

THE BOILER MAKER

VOLUME XXIII

JANUARY TO DECEMBER, 1923

PUBLISHED BY

SIMMONS-BOARDMAN PUBLISHING COMPANY

30 Church Street, New York, N. Y., U. S. A. 34 VICTORIA STREET, WESTMINSTER, S. W. I., LONDON, ENGLAND

INDEX

JANUARY TO DECEMBER, 1923

Note-Illustrated articles are marked with an (*) asterisk; Book reviews (B. R.); Editorials (E); Letters to the Editor (L); Paragraphs (P); Questions and Answers (Q).

A

A. S. M. E. Boiler Code, Second revision	
of the	
of the	103
of	289
Accuracy in boiler making. Lawrence Mc-	
Carthy (L)	28
Adoption of higher steam pressures and tem-	
peratures (E)	291
Air motor testing device Air reservoirs, Devices for testing super-	*50
heater units and	*226

Heavy Plates Used in Fireless Locomotive

Details of Construction of the Tank of the Largest Fireless Steam Locomotive Ever Built

By C. E. Lester

I is thought that in describing the tank of this locomotive that a word in reference to the general description of the locomotive should be given. The designers' reference gives, perhaps, the most clear and concise, short description and is quoted verbatim. "The fireless steam locomotive is a steam locomotive without boiler and firebox. In place of a boiler the fireless locomotive carries a tank containing water which is heated from a suitable stationary boiler or boilers. To insure dry steam the storage tank is filled but four-fifths with water. The locomotive tank is specially lagged and jacketed to prevent loss of heat.

"As steam is used by the locomotive the temperature of the water and the pressure of the steam in the tank is gradually reduced and part of the water turns to steam."

The locomotive is suitable for a wide range of shifting and hauling within reasonable limits as to distance. Due to its fireless features the locomotive is especially valuable around woodworking plants of all kinds, textile mills, powder works and other ammunition plants, oil works and innumerable places where fire locomotives would be dangerous. The steam is generated in the stationary plant more economically than in a locomotive.

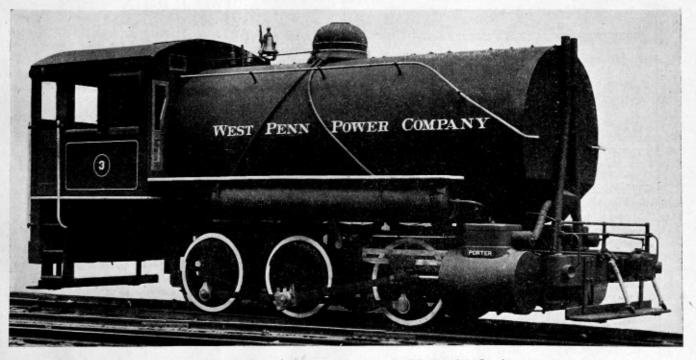

To charge the tank it is first filled four-fifths full of water and the steam from the stationary plant turned in. As soon as the steam equalizes in temperature and pressure the charge is completed and the steam is shut off. The charging fittings are then disconnected and the locomotive is ready for work.

For storing steam there must be water in the tank. Filling the tank with steam without water is useless. The stored energy is the heat in the hot water which turns the hot water into steam as fast as the steam is used. The hot water will continue to turn into steam at gradually reducing pressures until it reaches atmospheric pressure and 212 degrees F. A tank of hot water will supply about fifteen times as much steam as will fill the same tank.

DETAILS OF CONSTRUCTION

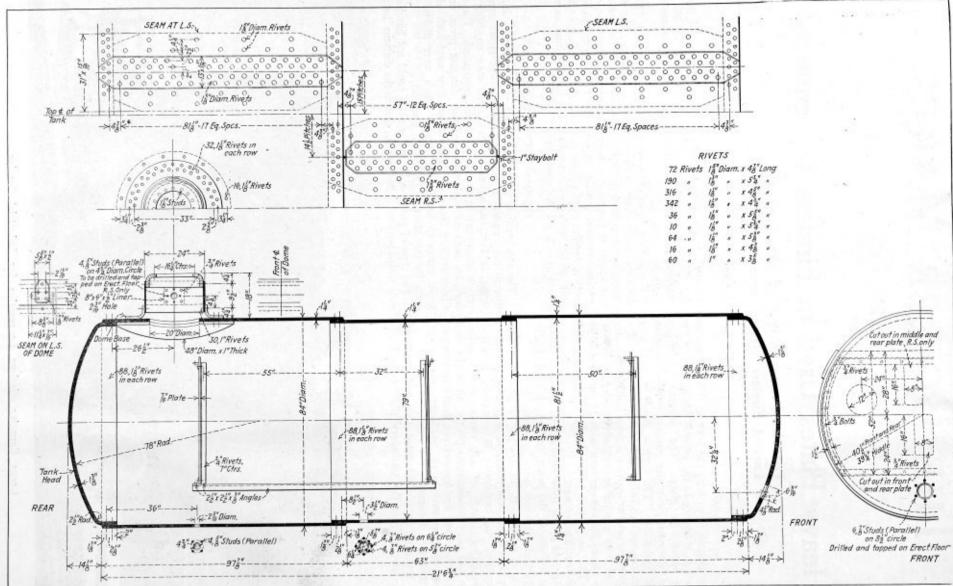

The construction of the tank was of considerable interest due to the unusually heavy plate and large rivets used; it being, in fact, much heavier and larger than anything ever before attempted in the shop where constructed. The shop contains both a Southwark sectional flanging press and a Chambersburg four post flanger, but they were both of too small range to handle the heads, which were dished and spun by the Midvale Ordnance Company.

The type of power rolls in the shop could not handle the welt straps without a flat section, due to the distance between

Large Capacity Fireless Locomotive for Industrial Service

1

Details of Tank for Fireless Locomotives and Arrangement of Longitudinal Seams, Rivet Sizes, Layout of Heads, Dome and Tank Sections

2

the rolls, so it was found necessary to press them under the four post press. This was done by means of a long cast iron V block for a matrix and a wooden former. The dome base and ring were also formed on the four post press by use of a former and matrix which were part of the regular shop equipment, the products being used on many of the larger types of locomotives built in the plant.

The two shell plates 11/4 inches by 981/2 inches by 261 inches and 11/4 inches by 631/2 inches by 2521/2 inches were too large to handle in the plate planer and due to the plates all being about 1/2 inch over size it was found necessary to chip all calking surfaces and butt joints. This was extraordinary only in that to chip 130 feet of 11/4-inch plate entails quite some labor. The large diameter of the shell courses precluded the possibility of getting them under any drill press in the entire plant so it was necessary to lay out all plates for drilling on the flat; that is to say, all holes in the shell were drilled before rolling. For the purpose of fitting up, the heads had 24 holes in groups of three drilled equally distant on the circumference. These were drilled 1/4 inch smaller than the finished size of the holes. Due to the necessity of drilling plates before rolling, unusual accuracy was necessary, especially in view of the fact that there were variations in thickness in different sections of the plate as high as 0.005 inch.

DRILLING THE SEAM HOLES

Before bending the plates, all the longitudinal seam holes were drilled 1/8 inch small to compensate for errors and irregularities. The circumferential holes were drilled full size in the plates. On the assembly, after fitting the shells to the heads with 7/8-inch tack bolts in the tack holes, drilling was commenced through the heads with air motors on centers opposite the seams. After drilling each set of four holes, the plates were bolted up securely with 11/8-inch bolts. This insured that there was no slack to take up, with the result that the plate edges met nicely at the joints when they were assembled.

It may be added that to prevent the possibility of the heavy plates cracking out from the holes on the roll up, all holes in the circumferential seams were slightly countersunk on both sides of the plate and the rough edges on the sides of the plates filed off. In addition to this, to insure a perfect joint at the butt, the butt joint ends were beveled about 3/16 inch. This was necessary because of the thickness of the plate. The layout being made from the neutral diameter and the true length of the plate being in the center, it was necessary to shorten the plate a little on the inside half. As it was, naturally the plates were slightly short on the outer half.

