Div. 101. MRS. J. C. ANDERSON.

AS THE members of Div. 53, Minneapolis, Minn., appreciate the services of their officers, especially the older ones who have filled offices for some years, therefore, in order to show their appreciation, they got up a surprise party on February 24 on their Secretary, Sister McLane, and presented

her with a leather upholstered rocking-chair, and in acknowledgment she made one of her quiet little speeches. It proved to be a genuine surprise, as the ladies called on her early in the day, bound to have a long day and a good time, but found her house in a very unsettled condition, not having her breakfast dishes washed or beds made up. She may now see the necessity and hereafter have her housework done up in proper season and always be prepared for such occasions. This perhaps would apply to a great many of our Sisters, therefore they better have their work done, as they never can tell what may occur. Refreshments were served by the ladies, and the company was entertained with vocal and instrumental music by Sisters McLane, Clark, Martin and Hanson, and a few fancy dances by some members of the Division.

For the good of our order throughout, I think if more of these little pleasure parties were adopted it would prove beneficial and dispel dissension, if any exists. I have learned from experience that petty jealousies arise in our order which ought not to occur, but peace and harmony prevail.

A MEMBER.

PINK CARNATION Div. 288, Sapulpa, I. T., wants to thank the Divisions through the JOURNAL that made donations to us for our bazar in December. We certainly appreciate their kindness. Our bazar was a success. MRS. WM. TULL, Sec.

"THERE was a sound of revelry by night," March 16, at Institute Hall, Fortieth street, Philadelphia, Pa. The cause could easily be solved by buying a ticket and entering, where you would have found the ladies of Div. 112, G. L. A., very busily engaged supplying the needs of the inner man with supper and the needs of the outer man by a dance in the upper hall.

It was a great success, both socially and financially, and the ladies deserve lots of credit for the way they worked; also some of their husbands for the help they gave and the many tickets they sold. They realized over all expenses \$160, which makes the ladies feel that their work was not in vain.

We were highly honored by the acceptance of our invitation to Deloss Everett, who, besides coming five hundred miles to lend his presence, gave several of his own compositions of music to be rendered at the dance.

Quite a number of neighboring Division workers were there, and on the whole we feel that the first attempt of Div. 112 to give a supper and dance was a splendid success. We extend our thanks to our many friends, one and all, for the kindly interest and help they gave us.

Most sincerely yours,

MRS. JOHN MATHER, Div. 112.

DIV. 222, of the B. of L. E. and Div. 108, of the G. L. A., Salt Lake City, Utah, gave their second annual ball on January 31, which was a grand success socially and financially. The hall was beautifully decorated and the committee received many words of praise.

The grand march began promptly at 9 o'clock, and was gracefully and artistically led by Brother and Sister Yeates. Over 100 couples made up of Brothers and Sisters and friends were in line with smiling faces and glad hearts, which always marks the characteristic of the engineers.

The Auxiliary is flourishing and is adding many new members to its list. We have three names to ballot on at the next meeting and several more in view.

On the afternoon of February 23 the ladies assembled and surprised our Past-President, Sister McQueeney, and presented her with a Past-President's pin, which was given with deep love and regards that marked the appreciation for Sister McQueeney's many sterling qualities as President of Div. 108, G. I. A., for the year that has passed. The Sisters all join in wishing her many happy days of health and happiness to wear the token in loving remembrance of us all. With good wishes to all, I am,

Yours fraternally,

MRS. M. T. KEARNS, Div. 108.

I TAKE pleasure in informing you and the Sisters of our order through our valuable JOURNAL of an entertainment and ball given by Vanderbilt Div., 264, G. I. A., New York City, assisted by Vanderbilt Div., 145, B. of L. E., held at Ebling's Casino, March 9th inst. The above was to honor our fourth anniversary of Div. 264. The entertainment consisted of high class local talent, the participants of which were friends and members of families of the Divisions.

At 11 P. M. the grand march was started by Floor Manager Brother P. O'Donnell, of 145, and Sister President J. T. Wheeler, of 264, followed by 300 couples under the strains of Prof. Pierce's orchestra, after which dancing was resumed until 4 A. M., when it was decided by all that a royal good time was enjoyed. One of the pleasing features of the occasion was the presence of Sister F. Cook, First Assistant Grand Vice-President.

MRS. WM. DAVIS, V. P.

TUESDAY, March 14, at a call meeting of Texas Pride Div., 196, Longview, Tex., to take the place of the last regular meeting, a delightful lunch was served in honor of the departure of one of the Sisters, Mrs. Mary Sweeney, who leaves us soon for her new home in Laredo, Tex.

The President, Mrs. Hansen, in behalf of the Division, presented Mrs. Sweeney with a beautiful hand-painted china cake plate. Mrs. Sweeney, in well-chosen words, thanked the Division for the beautiful token, and said the beautiful rose surrounded by leaves painted on the plate would always remind her of the President as the rose and the leaves as the Sisters of Texas Pride Div., 196.

We sincerely regret to lose Sister Sweeney. She has been a faithful member, a kind neighbor and a good citizen.

Another pleasant feature of this meeting was the presentation by the Division to our faithful Past-President, Mrs. Z. L. Jarrett, of a beautiful bouquet of white and pink carnations, the flowers of our order.

The lunch for this occasion consisted of turkey, cranberry sauce, celery, two kinds of salad, dressed eggs and pickles, dessert, chocolate, caramel and fruit cake, and coffee. Each guest was presented with a bouquet of violets and maiden-hair fern. Sec.

G. I. A. Voluntary Relief Association.

TOLEDO, O., May 1, 1905.

To Division Insurance Secretaries, V. R. A.:

You are hereby notified of the death of the following members, and for the payment of these claims you will collect 75 cents from each member carrying one certificate, and \$1.50 from each one carrying two; providing, however, that no one be assessed on a certificate, if the application for same was dated later than March 31, 1905.

ASSESSMENT No. 208.

Died March 5, 1905. Sister Emma Gano, aged 38, of Div. 84, Springfield, Mo. Cause of death, acute Bright's disease. Carried two certificates, dated December, 1901, and January, 1905, payable to F. E. Gano, husband.

ASSESSMENT No. 209.

Died March 19, 1905. Sister Adaline Wakely, aged 51, of Div. 26, Danville, Ill. Cause of death, heart lesion. Carried one certificate, dated September, 1890, payable to John Wakely, husband.

ASSESSMENT No. 210.

Died April 1, 1905. Sister A. J. Jones, aged 65, of Div. 41, Newark, O. Cause of death, pneumonia. Carried two certificates, dated August, 1895, payable to daughters.

ASSESSMENT No. 211.

Died March 21, 1905. Sister M. J. Flynn, aged 40, of Div. 60, Sayre, Pa. Cause of death, heart failure. Carried two certificates, dated April, 1901, and February, 1904, payable to M. J. Flynn, husband.

ASSESSMENT No. 212.

Died March 30, 1905. Sister Alice Martin, aged 42, of Div. 69, Ft. Madison, Ia. Cause of death, typhoid pneumonia. Carried one certificate, dated March, 1899, payable to M. M. Martin, husband.

ASSESSMENT No. 213.

Died April 3, 1905. Sister Ella Tremaine, aged 49, of Div. 23, Corning, N. Y. Cause of death, endocarditis. Carried one certificate, dated March, 1903, payable to L. E. Tremaine, husband.

ASSESSMENT No. 214.

Died April 7, 1905. Sister W. B. Curley, aged 43, of Div. 132, Louisville, Ky. Cause of death, cancer. Carried one certificate, dated November, 1892, payable to husband, W. B. Curley.

ASSESSMENT No. 215.

Died April 7, 1905. Sister W. S. Putnam, aged 30, of Div. 275, Bradford, Pa. Cause of death, tuberculosis. Carried one certificate, dated February, 1900, payable to W. S. Putnam, husband.

Members will pay their Insurance Secretaries on or before May 31, or be marked delinquent; and in order to reinstate must pay a fine of 10 cents on each certificate besides the delinquency. Insurance Secretaries must remit to General Secretary and Treasurer not later than June 10, or stand delinquent till remittance is made.

Assessments Nos. 211, 212, 213, 214 and 215 will be paid from the Assessment Fund.

Members in good standing March 31, 1905, forty-nine hundred and forty-one in the first class; two thousand and fifty in the second class.

Every Insurance Secretary should have a death proof blank constantly at hand. Apply to General Secretary.

MRS. GEO. WILSON, Pres. V. R. A.

M. L. ROBERTSON, Gen'l Sec'y and Treas.

venient location inside the cab, there is a vent hole, with an alarm whistle, through which a portion of the air may escape and notify the engineer that the automatic attachment has operated, or that the main reservoir pressure has been depleted to an objectionable amount.

The three-way cock in the heating system is located in the exhaust pipe of the air pump, having levers connected to an operating rod which leads back into the cab, with a handle attached to the inside end inside the cab for operating.

When the operating rod is in the extreme forward position, at an angle of 45 degrees, the exhaust from the air pump is discharged through the three-way cock to the front end or stack. When the handle of the operating rod is in the extreme backward position, at an angle of 45 degrees, the exhaust from the pump is discharged through the three-way cock and the connecting pipe into the reservoir of the heating system.

With the heating system in use, the pressure in the system is the actual amount of back pressure in the pump.

Supposing, for the purpose of illustration, that the engine considered is hauling a high-speed passenger train with a brake pipe pressure of 110 pounds, that the main reservoir pressure is 130 pounds, and the pressure necessary to heat the train is 40 pounds, this latter pressure depending on the locality and length of train. This would mean that, for the pump to operate, it must overcome the back pressure in the heating system of 40 pounds plus the main reservoir pressure, which in this case is 130 pounds, or a total back pressure of 170 pounds.

With these conditions existing, and

CONTROLLING VALVE AND CONNECTION.

with a boiler pressure of 200 pounds, there would be a margin of 30 pounds of the steam pressure over the air plus the back steam pressure of the heating system. Due allowance must also be made for the fact that 200 pounds of steam pressure will not compress 200 pounds of air pressure, owing to the friction of the operating parts of the pump.

The automatic feature is adjusted so that if, from any cause, the main reservoir pressure should fall to an objectionable amount, the exhaust from the pump would be turned into the front end, thus doing away with the back pressure on the pump from the heating system. With the older form of heating system it is necessary for the engineer to watch the steam gauge and change the exhaust of the steam by hand when the steam pressure reaches some predetermined amount. This is an added care which is done away with by the addition of the automatic feature now used.

If the main reservoir pressure is 130 pounds and that in the train pipe 110 pounds, the controlling valve is adjusted for 115 pounds. While the main reservoir pressure in the diaphragm chamber of the controller valve is maintained in excess of 115 pounds the tension of the coil spring is overcome, the diaphragm held in its uppermost position and the pin valve held to its seat. The main reservoir pressure, therefore, in the chamber of the controlling valve will be maintained and the controlling valve remain inoperative.

If the pressure in the main reservoir falls below 115 pounds, the diaphragm will be forced down and the small valve unseated. Main reservoir pressure will then pass through the pipe to the rear of the operating cylinder and move the piston to the forward position. The forward movement of the piston causes the three-way cock to be turned so that the exhaust steam from the pump can pass direct to the stack. The air which passes the controlling valve and flows to the operating cylinder is also free to pass into the pipe connected with the alarm whistle, thus causing a blast of the whistle, which noti-

fies the engineer that the air pressure is falling, also the steam pressure.

When the air pressure has again been raised sufficiently the diaphragm in the controlling valve is raised, causing the small valve to seat and the supply of air to the operating cylinder to be shut off; any air left in the operating cylinder escapes through the whistle. When the steam pressure has eventually reached the desired amount, the engineer pulls operating rod back and the heating system is again in service.

As soon as the pump exhaust has been diverted to the heating system, the pressure regulator, or reducing valve, will automatically close and shut off the direct supply of steam from the boiler.

When the air brakes are released on a long passenger train after a full application has been made, all of the air necessary to recharge the auxiliary reservoirs on the locomotive and cars is drawn directly from the main reservoir on the locomotive, and it might occur on a locomotive having a small main reservoir capacity that the main reservoir pressure would be momentarily drawn to a pressure of 115 pounds, or that to which the controlling valve had been adjusted to operate the automatic attachment.

Although the air pump would restart and almost immediately recharge the main reservoir to its maximum pressure, it would not be desirable that the automatic attachment should operate under this condition.

A small auxiliary reservoir, having a restricted opening, connected to the main reservoir pressure, is therefore used. If, under the condition named, the main reservoir pressure should be reduced to a pressure of 115 pounds, that at which the controlling valve has been adjusted to operate the automatic attachment, from thirty to forty seconds, according to the size of the restricted opening, would be required for the pressure in the auxiliary reservoir to decrease to 115 pounds, or to the pressure at which the controlling valve has been adjusted.

Before this low pressure would be obtained in the auxiliary reservoir and the

automatic attachment would have operated, the pressure in both the main reservoir and the auxiliary reservoir would be increased to a pressure in excess of 75 pounds, or that at which the controlling valve has been adjusted.

The restricted opening cannot interfere with the operation of the automatic attachment, as in case the main reservoir pressure should fall slowly on account of the air pump stopping, the restricted opening will allow the pressure in the auxiliary reservoir to fall equally with the decrease in the main reservoir pressure, and the automatic attachment will operate at the pressure of 75 pounds, that for which the controlling valve is adjusted.

On all locomotives having main reservoirs of small or limited capacity, the auxiliary reservoir in the pipe connecting it to the main reservoir should be used; but on locomotives having main reservoirs of large capacity the auxiliary reservoir and the restricted opening are not necessary, the opening between the auxiliary and the main reservoir being left the full size of the pipe connection.

In case of leaks or other defects in the pipe connections, the cut-out cock can be closed and automatic attachment be made inoperative.

If the heating system is in use for heating a long train, while the auxiliary reservoirs on the cars (which contain no air) are being charged the cut-out cock should be closed, as the main reservoir will be drawn down below a pressure of 115 pounds or the pressure for which the controlling valve is adjusted.

As soon as the proper main reservoir pressure has been obtained the cut-out cock should be opened, and the automatic attachment will be operative.

QUESTIONS AND ANSWERS.

Q.—G. D. F.—Why is it that there are so many driver brakes placed on the back of the drivers? They used to put them all on the front; now there seem to be about as many of one kind as the other.

A.—The location of the driver brake shoes depends, to a large extent, on the design of the engine.

It is desirable, from several standpoints, to put them at the rear of the drivers, but it is often found inadvisable to do this owing to some peculiarity as to engine construction. Where placed back of the drivers it is customary to put the cylinders between the frames just back of the cylinders. Sometimes this space is so small that they cannot be put here without interfering with the link motion, or it may be that they would have to be placed so near the cylinders to get them in that the matter of maintenance would be seriously interfered with.

So placed there is much less strain on the frames of the engine since, placed at the rear, there is a twisting action, due to the power of the cylinder being transmitted through a crank shaft, and the frames are not always designed to take care of this undesirable force which is gotten rid of where the cylinders are placed back of the cylinders.

With the shoes placed back of the drivers there is a great saving of wear and tear on the spring rigging since, so placed, the tendency is to lift the frames rather than to pull down on them when the engine is running ahead; this condition is the one to consider on road engines. In switching engines, where the movements are made in one direction as much as another, it does not make so much difference.

The tendency for the shoe to rise instead of lower produces better piston travel effects as a slight rise will not affect the travel as does a slight lowering of the shoes.

The heavier the engine the greater the effort made to locate the brake cylinders back of the main cylinders, since by so doing a corresponding strain is removed from the frames due to the lack of twisting effect produced, as already described.

Q.—S. B.—We have some new engines on our road that have two pumps on and only one lubricator for them. I haven't heard much groaning from them but am always expecting it, for I don't see how an equal amount of oil will get to each cylinder. Is it the common practice to only use one lubricator where two pumps

are used, and do you consider it good practice?

A.—The general practice is as you describe, that is, to use but one lubricator for the two pumps even when they are on opposite sides of the engine. One or two roads are using a four-feed lubricator on the engine, two feeds being connected to the pumps, one to each. This is, no doubt, the surest way, but as long as good results are obtained by the use of one we should not decide against this as being poor practice until it has been given a good trial. It is certainly the cheapest from the standpoint of original expense, though the wear of the pumps may prove, in the long run, to more than offset the original saving. This is one of the things that will have to be proven out in practice.

Where one lubricator is used it is very essential that extra care be given to the piping, that there may be no sags, and that the connections be so run that the chances for an equal amount of oil reaching each pump will be the same.