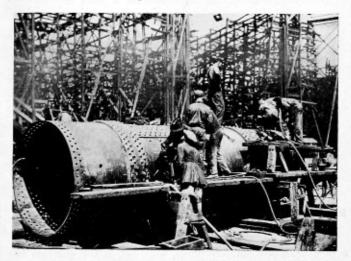

After the plates and heads were assembled, the welt straps with tack holes were bolted on, marked off, then taken down and drilled on a drill press. Later all flanges, plates and straps were assembled and all holes reamed to size. After this was done all parts were disassembled, all chips, cuttings and burrs removed and all parts reassembled. The parts were bolted up, heats taken and everything necessary was done to make the plates tight. In the test it was impossible to insert a 0.005 inch feeler between the plates. The tank was then riveted on the hydraulic riveter with pressures varying from 90 to 150 tons, according to the thickness of the plates and the sizes of the rivets.

The total weight of the shell being much greater than the capacity of the boiler shop crane, the two shell sections, after riveting were delivered to the erecting floor, there assembled and the one girth seam driven with a pneumatic hammer. Prior to the test, all girth seams except the heads were calked on the inside. All seams were calked outside. All girth rivets were also calked on the inside; that is, the seam which had been pncumatically driven.

The tank was built with a factor of safety of 4.85 to carry 350 pounds of steam. It was tested out at 525 pounds cold water. So well was the work done that there was barely a leak of any kind until the pressure reached 400 pounds, and very little after that. While the A.S.M.E. Code had had no special provision for *tanks* of this character it was built closely to this code for *boilers* of similar character and was inspected and passed by a boiler insurance company. In view of the character of the tank and the utter lack of combustibles in its operation it would seem that a lower factor of safety could profitably be used without in any way lessening the actual safety of the machine.

Heavy Plate Penstock Built for Recent California Power Development

MANY boiler concerns and plants equipped with machinery suitable for heavy plate fabrication have during the last year or two turned to tank and pipe line construction with great success. An example of such work occurred at the yard of the Los Angeles Shipbuilding and Dry Dock Company, where the facilities of the boiler and plate shop were recently employed in the fabrication of a penstock for the Southern Californian Edison Company, to be used to replace a section which failed in the

Heavy Pipe Constructed at Plant of Los Angeles Shipbuilding and Drydock Company

pipe line from Big Creek to number eight plant of the Edison Company.

The penstock was 22 feet 3 inches long and 6 feet in diameter of steel 1 1/16 inches thick. Butt joint construction was employed, with interior and exterior butt straps, calked inside and out. About 1,600 13%-inch rivets were required in lining up the plates of this penstock." This penstock, weighing thirteen tons, was loaded on a six wheel chaindrive tractor Mack truck. In order that no delays might occur, three drivers were provided for the truck and a similar truck followed light in case of accident. The trucks left the plant of the shipyard going via Bakersfield to Fresno, shortly above which point they were met by a locomotive and flat car of the San Joaquin and Eastern Railroad. The railroad transported the penstock 70 miles to Big Creek whence an inclined railroad carried it 2,000 feet down to a second inclined railroad which dropped it another 800 feet to the concrete base prepared for it about seven feet above the ground against the side of the mountain. The penstock is called on to withstand a pressure of around 450 pounds to the square inch from water under an 800-foot head.

Fan Draft for Locomotives Discussed By A. S. M. E.

By Frans H. C. Coppus

The following is an abstract of a paper on the "Mechanical Drafting of Locomotives" presented at the annual meeting of the American Society of Mechanical Engineers. Methods of drafting by means of turbine driven fans, as outlined in the paper, offer a possibility of effecting great savings in fuel by permitting the application of additional economizing equipment.

G ENERALLY speaking, it is a simpler task to incorporate extensive improvements into the design of a new locomotive than to apply them to one already in operation. Though the author would be the last person to discourage the development of the locomotive along radical lines that would require a total reconstruction or rearrangement of the present locomotive power plant, he believes that more can be accomplished for the immediate future by adding to the existing locomotive equipment which is standard, in principle at least, in stationary and marine practice, and which does not necessitate extensive or costly alterations. The existing locomotives, 68,000 in this country alone, represent such a large investment that no matter how efficient

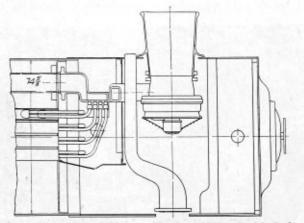

Fig. 1.—Modified Form of Standard Front End with Induced Draft Fan

a new locomotive may be built, it is out of the question to relegate them to the scrap heap, and they will be with us for many years to come.

In the treatment of this subject the author has therefore limited himself to the existing locomotive. The supporting data employed are based on modern steam locomotives equipped with superheater and brick arch and fed by means of a live-steam injector.

The use of the exhaust steam for drafting the locomotive makes the locomotive power plant differ in principle from the marine or stationary power plant. In the latter the boiler is an independent unit, while in the former the boiler and the engine are interdependent inasmuch as the exhaust of the engine creates the draft for the boiler and the shutting down of the engine renders the boiler inoperative. Separate the two by substituting mechanical draft for the exhaust jet and there is no reason why the locomotive power plant cannot be fitted out with the devices which have been responsible for the low cost of power generated in marine and stationary power plants. The problem is one of successful adaptation with reliability and moderate maintenance cost, within the present limitations of clearances and other conditions under which the locomotive must operate.

The logical course of development would be as follows: I mechanical induced draft, II undergrate forced draft, III condensing the exhaust steam, IV pumping the hot water from the tender through a waste-gas heater into the boiler, V operating condensing.

MECHANICAL INDUCED DRAFT

About ten years ago extensive experiments with mechanical induced draft were made on the Atchison, Topeka and Santa Fe, but they failed because of the "inability to secure a fan of sufficient capacity to properly handle the volume of gases" within the limitations of clearances.

It is doubtful if a fan without the introduction of an intensifying element can be built to overcome this difficulty. Only recently this new element has been brought out. It takes the form of stationary guide vanes held in a casing. The current of air leaving the propeller is radially subdivided by the individual vanes and taken up without shock. These guide vanes, which have a curvature increasing in the direction of the rotation of the propeller, concentrate the air current and give it a further acceleration, so that a large part of the pressure is produced and a large part of the end thrust taken up by them. This new fan or blower is very much smaller than a multi-blade centrifugal fan of the same capacity, both of commercial construction. Because of this fact the former can be made applicable to the locomotive and the latter not.

Fig. 1 shows the smokebox of a modern locomotive fitted out with a blower in the stack and the exhaust pipe and nozzle displaced by a plain exhaust pipe discharging the exhaust steam into the atmosphere. The guide-vane casing takes the place of the lower part of the stack.

A modification of the fan is necessary in order that it may function properly as an induced-draft blower for locomotives, keeping in mind especially, simplicity of construction, low maintenance cost and assurance that the bearings are kept cool and well lubricated at all times, as the success of the whole scheme hinges not only on the capability of the blower to create the desired draft in the smokebox, but also to stand up under it. A special design has been prepared in which the fan is driven by high pressure steam acting on a turbine wheel at the periphery of the propeller. The revolving unit has oil cooled bearings and the end thrust is taken up by floating the shaft in oil under pressure.

SAVING BY REDUCTION OF BACK PRESSURE

One of the outstanding advantages of the use of an induced-draft fan instead of the exhaust jet for drafting the locomotive is the reduction of the back pressure in the cylinders. Prior to the experiments of the Atchison, Topeka & Santa Fe, a series of indicator cards taken from actual road tests of representative locomotives in various classes of service were prepared showing the initial pressure, mean effective pressure, back pressure, and indicated horsepower, and in addition the added mean effective pressure and indicated horsepower which could be obtained by reducing the back pressure to 4 pounds. These showed increases in indicated horsepower ranging from 18 to 30 percent for simple locomotives and an average of 53 percent for a Mallet compound.

The author understands that since these tests were made the exhaust nozzles have been opened up considerably so that the back pressures have been greatly reduced. It would be idle to estimate what saving in fuel would result from drafting locomotives mechanically due to reduction in back pressure. However, the field seems broad and the prospects bright for enormous savings along this line.

If the only effect of drafting locomotives mechanically was the elimination of the back pressure on the pistons, this would in itself be sufficient to deserve the keenest interest of those responsible for the economical operation of locomotives, but the subject embraces a great many other questions and vitally affects many features in connection with the economical generation and use of steam. Mechanical drafting gives the locomotive a degree of flexibility which it does not now possess.

The steam pressure may be picked up at will or allowed to drop, regardless of the amount of work the engine is doing.

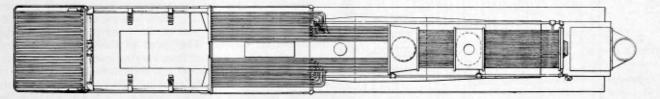

This flexibility of draft makes it unnecessary to favor the engine at any time. The practice of favoring the engine on hills, often no doubt unavoidable under the present method of drafting, is not only wrong from the point of efficiency but cannot help but result in leaky tubes, increasing maintenance cost, and in shortening the life of the boiler.

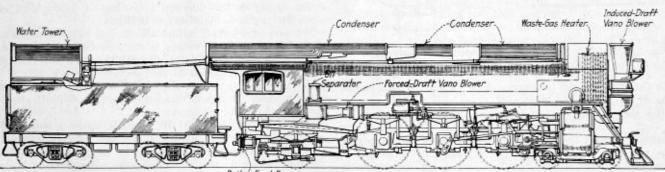

The advantages of mechanical induced draft mentioned above largely relate to economy in the use of steam after it

While it is not impossible to operate a forced-draft blower in conjunction with an exhaust jet, it is much simpler and better to connect it up to an induced-draft fan. The speed of the two blowers could be so adjusted-and after once adjusted, maintained-that there would be an atmospheric pressure condition in the combustion chamber, if carried to a nicety. This is very common practice with stationary and marine boilers. With the fire door open there would be no inrush of cold air nor any outward leaking of flames or gases. Such a condition is called "balanced draft." It can be effected only by the use of a forced-draft blower in conjunction with an induced-draft blower, jet blower, or stack. While in a locomotive boiler there is no boiler setting through which air can filter in, the draft over the fire is so much stronger than in stationary practice and the fire door (on hand-fired coal burners) opened so much oftener, that even greater economies than in stationary practice should result from balanced draft.

With forced draft there is no reason why cheaper grades of fuel could not be utilized, which will not only result in economy in the cost of fuel, but also in the cost of handling and storage of coal.

The air space in the grates may also be very small so that no fuel will be lost in the ashpan, and at the same time the

Boiler-Feed Pump

Fig. 2.—Proposed General Arrangement of Locomotive with Induced and Forced Draft, Centrifugal Boiler Feed Pump and Steam Condensing Apparatus

is once generated. In addition thereto mechanical draft has a strong bearing directly upon fuel economy and will greatly increase the overall boiler efficiency.

The heat loss due to combustible in cinders, estimated anywhere from 5 to 20 percent depending largely on the class of service, is generally classed among the "unavoidable losses." With a fan the constant flow of air through the fuel bed, while gradually changing in intensity, will not lift or tear the fire, and this loss, therefore, can be practically entirely eliminated.

UNDERGRATE FORCED DRAFT

To put the ashpan of a locomotive under pressure might prove impractical for several reasons. To overcome this difficulty the author has constructed a grate with hollow bars taking the air from a wind box to which the forced-draft blower is connected.

The forced-draft blower is of the same general construction as the induced-draft blower. It operates, however, in a horizontal position with no excessive end thrust and handles cold air. Therefore, the special lubrication, end-thrust balancing, and cooling features are unnecessary. grate will let sufficient air through on account of the air being delivered under pressure.

The forced-draft blower creates sufficient pressure to force the air through the fuel bed, leaving only the drawing of the gases through the boiler tubes to the induced-draft blower, and the latter may, therefore, be smaller or may be run at **a** lower speed than if used alone. For these various reasons it is easier and more efficient to use a balanced-draft system than merely induced draft.

CONDENSING THE EXHAUST STEAM

When the locomotive is drafted mechanically all of the exhaust steam is available for whatever use can be made of it. Heretofore a small part of the exhaust steam has been used to heat the feedwater. This practice has been quite common in Europe but has been only recently successfully carried out on this continent and to only a very limited extent, less than one percent of American locomotives being thus equipped. The exhaust-steam feedwater heaters have been constructed on the principle of imparting to the water the maximum amount of heat with the minimum amount of exhaust steam because the latter was needed to draft the locomotive. With mechanical draft, the more steam used for heating the feedwater the better, as the more water will be saved. Railroad men fully appreciate the economy in time and fuel due to the saving of water, especially in freight service, and incidentally the not negligible economy in boiler repairs in bad-water districts.

PUMPING THE HOT WATER FROM THE TENDER THROUGH A WASTE-GAS HEATER INTO THE BOILER

The exhaust steam, or as much of it as can be condensed, may be passed through a condenser on top of the locomotive running all the way back to the tender (see Fig. 2). The remainder may be allowed to pass to the air free for the time being. Such an arrangement affords a large cooling surface and the amount of water which can be saved without even attempting to run the engine condensing will be much larger than the amount saved by merely heating the feedwater by means of an efficient heater. The cooling surface may be made more effective by directing over it a current of air created by the speed of the locomotive with or without

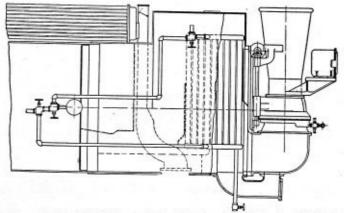

Fig. 3.-Modified Front End, Equipped with Induced Draft Fan and Feed-Water Heater

the assistance of the undergrate-draft blower. It is a simple matter to encase the condenser, provide it with louvers to catch the air, and connect it to the blower inlet by means of a duct. This would have the additional advantage of reclaiming part of the latent heat of the exhaust and supplying the fuel bed with preheated air. A cooling tower located in the back of the tender would further assist materially in condensing the exhaust.

It needs no explanation that with all the exhaust steam available it will be a simple matter to keep the water in the tender at any temperature desired up to the boiling point. This would convert the tender practically into an open heater. Instead of the injector a boiler-feed pump, preferably of the centrifugal type, installed in duplicate, will feed the water through a waste-gas heater into the boiler. The pumps will be located under the cab of the locomotive, so that there will be a sufficient head of water from the tender. Waste-gas heaters have been so far a distinct failure largely on account of the prerequisite that the heater should not interfere with the draft, because if it does the economy derived from its use would be nullified by an increase in back pressure.

The author has constructed a waste-gas heater which can be placed in the front end with slight alterations thereto, and which has a heating surface of over 1,000 square feet. By extending the front end this heating surface could be increased if necessary.

From the point of efficiency it may be considered that at the present time the water is put in locomotive boilers at an average temperature of 60 degrees F. the year round. If, instead of an injector, a pump is used the exhaust steam and the waste gases—which comprise the two largest items of waste energy in present locomotive operation—can heat

the water from 60 degrees to 300 degrees. With an absolute steam pressure of 200 pounds this is an undisputed saving in fuel of a little over 20 percent.

OPERATING CONDENSING

Mechanical drafting of locomotives makes it possible to run locomotives condensing. It can be accomplished without material change in their construction outside of an enlarged and modified tender. This, however, will come later after the steam consumption of the locomotive has been made as small as possible, which will, in itself, make condensing operation easier.

GENERAL ARRANGEMENT

Fig. 1 shows the induced-draft blower located in the stack. This is naturally the logical first step in the development of an induced-draft system for a locomotive, but a blower in such a position is not readily accessible. Practical considerations led the author to place the blower outside of the smokebox. A diagram showing the general arrangement of exhaust pipe, waste-gas heater, and induced-draft blower is shown in Fig. 3 and will need no further explanation.

Means are provided whereby the guide-vane casing can be quickly separated from the fan casing, giving access to both the fan and the guide vanes for cleaning. Automatic adjustment is provided for maintaining the proper relation between the pressure at the grate bars caused by the forceddraft blower and the draft at the front end caused by the induced-draft blower. The speed of the fans is controlled to keep the boiler pressure from varying more than 10 pounds.

The induced-draft blower not only furnishes the necessary draft but also controls the amount of fuel used and the water fed into the boiler. Proper provision is made whereby the steam supply to the different apparatus is partly shut off when the engine is standing, or drifting.

Whatever the saving in fuel will be, due to the elimination of back pressure, the heating of the feedwater, the stopping of the waste of unburned coal through the stack and through the grate, the elimination of cold air over the fire, etc., it is going to reduce just that much the amount of coal that is being fired, or the rate of combustion, which in itself greatly increases the boiler efficiency.