Q.—W. K. P.—Some of us got to talking about air brakes the other day and one of us said that some day we would probably have brakes operated by electricity instead of air. Can you tell me whether any electric brakes have ever been tried for controlling freight trains? They seem to have used it for most everything and I would like to know what has been done in this line.

A.—There are electrically operated brakes for electric cars, and electro-pneumatic brakes for elevated road service, that is, the compressed air is controlled by electricity, but the power that actually brings the shoes against the wheels is still compressed air.

We are not aware of any electric brakes being used in freight service.

Back in the days of the Burlington Brake Tests there was a brake known as the Carpenter Brake. This was also a brake in which the compressed air was controlled by electricity. This brake was given a trial at the tests referred to, but unfortunately, or otherwise, one of the wires became disconnected in one of the tests, and when it was desired to

apply the brakes they failed to operate. This failure was accepted as a practical demonstration as to the undesirability of electricity for use in this connection.

Electricity may be said to have been in its infancy at this time and it may be that some means will be devised in the future so that an electric or an electro-pneumatic brake may be used.

Q.—D. K.—I ran an engine the other day and the pump stopped and wouldn't go to work again. I had to take it apart and helped to look it over but could not find anything the matter with it. It was oiled up and put together and seemed to work all right for a while, but finally stopped again. I didn't have time to see what was the matter and want to know if you could suggest something that was wrong and that I could not see.

A.—It may have been the rings in the small main valve piston were loose and that the steam was getting by faster than it could escape through the small escape port that leads to the exhaust port. If the rings were in this condition the pressure would be the same on either side of the piston, instead of its being atmospheric or exhaust steam pressure on one side, as it should be the case. If this were so the pressure on each side of both would become balanced and the pump would refuse to reverse. This defect could exist and not be noticeable to the eye when inspected, as you say was done. To detect this defect it would be necessary for the one making the examination to be aware of the possibility of such a condition and make a special examination to note the condition of the rings.

The small escape port being stopped up or partially so, could produce the same effect.

With this condition existing tapping the pump gently will sometimes cause it to start.

Engine Failures.

J. W. READING, DIV. 286.

GRAND RAPIDS, MICH.

The model engineer confers with his fireman as to best methods of firing to ge

the most satisfactory results, particularly when from atmospheric and other causes engine fails to steam properly.

As heretofore mentioned our progressive engineer wants fire and water closely watched, he wants both in condition to leave a station on short notice should occasion demand it. When leaving a station if there is plenty of water in the boiler and a bright level fire has been maintained the work of the fireman is lighter, and the risk of damage to the boiler less than when the two factors named have been more or less neglected. Our competent engineer has made a thorough study of the matter of cause and effect in all things that pertain to his calling, and the manner of caring for the water and fires around stations is a matter of such importance that he gives the subject his constant attention; he knows that it is a difficult matter to build up a fire, fill a boiler, and get a train under motion all at the same time.

Building up a fire at the time engine is laboring hard to get train under motion necessarily causes frequent fires, the firebox door is open fully as much of the time as it is closed, the fresh coal loaded on the light fire acts for a time like a wet blanket, or a bank, and the results are a rapid falling of firebox temperature and does this just at a time when the greatest intelligent effort should be used to keep the firebox heat, if anything, a little above the normal; with an almost continual inrush of cold air through the fire hole we have the cause that produces the effect of leaky tubes and consequently one of the most common causes for engine failures.

Our progressive engineer never forgets that the company for whom he works has interests that he is bound to respect, and in consequence is continually weighing in his mind the numerous problems which produce the causes for the many mishaps which delay traffic and bring about financial loss; he is anxious to make an economical showing in the amount of supplies used, and tries to handle the engine and train at all times in such a manner that any damage to the engine, cars, or freight in transit will be avoided; he is possessed

of too much good hard sense to take a so called "run and jump" at the cars if couplings will not make after one or two efforts; if the track is bad and he finds it hard to hold engine to rail, he works less throttle and increases the stroke and tries to coax engine and train over the difficult places by using careful judgment and resorting to such means as practice and skill have proven best methods in overcoming this, one of the very numerous causes for damage to the motive power as well as the delay of traffic; he could not be induced for one minute to allow his temper to get the advantage of his better judgment to such an extent that throttle would be jerked wide open and driving wheels be allowed to slip needlessly; he has figured out the effect of such senseless procedure; he has made quiet investigation where side rods and pins have been torn off and seriously believes that the lack of common sense displayed in the handling of the throttle and lever has been the cause of many engine failures, and a monetary damage to the various railway corporations which if accurately known would be something astounding.

Our progressive engineer is not only considerate of the company's property, but will always be found considerate of the feelings of his associates; it would be hard to make him believe, that for some real or fancied grievance given on the part of the trainmen, he could get even by trying to start the caboose first, or by slamming on the brake full emergency; his "bump" of common sense comes into play here just as it does in the matter of being careful at all times and under all conditions of service in the manner that his couplings are made, and in the way he handles his engine when "patience does not cease to be a virtue," even in the matter of slippery rails.

It is the custom of our practical engineer, when being held at meeting points, or when delays occur from other causes, to be spending the spare moments taking into consideration the general condition of his locomotive, he notes the condition of bearing surfaces, looks for loose nuts, set-screws and various other defects; if he

has a cylinder, or valve blow, he makes at these times an effort to locate the same; he also looks for that disagreeable thump, or pound that may be annoying him, and he makes a record on a leaf of his "scratch" tablet of work that may be needed; he has found that these side track investigations save time when he has finished his run and wants to get home; the little notes made of repairs needed are quickly transferred to the work order book and by retaining the original slip he finds it of value as heretofore mentioned; he watches such of his oil cups as may have feeders which are to be open when in service only and lubricator is not allowed to feed while engine is idle, even if only for a very brief period.

Should this competent engineer be unfortunate enough to have a very poor steaming engine assigned to him all details for close firing and careful procedure will be given most extra consideration; when it becomes necessary to "trade steam for water" in order to get from one station to the next and in consequence water level is lower than it is good practice to allow it to go, and as soon as steam is shut off both injectors must be brought into play; he will be particular to note whether there is a good bright fire or not and will have the blower put into service and insist on the fire being kept in a good condition to keep up as high a firebox temperature as it is possible to maintain; he has learned that if steam runs up rapidly after throttle is closed and in consequence pops are lifted, it is not business with a poor steaming engine to shut off blower, drop dampers, or open firebox door because steam is wasting at the pop valve; he has learned that the water being forced into boiler from both sides has got to be brought up to the boiling point, and that while the gauge does not seem to be affected by it while drifting into the station the gauge will surely show it if the stay at stopping point is of necessity only a brief period; he wants this bright fire kept up even at the expense of a waste of steam through the pop valves; if the stop should be for water he will as heretofore mentioned, divert the steam through

the injector to the full tank of water instead of allowing it to be lost, particularly when a freezing temperature exists.

Our competent engineer, the one we have taken for a model worker, is quietly investigating causes for the many mishaps that are liable to occur at any time; when he notes the absence of a signal where a signal ought to be, he feels it to be his duty to consider the absence of the signal a factor of danger and acts accordingly; he makes it his business to report to the proper authority anything that menaces life and property, and feels at all times that it is a part of the business for which he is paid.

After our practical engineer has made the trip and takes his engine to the roundhouse he will, as far as conditions will permit, look his engine over carefully, the amount of time he consumes will depend largely on how much time was spent on side track investigations and how close the last inspection might have been to the home terminal; he wants, in every case, to feel satisfied that when he leaves the engine he is acquainted with any fact in the way of a defect which may be an element of danger; it is not in the nature of this engineer to guess at random as to conditions; his "bump of caution" helps to protect his interest, possibly on his next trip he may save himself no small amount of trouble and inconvenience by knowing that work needed has been reported, and knowing when he starts for his next journey that the work needed has been attended to: if his engine for the trip is in a "pool" it is as much satisfaction to him to know that he leaves things right for the next man as if he intended to make his next trip on the same engine, it is his nature, he is broad enough to "want to do by others as he would like to be done by."

Our competent engineer makes it an important part of his duties to leave his engine with a full boiler of water and also wants the amount of fire left in firebox enough to properly cover grates, yet not so much as might cause pops to lift before fires were cleaned; he has made it a point in times past to note methods in vogue on the clinker pit, he has seen on various oc-

casions the blower and injector doing service at a time when drop grate was down and what little heat there might be remaining behind the flue sheet was rapidly disappearing through the hole caused by the displacement of this grate; he has figured that if he leaves his engine on the coal dock track with a full boiler of water it will not be probable that hostler will work the "sewer" which should be locked when closed, if no other course could be relied upon to prevent its being worked during the cleaning of the grates.

This series of papers entitled Engine Failures ends here; it is possible that I might have given the articles a name that would have been more appropriate; however, the primary idea was to outline the duties of the engineer who wants to make a success of his calling. The old proverb "that a stitch in time saves nine" or "an ounce of prevention is worth a pound of cure" applies strongly here, and the idea that I have endeavored to outline was that by studied effort engineers can prevent accidents and incidentally save themselves disagreeable labor; if a lack of knowledge, or an indifference to a duty which engineers obligate themselves to perform, ended with nothing more than the disagreeable duties of disconnecting or remedying breakdowns they could possibly live through it, but what about the interests of the company for whom they work? and how about their reputation as engineers? Is it not worth their while to be known as masters of their profession? Why not be leaders instead of tagging along behind? And last, but not least, how about losing their positions? It has come about that the engineer out of employment who has not the stamp of intelligence printed indelibly upon his brow, seeks in vain for a situation, and not only himself but the loved ones at home must suffer. I take no stock in predestination, we are what we make of our opportunities; the man that is contented with doing nothing further than to spend his leisure moments discussing the latest baseball game, dog fight, the remarkable flavor of a certain kind of tobacco or cigar, or telling of a remarkable run he made on

a certain occasion, how many "bulls" he had slaughtered once upon a time, and has so much to tell and discuss on lines named that he cannot spare time to attend the Division meetings, "builds his house upon the sands." You cannot tell me that this man is not working out his own destiny; if he is a man that cannot pass a saloon without going inside, if he makes a swill-tub of his anatomy and violates the law of a "simple life" and takes a short cut across from the "path of life" to where the shadows darken, he is working out his own destiny and the shortened life is not something which was foreordained by a living God.

The engineer who makes of his calling a burden, who sees nothing but the wrong, or imposition as he may term it, who fancies perhaps that the whole world has conspired against him, who commences to damn things as soon as he appears upon the scene of his labors, and continues to damn everything, including his train crew, the engine, the officers, and almost everything, animate and inanimate, while making the round trip, is working out his own destiny, and it is but charitable to say of such a man that he is not well, his digestion has gone "hay wire" as it were.

The man who accepts the position of a locomotive engineer on our American railways accepts the responsibilities of the situation, and should be man enough to do his level best to perform the duties that are necessary for good service; the burdens never become lighter by worrying over them. Man is prone at times to have a distorted imagination, and at these times he will be "bidding the devil good morning long before he meets him." Should the expected or the unexpected occur, meet it with every good grace at your command; be brave. If it is not possible to speak kindly to those associated with you, say nothing. "Silence is golden" and no better time could be picked to demonstrate the truth of this old adage.

I expect that the articles written will provoke criticism; to be honest, I hope numerous adversaries may appear upon the field. The discussion of the subject matter should certainly be of interest to

the engineer who reads, who thinks, who wants to progress; there is considerable "dry rot" in this Dear Old Organization of ours. We should come out of our lethargy and recognize at the earliest possible moment that there is not one single member of the B. of L. E. but has some duty, some obligation to perform, and should every Brother live up to his obligations our order would be improved, and the world would be far better because our Brothers have lived.

Electricity—Dynamos—Their Care.

BY EDWARD A. GRISSINGER, E. E.

Through an error in the last paper, Figs. 3 and 4 changed places. To make the correction and facilitate the reading

FIG. 1.

of this article, what should have been Fig. 4 is here reproduced as Fig. 1, which is a diagrammatic representation of the field coils, armature and circuits of a compound-wound dynamo. This form

of dynamo will give automatic regulation of voltage. In the figure, N and S are the two field poles upon which are wound the series and shunt coils; B, known as the field coils; A, the brushes for collecting the current from the commutator; D, the armature, and E, a rheostat placed in series with the shunt coils, by means of which the magnetization of the field with the shunt coils can be given a certain value. A series circuit is shown in heavy lines, and a multiple circuit in dotted lines. In the series circuit, such as street lights, any irregularity in one lamp would be evidenced in the others on the same line. In the multiple-circuit system, each lamp is an independent element, yet each lamp is virtually in series with the armature and the series field coils. The readers of this paper will find, however, that in practice multiple circuits are run from compound-wound dynamos.

The compound-wound dynamo is virtually a combination of the series and shunt forms. Part of the main current passes through the shunt coils and rheostat, while all of the current generated passes through the series coils. The operation combines the features of the two machines mentioned. The shunt coils are made up of a large number of turns of fine wire, and the number of amperes flowing is almost constant after the machine has once acquired full voltage. The series coils have but a few turns of wire, which latter must be of sufficient size to carry the full current that the machine will generate at any time. To explain briefly the action of the compound dynamo, it might be well to recall a part of the previous paper, where we note that, with a multiple external circuit, the addition of a lamp across the mains will reduce the external resistance. Since a current divides proportionately to the resistance through paths provided, more current will flow through the circuit whose resistance has been decreased. This would take current from the shunt coils, whose resistance remains constant. But the lamp which has been added is in series with the armature and the series field coils. The current from the lamp

will, therefore, pass through the series field coils aside of the shunt. What was diverted from the shunt coils has been added to the series coils. Loss of current from the shunt coils would cause a drop in voltage at the terminals of the dynamo. Inasmuch as the series coils have had an increased flow of current, they have strengthened the field by just that much, and instead of the voltage falling it remains constant. As a matter of fact, all compound-wound dynamos are made to over-compound; that is, if the voltage at no load is say 500 when running at full load, the voltage would be over-compounded to 550. This is brought about by the series coils alone. Over-compounding is desirable for the reason that the resistance, or losses, in the external circuits increases, and an increase in voltage or line pressure is necessary in order to compensate for such loss and give normal voltage at the points where the current is in use. The percentage of compounding of such a dynamo considers the internal losses in the machine itself. As in the case of the line losses increasing with increased load, so in the armature and coils. These losses vary throughout the range of load, and in first-class machines follow well-defined curves. The rotation of an armature carrying a current tends to demagnetize the field—is a magnet itself, and produces a cross-magnetizing effect. The series winding must assist to overcome such action. There are several other similar actions, which are more or less technical, and can be omitted. In the design of a dynamo, however, all such points are of importance, especially so when close regulation is a necessity.

The street railway motors of this country are operated by a direct current of approximately 550 volts pressure. Such a current, with a few exceptions, is furnished by compound-wound dynamos, either belt-driven or directly connected to an engine. In setting up a dynamo, care should be exercised in selecting a dry place. The machine should be given a good length of belt, to insure smooth running, unless it is a direct-connected

type. Belt-driven dynamos are always provided with an adjustable base, whereby the belt tension can be altered from time to time. A belt always runs better and gives less trouble if there be a heavy sag in it. The under side of the belt should be the taut side. Sometimes this cannot be arranged. A dynamo should run without any vibration, as there are no reciprocating parts. If it is a machine of small capacity, it can be fastened to the floor, but large machines require a good foundation. The frame of the machine should be insulated from the foundation. This is important in all cases. Many readers are, no doubt, familiar with the fact that a spark can often be drawn from a belt running at a high speed. Sometimes on large belts carrying great power the sparks are to be seen passing from belt to pulley, and vice versa. This is static electricity—scarcely any current, but a high voltage. If allowed to exist, and no precautions are taken for prevention, the insulation of an armature or a field coil is almost sure to be damaged sooner or later and serious results follow. "An ounce of prevention is worth a pound of cure" is an old saying. There is no place where this is more appreciable than in the dynamo room. Static electricity can be kept away from the dynamo in a very simple manner. Place any bare electrical conductor at right angles and close to the belt. Connect it to a gas or water pipe, or anything else that leads to the ground. The static charge will gather on the conductor and be carried to the ground.

It is equally important to keep the machine clean in all respects,—also dry. Moisture will do no harm; at the same time, a wet dynamo is to be avoided. Oil about a dynamo has only one place—in the bearings; and since such are self-oiling on all modern machines, there is no reason why oil should be seen around a dynamo. If a bearing throws oil it must be remedied, because oil will deteriorate insulation on an armature or a field coil. In self-oiling machines, the oil chambers should be kept well filled and the oil changed entirely about once a

month—new oil put in, and the original oil removed and filtered for use again.

The commutator of a direct-current dynamo is usually "the bone of contention." The best commutators are made of forged copper, the insulating material used between the segments being white mica, carefully selected, so as to give the same hardness as the commutator segments between which it is placed, thereby insuring uniform wear on the surface. Carbon brushes are used exclusively on the best make of machines nowadays. The carbon should be reasonably hard and close-grained and free from impurities. After a machine is in operation a short time using carbon brushes, the commutator should wear to a deep brown gloss, and run with very little noise. If lubricant of any kind is used on commutator, it should be in very small quantities and not often applied. If the brushes are properly fitted and the commutator begins to wear as it should, lubrication other than what the carbon affords is seldom necessary. Of course, with dynamos whose commutators have an abnormal peripheral speed, conditions will change. With such machines, sparking is very liable to occur.

Sparking at the brushes of a dynamo is always injurious. It may be due to a number of causes. An examination may show that the brushes do not make a good contact on the surface of the commutator. They may not move easily and quickly in the carbon holder. The pressure of the carbon on the commutator should be just enough to insure that it will always be in contact as the commutator passes beneath it. The carbon must move freely up and down in the holder provided for it, so as to accommodate itself readily and rapidly to any inequalities of the commutator's surface. It is a rare thing to find a commutator so true that there will be no up and down movement of the carbon. It is readily seen that if there were a portion of the commutator a little higher than another part, when the carbon left it for a lower portion, if it did not do so regularly and remain in contact the commutation would be momentarily in-

terrupted at that brush and a spark would result. Another frequent source of trouble comes from a dirty commutator—one upon which there has been placed too much of some form of lubricant, which has become sticky, collected dust, and caused the commutator to be covered with minute non-conducting particles. The remedy is to clean the commutator, which can be done by sandpaper in the hand, or placing some of the same upon a small block of wood which has been cut to conform to the contour of the commutator. If a dynamo has been started properly when new and the brushes never allowed to show sparking, the chances are no trouble will ever be experienced with that commutator. On the other hand, if sparking has ensued every day or so, it will soon be found that the commutator segments are slightly worn away in spots, making the surface irregular; sandpapering, adjustment of the brushes, lubrication, etc., no longer avail toward keeping the machine in good operation. What must be done is to remove the armature, if it is a small machine, place in a lathe and turn off enough of the commutator to make it smooth. After using a sharp tool for this work and removing the necessary cut, apply sandpaper freely, so as to acquire the smoothest possible surface. In placing such armature in a lathe care must be exercised to the end that the same is well centered, else the commutator will be out of true with the shaft when finished. In the case of larger machines the turning can be effected without removing the armature. In this case the brushes are lifted and such removed as are in the way for work. A turning tool can be obtained from the manufacturer of the generator which is fastened to the frame of the machine. Then, by running the engine or other source of power at reduced speed, the commutator can be turned up as well as if done on a lathe.

Too much stress cannot be laid upon the care which the brushes and commutator of a direct-current dynamo should have. They must be kept clean, and the brushes given a perfect freedom of motion with light but firm pressure upon the commu-

tator. As long as the commutator runs smooth, quiet and with a good gloss, avoid lubricants of any kind. It is always of value to keep any machine clean in every respect, and this is particularly so of the dynamo. Great care should be exercised that the windings never become wet or receive mechanical injuries from external causes.

After a dynamo has once been in operation and doing regular service, accidents may happen unbeknown, and heavy flashing occur at the brushes, regularly or periodically. This flashing is a serious condition, and will often extend all the way round a commutator. It is possible that it may be due to an open circuit in the armature winding. If an open circuit is present the flash will appear green in color and seem as though it ran all the way round. An open circuit will be shown by the scarring of the commutator at two points diametrically opposite in some windings and 45° apart in others. The scarring has been caused by the sparks. If allowed to continue, the bars at which scarring has begun will wear down rapidly and the insulation between partially destroyed. The spots on the commutator locate the coil which is open. The temporary method of remedying the defect is to place a "jumper" around the bad coil. To do this connect the adjacent commutator segments which have been marked as above mentioned with solder. This will cut out the defective coil. As soon as a new coil can be placed on the armature it should be done. It is unnecessary to put more than one "jumper" on an armature showing but one open circuit.

Another cause of a steady flare is a weak magnetic field. This may come from a field coil having been grounded and some of its turn of wire short-circuited, thereby lessening the number of ampere turns of such field coil. To satisfy one's self regarding the field coils, it is necessary to revert to Ohm's law, shown in an early paper, and with the aid of the formula for resistance calculate the resistance of each field coil. To do this it is necessary to place a low reading ammeter in the shunt field circuit, measure the cur-

rent strength, and then with a voltmeter measure successively the voltage on the outside of each field coil. With the current flowing and the voltage, the resistance of the coil is calculated at once. If there is a material discrepancy in the resistance of one coil as compared with the others, showing a much lower reading, that coil is undoubtedly out of line, and should be marked, removed at the first opportunity and repaired. When machines are erected after having been dismantled, a field coil might be placed wrong, producing a north pole when it should have been a south, or vice versa. Many machines will evidence such an error by a failure to give full voltage, while others which have a wide margin in field magnetization will show full voltage, but the moment a load is placed on the machine heavy flashing will occur. Under such circumstances it will be found necessary to shut down and remedy the error before proceeding farther.

A troublesome occurrence in many railway stations is so-called "bucking" of a generator. This is virtually a short-circuiting of the armature. A heavy flash extends from one brush to another, a loud report, and, unless the protective device operates successfully, off goes a belt, the engine slows down, or something gives way. Such an occurrence is usually due to a heavy and sudden overload on the machine. It may also be due to the brushes not having the best position with reference to the field poles. Some machines will stand very hard usage without "bucking," while others will do it with the slightest provocation. "Bucking" is always severe. The commutator is blackened and carbon holders blistered with the flash. The remedy is, to be sure the brushes are properly set, and keep the circuit breaker (a protective device) clean, and in such condition that it will open up under such service as would make the machine buck.

The Model Engineer Not Possible in Pool.

McCOMB CITY, MISS., March 16, 1905.

EDITOR JOURNAL: In looking over the March number of the JOURNAL, I was

greatly impressed by the marked improvement both in the number and matter of the contributions to the Technical Department. I read with deep interest the contribution of Brother Reading, and while I must congratulate him on his exceedingly well-written article, I am compelled to rank myself with the critics, which he for good reason expects, to assail his position.

The model engineer he sketches for our pattern may belong to some other planet, but he certainly is nowhere to be found on earth, in the employ of any of our large roads that are cursed by the pool system in the year of our Lord, 1905.

In the good old days when Brother Reading and first went running, his model engineer could very well exist, for at that time the engineer owned his engine, or at least, thought he did, and he took a corresponding pride in keeping it up in the best possible shape. When he had sufficient rest he came down to the roundhouse and tinkered around his engine in his spare time, and in consequence he knew at all times the condition of his machine, so that engine failures were few and far between. But alas! things have changed, I fear, for the worse, for the various companies have impressed upon us the fact that they, and not we, own the engines, and as a result the pride we used to take in them is fast passing away, and now the most successful engineer is he who can fan a train over the road in the quickest time, and if anything goes wrong, contrives to throw the blame on the other fellow.

As a matter of fact, it is an impossibility for an engineer running in a pool to do half the things which Brother Reading makes his model engineer do before leaving time. In the name of common sense how is it possible for an engineer who is called on an average one hour before leaving time, to get out on time if he begins to try and do half the things Brother Reading makes his model engineer do. He has, if called during the night, to get up, dress, wait until something is cooked for him to eat (for I suppose a model engineer must eat the same

as the balance of us), all of this takes up the half of his available time, so that it is within thirty minutes of leaving time before he reaches his engine. By the time he gets a light and changes his clothes another ten minutes has elapsed and he now has twenty minutes to oil around, get on his train and pump up and test his air. But even if he had ample time to make the thorough examination suggested by Brother Reading, it would be practically impossible to do so at most places where I have been located, as the engine is generally turned out on a track where there is no pit, the ground being saturated with oil and the brake gearing so low that it would be foolish for a man to crawl under except in a case of emergency, and if he got hurt in so doing the claim agent would console him by telling him that he had no business under the engine, as there were men paid by the company for doing such work.

Of course, I concede and have always held, that the companies which employ us are entitled to receive our very best services, and any practical pointers which will help us to become better engineers will be thankfully received by the majority of the rank and file; but I cannot help expressing my conviction that it is detrimental to our interests when a Brother of Mr. Reading's ability sketches out a line of duty for us to pursue which is practically impossible and which is liable to cause some official who knows no better to discipline a Brother for failing to do that which Brother Reading makes his model engineer do with ease.

I will watch with interest the succeeding articles of Brother Reading's and if they are helpful and practical I will be glad to endorse them; but if, on the other hand, his model engineer continues to do impossible things, I will not fail to take issue with him.

Fraternally yours,
ALEX. M. STEWART, Div. 196.

The Engineer of the Future.

MISSOURI VALLEY, IA., April 2, 1905.

EDITOR JOURNAL: Of late years a great deal of discussion is heard among engi-

neers and firemen regarding their life and work and the hardships they have to endure from the time they are first hired as firemen. A few days ago a number of engineers and firemen were discussing the question—does it pay a young man to take a position of firing a locomotive and working for promotion to the position of engineer? One engineer in discussing the question said he would not advise a young man to seek employment as locomotive fireman; if he wanted to go into railroad service get into some other department, that firing the large engines now in use on most of the railroads was hard work, and when a fireman got promoted to the right hand side of the battleship he has a poor job and more responsibility.

Suppose a young man got a position as fireman. He is put on the extra board and only earns about enough to pay his board for the first six months; then perhaps he will get a few months' steady work; then back to the extra board again, owing to how business on the road fluctuates.

It will be two or three years before he gets a steady run. He will have five to ten years or more; then if he hasn't ring-bone or spavin, or other ailments, he is promoted and is put on the engineers' extra board, and hardly makes expenses, and if business on the road gets slack is set back firing until the next increase of business comes. After about fifteen years from the time he commenced firing he may get a steady run as engineer, and counting the time he has lost by being on the extra board as fireman and engineer, he is no better off financially than he was at the beginning. He has suffered all kinds of hardships in blizzards, snow-drifts and rain storms, and worked most of the time on night runs, and lived on food usually sold at the railroad lunch counters, called "boxing gloves," and stale coffee to wash them down. It is a wonder how men can live as men in engine and train service do and have reasonably good health.

After putting in the number of years as fireman and engineer the unexpected happens and then he loses his job. He is now

too old to get another, as he has got beyond the age limit. He has put in the best part of his days on a locomotive and nothing to show for it. If a man in any kind of business cannot accomplish anything or save any money in fifteen or twenty years, he has been a failure unless he has had sickness or some other misfortune.

A fireman in discussing the question said "he thought before he got a position as fireman that he would like to run a locomotive, as he thought engineers had a good position, but since he had seen by experience what engineers had to contend with and the amount of coal a fireman had to scoop before getting promoted and a chance of his being turned down on his final examination, he was thinking of looking up some other kind of employment while he was yet a young man."

As long as there are locomotives in use on the railroads there will be men to run them. Young men are not hired for firemen only; they are hired for the purpose of making them engineers, and the railroad companies should try to get good men and after they get them try to induce them to stay and not be too technical in the examinations for promotion. The position of an engineer is an important one, both to the company which employs him and the public, but a technical education does not always make a good engineer. An engineer should have at least a common school education and have a practical knowledge of combustion, boiler construction and valve motion, and how to block up breakdowns. He must also have a practical knowledge of the air brake, as it requires skill to handle long trains and do good braking.

There is no doubt but what it would be better for the profession if locomotive engineers had a college education, but there are very few young men who are well educated that are looking for ten or fifteen years of hard work as firemen to get to be engineers, and then perhaps lose their position by making some mistake in a short time after being promoted.

Mistakes are sometimes costly both to the company and men on the engine, but

I think railroad officials in disciplining men, should not take snap judgment; they should consider well before discharging men for unintentional mistakes. Men do not like to lose their positions after working for years to get them, and after they get their homes established and paid for.

Railroad officials should be broad-minded and just in dealing with the men. I think it would bring about good results if the Division officials and men would get together once a year and discuss questions that are of interest to all concerned.

Fraternally yours,
GEO. H. CONNER.

An Engineer's Kit.

PHILIPSBURG, PA., April 6, 1905.

EDITOR JOURNAL: While looking over the JOURNAL for this month I noticed an article written by Brother Reading, where-in he gives his opinion of what constitutes a practical, competent and successful engineer, in which he says a practical engineer always carries with him a satchel, inside of which he keeps an extra collar, shirt, handkerchief, soap, towel, brush, comb, memorandum book, tablet, time-book, and such tools as calipers, dividers, thread gauge, two or three files, and a coil of wire and nippers to cut the same with, two or three small monkey and alligator wrenches, and I presume he forgot to say anvil and a hydraulic jack. The value of such a grip, Brother Reading says, is without a known limit, and further says it does not take up much room. Most surely all those tools are not only a matter of convenience, but an absolute necessity to have on the engine; but why should the engineer buy them himself and lug them around from one engine to the other when they are used for the company's benefit? Why is it that the company's machinist, blacksmith, painters, carpenters and other employees do not lug their tools from shop to home?

It is often maintained that it is bad policy for a small railroad to build its own locomotives; nevertheless, it is doubtless true that locomotives can be built more cheaply in a small shop when aided by a

score of skilled mechanics than by a single individual out on the road while he is overloaded with a hundred other duties. Small shops are often accused of being slow and behind the times; so are some engineers who are always tinkering around the engine when trains are to be moved along under quick orders. If railroading were like it was years ago when every crew had their own engine, and when the telegraph offices were at each end of the road, and when trains lay for hours on siding waiting for some train, then the matter of not only a satchel filled with private tools would come handy, but we could have on the engine a bureau, bath-tub and a hammock, and they would not be so burdensome to the engineer as a satchel to lug around from engine to engine, with dinner pail, overclothes, lamps, oil cans, torches and other things that go to make up the engineer's and fireman's kit of today.

Fraternally yours,
T. S. KEATING, Div. 467.

We trust Brother Reading, who has had a long and varied experience in railroad service, will take no exceptions to Brother Keating's rather sarcastic allusion to his satchel suggestion, as Brother R. doubtless realizes that there are pooling conditions which are not calculated to make men feel pleasant, or give them opportunity to do all that he has prescribed for his Model Engineer. Hence he will naturally expect some of those in disagreeable pooling service to say things in a vigorous way. But we think the discussion may tend to better these conditions if the evils are pointed out, and reasons stated why better service cannot be given without change in the system. Sarcasm is never convincing; facts are. So we hope our correspondents will deal in facts, and be liberal enough to allow each to express his opinion that all may profit by the discussion.

EDITOR.

Help is Better Than Criticism.

CUMBERLAND, MD., April 3, 1905.

EDITOR JOURNAL: I see in our March JOURNAL an article about a breakdown by a man off some old trunk line in the East, written by a Brother coming home from Los Angeles,

I have been running on an eastern trunk line, namely, B. & O., for over thirty years, and I think if this company had an engineer that did not know what to do in a case like the one to which he refers, it would discharge him. If true, it says very little for the man who was running the engine and less for the company that has such men in its employ. It also speaks very little for the Brother on the bank. Why did he not get down, if he did have on his trotting harness, and just help enough to show the engineer his mistake?

Brother, if you cannot write anything for the JOURNAL without showing the mistakes of some poor weak Brother, if there be any, don't write.

Fraternally yours,

DAVID M. LINN, Div. 337.

Too Crusty to Take Advice When Given.

BROOKLYN, N. Y., April 7, 1905.

EDITOR JOURNAL: I do not wish to start a controversy through the JOURNAL, but would like to make a few concluding remarks regarding my article about breakdowns in the March number, thereby, perhaps, vindicating myself from the somewhat harsh criticism of my Brothers of Divisions 526 and 439. The Brother I wrote about simply made a mistake in stripping the disabled side, that's all. As it was not necessary, he put back the main and back side rod and made his running time to the end of his Division.

He did not touch his left main rod to take down the forward side rod, but it was not the mistake I wished to emphasize, as we have all made them, but it was the way he treated his fireman, who meekly tried to call his attention to the mistake, also to your humble servant, who has been compelled to take down more than one of the same kind, and who politely attempted to "butt in," introducing myself by my traveling card, although I could not do much manual labor as I had my "glad rags" on, but simply tried to suggest that he could use the main rod on both sides, when he gave me a M. Y. O. B. look, like a turkey looking into a bottle. Well, I may be thick about some

things, but it is not necessary to give me a kick to convince me that I am not wanted, so there was nothing else for me to do but to retire to my "high hoss" on the bank and watch proceedings; and mind you, what made it more interesting, we had had no breakfast yet and it was about 9 A. M., and the "grub town" about two hours away yet; so you can imagine how I felt to see him wasting so much precious time taking the main rod down, putting it up on the pilot beam and then take it off again and put it on.