A rate of combustion of 100 pounds shows a boiler efficiency of 65 percent. Reducing this rate of combustion to 60 pounds, directly and indirectly by means of mechanical drafting, which is not impossible, the corresponding boiler efficiency would be 74.2 percent, or a saving of 9.2 percent.

In a paper presented by John E. Muhlfeld, at the annual meeting of the American Society of Mechanical Engineers, December, 1919, entitled Scientific Development of the Steam Locomotive, the following heat balance is shown as representative of locomotives worked at from 25 to 35 percent cut-off and hand-fired:

		Percer
Heat absorbed by boiler		55
Heat absorbed by superheater		10
Icat loss in smokebox gases		14
feat loss in cinders		8
leat loss in vapors of combustion		4
leat loss in combustible in ash		3
leat loss in carbon monoxide		
Izat loss in radiation and unaccounted	for	
Total		

Under the same conditions but with mechanical draft and the waste-gas heater as described by the author, the heat balance should be approximately as follows:

		Percent
Heat absorbed by boiler and waste gas-heater	 	. 74
Heat absorbed by superheater	 	. 10
Heat loss in smokebox gases	 	. 5
Heat loss in cinders	 	. 2
Heat loss in vapors of combustion	 *******	. 4
Heat loss in combustible in ash Heat loss in radiation and unaccounted for	 	. 1
near loss in radiation and unaccounted for	 	
Total	 	. 100

In conclusion, it may be stated that mechanical drafting of locomotives is imperative for the following reasons:

(a) It reduces the back pressure to a minimum, effecting a saving in fuel of from 10 to 30 percent; or increasing the power of the locomotive in the same degree, especially as speed increases, therefore adding to the hauling capacity or speed of fast freight and passenger engines, producing additional revenue tonnage and also eliminating or lessening the necessity for double-heading.

(b) It produces an engine that is free-steaming under the most adverse conditions and with all grades of fuel, decreasing liability of delay and saving time and money now spent in changing nozzle tips and experimenting with them.

(c) It keeps the steam pressure constant, regardless of load, saving steam now wasted every time the safety valve pops and making it unnecessary to favor the engine at any time, thereby saving fuel, avoiding unequal stresses in the boiler and resulting in saving in maintenance cost.

(d) It increases the efficiency of the boiler and grate by effecting better combustion and eliminating the waste of unburned fuel through the stack and in the ashpan—and incidentally stopping the inrush of cold air every time the fire door is opened—thereby avoiding sudden cooling of crown sheet and tubes.

(e) It makes possible the use of cheaper grades of fuel, resulting in large economies and in simplifying the handling and storage of coal.

(f) It eliminates the smoke nuisance in terminals and freight yards.

(g) It makes it possible to condense from 25 to 95 percent of the exhaust steam, depending upon the season of the year and the kind of condensing apparatus used, resulting in economy in the cost of water and of maintenance.

(h) It effects a saving in fuel of 20 percent by making it possible to preheat the feedwater from 60 to 300 degrees F., and incidentally greatly decreases the cost of maintenance by eliminating unequal stresses caused at present by the great difference in temperatures between the lower and upper portions of the boiler.

(i) It reduces the rate of combustion, thereby increasing the boiler efficiency.

(j) It lessens the work of both engineer and fireman, thereby necessarily increasing their efficiency.

DISCUSSION

William Elmer (Pennsylvania System) questioned the desirability of making the boiler output independent of the locomotive steam consumption. To show the great amount of air that it would be necessary to handle with a fan if locomotives were drafted mechanically, he presented figures from test plant trials of a Pacific type locomotive with 27 inch by 28 inch cylinders. This locomotive developed over 3,000 horsepower, evaporated 65,000 pounds of water and burned 12,000 pounds of coal an hour. The draft in the front end was as much as 18 inches of water. It is difficult to determine the amount of air required to burn each pound of coal, but J. T. Anthony states it varies from 12.7 to 8.7 pounds. Assuming an average value of 10 pounds of coal and assuming further that a locomotive consumes 10,000 pounds of fuel an hour, the fan would be required to handle 100,000 pounds of air per hour. This would amount to 1,300,000 cubic feet per hour at atmospheric pressure, and at a temperature of 600 degrees, which might be expected in the front end, the volume would be double.

Robert Rennie (American Locomotive Company) stated that a locomotive with 55 square feet of grate area working at full capacity should have a fan capacity of at least 48,000 cubic feet per minute at atmospheric pressure. Cooling the air before it is admitted to the fan would make mechanical drafting less difficult, but the additional resistance due to any appliance for recovering heat from the waste gases is a disadvantage. He considered that the method of reclaiming water from the exhaust steam would hardly be practical because of the enormous cooling surface required.

W. L. Bean (N. Y., N. H. & H.) called attention to the magnitude of the fuel problem on the railroads and pointed out the desirability of trying such designs as proposed by Mr. Coppus because of the possibility for large savings. He stated that fan efficiency and capacity had been greatly improved since the last trials of mechanical draft.

Dr. W. F. M. Goss discussed mechanical drafting of locomotives by means of a turbo-exhauster. He called attention to the objection of the operation of locomotives in cities on account of the noise and smoke and outlined how these could be overcome by the turbo-exhauster. He stated that the required draft could be obtained with from 40 to 50 percent of the existing back pressure, and in conclusion expressed the opinion that mechanical drafting had so many advantages that it is likely to come into use soon on the railroads.

In closing the discussion, Mr. Coppus stated that his proposal had in some cases been misunderstood due to failure to consider all the conditions set forth in the paper. His conclusions had been based on careful study and he felt certain that they were practical.

Chinese Board Specifies A. S. M. E. Boilers

IN a recent communication, William Althoff, Assistant Chief, Industrial Machinery Division of the Department of Commerce, Washington, D. C., states that the Department has received copies of specifications for tenders invited by the Min River Conservancy Board, Foochow, China, for a steam-operated river-type hydraulic dredge for improving the channel of the Min River; tenders to be in the hands of the Board not later than February 15, 1923. These specifications include the following clauses:

Boiler. The boiler shall be constructed in accordance with the specifications of the Boiler Code Committee of the A.S.M.E.—or other equivalent specifications. Hull. The steel used in the hull shall meet the require-

Hull. The steel used in the hull shall meet the requirements of the specifications for structural steel for ships of the American Society for Testing Materials—or other equivalent specifications.

The Min River Conservancy Board, although a Chinese Government organization, is, through their representation on it, under the virtual power and control of the commissioner of customs and the foreign consular representatives and representatives of foreign commercial bodies. Its funds are supplied by a surtax on the regular customs tariff and the funds are administered by the Board though collected by the customs. The engineer in chief is an American.—*Mechanical Engineering.*

THE PROBLEM OF REBUILDING LOCOMOTIVES .- One of the problems which the railroads have had to face in recent years has been to obtain a well balanced design in rebuilt locomotives. Boiler accessories include practically all the modern appliances for increasing economy but, if the boiler is rebuilt with the addition of such devices, the cylinders should also be enlarged. Stresses on the main rods, frames, and the like are also greatly increased, so that practically a whole new machine is necessary. By applying such devices as those for utilizing the trailer or tender wheels for increasing the tractive force, the capacity of the boiler at low speed can be utilized. At higher speeds the main cylinders would be able to utilize the full boiler output by running at a slightly longer cutoff. Thus from the engineering standpoint, the introduction of auxiliary devices for increasing tractive force offers new possibilities for obtaining a well balanced design in locomotives .- Railway Mechanical Engineer.

Vertical Type Boiler Explodes on a British Ship

Details of Board of Trade Investigation With Conclusions by the Engineer Surveyor-in-Chief

A RECENT Board of Trade report covering a tube explosion in the main vertical, cross-tube type boiler on the steamship *Ixion* indicates the extreme thoroughness with which investigations of what in this country would be considered minor explosions are undertaken.

The explosion occurred at sea, four miles off Kinnaird Head, while the vessel was on a voyage from Bridgeness to Stromness. The vessel was owned by The East Coast Salvage Company, Limited, Dundee, Scotland. No person was injured by the explosion.