I hardly think you can call me an upstart trying to down an old man, but am an old man willing to try and help any upstart, as I have run most thirty years. The passenger I was talking to was a relative traveling with me, and our talk was confidential after I had been rebuffed.

I could not help comparing the treatment of his fireman with my past, when I was firing. If we slipped an eccentric or broke down in any way, the engineer handed me the tools, here Con, take her down and fix her up to get in, and if I went wrong he would show me, but if right he said nothing, thereby teaching me in a practical way; and I never heard of an engineer before who was not willing to listen to or help his fireman.

I believe the engineer and fireman should work together and help each other, and when an engineer is too conceited to listen, he of course cannot be helped, whatever your disposition to do so. I realize that I should have made his attitude a part of my previous letter.

Fraternally yours,

CON. TROLLER.

A Pointer Thankfully Received.

BOSTON, MASS., April 3, 1905.

EDITOR JOURNAL: After reading Bro. Con. Troller's letter on page 252 of the March JOURNAL, I would like to tell of helping an engineer out, who was in trouble through something that happened on our way to the Los Angeles Convention.

On our first moving after leaving Colorado Springs we had a compound engine pulling the train and she broke a transmission bar on the right side; the engi-

neer took off the broken parts and clamped the valve stem, but the engine was on the dead center on left side; the engineer got a jack and put under the back end of main rod left side, but the engine was too heavy to be moved that way, so gave it up.

Someone in the crowd that had collected said to the engineer in a quiet way, "Unclamp your valve stem and give her a little steam and she will move off the center" (main rod had not been taken down), so he did and it worked O. K., and the train was only delayed thirty minutes. The engineer was very thankful for the information.

We are all liable to mistakes and a little advice comes in very handy sometimes.

Yours fraternally,
MEMBER BAY STATE DIV.

Bro. Hoyt's Train Order.

AURORA, ILL., April 4, 1905.

EDITOR JOURNAL: In reply to Brother Hoyt in regard to not finding my obituary in the March number of the JOURNAL, I wish to state that he will find me very much alive before we are done with this discussion as to train rights and superiority.

Before answering his question in the January number of the JOURNAL, I noticed a mistake was made in either the number or superiority of trains. This I allowed for and took the order as it read. The question at issue is this: Brother Hoyt received the following order when pulling Train No. 32:

No. 32 will take siding and meet First No. 31 at C and Second No. 31 at B.

He asked, "What shall I do at B, take siding or hold main track?"

I contend that the order directs No. 32 to take siding at both C and B.

In the April number of the JOURNAL Brother Hoyt asks me this question: Suppose you received this order.

Train No. 32 will run in advance of time A to B, keeping clear of Extra 467. What would you do?

In reply to this will say, the order is not in regular form under Standard Code and would not or should not be issued. If, however, I received such an order I certainly would not leave A in advance of time unless Extra 467 had arrived there. In this case I would expect the order to read:

On arrival of Extra 467 South at A, No. 32 may leave ahead of time.

Referring to the rights of extra trains, I will say that they are equal in Pennsylvania and Illinois, and wherever the Standard Code is in effect. I will, therefore, make an effort to convert him to my side of the question.

For an example, let us suppose that A

is the eastern and M the western terminal of a division. That shortly after midnight on a certain date the following order is issued:

Order No. 3. To C. & E. Eng. 363 at M: Eng. 363 will run Extra M to A.

With these orders in effect we have two trains moving in an opposite direction, with no time table authority, no class, no schedule, and therefore can have no superiority until order No. 2 is delivered. This order reads:

Extra 364 West will meet Extra 363 East at G.

Engineer and conductor of 364 each receive a copy of this order at F. Engineer and conductor of 363 each receive a copy at H. Order No. 2, therefore, makes 364 superior F to G, and 363 superior H to G. At meeting point G, provision is made for one to take siding. On some roads this is done by special rule, on others by practice, the train holding main track being the one moving in the superior direction as indicated by classified trains. Sum this up and we find the result. Orders No. 1 and 3 gave Extra 364 West and Extra 363 East equal rights. Order No. 2 made Extra 364 West superior F to G, and Extra 363 superior H to G.

To those of you who are running against the current I wish to call attention to a few of the definitions that are found on the front pages of Book of Rules, and with these properly digested you will, no doubt, take the nearest crossover and pass from the wrong to the right track. Here we find:

Extra Train.—A train not represented on the time table.

Superior Train.—A train having precedence over other trains. A train may be made superior to another train by right class or direction.

Right is conferred by train order: Class and direction by time table.

Train of Superior Right.—A train given precedence by train order.

Train of Superior Class.—A train given precedence by time table.

Note in particular class and direction is conferred by time table, and as an Extra is not represented in time table it cannot have either class or superior direction.

Knowing that there are a great many holding the same opinion as Brother Hoyt it would be interesting to have you express yourselves in the columns of the JOURNAL. It would not only be interesting but beneficial. It looks unimportant as to the rights of Extra trains, but when an order such as Brother Blaisdell received comes to us, it is very important that no mistake be made.

I will be disappointed if I do not get an answer from Brother Hoyt in the next number of the JOURNAL.

Thanking you kindly for past and probably future space in your valuable JOURNAL, I remain, Fraternally yours,
 JAMES LENAHA, Div. 32.

Went Lame--Lubrication.

SOUTH BALTIMORE, MD., April 3, 1905.

EDITOR JOURNAL: As I have had a case in my experience of locomotive running very similar to that related by Bro. T. S. Keating, on page 338 of the April JOURNAL, I would like to state my experience in answer to his letter.

On December 20th of last year, I left Baltimore for Brunswick, with one of our heavy freight engines of the Wootten pattern, hauling a very heavy train of empty cars. There was about ten inches of snow on the ground which made the train run much harder. The first ten miles of my run was made with fairly good result, considering the train and weather. After this my engine began to go lame. I was particularly anxious to make a good run, as there was a fast freight following which generally consists of from three to five sections, and I knew if I "knocked this train out" it would call for an explanation.

When I arrived at the first water station I oiled up as quickly as possible and looked over the valve gear, and everything seemed to be in perfect order, as far as I could see without getting under her, and as the valves had not gotten so very bad yet, I concluded to "drive her" till something showed up; all the time I was trying to cipher out what could be the trouble. I had run my water to two gauges to make sure I was not carrying too much. I examined my lubricator and it was feeding fast as the scant supply of oil would allow. So, having satisfied myself that there was no mismanagement on my part and being confident there was nothing wrong with the machinery, I was certainly puzzled to know what the trouble was. The farther I went, the more lame. Finally, she got so lame that she almost quit. So I decided to stop and make a thorough examination. I knew I would not have any trouble to stop, but I was wondering how I was going to get started after I had stopped. Everything indicated that I had a very loose or slipped eccentric. However, after a very careful and thorough examination, I found everything to be in good order; so I decided if I could start the train again I would keep going. To my surprise I got my train started the first effort, and what seemed a greater surprise, she seemed a trifle less lame than she did before I stopped. This led me to believe that the trouble must be insufficient lubrication,

as all the reason I could assign for the improvement was that after standing ten or fifteen minutes (which time I consumed in making the examination and waiting for the flagman to come in), the oil had a chance to get to the valves in a larger quantity than it had before and thus lubricate the valves more thoroughly. After arriving at this conclusion, I set the lubricator to feed considerably faster, in fact, I set it to feed very fast for a short time.

By the time I arrived at the next passing siding, I had the fast freight "fixed" for twelve minutes; my supply of cylinder oil that I had drawn for the trip was gone, and there was a message from "D. O." to "explain why," but I had my valves set.

Now, had I not been a man who believes in preparing for war in time of peace, I would have been in as bad a position at that time as I was before, but I always carry an individual can and save up a little "salvation oil" to use in emergency cases.

It is obvious that the cause of my trouble in this case was that the valves were not properly lubricated; but I am yet at a loss to know why the engine should have required an unusual amount of oil. I have had fairly good results on other engines, using no more oil than I did on this engine before the trouble showed up. Dry valves will usually groan and let one know where the trouble is, but this did not.

If there could have been any other cause for Brother Keating's trouble and mine, I would like to hear some other Brother express his opinion.

Fraternally yours,
 J. T. A. STROUP, Div. 97.

In answer to Brother Keating's question, Bro. H. Gray of Div. 221 says in part, "The Brother states that the engine would not start." A locomotive in perfect order must start when steam is applied and the trouble should be easily seen, that when the engine stopped the side that was receiving steam was on the dead center, and the engine on the opposite side had some foreign substance in the steam pipe.

Bro. Fred Nihoof of Div. 603, says, "Bushing in cylinder had turned."

Bro. Wm. Wilcox, Div. 219, says, "The trouble was in the rocker-box. It probably got hot and stuck."

Bro. W. M. Calkins, Div. 517, says, "I think the Brother forgot to draw oil."

Bro. W. L. Heath, Div. 530, says, "I think it was a cylinder that had been bushed and the bushes had gotten loose

and turned so as to close the parts of the cylinder."

Bro. J. F. McGraw of Div. 420, also says a bushed cylinder would, of course, cause the result complained of. ED.

PORTSMOUTH, OHIO, April 4, 1905.

EDITOR JOURNAL: Please allow me space to answer Brother Keating's question which appeared in the April number of the JOURNAL. The trouble with this engine was the cylinders had been bushed and the bushing in one of the cylinders was gradually turning, thus making the engine lame, and at last cutting the steam off entirely from one side. Then when the engine was stopped the side that had the admission of steam to the cylinder was on the center. E. A. LINDSEY, Div. 584.

Night roundhouse foreman asked me to have this question appear in our JOURNAL. I would appreciate the fact if you would allow it space. Was running an engine that had a D 8 brake valve with the pump governor connected to train line and controlled by train-line pressure, which would allow main reservoir pressure to pump up nearly equal to steam pressure of the boiler. Just before applying my brake one day I placed the brake valve on lap and the brake made a nice service application without me making a reduction in the train line at all. No leaks in the train line or auxiliary connections, no leak in the pipe running to air gauge. What was wrong with this brake that caused this trouble?

ROUNDHOUSE FOREMAN, Portsmouth shops.

EDMONTON, ALA., March 15, 1905.

EDITOR JOURNAL: As to "Member of Div. 496's" question, would think there was an obstruction between equalizing chamber and small drum, but not complete stoppage, thus causing heavy blow at first and equalizing and raising pressure on gauge while on lap.

JAS. G. ENTWISTLE.

Please allow this train order space for discussion. Engine 352 will run as passenger special leaving Pulaaskia on the following schedule having right of track over all trains except first class:

Leaves Pulaaskia, 6 a.m.; Draper, 6:25; Allisonia, 7; Rich Hill, 7:30 a.m.; arriving at Chestnut yard, 8 a.m. Rich Hill is a blind siding and you are on a second-class train, can you go after 7:30 p. m.? Rules of the road is a train 12 hours late loses its rights, and all orders held by such train are annulled; this order has caused quite a lot of debating. Let us find what the Brothers say about it?

Yours fraternally, E. A. L.

Answer to Bro. Lenahan's Order Question

PITCAIRN, PA., April 4, 1905.

EDITOR JOURNAL: In answer to Bro. Lenahan of Div. 32, would say the order received at A, "First and Second No. 8 has right over No. 6 A to M, regardless of No. 6," gives train of superior right of track against one of superior right to designated point. If the trains meet at designated point, the train of inferior right must take the siding, unless rules or orders otherwise indicate.

Under this order, if train of superior right reached M before the arrival of No. 3, No. 6 could proceed to next siding, provided it keeps clear of the schedule time of No. 3 as many minutes as No. 3 is required by rule to clear time of No. 6. If No. 6 reached point beyond M, the conductor must stop the train where it is met and inform it of its arrival.

Order No. 2 which states that First and Second No. 8 would meet First No. 6 at L, means trains meeting at designated point, train of inferior class must take the siding, unless otherwise indicated.

No part of Order No. 1 superseded or annulled gives First and Second No. 3 perfect right to run from L to M regardless of Second No. 6 taking siding at that point.

Yours fraternally,

E. E. SWANK, Div. 325.

What Caused Brakes to Set?

NEVADA, MO., April 7, 1905.

EDITOR JOURNAL: I have a question I would like to have some worthy Brother answer through the JOURNAL.

I picked up six cars at a small station some time ago; three of them were air cars and cut in they seemed to pump up fairly well, but after I got started could feel brakes sticking, would release again and go a little distance and stick again. Brakeman was riding on pilot and as block-hand would fall back and then come up again to normal pressure, I thought he was playing with angle cock, but on examination at next stop I discovered that angle cock could not be reached from pilot.

I then went back to locate trouble, and found brakes all set. They soon all released again and while I was trying to figure out the cause they set and released several times.

I found and repaired bad brake in train line, and had no more trouble. It is a known fact that any reduction in train line will cause Westinghouse automatic brakes to set, but what defect acting in conjunction with train line leak will cause brakes to continuously set and release?

Fraternally yours,

C. I. SMITH Div. 359.

MAY, 1905.

Constitutionality of the Ten-hour Day.

The Bakeshop law of New York State was enacted in 1895, and became a part of the general labor law, section 110, which limits the hours of labor in bakery and confectionery establishments to ten a day, and permits no overtime save for the purpose of making a shorter work-day on Saturday, and fined \$50 fine for its violation. The first arrest under it brought a test case in Utica, where a master-baker, Joseph Lochner, was arrested upon complaint of Deputy Factory Inspector O'Rourke to whom an employee had given affidavit that he had worked in Lochner's bakery more than ten hours a day. In the Oneida County court Lochner was convicted of violating the law and fined \$50, and from that judgment took an appeal on the ground that the law unwarrantably impaired the liberty of contract. The appellate division—*by a divided court*—held that the statute did not prohibit any right, but simply regulated the business; that as there was a *quasi*-public interest in his business it was subject to the police power of the state, so as to protect and preserve the public health, the public

morals, and the general safety and welfare of the public; the decision agreeing with the Court of Appeals on the constitutionality of the anti-Sunday barbering-law.

Justice Davy, in delivering the prevailing opinion, said:

"It is very important for the health of the community that bakers should supply the people with wholesome bread and pure food. The people are interested in the business; it is of so much public interest that the legislature under the police power of the state may control the business by any regulation which is necessary to secure the public health, etc."

An appeal was taken to the Court of Appeals which court affirmed the judgment of the trial court, Judge Parker writing the opinion, the court being divided, four to three. The case was then appealed to the United States Supreme Court, which rendered its decision on April 17th, reversing the two decisions of the New York courts, the judges standing five to four.

Justice Peckham, in delivering the decision, said:

"The law is not an act merely fixing the number of hours which shall constitute a legal day's work, but an absolute prohibition on the employer permitting under any circumstances more than ten hours' work to be done in his establishment, and the employee may desire to earn the *extra money* which would arise from his working more than the prescribed time, but this statute forbids the employer from permitting the employee to earn it. It necessarily, therefore, interferes with the right of contract between the employer and employee."

The majority of the judges evidently presume that the employee will get extra money for working more than ten hours in a day. The bakers have fought against a twelve-hour day and low wages for years, and if a law cannot be constitutionally made in the interest of decent wages and conditions which conduce to good citizenship, which interferes in the slightest with the right of contract of employers, representing ten per cent, and

in the interest of employees representing ninety per cent, then some mean employer will demand twelve hours' work, with no increase in wages.

We do not charge prejudice, but we do believe that the five justices who rendered this decision do not understand the needs that confront labor, and the bakers in particular. They do not believe that the public health and welfare justify the law as claimed by the trial judge, as Judge Peckham says: "It is impossible for us to shut our eyes to the fact that many of the laws of this character (laws in the interest of labor), while passed under what is claimed to be the police power for the purpose of protecting public health or welfare, are in reality passed from other motives. We are justified in saying so when from the character of the law and the subject upon which it legislates, it is apparent that the public health or welfare bears but the most remote relation to the law."

That the influence of the Journeyman Bakers' organization, assisted by other factors of organized labor, secured the enactment of the law in question, will hardly be doubted; but that does not prove that public health and particularly public welfare are conserved by the law. Two courts in the State of New York declared the law constitutional, and the majority of the two New York courts and the minority of the United States Supreme Court makes a majority in favor of the constitutionality of the law, and we do not believe that the employing class will make any radical move in the direction of longer hours, because of the last decision, and the Supreme Court's decision hangs upon too slender a thread to endanger the large number of other laws placed upon the statute books by the influence of organized labor which, in some degree, abridge the rights of employees, to do as they please in all things.

Railroad Regulation.

The Congressional committee authorized to investigate railroad practices so as to give the Senate more information when the Esch-Townsend bill, passed by the

House, comes up at the next session, probably in October, began their inquiry on April 17. We believe the Esch-Townsend bill will have to be very much modified before it can pass the Senate; but every subdivision of the B. of L. E. in the states should take an interest in this subject, which they ought to feel is very near to them, for the interest of the railroads, in a large sense, is their interest; not that it would result in the reduction of wages, but would, in all probability, deter any advance and would likely make it more difficult to sustain what we have, and it would be a good move either to see or write each Congressman and Senator, and express disapproval of any measure which would take from the railroad management the rate-making power. Let the law be amended, if necessary, to give the commission power to cure such evils as are complained of, and give it unqualified authority to enforce the Interstate Commerce law.

It is very difficult for a layman to see wherein the government can infringe at will upon the liberty of contract of railroads in the interest of the shipper, when there can be no legal restriction placed on bakeshops in the interest of the journeyman baker or the public.

Look Happy, Even if You are Hungry.

President Eliot, of Harvard, is reported as saying that "he has lately had occasions to think a good deal about the conditions of labor in America, and that the saddest thing he had learned was the lack of a happy spirit—a most lamentable thing. What is the cure for this evil? It is the bringing into American industries the method and spirit of the artist. The artist rejoices in his work; it is his chief satisfaction and happiness in life."

A very nice picture, surely! A man with a shovel, handling ten tons of dirt at fifteen cents a ton, according to the president's theory, ought to have a face wreathed with smiles, even if he had ten in the family to divide his earnings and smile with.

We wonder if the president were on a "Hog" hauling ninety cars, and the ten-

der held fifteen tons of coal, how broad his smile would be when he got the last shovelful in the box, and realized that he had earned \$2.00? Or, even if he were qualified to run a "Hog," how broad his smile would be when he was trying to get a signal from the ninety-ninth car, and he had been eighteen hours on the road?

If President Elliot will look into the lives of all artists, he will find many in garrets starving and disgusted with art because the effort brings little money and no comforts; and if he will look beyond his theories and into the facts as they exist, he will find that pleasant looks follow lines of comfort, or at least enough of comfort to prevent distress and to make one feel as though his efforts were in some sense appreciated; and this feeling comes from fair reward and fair treatment, and never from taking a mean, narrow advantage of men on the principle of supply and demand. It requires some degree of moral obligation to tote fair, but if we are to have laborers look pleasant and feel so, that element must enter into the solution. There will be few quarrels between employer and employee when men are fairly paid and treated with that consideration due to our fellowman, whether he be a college preceptor or has a shovel in his hand.

BRO. ROBERT M. ORR, member of Div. 417, Peoria, Ill., who was twice elected to the office of City Clerk, made so many friends while in that office that at the late election he was successful in being elected to another good office. As about the only Democrat elected, he may appear in a party sense somewhat lonesome, but he can afford to forget party lines as his friends have done in voting for him, not because he was a Democrat or a Republican, but because he was worthy of their confidence, because he has been tried and not found wanting, certainly a very high compliment, and we congratulate Brother Orr upon his political success made possible by honesty and fidelity. It is an honor to be proud of and, indirectly, it is a compliment to the B. of L. E., of which he has been a faithful member so long.—ED.

Editorial Paragraphs.

Bro. Chas. F. Hubbard, Chief Engineer of Div. 238, Tacoma, Wash., who will be remembered as a delegate to the Los Angeles Convention, representing Divisions 238 and 439, has been appointed Railroad Commissioner by Governor Mead of Washington, which is very satisfying to the members of the B. of L. E. in Tacoma, as it is to all classes of union men.

Brother Hubbard is a Vermonter by birth, and began his railroad life at the age of 17 years, starting as a telegraph operator. Getting the Western fever he moved to Minneapolis and secured a position as fireman for the C. & N. W. Ry., remaining with that company about ten years, in which time he was promoted to engineer and met success. Desiring a change, he went to the Northern Pacific with headquarters at Tacoma, where he has since remained, always taking an active part in the B. of L. E. and won favor with all classes. Being intellectual, practical and broad-minded, he naturally became a leader among men; being studious and a deep thinker, he is well equipped for the manifold duties of the important office with which Governor Mead has honored him.

Next to Brother Hubbard, the Brothers in Washington will appreciate the action of the Governor in selecting a member of the order as a part of his official force, and we predict that the Governor will never have occasion to regret his choice.

Bro. M. F. Kincaid, member of Div. 399, Seattle, Wash., has also been honored by Governor Mead, who appointed him a member of the State Board of Control.

Brother Kincaid is a son of Dr. Kincaid and brother of Trover Kincaid, a member

C. F. HUBBARD.

of the faculty of the University of Washington, and has a brother, Kenneth, in the medical department of the regular army.

Brother Kincaid started his railroad career at the age of 16 years on the Midland Railway of Canada as a caller and later fireman; went to the Canadian Pacific in 1883, promoted to engineer in 1885, going to the Pacific

M. F. KINCAID.

Coast in 1886, where he secured a position on a tramp steamer in charge of the electrical machinery, and made a trip around the world, arriving in New York in 1888, securing a position with the Baldwin Locomotive Works. In 1889 went with the Erie Railway as fireman and engineer until 1897, when he went to the Klondike where he had charge of the first railroad in the Yukon and ran the first engine in that country, but his health compelled him to seek a milder climate.

Governor Mead makes another good choice in the appointment of Brother Kincaid.

The Brothers in Washington have confidence in both these honored members and are much pleased with the evidence of good standing with the Governor and the people who expressed preference for their appointment, and we feel sure that neither will be disappointed in the result.

BRO. HOWARD M. CURRY, member Div. 474, who made a wide acquaintance as delegate to the Ottawa Convention in 1896 and St. Louis in 1898, was later appointed Traveling Engineer for the Northern Pacific Co., and demonstrated both ability and energy in that position, resulting in his appointment as Division Master Mechanic with headquarters at Staples, Minn., and the same qualities of push and energetic attention to business have again resulted in his further promotion on Feb.

27 to the position of General Master Mechanic with headquarters at St. Paul. This is a very flattering record for Brother Curry. It is a striking illustration of what intelligence coupled with energy can accomplish. Brother Curry has won his place by demonstrating his practical ability to fill it. His accomplishments in the service was all the recommendation he needed, and the company pays him a deserved compliment in placing him next to the Mechanical Superintendent.

We feel that he will continue to deserve the best the company has to give, and that he will continue to deal justly and fairly by those in train service he has been so long and so closely associated with. He knows all the trials of road service and can understand cause and effect, which greatly assists in decisions which mean peace and prosperity of both men and company.

The same bulletin from the Mechanical Superintendent, Mr. David Van Alstyne, appoints Bro. Willard Lincoln, member of Div. 895, as Master Mechanic, to succeed Brother Curry, at Staples, Minn., another good selection and another compliment to the membership of the order on the N. P. Ry. May Brother Lincoln find his way up the ladder of promotion by close attention to duty and fairness to both the company and those who serve under him. The good wishes for the success of the two Brothers will be with them from all members of the order.

BRO. JAMES JACOBS, member of Div. 14, Utica, N. Y., has just completed his fiftieth year of service for the N. Y. C. & H. R. Ry. Born in Wexford, Ireland, July 1840, he with his brothers and sisters came to this country and settled in Schenectady, N. Y., July 3, 1847, and started to work for the Central road April 7, 1855, three months before he was fifteen. He proved faithful and energetic in any work given him, and in 1857 was given a position as fireman between Schenectady and Utica. The Central was then composed of three short divisions, Albany to Schenectady, Schenectady to Utica, Utica to Syracuse. In September, 1865, he was

promoted to an engineer and ran from Utica to Syracuse, and has been in passenger service for the past 25 years. He joined the B. of L. E. in its infancy, has presided as Chief Engineer of Div. 14 in all 18 years, and has attended six conventions as the delegate representing his Division; certainly an excellent record and one to be very proud of. He is still as vigorous as many at 45, never patronized a saloon, and regardless of Dr. Osler's opinion, Brother Jacobs was never better equipped for the duties of an engineer than now. May good fortune continue to attend him, and the company and the public to have the benefit of his safe and painstaking service as long as he desires to continue in it. EDITOR.

The Twin Meetings.

It is not often that we have had meetings of this character that can justly be termed "A Twin Meeting," yet Divs. 37 and 577, located at Mattoon, made such an event possible and nobly did they do their share to make the 26th and 27th days of March two red-letter days in our history, which every true lover of our Brotherhood will be pleased to read.

The writer having an invitation to attend both of these gatherings left Cleveland, Saturday, March 25, for Mattoon, Ill., arrived there the same night, was met at the station by Bro. Wm. Bird, of Div. 37, who escorted him to his beautiful home, 194 Wabash avenue, and informed him that he was to be his guest during his stay in Mattoon. The evening was pleasantly spent in chatting about the happy reminiscences of the past, and of the present and future prospects of our Brotherhood until the dials of the clock indicated the midnight hour. Retiring for the night, we awoke Sunday morning to be greeted with the bright rays of the sun, which betokened a clear and beautiful day, for our union meeting. At 10:45 A. M., in company with Brothers Arthur Khron and Wm. Burke, we attended divine service at the Congregational Church and heard an elegant sermon by the pastor, Rev. Naboth Osborne, and

Mrs. Mabel Hooper Kerns, the famous soprano of Mattoon, rendered a solo entitled, "In the Palace of the King," that made one think of the better land as we listened to the inspiring melody by this gifted singer.

The union meeting was opened promptly at 2:30 P. M., Bro. O. F. Hamilton, Chief of Div. 37, in the chair. This being a joint affair of both Divisions in Mattoon, Bro. John M. Rossiter, Chief of Div. 577, assisted in the duties of the occasion, which in part was the initiation of a candidate. Their sister Division 245, situated at Charleston, only about twelve miles distant, was well represented. After the usual routine of duties had been dispensed with, Bro. Deloss Everett, Third Grand Engineer, delivered an address on the duties and responsibilities of the day and hour in which we live, dwelling principally on the vital and all-important subject of true and genuine brotherhood, which met with a hearty response of all present. To give a detailed description of this gathering would make a lengthy article. The meeting was honored with the presence of Bro. G. H. Daniels, Chief of Div. 245, and Brothers C. W. Kemp, C. J. Singleton, and a host of others too numerous to mention, who made the welkin ring with happy speeches in defense of the principles we advocate.

About 6 P. M. a delegation of the members of the G. I. A. were admitted to the hall, when Mrs. D. Flynn, President of Div. 47, welcomed us in a neat speech, and announced that supper was ready. Forming in line, we were escorted to the dining room, keeping step to the inspiring strain of the "Amazon March," a piano selection played by Mrs. Maggie McComb. It would appear that our good sisters had searched the four corners of the earth for all the good things imaginable to satisfy our craving appetites, for their meal was all that could be desired. After this was over we returned again to the Division room, and in conjunction with our lady friends, spent the evening in social converse, until we were reminded of the approach of the midnight hour, when we separated each for their different homes,

thus closing another happy event in our history.

Monday, March 27, in company with Brother Wm. Bird, we left Mattoon for Charleston to participate in the celebration attending the twenty-first anniversary of the birth of Div. 245, of which the Charleston *Daily Courier* gives the following account:

On Sunday afternoon, March 26, 1884, the Brotherhood of Locomotive Engineers' Div. No. 245 was organized in this city. The day was pretty and bright, and to assist in the celebration of the twenty-first anniversary, the weather man sent the same kind of weather, Monday evening.

The anniversary was one of best celebrations ever held here; it was a success in every way and the various committees are to be congratulated.

Fourteen members and their wives of the Delphos, O., Division, 550, arrived here at 1 o'clock.

At 7 o'clock a special train on the Big Four with fifty-seven members and their wives of the Mattoon organizations, Nos. 37 and 577, arrived to assist the members of 245 in celebrating and they did their part to perfection.

Engineer C. W. Kemp, master of ceremonies, made a short address on behalf of 245, welcoming the visitors. He introduced Mayor Digby, who made a neat and witty address of welcome.

An entertaining and interesting program was announced; for an hour the audience was royally entertained. The program was as follows:

Piano selections—Mrs. Harry Shrieves, Mrs. Ed. Eckenrode and Miss Marguerite Waible.

Recitations—Miss Irma Martin, Irma Bradley, Laura Laughlin.

Violin solo accompanied with piano—Miss Laura Laughlin and Miss Ione Walker.

Cornet duet—Tyron Shuler, Charles Myers.

The program, a selected one, was of the very best and every number was heartily encored. It was far better than the attraction at the Charleston Theater, and was the subject of much comment.

Short talks were made by Engineers Wm. Bird, Arthur Khron, J. F. Nelms, W. C. Parson and W. H. Morris of Div. 37, and Vic Gustafson, Div. 577, and Thomas Campbell and F. A. Drolett, Div. 550.

Deloss Everett, Third Grand Engineer of the B. of L. E., was introduced and made a very good address. Mr. Everett has grown gray in the service, and although an elderly gentleman, he still has a good strong voice and handles it well; has a good store of short stories and makes illustrations with them to the point, and is a very pleasant speaker.

At the conclusion of his speech, the way was led to the dining rooms where the Ladies' Auxiliary had prepared a supper—not a banquet. The tables were so crowded with the many good things of an hundred different varieties of "eatables" that another toothpick could not have found room on the snow-white linen. The table decorations were neat and pretty.

After the large number had satisfied the "inner

man" the remainder of the time was spent in amusements. The Wizard club rooms were used for a dance, and many of the engineers and their wives enjoyed the waltz and two step, while others returned to the Engineers' hall and found amusement in cinch and other games.

The Mattoon and Delphos, Ohio, visitors were loud in their praise of the hospitality shown them by the members of the Charleston lodge and citizens, and wish that 245 could have a celebration each night in the year. D. EVERETT.

LINKS.

A UNION meeting under the auspices of Divisions 56, 436, 432 and 386, will be held in Birmingham, Ala., on June 21, to be followed by a picnic at German Park on the 22nd. The Governor of Alabama and other distinguished men of Birmingham are expected to be present. The Grand Officers of the order have been invited and the local committee is doing everything possible to make the meeting a success, and desire the Brothers from all points to come and participate in the social and educational features, which always attend these meetings and we will try to make you glad you came.

GEO. L. CARLISLE, Chr.,
GEO. T. ROBERTS, Sec'y.

THE Canadian Divisions of the B. of L. E. will hold their Annual Union Meeting in Riviere du Loup, Province of Quebec, on July 4, 5 and 6, 1905. We insert this notice early, for it deserves consideration. Riviere du Loup is one of Canada's beauty spots, and our Canadian Brothers make their annual gathering a notable event, in which there is pleasure, education and social relations long to be remembered by those who attend.

The committee will have something in the June number which will give the needed information to all who wish to attend. Any one desiring earlier information can write Bro. F. W. Rioux, Sec'y. There should be no Canadian Brother missing from this meeting who can get there, for they not only miss a grand good time, but fail to give the encouragement they should. These meetings are important to the fraternity in Canada, and the committee deserves the encouragement of your presence, and all will profit by helping to make it a grand success.

BRO. FRANK BURKE, a member of Div. 559, has been appointed to the position of Traveling Engineer of the Duluth, Missabe and Northern Railway, one of the United States steel and iron ore roads in Northern Minnesota.

Brother Burke's selection we feel assured was due to his many years' experience and ability as an engineer on different roads, and Brother Burke will fill the position with credit to himself and honor to the Brotherhood of which he is a valued member. Div. 559 wishes him every success in his new position.

J. S. BROWN, F. A. E. Div. 559.

ON March 8, Bro. M. W. Cadle, A. G. C., visited Div. 482, at East Tawas, Mich., where quite a number of the Brothers had the pleasure of meeting him. Bro. R. D. Cutler, Chief, and Bro. Luke Murray, Traveling Engineer, met Brother Cadle in Bay City and accompanied him to East Tawas. Brother Cadle entertained some of our members with an address in his pleasing way, all regretting that he was unable to stay with us longer and expressing the hope that we may have the pleasure of meeting with him again.

JOHN L. SWARTZ, F. A. E. Div. 482.

DIV. 302 held a special meeting March 27, 1905. Assistant Grand Chief Cadle and Brother Hammond, C. E. of Div. 548, were present. We had a good attendance, several members of the other Chicago Divisions attending.