DESCRIPTION AND PRINCIPAL DIMENSIONS OF BOILER

The boiler was of the vertical, cross-tube type, 15 feet in height and 6 feet 3 inches in diameter, made of steel, and worked at a pressure of 95 pounds per square inch. The firebox, which was 5 feet in diameter, had four horizontal steel cross-tubes, 12 inches in diameter and 3%-inch in thickness. There were six handholes, for cleaning purposes, 8 inches by 5 inches; four were opposite the cross-tubes and two were at the bottom of the water space and close to the fire-door. The usual boiler mountings were fitted.

The boiler was not new when fitted on board the *Ixion*, in 1915, and the name of the maker and age of the boiler could not be ascertained.

PARTICULARS AND DATES OF REPAIRS

The firebox, uptake and cross-tubes were renewed in 1915, previous to placing the boiler in the ship. It was not possible to obtain particulars of repairs done, if any, between 1915 and 1920, while the vessel was on government service, but no repairs had been done to the boiler by the present owners.

The boiler was inspected in December, 1920, by a consulting engineer, of Dundee, when he surveyed the ship at Glasgow on behalf of the present owners, before purchase, and it had been examined twice since then by the mechanical engineer in charge of the salvage plant at the company's depot, Dundee. The boiler was not insured.

NATURE OF THE EXPLOSION

The right hand lower cross-tube was bulged in two places on the underside and the plate was torn apart, forming a ragged hole 3 inches in length and varying between ½-inch and ¼-inch in breadth, and through this opening water and steam escaped from the boiler.

The explosion was apparently caused by overheating of the cross-tube, under working conditions, due to a deposit of oil and scale.

The *Ixion* was a small steamer with a crew of four persons, two on deck and two in the engine room, and was used mainly for the transport of salved cargo from wrecks. The boiler on board had been previously used by the Glasgow Steam Coaster Company, Limited, Glasgow, in one of their vessels; and it was thoroughly repaired in 1915, when the ship was requisitioned by the Government for war service. This firm is now out of business and their records are destroyed.

EVENTS LEADING TO EXPLOSION

The voyages made recently were often coastwise, and, at times, were so long that the supply of fresh water—eight tons—carried for the boiler was not sufficient, and, on a trip to the Orkney Islands, it became necessary to use sea water for supplementary feed. On March 7, 1922, the engineerin-charge for the first time, stated that he noticed signs of salt water in the boiler at that time, and, as there was not a salinometer on board, he asked the skipper to get one. The skipper promised to try and obtain the loan of one, but never got it. The engineer resorted to blowing down the boiler frequently in order to freshen the water inside. He admitted having put in a demand for stores at Dundee in April, 1922, without including a salinometer in the list, and said that he still expected the skipper to get one and that the need did not seem urgent as so much fresh water was obtainable when the ship was in port.

Between May 8 and May 22, the Ixion was standing by the steamship *Thistlemore*, stranded at North Berwick, and carrying salved cargo to Leith. This cargo was chiefly bags of flour thickly coated with oil fuel which had escaped from the bunkers of the *Thistlemore*. The drainage from the oily

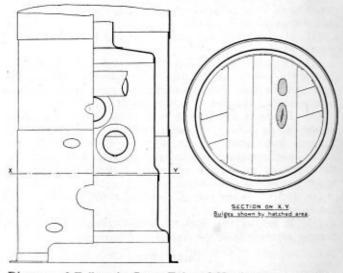

Diagram of Failure in Cross Tube of Vertical Marine Boiler

cargo accumulated in the bilges of the *Ixion* and was being constantly pumped overboard but, when the vessel was not under way, the auxiliary pump used for the bilges was the same as that for feeding the boiler. The vessel was in Tayport on June 2, 1922, and the engineer having reported that the boiler was dirty, understood that it would be cleaned a day or so later. He left the same day for another post.

The new engineer, when he joined the *Ixion*, stated that he noticed a lot of fuel oil in the bilges, and that he tried the density of the water in the boiler with a salinometer which was his own property and found it to be fully 2/32. This was reduced to 1/32, during the next two days, by blowing down.

Four days later, while on a voyage to the Orkney Islands, the explosion occurred. The fireman was on watch at 3:30 A. M., and had raked the fire and gone on deck for a few minutes. He was just starting to descend the engine room ladder when there was a rush of steam from the boiler furnace. He called the engineer, but it was a quarter of an hour later before they were able to go below. The engines were still running and about 80 pounds pressure was showing on the gage. The boiler fire was found to be extinguished and it was seen that the right hand lower cross-tube had failed, as above described. The Ixion was towed to Fraserburgh, where the tube was patched and she then proceeded to Stromness and returned to Dundee, where the tube was taken out of the boiler. The tube was found to be hogged about $\frac{1}{8}$ -inch, as might have been expected from working conditions, and the position of the defects, as ascertained, was as shown in Fig. 1.

The supervision of the care and maintenance of the boiler was left to the salvage company's engineer at Dundee. He arranged to examine the boiler twice a year, at convenient times; and it was emptied and cleaned for his examination in April, 1921, and in January, 1922. He had intended to examine it next when the vessel came back from Stromness in June, 1922; and it appears that these examinations were the only times when the boiler was opened and cleaned. He also stated that at each examination the condition of the boiler was satisfactory, and that the amount of scale to be removed was small. Further, he stated that it was unknown to him that the engineman had not been in charge of engines and boilers before and understood that he had been recommended to the skipper at Arbroath as having been an engineman in fishing craft. He did not think it necessary, therefore, to exercise extra supervision in his case.

When the boiler was opened out at Fraserburgh on June 9, 1922, the damaged tube was found to have a deposit of scale, about 3⁄4 inch in thickness, firmly attached to the lower part. There was a considerable amount of black grease in this scale, and free oil was also present in other parts of the boiler. At the point of failure there was a clear indication of overheating.

There is no doubt that, although both engineers stated that they took great care to wash through the donkey pump after using it on the bilges, the boiler must have been fed frequently with water which was contaminated with oil. Moreover, the period which was allowed to elapse between each cleaning was too long for a boiler of this description, and it does not seem to have occurred to anyone concerned that there was a danger from oil finding its way into the boiler. It is very undesirable for a pump with a bilge connection to be used for feeding a boiler, and if this boiler had been cleaned at Tayport at the beginning of June, just after the *Ixion* had returned from the *Thistlemore*, it is most probable that the explosion would not have occurred.

The owners have since had the boiler insured and it is now subject to periodical inspection.

The failure of this tube was apparently due to a heavy deposit of lime scale, this being no less than 3/4 inch thick on the interior surface of the tube.

The working equipment was somewhat deficient as the feed pump was also used as a bilge pump, in consequence of which oil from the bilges was pumped into the boiler and oil in boilers frequently leads to overheating. Although sea water was sometimes used as feed, no instrument for ascertaining the density of the boiler water was provided, and internal inspection and cleaning of the boiler was carried out only once every six months. Altogether, the method of working described above was such as might be expected sooner or later to lead to a serious mishap. Fortunately no person was injured by the escape of steam and hot water.

Water Used With Sand Blasting Machine to Eliminate Dust

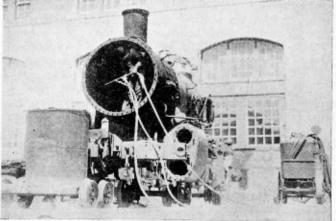

ONE of the disagreeable effects of sand blasting in boiler work has been eliminated at the Southern Pacific shops at San Francisco by mixing water with the sand in the sand blasting machine. Instead of sand and dust flying all over, the water carries it away from the part of the boiler that is being cleaned, leaving an absolutely smooth job.

As shown in Fig. 1, the device consists of a 16-inch by 42inch tank which can be mounted on a 4-wheel truck for easy movement about the shop. Suitable hose connections are provided to the air supply and water supply, the latter being used to keep down the dust. Air is furnished from the shop mains through a flexible hose to a line of 1-inch pipe and fittings beneath the tank. An auxiliary $\frac{1}{2}$ -inch pipe is connected to the top of the tank and admits air through the valve on top of the sand. The tank can be filled with sand through the funnel and valve shown. Other valves are located in the lower pipe lines as shown and a $\frac{1}{2}$ -inch pipe to the bottom of the tank facilitates keeping the sand in agitation so that it will readily fall through the 1-inch pipe to the moving air column. Air and sand are delivered through the flexible hose, brass reducer and two Y branches to a $\frac{1}{2}$ -inch pipe which the operator uses in directing the final flow of air, sand and water.