Assistant Grand Chief Cadle exemplified the work, and gave us a very interesting talk on subjects of interest to the order. Brother Hammond and several other Brothers had a little speech to make. It is the first time a Grand Officer has visited 302 in a long time. If Grand Officers would visit Divisions more often it might get some Brothers interested, so they could attend Division once in a while.

F. A. E., Div. 302.

THE members of Div. 290 think they have something to feel proud of, for within the last three years there have been three of its members taken from the

rank and file and promoted to official positions on the G. N. R. R. The first was Bro. P. H. McGuire, who was promoted to Traveling Engineer and afterward to Master Mechanic, which office he still holds.

About eight months ago Bro. C. E. McAuliffe accepted a position as Traveling Engineer with the Mo. P. System with headquarters at Argenta, Ark.; and on April 1, 1905, Bro. F. E. Owen accepted a like position on the Dakota Division of the G. N., with headquarters at Larimore, N. D.

Bro. Owen is a young man under thirty years of age, but with a head full of good mechanical ideas, and has a faculty of demonstrating them so they will be some use to himself and others who come in contact with them, of which he had several on his engine while running on the Lake District. He was painstaking and studious in regard to his work and engine and improved his idle hours in studying, and is somewhat of an electrician and a number of other accomplishments; and for the benefit of some of the old timers who may see this, will say he is a son of A. J. Owen, commonly known as "Old Shang Owen," who ran an engine all through the Middle West.

The promotion of Brother Owen shows what opportunities are open for a young man in railroad circles of today, if he will only improve his idle time in a little study, and Div. 290 wishes Brother Owen success in his new field.

MEMBER, Div. 290.

ON March 29th, Bro. H. E. Wills, Assistant Grand Chief Engineer, paid Jefferson Levy Div. No. 513, Charlottesville, Va., a call. This is the first visit from the Grand Office in the history of the Division. Our Chief, Bro. L. D. Payne, posted a notice that there would be a called meeting at 1:30 P. M. on the date above. Every member in town was present. Yes, even Bro. L. D. Edwards, who has been unable to attend for a long time, on hearing of the meeting thought he could venture out and he did and seemed much pleased with the talk.

Brother Wills made a good talk for the good of the Brotherhood and for the good of the employer, advising the Brothers to adhere strictly to the rules of the company for which they work, saying that there are three things that our Grand Chief would not stand for, viz., intoxication, insubordination, and a violation of the companies' rules.

After Brother Wills' talk was over there were short talks from several of the Brothers and the meeting closed without form, all seeming to have been much benefited by Brother Wills' good advice.

The next morning Bros. W. I. Steele and E. L. Bailey took Brother Wills for a drive around our historic town and to Monticello, the home of Thomas Jefferson, and to the University of Virginia, returning in time for the Chesapeake & Ohio train No. 4 at 12:15 P. M., on which Brother Wills left for Washington, D. C.

We hope we may have another call from the Grand Office in the near future.

W. J. JONES, F. A. E. Div. 513.

On Sunday afternoon March 26, a large number of Brothers of Div. 205 with many of our firemen, gave to our retiring Master Mechanic, Louis Wyler, a complimentary dinner at the New England Hotel at East Hartford, Conn., all employees of the N. Y., N. H. & H. R.

The assemblage was called to order by Brother Barnes, C. E. of Div. 205, in a few appropriate remarks. After partaking of a dinner such as Landlord Risk can furnish in good style, Bro. C. D. Moore was named as master of ceremonies, and filled the place with credit. Speeches were indulged in by nearly all present; but the most pleasant feature was the presentation by Brother Moore of a solid silver service to Mr. Wyler, as a slight appreciation of our regard for a man honored by all the men who were employed under him. Mr. Wyler responded with such feeling and spoke of the pleasant relations that always existed between the men and their master mechanic. The affair came to a close at 6:30 P. M., all voting it a complete success.

A PARTICIPANT.

A. G. C. E. BRO. M. W. CADLE visited Div. No. 548, Peru, Ind., on the afternoon of March 29th, when we met in special session. Brother Cadle made a splendid address and we then had an exemplification of the work. I cannot begin to tell the good that Brother Cadle's address did. Old Brothers who have been members for thirty years, and the younger Brothers all expressed their appreciation of the address, filled with good advice and encouragement, and a vote of thanks was unanimously adopted.

This is the first visit we have ever had from a Grand Officer and we hope we may have that pleasure again soon.

At the conclusion of the meeting the members of the Ladies' Auxiliary, always ready with their helpfulness, provided a bountiful luncheon, which was participated in with a relish, for we were all hungry. The luncheon over, Brother Cadle gave them a nice talk, so we are exceedingly pleased with his visit.

F. A. E., Div. 548.

In the midst of some turmoil and unfortunate circumstances that have occurred in this part of the country lately, it is a genuine pleasure to record the fact that there are some pleasant circumstances attending our troubles, and Div. 419, Brooklyn, N. Y., has been very fortunate lately in being honored by the presence of so many of our Grand Officers who were called to this part of our domain to settle troubles, and Div. 419 took the occasion to couple on to them and escort them to our festivities, the first of which was our annual ball held on the night of March 1, when we were honored by the presence of two of our Grand Officers, G. C. E. Bro. Warren S. Stone, and Grand Guide Bro. T. H. Tucker; and it did one much good to see them mingling with our genial General Superintendent Dow S. Smith and Superintendent W. O. Wood and our past superintendent, F. A. Fay, of the B. H. R. R. Co.

Our last pleasure we received was by the presence of our A. G. C. E. Bro E. W. Hurley, who unexpectedly dropped in upon us at our regular meeting last

Sunday, the 9th, and we all expect to profit by his kind words and by the laying down the law to us to settle some little dissension that had arisen among us; and we hope his presence among us so timely may prove a lasting benefit to us, so that perfect harmony may prevail with us; for if we do not agree among ourselves, how can we expect to agree with those who naturally disagree with us, regarding rates of pay, hours, etc. "United, we stand; divided, we fall."

F. A. E., Div. 419.

WE never see anything in our JOURNAL from Hanging Rock Div. 363, B. of L. E., or Kentucky Bell Div. 45, G. I. A., both of which are located at Somerset, the Queen City of the Sunny Mountains in Kentucky. We have our share of social happenings and plenty of members who could give an interesting account of the same if they would. Why do we not?

On Jan. 19, the ladies of Div. 45, G. I. A., gave a masquerade ball, which from all accounts was a grand success, those participating doubtless enjoying themselves to the fullest extent. As the writer was not present he cannot give details, but he knows our G. I. A. has no hand in failures.

One feature of this occasion, however, he can and wishes to give in detail, viz., a piano, the property of the writer, was disposed of by lot. The numbers were all put in a quart can, a cover over the can and all well shaken; then a blind-folded child drew one slip, it was No. 580. The fortunate holder of that ticket was Dr. Allen of this place. He got the instrument a day or two after.

I wish to thank Brothers Lester and Peffer, also Sisters Peffer, Lester and Devoe and others for their kindness in getting up this drawing for me. It was no little trouble I am well aware; still, none would accept a cent for the trouble. I realized \$250, full cost for the piano. Only for Brother Lester's faithful work the drawing would have failed to materialize. Many wished us well, as it were, from a distance, and perchance made remarks in regard to the manner in which the affair

was handled, but Brother Lester did the work and did it thoroughly and satisfactorily, and again I express my kind feelings toward him. I wish to thank everyone who held a ticket, and especially those of other Divisions. Kindest regards to all.

Fraternally yours,
THOS. SWEARINGEN, Div. 363.

AMONG the many sociable affairs in the month of March was the supper given by the good Sisters of West Philadelphia Div. 112, of the G. I. A. It was given in honor of the Brothers who compose the membership of West Philadelphia Div. 45, B. of L. E. This happy event took place on Thursday evening of the 16th, at Institute Hall, 40th Street, above Chestnut Street, Philadelphia, Pa.

It was the first supper of the kind they ever gave, and it was a success in every particular. One grand feature was the meeting of old friends who gathered around this festive board, who with happy smiles and warm grips of the hand talked of the days of Auld Lang Syne. Among the many veterans present were Brothers Geo. K. Strouse, John Deisem and his brother Amos Deisem, Night Depot Master at Broad Street Station and a host of others, including Bro. Deloss Everett, who with Bro. Geo. K. Strouse was one of the founders of Division 45. Brother Everett, upon request, made a happy speech and complimented the G. I. A. for the magnificent work they have accomplished. There were some of the old familiar faces we missed, who were not present on this occasion, faces of those Brothers who were prominent in the early struggles of our organization for a foothold on the Great Pennsylvania System. Such men as Brothers John Rynier, Samuel Manahan, Frank Irwin, and Bros. Wm. R. Irwin, Andrew Hill and Wm. Smirthwait, the three latter having crossed the silent river never to return. Yet in the midst of the festivities of the passing hour, they were not forgotten.

After the supper was over the guests were invited to the ballroom, where a goodly number tripped the light fantastic toe until the wee sma' hours of the morn.

Too much credit cannot be accorded the Sisters for this splendid entertainment, for each seemed to vie with the other as to who should contribute the most joy and pleasure to the occasion. It was simply one of those affairs that has so often brightened the pathway of our Brotherhood, the memory of which will never be forgotten.

A VISITOR.

THE accompanying picture is of the room in the Railway Men's Home, furnished by tobacco tags and coupons that I solicited from all Brothers of the four or-

Now, I kindly request all Brothers to save their tags and coupons, that is, those who read their JOURNALS, and interest those Brothers who don't read to do likewise, and send them to me by July 15. If you will do that we can refurbish the Home completely. Most all tags and coupons have a value.

M. E. MURRAY,
972 76 Place, Chicago, Ill.

BRO. GEO. E. HUTCHINS, member of Div. 572, was recently elected Mayor of Berlin, N. H. Brother Hutchins though

ROOM FURNISHED AT THE HIGHLAND PARK HOME THROUGH TOBACCO TAGS COLLECTED BY BROTHER MURRAY, LODGE 4, B. OF R. T. CERTAINLY A GOOD USE TO WHICH TO PUT THE TAGS FOR THOSE WHO CONTRIBUTED THEM.

ganizations, to which about one per cent of all responded. When the picture was taken by Supt. O'Keefe of the Home, I lacked three pieces of completing it. I have since added one more piece and hope to get the required amount very soon, as they are coming in little by little.

This plan has awakened considerable interest in the Home, the interest we should all take in this grand and noble work and show to the world our integrity and benevolence which we all possess.

but 50 years of age, is one of the pioneers in railroad construction in his section of New Hampshire.

When the line was built into Lancaster, then the northern terminus of what is now the White Mountain Division of the Boston & Maine, Brother Hutchins was engineer of the first train into that terminal, and when the branch was constructed to Berlin, he moved there.

He was elected to the State Legislature in 1908, and his present political honors

bear evidence that he has the esteem of his neighbors. He is a devout church man and an old member of the B. of L. E., formerly a member of Div. 835, and the members of the order are greatly pleased with his success, feeling that he will do honor to himself and his associates in performing the duties of Mayor. BERLIN.

EDITOR JOURNAL: I want to tell our Brothers what a member of Div. 836 did in the way of securing subscriptions for the JOURNAL in Hattiesburg, Miss., a town in which there is no Division of the B. of L. E. A comparative stranger myself I got over *thirty* subscribers, which shows what can and ought to be done in towns or cities where Divisions are located and where the Brothers are acquainted and have business dealings with the people. If the effort were made in each place where our Divisions are located, and even thirty subscribers obtained, it would mean over 20,000 and be a great help to the charity fund, and give opportunity for those not of us to know more about what we stand for.

Brothers, why not make the effort, and in doing so get one of the splendid watches given as premiums?

In this communication I wish to thank all the business men and others in Hattiesburg who expressed their interest in the Brotherhood by subscribing for the JOURNAL.

Fraternally yours,

J. O. DETWEILER, Div. 836.

JACKSON DIV. No. 2 having been assured that Grand Chief W. S. Stone would be with us Sunday, March 19, and as it has been a long time since we have been honored with a visit from a Grand Officer, all effort was made to get word to all the members on the system and the attendance at the meeting on that date showed that we were successful beyond our expectations. Members were present from Detroit, Grand Rapids, Battle Creek, Michigan City and Marshall.

The meeting was a success in every way. Brother Stone gave us a good heart to heart talk, and explained a good many things we had all wished to know, and gave us some good advice. If heeded will

be beneficial to our organization and to individual members.

Brother Stone made a good and lasting impression here and his visit will result in quite a good substantial increase in our membership. We initiated a class of twelve new members at the meeting and more are to follow. Honors we divide between Brother Stone and Bro. Charles Baker, the old reliable of Div. 1, Detroit.

Brother Bryant, our worthy Chaplain, told us in a very convincing way that the meeting had certainly revived his spiritual strength; in fact, I guess it did the same for us all.

Mayor Todd of our city had an automobile in readiness to give Brother Stone a ride about the city, but the inclemency of the weather prevented. It being Sunday there were no arrangements for an evening's entertainment.

It was the sense of the meeting that hereafter we hold a Fifth Sunday Union Meeting on the system. Brother Stone assured us he would have a Grand Officer with us on these occasions, if possible.

The meeting opened at 2:30 P. M. and closed at 8:30 P. M., and was one to be remembered by all who were fortunate enough to attend.

Yours fraternally,

GEO. A. HOLDEN.

DIVISION No. 88, North Platte, Neb., will give their Twenty-Third Annual May Party on May 2, 1905, to which the Editor has been favored with an invitation and complimentary ticket. The invitation is in the form of a train order, the body of which reads, viz.:

"You will display signals for your ladies and run as first section of Division 88, B. of L. E., to North Platte, and there attend the Twenty-Third Annual May Party, to be held at Lloyd's Opera House, on Tuesday, May 2, 1905.

"After arriving at the Opera House you will work extra from Nine P. M. until Twelve A. M. From Twelve-one A. M. until One-ten A. M. you will have right of track to the Cafe and return, and will receive all of the hospitalities that Division 88 can extend to you, in winding up

their Twenty-Third Annual May Party. Returning home you will protect yourselves against the police patrol or from heading into the hurry-up wagon.

R. A. G."

We take this opportunity to thank Bro. Douglas, Chairman Arrangements Committee, for remembering us, and we would be exceedingly glad if it were possible for us to share in the festivities and the hospitality of our Brothers and Sisters of North Platte, but we might be "heading into the hurry-up wagon" if we neglected our duties in connection with the JOURNAL Department, and to keep out of trouble we will have to be content with thanking them and wishing the greatest possible success for their May Party.—Ed.

STAR OF 1900 Div., 138, G. I. A. to the B. of L. E., has not been either dead or sleeping since I last wrote the JOURNAL an account of their social, but this time they have branched out on a new road, sending out invitations and tickets for their first annual ball given March 3rd, and for a first attempt to call it great is but a mild name for it. The K. of P. Hall was hired for the occasion and most artistically draped in the colors of the Auxiliary, and with the electric headlights kindly loaned by Mr. G. P. Drodge, our local Master Mechanic, the hall was indeed a blaze of light and color.

At 8:30 P. M. a splendid orchestra opened in the music of a preliminary waltz, and at its close at once struck up the opening bars of the grand march. This was led by Brother and Sister C. M. Cunningham and before they had made the first circuit of the hall 150 people were following their lead, and they led them through the mazes of one of the prettiest grand marches ever seen in El Paso. That was the start, and from then till the wee sma' hours, through a program of twenty-one numbers and several extras, mirth and music reigned supreme, and when the last bars of "Home, Sweet Home" signaled the close, one might hear, "The swell ball of the season," "the prettiest and best dance I ever attended," etc., on all sides; and that is high praise in a city that en-

joys as many balls as El Paso each season, and the ladies of our Auxiliary need never fear a frost for their annual ball in the future.

The only regret I heard expressed was, "It's a long time till their next."

The ladies have only praise and thanks for each and every Brother who helped them in all ways in their power; but the Brothers who were fortunate enough to be in and able to attend felt well repaid.

Call again, Star of 1900, may your light be ever a bright guide for loving friends and kindred in the darkest, wildest night.

May God ever guard and guide you,
Free from trouble, pain or woe,
Every joy and blessing grant you,
In life's struggle here below.

M. N. GEDDES, Div. 192, B. of L. E.

AT a regular meeting of Div. 154 at Howell, Ind., March 30 1905, the following report was read by the F. A. E. and ordered sent to the JOURNAL for publication:

Worthy Chief and Brothers: Tonight ends my fourteenth year as F. A. E. of this Division. The Division had just moved here from Mt. Vernon, Ill., on account of the removal of the L. & N. shops from Mt. Vernon to Howell.

My name first appears on the register as a visitor from Div. 246 on Feb. 15th, 1891. On March 1st, I was admitted by card from Div. 246 and on March 15th was elected F. A. E., and have been honored by the unanimous vote of the Division for the position ever since.

Some statistics of what we have done in fourteen years may be of interest at this time. We then had 25 members; now we have 71. We have initiated 50 into the Division, admitted by card 15, had 4 deaths, expelled 3, granted 1 final card, and 11 transferred to other Divisions. It has never been the policy of this Division to have a surplus, as we could always raise any amount needed on short notice. We have always made our assessments just large enough to cover actual needs. In the fourteen years I have handled more than \$7,500. Each active member for the fourteen years has paid \$134, or less than \$10 per year. There never has been an active member dropped from this Division for non-payment of dues, and tonight, the last meeting in the quarter, there is only \$3 50 outstanding. We have no debts, have a few dollars in the hands of the S. A. E., and \$47 in the hands of the F. A. E. In the fourteen years we have held 320 meetings. My name is on the register 293 times. I have written an average of 25 due notices each quarter, a total of 1400. I have written at least 50 letters each year, or 700 letters. I have been your member of the State Legislative Board for six years, and honored by the unani-

most vote of the Division for delegate to the Los Angeles Convention.

My duties have always been a pleasure to me, for we have had peace and harmony throughout the entire fourteen years, and all Brothers have been so prompt to co-operate and assist whenever called upon to do so. There is much work to be done outside of the meeting hours by the F. A. E., but when appreciated, as it has been done by this Division, it is indeed a pleasure.

CHAS. SUTTER, F. A. E.

The above deserves to be read more than once, and to be remembered as an example of what may easily be done when all pull together. We have about twenty-five subdivisions yet without the new work because they have failed to comply with the law and pay their Grand Dues for 1904, and nearly, if not quite all of them, are as well conditioned to meet their obligations as subdivision No. 154. Every subdivision ought to move up in line, pay its dues promptly, and when the F. G. E. sends out his annual report have the record show clear of debt. Let those who are slow try it and see how much better they will feel, and how much more interest is created by a policy of punctuality. EDITOR.

SATURDAY, April 8, Bro. Sylvester G. Canney of Boston Div. 61, with his wife, celebrated the 56th anniversary of their marriage at their home in Salem, at 87 Buffum Street. Some time ago I gave to the JOURNAL a sketch of three of the oldest engineers on the B. & M. Railroad, and who are, I believe, the oldest in the country, Bro. Rufus T. King of Nashua, Brother Canney and Bro. Reuben Jones of Salem. Brother King has been quite sick for many weeks at his home, and not yet returned to work, but Brother Canney is still on duty on his Salem and Lawrence run, excepting Brother King the oldest engineer in the country in active service and on a regular passenger train. He is in his 56th year of railroad service on an engine. Prior to being a fireman, which he was for two years, he was brakeman, employee of freight office, and as beginner, a section hand in his long railroad career. April 8, 1849, he married Marie J. Briard of Kittery, Me., who has for the 56 years proved a most worthy companion.

Brother Canney is one of our best known engineers, both to the fraternity and the public.

Now, Brothers, you think perhaps I am writing of some old man that a few of the narrow-minded public might think ought to be relegated to the rear long ago. That might all be so with some, but if you could have seen him march me through a "cake walk" around Salem engine house last Saturday forenoon, you would not ever expect to see his train up for bids during the next twenty-five years at least. He is far more nimble than some of "us young trash," and if you don't believe it just watch him "do a jig."

He is one of our most constant and punctual attendants at the meetings of Div. 61, and his name appears as a member way over where the first ones were entered, and we hope to keep it there many years longer.

Last Sunday he, with 97 more of us (and one of the 97 was "Uncle" Reuben Jones of Salem), assembled in our new hall at 164 Canal Street (space is short and I'll tell you more about the street in a later issue), and admired our new quarters. By the way, Brother readers, we boast now of the largest Division in the country, and I will challenge any Division for a greater attendance. The hall committee certainly have "done themselves proud," for which we are all truly grateful. Then, too, we can't give the ladies praise enough for what they have done. Sickness of your humble servant kept all knowledge of the many changes from the writer till Sunday, April 9, when for the first time he entered the new quarters. It was christened a week before; to be more definite, Saturday evening, April 1, by the Ladies' Auxiliary; but I trust I can read a good account of their "doings" in our JOURNAL by one who was there.

From our last meeting we missed one constant attendant, Bro. John H. Green of Lynn. There is only one "Jack" Green with us and we miss him when he's gone. On the evening of April 5, while passing out of the roundhouse to go home from his work, he slipped and fell into an engine pit, breaking one leg below the knee.

For many years he has been one of our best workers in the cause, and we all regret his misfortune and shall miss his presence among us for some time.

Thinking I am taking more space than I ought I will wait till next issue to tell you more.

Kindly allow me to thank Bro. N. H. B. Wardwell of Lowell, for attending the needs of the Division, and also Bro. George B. Dority during my sickness.

Fraternally yours,

W. F. BUCKNAM, Cor. Sec. Div. 61.

A PRETTY home wedding occurred in Meadville, Pa., on Wednesday evening, March 15, at the residence of Brother and Sister Albert T. Stenger, in which the bride was their daughter, Miss Minnie Mae, and the groom was Dr. Frank Allison Clawson, also of Meadville.

The house was handsomely decorated in yellow, white and green, with a wedding bell canopy backed with palms, ferns and yellow narcissus. The ceremony was witnessed by about 150 guests, and was performed by Rev. P. F. DeLancy, pastor of the Baptist Church, using the ring ceremony. The ceremony was performed at 7 o'clock, and at the close the happy couple were showered with bridal roses from the marriage bell above. The high esteem in which the bride is held was shown by the many gifts, being too numerous to mention.

Mr. and Mrs. Clawson had intended driving to the trolley station to take a car for Cambridge Springs, from where they will depart on an eastern trip, but their young friends vetoed the carriage and escorted them to the station on foot, the carriage following behind, and at the station they were given a royal send-off.

Both Mr. and Mrs. Clawson are well known in Meadville, and their many friends wish them happiness and prosperity. Mrs. Clawson is a graduate of the Meadville High School, and is happy in many womanly graces and accomplishments. Dr. Clawson is a successful surgeon and physician and a specialist of the eye, ear and throat, and is the examining physician for Div. 43, and the members wish them both success through life, and

may they float down life's turbid stream like a dish of ripe strawberries smothered in cream.

W. E. N.

ONE of the most enjoyable gatherings in the history of Div. 61 of Boston, was held on Saturday evening, April 1, it being the "housewarming" of their new hall, 164 Canal Street. To say that our new hall was well filled hardly fits the case, for it was packed with Sisters and Brothers and friends, and many were turned away for lack of room.

Perhaps, as we are so proud of our new quarters and appreciate so fully our committee's efforts in securing and refitting the place as they have in such short time, a short description of our new home may not be amiss. On entering from the street one ascends a fairly wide flight of stairs, one door on right at the top leads into our main hall (which will comfortably seat 300 people) with a slightly raised platform at the head with a row of electric footlights for theatricals, etc. A raised platform extends along both sides of the hall, accommodating a row of settees and also accommodations for the other officers at their respective stations. Near the foot of the hall a door leads into a small entry out of which one door opens into the toilet rooms, one into the kitchen, supplied with suitable tables, closets, sink and gas ranges; another door leads from a small entry into the banquet hall, nearly as large as the main hall, and which is supplied with many small closets and also a coat room where clothing may be checked, also many hooks (all numbered) on the outside for clothing not checked.

At the head of this hall an ornamental iron railing incloses a small space for desks or office purposes and near the door leading into the landing at top of main stairs directly opposite the door into main hall.

Both halls are finished with steel ceilings and furnished with both gas and electric lighting, and with their new coat of paint brought forth many expressions of pleased surprise and delight from the Sisters and Brothers gathered there for the "housewarming," most of whom had never seen our new home before.

The committee having the procuring

and refitting of the hall in charge, consisting of Bros. Woodman, Wilson and Channell, may well feel proud and amply repaid for their efforts at these expressions of approval and congratulation showered upon them by the Sisters and Brothers during the evening, and after the work of getting thoroughly settled is over, we may all well be proud of the new home of "Old 61."

Next Sunday, April 9, we shall hold our first regular meeting in our new hall, and we hope the attendance at that time will test the capacity of our new hall.

The evening's entertainment was furnished by the Ladies' Auxiliary 99, and consisted of a "coon show" with cake walk, songs, fancy dancing and introducing many "hits" on different Brothers and Sisters, a full account of which will probably be sent to the Ladies' Department of the JOURNAL by the Corresponding Secretary of Div. 99. During the evening the writer read an original poem written for the occasion and as I have received a request for several copies will send you a copy for publication, if space permits you to do so.

After the entertainment all enjoyed light refreshments, consisting of sandwiches, cake and coffee, furnished by the Sisters of Div. 99.

The evening was thoroughly enjoyed by all and the bursts of applause from the Brothers and Sisters, as each got a "rap" from the "coons," made the steel ceiling ring again and again, and I think I might safely say that never in the history of Div. 61 have we had a more enjoyable time than at our "housewarming" on April Fools' Day.

I want to say that everyone taking part in the "coon show" and entertainment was a member of either Div. 99, Auxiliary, or of Div. 61, B. of L. E., with two exceptions, they being daughters of members; so we were wholly independent of any outside assistance, and in fact needed none.

But I must quit or you will have to take out more than the Division Addresses from the JOURNAL. More some time.

N. H. B. W., Cor. Sec. Div. 61.

At a regular meeting of Div. 821, B. of L. E., held March 27, 1906, the following resolutions were unanimously adopted:

WHEREAS; Our former Roundhouse Foreman, Mr. Samuel C. Sheppard, having been promoted to General Foreman of Southern Railway Shops at Manchester, Va., we, the committee appointed by the engineers of Max Nathan Div. 321, wish to express our high appreciation of his valuable service and pleasant relationship which existed between Mr. Sheppard and the engineers, as Roundhouse Foreman for the past seventeen years.

Resolved, That we heartily commend Mr. Sheppard to all with whom he may come in contact in his duties, as we have always found him to be a gentleman of the highest integrity. Therefore, we wish for him the greatest success and prosperity in his upward path of life.

Resolved, That a copy of these resolutions be furnished Mr. S. C. Sheppard and a copy be sent to the B. of L. E. JOURNAL, also to be placed on the minutes of Div. 321.

W. A. VIAR,
J. E. MCALLISTER,
J. T. GARRETT,
Committee.

SPECIAL NOTICES.

Wanted—To know the whereabouts of Daniel P. Cohan, an engineer on the Mohawk Division of the N. Y. C. & H. R. R., who disappeared Nov. 17, 1904. Address Bro. J. W. Blewer, F. A. E. Div. 46, 1 Hunter avenue, Albany N. Y.

Anyone knowing the whereabouts of J. Henry Fulton, formerly a member of Division 99, running out of Paducah, Ky., will please write Mrs. Will Etta Stoker, Water Valley, Miss. Very important.

The traveling card of Bro. LeRoy B. Miller has been lost. If presented, please take up and forward to A. G. Archer, F. A. E. Div. 522, Chicago Junction, O., and oblige.

Information is wanted of Wallace B. Sisson, born in Louisiana, supposed to be an engineer somewhere in the South. Address J. P. Nesbitt, University, N. C.

Members of the following Divisions will correspond with the F. A. E. of their Divisions immediately:

Division—	Division—
571—James Pixton,	362—T. R. McGibbon.
V. R. DeGroff,	254—Thos. J. Riley.
C. P. Segerdahl.	274—Geo. M. Ireland.

OBITUARIES.

[In accordance with the action of the Ottawa Convention, no resolutions of condolence, obituary letters or poems will be published in the JOURNAL. All deaths will be listed under obituary heading only, with cause and date of death.]

Harrisburg, Pa., March 24, 1904, Bro. William H. Weber, member of Div. 74.

Harrisburg, Pa., Feb. 25, 1904, Bro. Madison A. Carnahan, member of Div. 74.

- Harrisburg, Pa., May, 1904, Bro. Elmer E. Walck, member of Div. 74.
- Harrisburg, Pa., Aug. 27, 1904, Bro. Harry R. Andrews, member of Div. 74.
- Harrisburg, Pa., Oct. 1, 1904, Bro. H. D. Drancker, member of Div. 74.
- Chicago, Ill., March 16, committed suicide by inhaling gas, Bro. F. Dunham, member of Div. 10.
- Auburndale, Mass., March 17, Bro. W. H. Bancroft, member of Div. 439.
- Albany, N. Y., March 14, burned to death on engine, Bro. Elmer G. Allen, member of Div. 46.
- Harvard, Ill., March 11, Bro. James N. White, member of Div. 96.
- Troy, N. Y., March 19, lobar pneumonia, Bro. Peter Egan, member of Div. 87.
- Albany, Ga., Feb. 20, Bro. Elijah Pate, member of Div. 210.
- Memphis, Tenn., March 17, injuries received from jumping off engine, Bro. W. F. Montgomery, member of Div. 285.
- Binghamton, N. Y., March 17, surgical operation, Bro. Allen A. Morse, member of Div. 311.
- Hornellsville, N. Y., March 11, Bro. Thos. Gartside, member of Div. 47.
- Palmerston, Ont., March 23, Mr. John Best, father of Bro. Geo. T. Best, member of Div. 518.
- Buffalo, N. Y., March 13, heart failure, Bro. Ed. Greenan, member of Div. 328.
- Ottawa, Ont., July 13, 1904, killed by train running over him, Bro. H. Demerias, member of Div. 168.
- Ottawa, Ont., Feb. 22, 1904, pleurisy, Bro. N. Pommerville, member of Div. 168.
- Minneapolis, Minn., March 25, pneumonia, Bro. Elmer Conright, member of Div. 357.
- Marquette, Mich., March 18, Bro. John Fitzgerald, member of Div. 94.
- Louisville, Ky., March 19, Mr. John M. Farrar, father of Bros. Henry, William and Jos. P. Farrar, member of Div. 78.
- Milwaukee, Wis., March 20, Bro. Fred Nenabuck, member of Div. 66.
- St. Joseph, Mo., Jan. 10, Bro. J. F. McCale, member of Div. 107.
- Mankato, Minn., March 29, derailment of engine, Bro. Jenkins Morgan, member of Div. 516.
- Concord, N. H., March 20, Bright's disease and shock, Bro. Chas. E. Jouis, member of Div. 335.
- Leonia, Idaho, March 23, running into rock slide, Bro. O. J. Jouis, member of Div. 576.
- San Francisco, Cal., March 23, Mrs. May J. Bunnell, wife of Bro. D. B. Bunnell, member of Div. 126.
- Pitcairn, Pa., March 26, Bro. William E. Welshans, member of Div. 325.
- Basin, Mont., March 30, killed in wreck, Bro. John A. Webber, Ins. Sec'y Div. 504.
- Fremont, Neb., March 27, heart failure, Mr. H. C. Mahanna, 35 years in the employ of the C. & N. W. Ry., serving from station agent to superintendent.
- Philadelphia, Pa., March 28, Bro. William H. Ossman, member of Div. 45.
- Philadelphia, Pa., March 29, Bro. John Bosley, member of Div. 109.
- Jersey City, N. J., April 1, Bro. Samuel Barr, member of Div. 53.
- Jersey City, N. J., March 30, Bro. James P. Haney, member of Div. 53.
- Rock Island, Ill., March 29, injuries received in wreck, Bro. Alvin C. Hotchkiss, member of Div. 60.
- Clarksville, Tenn., March 27, killed in collision of cut of cars on main track, Bro. John Murray, member of Div. 215.
- Mobile, Ala., May 8, 1904, Bro. P. Y. Davison, member of Div. 140.
- Mobile, Ala., Jan. 26, 1904, Bro. P. J. Hanley, member of Div. 140.
- Macon, Ga., March 25, heart failure, Bro. W. A. Strieter, member of Div. 323.
- Savannah, Ga., March 14, pneumonia, Mrs. W. E. Perry, wife of Bro. W. E. Perry, member of Div. 256.
- Binghamton, N. Y., March 27, Bright's disease, Mrs. Elizabeth H. Spaulding, wife of Bro. W. L. Spaulding, member of Div. 311.
- Sullivan, Ill., March 28, killed in collision, Bro. Chas. E. Bowe, member of Div. 606.
- Van Buren, Ark., Sept. 21, 1904, killed by engine turning over, Bro. Almou Carpenter, member of Div. 524.
- Wellsville, O., May 20, 1904, Bro. M. P. Wilson, member of Div. 170.
- Wellsville, O., April 4, killed in collision, Bro. E. B. Fuller, member of Div. 170.
- Altoona, Pa., Feb. 27, James H. Bradley, twin brother of Warren S. Bradley, son of Bro. A. J. Bradley, member of Div. 287.
- Livermore, Cal., April 1, Bro. Wm. Bradley member of Div. 283.
- Tuscaloosa, Ala., April 8, killed by boiler explosion, Bro. G. P. Humphries, member of Div. 450.
- Charleston, Ill., April 9, abscess of the bowels, Bro. A. Waibel, member of Div. 245.
- Rochester, N. Y., March 6, suicide, Bro. W. J. Pyatt, member of Div. 11.
- Fort William, Can., Feb. 28, 1904, heart disease, Bro. Joseph Elms, member of Div. 243.
- Raleigh, N. C., May 12, 1904, accident, Bro. J. R. Byer, member of Div. 339.
- Springfield, Mo., March 9, killed, Bro. F. A. McCormick, member of Div. 378.
- Chicago, Ill., Feb. 19, Bro. H. Downey, member of Div. 404.
- Somerville, Mass., April 4, pneumonia, Bro. Fred W. Dimond, member of Div. 61.
- Sunbury, Pa., Jan. 9, killed, Bro. Thompson Conzor, member of Div. 250.
- Sunbury, Pa., Feb. 2, Bro. A. Moulder, member of Div. 250.
- Hillsboro, Tex., March 11, pneumonia, Harry Corrigan, son of Bro. Ed. Corrigan, member of Div. 475.
- Syracuse, N. Y., April 1, killed, Bro. Geo. Wilkinson, member of Div. 441.
- Batavia, N. Y., March 25, diabetes, Bro. George Archer, member of Div. 18.
- Sunbury, Pa., March 26, Bro. W. T. Heintzinger, member of Div. 250.
- Selma, Ala., March 6, malarial fever, Bro. Wm. Laughlin, member of Div. 223.
- Georgiana, Ala., March 18, heart disease, Bro. W. W. Prince, member of Div. 223.
- Bradford, Pa., April 7, tuberculosis, Mrs. Bessie I. Putnam, wife of Bro. W. S. Putnam, C. E. of Div. 254.
- Mattoon, Ill., April 11, Bro. Sealy Ashmead, member of Div. 37.
- Denver, Colo., April 11, Bro. Henry Humburg, member of Div. 186.
- Clifton Springs, N. Y., April 9, Bro. John Coe-grove, member of Div. 421.
- Vancouver, B. C., April 7, heart failure, Bro. A. Goddard, member of Div. 320.
- Revelstoke, B. C., April 2, killed in wreck, Bro. David Little, member of Div. 657.
- Louisville, Ky., April 7, Mrs. Julia Agnes Curley, wife of Bro. W. B. Curley, F. A. E., Div. 485. Mrs. Curley organized G. I. A. Div. 132, which was given her name, and she will be remembered by very many in all sections, as she attended eight E. of L. E. conventions with Brother Curley, and these many acquaintances will feel keen regrets at the loss to the order and the family.
- Salem, Mass., April 13, Mrs. Marie J. Canney, wife of Bro. Sylvester Canney, member of Div. 61.