. In operation the tank is filled with dry screened sand and the valve on top closed. With main air pressure on the tank sand falls on the rapidly moving stream of air which carries it to the blast nozzle. The reducer has a tapered hole (1/4 inch at the smallest diameter) which automatically controls the amount of sand. The sand is moistened with water to keep down the dust and is finally ejected by the independent air hose connection.

Standard Tests to Determine Strength of Welds

Test Specifications of the American Bureau of Welding Designed to Compare the Effectiveness of Welded Joints

A NUMBER of months ago the American Bureau of Welding, through a special committee on "Standard Tests for Welds," prepared complete specifications for comparing the strength and quality of various types of welds. Many of our readers have from time to time requested data of this nature on welding and so it was thought advisable to publish the complete rules of the American Bureau which represent the best practice in this particular line of work.

The committee in preparing the "Standards for Testing Welds," which are transmitted herewith, proceeded on three assumptions as follows:

1. The fundamental basis of measuring the effectiveness of a joint between two pieces of metal, is the same as metal without a joint. A joint is a necessary evil in a structure which is avoided when it is possible. Therefore, the value of a joint is best determined by comparing the characteristics of a section of the structure which includes the joint with those of a similar section which has no joint. In other words, a weld is a joint and the practical basis of evaluating a weld is in terms of the metal of the parts joined together.

2. Three standards are desirable, as follows:

(a) Shop Standard. In the shop a standard test is required for such purposes as checking the work of a welder from time to time, testing a new lot of electrodes in electric welding or of welding wire in gas welding, testing the effect of some change in conditions which may have taken place, etc. Such a standard must necessarily be as simple as possible and preferably a single test. The technique of the procedure in making the test must be of a simple character.

(b) Commercial Standard. There are many cases where more than one kind of test should be made, but where the circumstances do not justify a complete investigation. There is, therefore, a need for what might be termed a commercial standard for making, for example, comparisons between different commercial welding processes or between different kinds of electrodes in electric metal arc welding or different wires in gas welding.

(c) Research Standard. When a complete investigation of a weld is to be made for research or other purposes, all tests and examinations are made which will contribute any information in regard to the characteristics of the weld. It may be necessary to make tests of a special character in special kinds of welds or where application under unusual conditions is contemplated, but there should be a standard list of tests which will give information which is complete as far as all ordinary requirements are concerned.

3. The details of the procedure in making the various mechanical tests should be carefully prescribed. It is believed by the committee that standardization in this respect is of the greatest importance, because comparatively small differences in procedure have a marked influence in certain mechanical tests and unless these are eliminated the results are not comparable.

Standards for Testing Welds

Note—These specifications are intended primarily to serve as a standard uniform basis for testing and comparing sample welds as distinguished from welds in structures. The testing of the latter must necessarily be by nondestructive methods which would therefore be, in general, quite different from those employed in examining sample welds (test welds) made, for example, for the purpose of testing a welder's proficiency, comparing welding wires or comparing welding methods.

I. Definitions

The following are definitions of terms employed in this specification:

(a) A Weld is a solid union of metallic pieces formed by uniting or consolidating by hammering or compressing with or without previous softening by heat.

Note—This definition is quoted from the Century dictionary. It is the broad definition of a weld and therefore includes forge welding and resistance welding by either the butt or spot process. While these specifications are prepared specifically for fusion welds, it is obvious that some of the tests can be applied to other types of welds.

(b) A *fusion weld* is a weld formed by heating to a fluid state the edges of the pieces to be joined and allowing the metals to flow together (with or without additional molten metal being supplied) without any pressure being applied. The heat may be supplied by a gas flame, an electric arc, thermit or otherwise.

(c) In a fusion weld, the base metal is the material composing the pieces to be united by the weld. Unless otherwise expressly stated, it will be understood that a weld joins two pieces of identical material.

(d) In a fusion weld, the *weld metal* is the material which has been used in forming the weld. It may consist entirely of a base metal adjacent to the weld or of the material added to the fused base metal from a welding rod or electrode, or other material.

(e) Filling metal is the metal added during the welding process to form part of the weld. In gas welding it is supplied by means of a welding rod, in carbon arc by a filling rod and in metal arc welding by the electrode.

(f) A test weld refers to a sample of welding which has been performed under known conditions and upon which mechanical tests are to be made.

(g) A test specimen is a prepared piece on which a mechanical test is to be made.

II. Shop Standard

Bending test only.

III. Commercial Standard

(a) Bending test.

(b) Tensile test.

Note-It is probable that eventually it will be desirable to include a fatigue test when a method is standardized which will be suitable for commercial application.

IV. Research Standard

A. Tests of base or parent metal.

1. Chemical analysis. To include carbon, manganese, silicon, phosphorus and sulphur.

2. Mechanical tests.

(a) Tensile. To include yield point, ultimate strength, total elongation and reduction of area.

(b) Bending.

(c) Fatigue.

3. Metallographic. Photomicographs at 100 diameters.

B. Test of weld.

1. Mechanical tests.

(a) Tensile. To include yield point, ultimate strength, total elongation and reduction of area.

(b) Bending.

(c) Fatigue.

(d) Impact.

2. Metallographic. Photomicrographs at 100 and 500 diameters, respectively, at (a) the junction between the

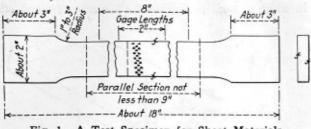

Fig. 1.- A Test Specimen for Sheet Materials

base metal and the filled-in metal, (b) the base metal adjacent to the junction, (c) the center of the filled-in metal.

C. Tests of filled-in metal.

1. Chemical analysis. To include carbon, manganese, silicon, phosphorus and sulphur.

*2. Mechanical tests. Standard round specimens to be prepared from ingots deposited in a base-metal mould of such dimensions that normal cooling conditions will be approximated.

(a) Tensile. To include yield point, ultimate strength, total elongation and reduction of area.

(h) Dending

(b) Bending.

(c) Fatigue.

3. Metallographic. Photomicrographs at 100 and 500 diameters, respectively.

V. Standard Procedure for Mechanical Tests

1. Preparation of test welds.

No detailed instructions for the preparation of test welds can be given as the dimensions, material, etc., will depend upon the purpose for which the weld is being made. The test weld should, however, duplicate as nearly as practicable, the commercial welds which it represents and should preferably be of such a size as to permit preparation of enough specimens from the one test weld to make all of the mechanical tests which are to be made.

When the test weld is made with material in sheet or plate form, the longest axis of the test specimen should, in general, be parallel to the direction of rolling.

2. General Procedure.

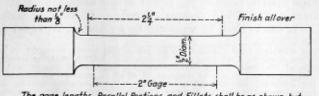

(a) Wherever applicable, the standard procedure of the American Society for Testing Materials as given in the A. S. T. M. for 1918 (serial designation E-1-18) shall be followed.

(b) Three duplicate specimens shall be tested in any one test and the average taken as the value of the property determined by this test.

3. Tensile Tests, Base Metal.

A. TEST SPECIMENS

(a) Sheet or Plate Material. The test specimen for sheet materials is shown in Fig. 1. The thickness of the specimen may be any that is desired, but a thickness exceeding 3/4 inch would require a testing machine in excess of 100,000 pounds capacity. If the specimen is cut from

The gage lengths, Parallel Portions and Fillets shall be as shown, but the ends may be of any form which will fit the holders of the Testing Machine

Fig. 2 .- Specimen Used in Testing Cast or Brittle Materials

standard sheet material, it is usually not necessary to machine the 1.5 inch faces of the specimen.

(b) Cast Material. The test specimen for cast or brittle materials is indicated in Fig. 2.* It is particularly important to use swivel specimen holders when testing such specimens in order to entirely eliminate undesirable stresses.

B. TEST RESULTS TO BE RECORDED

(a) Ultimate Strength. Unit stress pounds per square inch computed from the area of the original section.

(b) Vield Point. Unit stress pounds per square inch at which marked increase in deformation of the specimen occurs without increase of load as indicated by a sudden dropping of the beam of the testing machine or by a sudden increase of the rate of elongation as shown by dividers.

(c) Contraction of Area. Expressed in percent of the original area.