Goshen, Ind., Jan. 1905, Bro. G. W. Pollock, member of Div. 4.
 Philadelphia, Pa., April 17, Bro. D. A. Scudder, member of Div. 109.
 Bennett, Pa., March 27, from surgical operation, Mrs. Edward Ross, wife of Bro. Edward Koss, C. E. of Div. 452.

ADMITTED BY TRANSFER CARD.

LOCOMOTIVE ENGINEERS' MUTUAL LIFE AND ACCIDENT INSURANCE ASSOCIATION.

Official Notice of Assessments 852-856.

SERIES F.

OFFICE OF ASSOCIATION, ROOM 803, SOCIETY FOR SAVINGS BUILDING, }
 CLEVELAND, OHIO, May 1, 1905. }

To the Division Secretaries L. E. M. L. and A. I. A.:

DEAR SIRS AND BROS.:—You are hereby notified of the death or disability of the following members of the Association:

Five Assessments for payment of these claims are hereby levied and Secretaries ordered to collect

\$1.25 from all who are insured for \$750, \$2.50 from all who are insured for \$1,500, \$5.00 from all who are insured for \$3,000, and \$7.50 from all members insured for \$4,500, and forward same to the General Secretary and Treasurer.

Members of the Insurance Association are required to remit to Division Secretaries within thirty days from date of this notice, and the Division Secretaries to the General Secretary and Treasurer within ten days thereafter, on penalty of forfeiting their membership. (See Section 25, page 80, of By-Laws.)

Secretaries in sending remittances will send same to and make all drafts, express money orders or postoffice money orders payable to M. H. SHAY, General Secretary and Treasurer. Secretaries located in Canada will please remit by draft or express money order. We will not accept packages of money sent by express, unless charges have been prepaid. The JOURNAL closes on the 18th of each month. Claims received after that day will lie over until the succeeding month.

WRITE FOR CATALOGUE

Every Woman Loves a Diamond

The greatest feminine wish is for Diamonds. When a woman is truly beautiful she wears Diamonds. With Diamonds she becomes doubly attractive. Diamonds enhance the charms of all women. Sweetheart, wife, daughter and mother eagerly desire fiery, flashing aristocratic gems. And woman's intuition is right. The scintillating jewels make her beautiful, aid her in achieving social triumphs, and, in necessity are her instantaneous asset—her savings bank. A wise woman knows she can get prompt cash for her Diamonds—wherever she may be—in any part of the world. *Write for Catalog.*

Write for a Catalog The Loftis Catalog is free. Write at once for a free copy of our luxurious and beautiful catalog containing 1,000 illustrations of Diamonds, Watches and Jewels—66 pages of valuable information explaining our popular system in every detail, giving lowest quotations. We also send free to all applicants a unique and interesting Diamond Souvenir Booklet. Write at once and we will send you both Catalog and Booklet free, to your great pleasure and advantage.

The Loftis System of Diamonds on Credit, which won the Gold Medal at the St. Louis Exposition, is easy and confidential, enabling far-away buyers to select the finest Diamonds, Watches and Jewelry. The article is sent on approval to your home, place of business or express office as preferred, so you can examine it, being free to buy or not, as you please. We deliver anywhere in the United States, paying all charges, taking all risks. *Write for Catalog.*

Our Credit Offer All honest people—employer or employee—can open a confidential account with us. One-fifth the price to be paid on delivery—you retain the article—pay balance in eight equal monthly amounts, sending cash direct to us. You will not miss the small monthly payments from your income. Save a Diamond. Better than a Savings Bank. Diamonds are predicted to increase in value 20 per cent during the present year. *Write for Catalog.*

Our Cash Terms You select your Diamond. You pay cash for it. We give you a written guarantee that you can return the Diamond any time within one year, and we will pay you all you paid for it less 10 per cent. You can thus wear a \$50.00 Diamond Ring or Stud for one year—return it to us—get your \$45—which is less than 10cts. per week for one year.

Guarantee With each Diamond we give a written guarantee of quality and value signed by a member of our firm. *Write for Catalog—66 pages.*

Write at Once to us for Catalog of Diamonds, Watches and Jewelry and you will obtain every advantage by doing business with the largest Diamond House. *Write for Catalog—1000 Illustrations.*

We Will Buy

A 50c. Bottle of Liquozone and Give it to You to Try.

We want you to know about Liquozone, and the product itself can tell you more than we. So we ask you to let us buy you a bottle—a full-size bottle—to try. Let it prove that it does what medicine cannot do. See what a tonic it is. Learn that it does kill germs. Then you will use it always, as we do, and as millions of others do.

This offer itself should convince you that Liquozone does as we claim. We would certainly not buy a bottle and give it to you if there was any doubt of results. You want those results; you want to be well and to keep well. And you can't do that—nobody can—without Liquozone.

We Paid \$100,000

For the American rights to Liquozone. We did this after testing the product for two years, through physicians and hospitals, after proving, in thousands of different cases, that Liquozone destroys the cause of any germ disease.

Liquozone has, for more than 20 years, been the constant subject of scientific and chemical research. It is not made by compounding drugs, nor with alcohol. Its virtues are derived solely from gas—largely oxygen gas—by a process requiring immense apparatus and 14 days' time. The result is a liquid that does what oxygen does. It is a nerve food and blood food—the most helpful thing in the world to you. Its effects are exhilarating, vitalizing, purifying. Yet it is a germicide so certain that we publish on every bottle an offer of \$1,000 for a disease germ that it cannot kill. The reason is that germs are vegetables; and Liquozone—like an excess of oxygen—is deadly to vegetal matter.

There lies the great value of Liquozone. It is the only way known to kill germs in the body without killing the tissue, too. Any drug that kills germs is a poison and it cannot be taken internally. Every physician knows that medicine is almost helpless in any germ disease.

Germ Diseases.

These are the known germ diseases. All that medicine can do for these troubles is to help Nature overcome the germs, and such results are indirect and uncertain. Liquozone attacks the germs, wherever they are. And when the germs which

cause a disease are destroyed, the disease must end, and forever. That is inevitable.

All diseases that begin with fever—all inflammation—all catarrh—all contagious diseases—all the results of impure or poisoned blood.

In nervous debility Liquozone acts as a vitaliser, accomplishing what no drugs can do.

50c. Bottle Free.

If you need Liquozone, and have never tried it, please send us this coupon. We will then mail you an order on a local druggist for a full size bottle, and we will pay the druggist ourselves for it. This is our free gift, made to convince you; to show you what Liquozone is, and what it can do. In justice to yourself, please accept it to-day, for it places you under no obligation whatever.

Liquozone costs 50c. and \$1.00.

CUT OUT THIS COUPON

for this offer may not appear again. Fill out the blanks and mail it to The Liquozone Co., 458-464 Wabash Ave., Chicago.

My disease is
I have never tried Liquozone, but if you will supply me a 50c. bottle free I will take it.

NUMBER 6.

Denver, Northwestern & Pacific Railroad.

The Denver, Northwestern & Pacific Railroad, or as it is more generally known, "The Moffet Road," was projected by David H. Moffet, to extend from Denver to Salt Lake City, a distance of something over 500 miles. With Mr. Moffet the construction of the road has been a matter of sentiment as well as a business proposition. Nearly half a century ago he came to Colorado, and it has been within the confines of his adopted State that by successful ventures in mines, real estate, banks and railroads he has massed the millions which he is putting into the new road, which will open up a new em-

pire and stand as a lasting monument to his memory.

If the reader will consult a railroad map of the Rocky Mountain region, he will notice that between Denver and the "City of the Saints" lies a strip of territory 500 miles in length and 200 miles in width across which no railroad has stretched its meshes. The reason for this lack of steam communication with the outside world is not because the tract is a barren one, for it contains some of the most fertile valleys of the States of Colorado and Utah. In its mountains are rich deposits of the precious metals, gold and silver, and vast fields of coal, gilsonite, iron, etc., awaiting but the coming of

YANKEE DOODLE LAKE.

the railway to develop this vast wealth.

From the top of any high building in Denver one may see to the northwest the reason for this undeveloped region in the frowning battlements of the Front Range, the rampart of the Continental Divide, stretching like the Great Wall of China in front of the coveted territory on which the leading spirits of the western railway have cast longing eyes and made many a futile attempt to reach in the years gone by.

It has remained for Mr. Moffet and his engineers to scale the ramparts and to connect the outside world with the vast territory beyond its barriers.

It was early in January of 1903, a little

of the towering mountains which form the crest of the Continental Divide, the road climbs by varying grade whose maximum is two per cent. Thirty tunnels, varying in length from 75 feet to over 1,700 feet, and whose combined lengths are over 16,000 feet, have been driven.

It is the intention of the railroad company to pierce the Main Range of the mountains at an elevation of about 10,000 feet by a tunnel something over four miles in length. Until this is completed, the "temporary line," as it is called, winds away to the northward, and by a devious route and a four per cent grade, finds its way to summit on Rollins Pass, where

CLIMBING THE MOUNTAIN NORTH OF TOLLAND, COL. - F. J. FRANCIS, PHOT'R.

over two years ago, that the first work on the real construction of the line was commenced. In these two years only seventy-seven miles of grade have been completed and track has been laid. But to appreciate the reason for this apparent slowness of construction one has but to ride over the finished road and to note that from the time the foothills are entered, a few miles from Denver, until Arrowhead, the present western terminus, is reached, fully a half of the grade was constructed through cuts, or tunnels, which were blasted through solid rock on the mountain sides.

From Denver to Tolland, which lies at an elevation of 9,000 feet at the very foot

from an elevation of 11,660 feet, the highest point reached by any broad-gauged road in the world, the passengers may look eastward over the plains for a hundred miles, and to the west range after range with their snow-capped peaks are within the vision, and in the more immediate foreground the traveler may look down into the magnificent amphitheater of Middle Park, 3,000 feet below, where the Frazer River winds like a silver thread through the green meadows, and nearer yet are the vast pine forests, coming up to timber line below the Pass.

Often the train in making the ascent to the Pass, climbs through the clouds which hug the mountain sides and one looks

down upon the billowing vapor, which beats against the higher mountain peaks as the waves are dashed upon the islands of the sea.

A few miles from the summit, on the Pacific slope, is "The Loop." At "Rifle Sight Notch," as it has been named, the line leaves the regular slope of the Main Range and enters upon a trestle which carries it across the "Notch" to the well-timbered slopes of Spruce Mountain. This mountain is completely encircled by the railway, first traversing the east side, then around the west side and onward to the south side, where it passes through a tunnel directly below the "Notch" and under the trestle mentioned above, to the

Mr. Stetson's Denial.

"I'm sorry you're going home to-morrow," said Jimmy, regretfully. "You see, I've sort of formed the habit of dropping in for a chat and a cup of tea every afternoon."

"Four weeks ago you had never heard of me," reproved Miss Caswell.

"That," said he, "is where you wrong Mrs. Granger. She has sung your praises into this willing ear lo, these many years."

"Mrs. Granger is so enthusiastic," declared Letty, none the less pleased at the statement. "If she likes you she canonizes you."

"I know," he agreed. "I am trusting to

COAL CREEK BRIDGE, WHERE THE MOFFET ROAD ENTERS THE FOOTHILLS.—F. J. FRANCIS, PHOT'R.

east side again, thus forming a complete loop. In making the loop which is a mile around, the road has made a descent of 175 feet. (See loop on cover.)

Taken as a whole, the Moffet road cannot be excelled for the beauty and the grandeur of its scenery; for, leaving the levels of the streams, it climbs hundreds of feet above on the mountain sides, thus giving a vast panorama of plains and distant mountains.

Work on the grade between Arrowhead and Hot Sulphur Springs will be completed early in the summer and the road will then be extended to that point.

F. J. FRANCIS.

the pair of wings she has endowed me with to be my strongest argument with you."

"In what cause?" she asked curiously.

"I am a poor creature of habit," he began, lightly enough, with an undercurrent of seriousness in his tones. "I have contracted the habit of expecting chat and tea at four each afternoon, and I had hoped to convince you that it would be desirable to make the custom permanent."

"What are you driving at?" she laughed.

"I mean," he said more soberly, "that I crave the honor of making you my wife. Don't think I'm not serious," he went on as he saw her frown. "I speak lightly,

because, did I put into my plea all the feeling within me I should make even Mrs. Granger hear me."

Letty Caswell glanced at the unconscious hostess, who was placidly knitting in the bay window, her thoughts busy with the match-making plans which had led her to invite Letty Caswell to visit her.

"I am sorry," began Letty, "that you should have said this. It seems unfortunate that this should have come up the last day."

CASTLE GATE TUNNEL, MOFFET ROAD.—F. J. FRANCIS, PHOT'R.

"That means no?" he asked.

"You see," she explained, "I want the man I marry to be one of the world's fighters. The man I love must have done something. You have idled all your life because your father left you money."

"I am afraid," murmured Jimmie, "that Mrs. Granger has not been as good an advance agent for me as she has been for you."

Letty caught his hand in hers, carefully

evading his attempt to squeeze it. "Does that look like the hand of one who works?" she asked, pointedly.

"It does not," he agreed, promptly. "I have often thought I could get a good round sum as a recommender of the patent soap I use."

She dropped his hand with a gesture of vexation. "Did you ever do any hard work?" she cried.

"Lady," he said gently, "it is not for me to blazon my accomplishments to the world, but I have worked hard—real hard. Even now I accomplish much, but I am cursed with modesty."

"Please," she begged, "do not let us discuss the matter further. Let this last day be pleasant."