(d) Appearance of Fracture. The appearance of the fracture as determined with the aid of a low power magnifying glass (such as jewelers use) should be recorded. The characteristics described by the following nomenclature should be covered, indicating as far as possible the percent of the total area which is involved. For example, "10 percent not welded" would signify that approximately 10 percent of the total area of cross section at the fracture is exposed base metal—that is, not welded.

Spongy: Full of small cavities; the structure resembles that of a sponge; porus.

Slag inclusions: Foreign matter entrapped in the weld. Gas pockets: Small or large cavities, more or less isolated (*i.e.*, not of a regular spongy structure).

Not welded: Exposure of any portion of the surface of the base metal indicating imperfect fusion between the base metal and the filling metal.

Laps: Imperfect fusion between adjacent portions or between successive layers of filling metal.

(The recording of the following data is optional.)

(e) Proportionality Limit. Unit stress (pounds per square inch) at which the deformation ceases to be directly proportional to the load.

Any type of extensioneter may be used, but in precise work the deformations of two opposite elements of the specimen, preferably on the edges, should be obtained. For ordinary purposes deformations in only one element of the specimen need be measured, but in that case the gage marks should be on the center of the line of the 1.5 inch side.

The gage length may be either 2 or 8 inches.

(f) Modulus of Elasticity. Unit stress (pounds per square inch) computed from data obtained from a specimen having an 8-inch gage length; measurements to be taken on two opposite elements, one on each edge of the specimen.

(g) Total Elongation. Gage marks shall be laid off every inch along a line at the center of one of the 1.5-inch faces of the specimen before placing in the testing machine and the total elongation in every inch after rupture recorded. The total elongation in the 1-inch, 2-inch and 8-inch (if any) length, which included the break shall be reported.

Tensile tests, weld metal.

4.

A. Test Specimens

The shape and dimensions of the test specimens are shown in Fig. 2. It shall be prepared from a bar of weld metal, $\frac{3}{4}$ by 1 by 11 inches. This bar shall be formed entirely by depositing filling metal in an open box of the shape shown in Fig. 3, employing exactly the same method used in making the corresponding test weld. For metal electrodes this box shall consist of a copper plate $\frac{1}{2}$ inch

"The diameter of this specimen may be 0.505 inch if desired. This diameter gives an area of exactly 0.200 square inch.

thick, upon which is secured a frame of steel bars, 3/4 inch square. The parts of the box were secured in any convenient manner. The copper plate, during this operation shall rest upon a steel plate. After the bar is formed, the

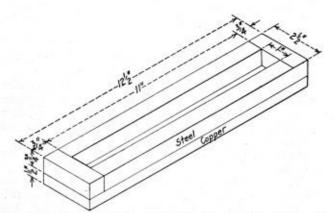

Fig. 3-Box Used in Forming Bar Entirely of Filling Material

copper plate and the frame may be removed by any suitable machining operation.

For gas welding, the copper plate should be replaced by a steel plate. For thermit, a box of suitable refractory material should be used.

B. TEST RESULTS TO BE RECORDED

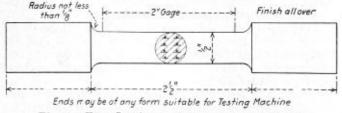

These shall be the same as those prescribed in Section V, 3-B (base metal) except those involving an 8-inch gage length. If, however, the modulus of elasticity is desired, a specimen similar to that shown in Fig. 2, with a gage length of 8 inches shall be employed.

5. Tensile Tests, Weld.

A. TEST SPECIMENS

The shape and dimensions of the test specimen are shown in Fig. 1 with the weld at the center. If the material is cast or brittle, the specimen shown in Fig. 2 shall be used with the weld located at the center.

It is especially necessary that the 1.5-inch sides of the specimens be machined, particularly if the two pieces of base metal are offset or if they form an angle at the weld. Tests made in the latter case, where the specimens are not machined, are not reliable. Furthermore, care must be taken that specimens having the latter defects are not "straightened" before being machined, because such treatment is likely to materially decrease the strength of the

weld. A roughening cut in a planer or shaper which will just "close up" the surfaces of the specimen is sufficient.

B. Test Results to be Recorded

The requirements for test results given in Section V, 3-B (base metal) shall be followed.

6. Bending Tests, Base Metal, Weld Metal and Weld.

A. TEST SPECIMENS

(a) Base Metal and Weld. The shape and dimensions of the specimen are shown in Fig. 5. In the case of welds in flat rolled material, the surface of the weld shall be machined substantially flush with the surface of the specimen unless the specimen is bent or offset, in which it shall be machined all over. Cast and other

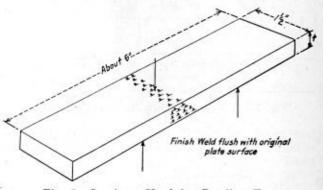

Fig. 5.-Specimen Used for Bending Test

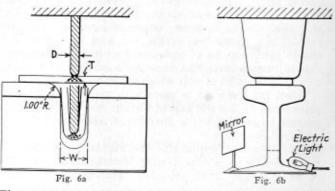

irregular specimens shall be machined all over. It is essential that the edges of all specimens be machined to remove material in a condition likely to cause premature failure.

The thickness, t, of a weld specimen shall be as nearly that of the base metal as possible.

(b) Weld Metal. A specimen may be prepared from a bar of weld metal prepared as prescribed for tensile tests. The box, Fig. 3, shall, however, have a width of 1.75 inches and the thickness, t, of the specimen shall be that of the test weld. These specimens shall be machined all over.

B. APPARATUS

In order to load the specimens so that as large a part of the bend as possible shall occur in the weld metal, the

Figs. 6a and 6b.—Sketches Showing Side and End Views of Apparatus Used in Making the Bending Tests

special fixture outlined in Figs. 6a and 6b shall be used. It is most conveniently used with any standard universal testing machine, but may be operated by any other convenient mechanical means.

The cylindrical surface, D (Fig. 6a), about which the specimen is bent shall conform to the requirements of the American Society for Testing Materials for bending tests of the base metal.* This piece is attached to the under side of the moving head of the testing machine. Upon the platform shall be fastened two blocks having machined top sur faces and polished corners of radius, R, of 1.00 inch. These blocks shall be separated by a distance, W, equal to

^{*}For ship-plate steel (58000.68060 lb. per sq. in. tensile strength), it is "The test specimen shall bend cold through 180° without cracking on the outside of the bent pertion, as follows: For material 34 in. or under in thickness around a pin the diameter of which is equal to the thickness of the specimen; for material over 34 in. to and including 14 in. in thickness, around a pin the diameter of which is equal to 1/5 times the thickness of the specimen; and for material over 14 in. in thickness, around a pin the diameter of which is equal to 1/5 times the thickness of the specimen; and for material over 14 in. in thickness, around a pin the diameter of which is equal to twice the thickness of the specimen."

D plus 2 T plus 1/8 inch. A lubricant of lard oil and graphite or similar compound shall be used on these surfaces.

Two specimens shall be tested. The load shall be applied at the center of the weld—in one specimen to the open side of the "V" and in the other specimen to the closed side.

The rate of application of the load shall not exceed that

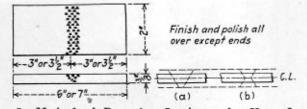

Fig. 7.-Method of Preparing Specimens for Upton-Lewis Machine

at which the beam can be kept balanced at all times or a maximum of 2 inches per minute.

The angle through which the specimen is bent may be measured by any convenient method. The following method is described as a matter of information.

A piece of paper is held firmly against the edge of the specimen when it is in place on the testing fixture and a line drawn on the paper along a corner of the specimen, thus outlining the shape of the specimen so far as bending is concerned. A line is drawn before loading and after

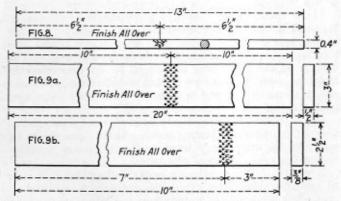

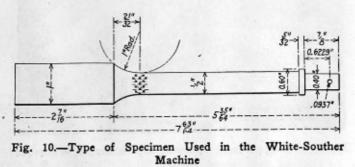

Fig. 8.—Specimen Prepared for Testing in the Farmer Machine

Fig. 9a.—Type of Specimen Used in the Strohmenger Reverse Torsional Machine

Fig. 9b.—The Strohmenger Bending and Impact Machine Used Specimen with Weld Just Outside of Clamp

failure occurs. The change in the angle in the two lines as determined with a draftsman's protractor is the angle through which the specimen had been bent at failure. See Fig. 14.

C. TEST RESULTS TO BE RECORDED

(a) The total angle through which the specimen has been bent when the first crack appears upon the convex surface (that is, the sum of the angles through which the two halves were bent). To be measured without removing the load.*

(b) The load on the specimen at which the first crack occurs.

7. Fatigue Tests, Base Metal, Weld Metal and Weld.

There is no generally accepted unit or standard of comparison for fatigue tests so that the results given by the several machines which have been developed for such tests are not directly comparable. It is not practicable at the present time to recommend the use of any particular type of machine, and consequently test specimens are shown for all of the more common types.

Although in general, the results of fatigue tests are of maximum value only when compared with similar results obtained on the same machine, it is assumed that reference tests will be made on the base metal so that the results of tests on welds and weld metal can also be stated in terms of the results of tests of base metal. It is hoped that this will permit direct comparisons between tests made with different types of machines.

A. MACHINES AND TEST SPECIMENS

(a) General. For tests of weld metal it will be necessary to form a suitable bar in a box similar to Fig. 3 and having the proper dimensions.

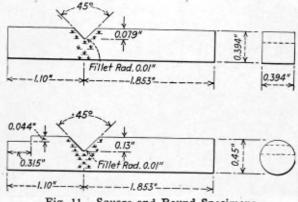

Fig. 11 .- Square and Round Specimens

Fatigue test specimens should in general be machined all over (except the ends) and the surface carefully polished (preferably with the polishing marks parallel to the longest axis of the specimen). No. 1 Manning emery

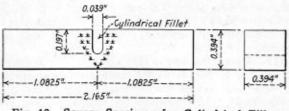

Fig. 12 .- Square Specimen for Cylindrical Fillet

cloth or paper or its equivalent will produce a satisfactory surface.

Provided the specimens are prepared from a test weld or other material of greater thickness than the specimen, an equal amount shall be removed from both sides so that

* Nore-An electric light and mirror will assist in observing this surface as indicated in Fig. 6b, the specimen shall represent the material at the middle as indicated at a and b, Fig. 7.

(b) Upton-Lewis Improved Machine. This machine puts a bending load on the specimen which is reversed during each revolution of the machine. Specimen shown

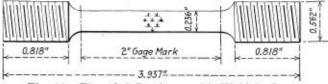

Fig. 13 .- Threaded Specimen with Weld in Center

in Fig. 7. The distance between the jaws of the machine shall be $\frac{1}{2}$ inch. If the specimen is a weld specimen, the jaws shall be equidistant from the center of the weld metal. (c) Farmer Machine. This machine was designed specially for testing weld specimens. It tests the specimen as a simple rotating beam with free supports at the ends

and two equal loads on a section at the middle (Fig. 8). (d) Strohmenger Reverse Torsional Machine. Comparative results only can be obtained, as there is no means

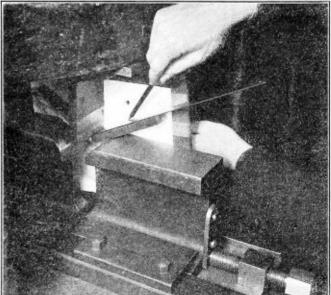

Fig. 14 .- Arrangement for Recording the Angle Through which the Specimen Is Bent Before Failure

of determining the stress. This machine loads the specimen in torsion, which is reversed for each revolution of the machine. Specimen shown in Fig. 9a.

(e) Strohmenger Bending and Impact Machine. Comparative results only. The machine strikes the specimen, which is held as a cantilever beam, bends it and releases it. This operation is repeated upon the other side of the machine (Fig. 9b).

(f) Moore Machine. This machine was designed for the Bureau of Standards for testing large size specimens of joints, both welded and riveted.

Specimens .- Any thickness not exceeding about 1 inch, with 8 inches, length 32 inches. If the specimen is a weld specimen, the weld metal shall be at the middle of the length of the specimen.

(g) White-Souther Machine. This machine loads each end of a rotating specimen as a cantilever beam. It is then rotated. The specimen is shown in Fig. 10.

B. TEST RESULTS TO BE RECORDED

(a) Number of cycles of the stress to cause failure (b) The stress developed in the specimen (if possible).

sectional boilers), no matter whether the boiler is empty or has water in it. Fig. 1 shows the fire sheet of a horizontal tubular boiler

in which there is a hole measuring approximately 18 inches by 24 inches. Waste paper and other refuse matter had been burned in the furnace while the boiler was empty. The damage to the boiler was discovered by an inspector who had been asked to make an inspection before the boiler was put in operation. It will be seen that extensive repairs were needed before the boiler could be used.

expansion and contraction strains (particularly in cast-iron

Fig. 2 shows damage of a similar character in connection with a watertube heating boiler. In this case the boiler was fired up without any water in it, and it was necessary to install a complete set of new tubes.

Never build a fire under an empty boiler; and it is safer to avoid burning refuse in a boiler furnace at any time except when the boiler is in operation. A surprisingly small amount of fuel may produce sufficient heat to cause serious damage, if the boiler is cold and the heat is applied to it suddenly and locally .- The Travelers Standard.

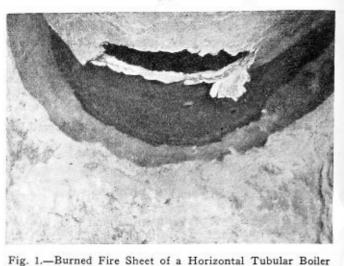

Fig. 2 .- Damage Caused by Firing Up an Empty Watertube Boiler

Burning Refuse in Heating-Boiler Furnaces

THE householder finds it easy and convenient to dispose of combustible refuse by burning it in the furnace

of his heating boiler, but disastrous results often follow. There is danger not only of overheating or burning the metal if the boiler is empty, but also of producing severe

Water Treatment on the St. Paul

I^N many places the available water supply is very unsatisfactory for use in boilers. The country traversed by the Chicago, Milwaukee & St. Paul east of the Missouri river in South Dakota presents conditions which may be taken as typical of those under which railroads are frequently obliged to operate.

The few streams run slowly through lands so rich in the soluble salts of calcium and magnesium that the river waters are always hard, and the more the rainfall on adjoining lands and the higher the rivers, the harder the water. Because of the scarcity at or near the surface, most railroad supplies are derived from drilled wells, which vary in depth from 50 feet to 1,500 feet and in which the character of the water varies as widely. In the ground are two layers of sandstone whose horizontal cracks furnish the supply, the water from the lower sandstone being very hard (80 to 90 grains per gallon) and carrying also 20 to 60 grains of sodium sulphate or chloride, while the water from the upper sandstone so closely resembles the lower water after softening that it is presumed to be the same water softened in the ground; that is, by zeolitic action. This soft water is available, however, only in sections near the Missouri river.

The problem through a considerable district was one of securing an increased amount of water, as bad as it was, and of accomplishing something in the way of improving it. Additional wells were drilled at a number of points and the use of boiler compounds was resorted to. Results were not sufficiently satisfactory and it was decided to install a series of water treating plants. Seventeen plants are now in operation and they cover every water station in a district which includes about 400 miles of line.

The new plants are continuous in operation. All of the main line plants with the exception of those at two points, are designed to treat 15,000 gallons of water per hour continuously and consist each of a hard water pump; a 40minute reaction tank within which the mixture of hard water and the necessary chemicals (all fed in continuous streams) is slowly stirred by mechanical means; a three-hour settling tank; a treated water pump which delivers to the track tank, and a chemical storage room; all strongly housed and heated.

and a chemical storage room; all strongly housed and heated. The plant at Scotland, 'S. D., is typical of the main line plants. Everything is of wood except the machinery and pipe. The drilled well, 12 inches by 168 feet, under the pump room furnished water to a double-stroke deep-well pump which delivers it through a 6-inch pipe to the water wheel which does the stirring. The water, after passing the wheel, flows to the bottom of the mixing tank where, as it rises, it meets in succession the continuous streams of milkof-lime, sodium carbonate and ferrous sulphate solutions.

Hydrated lime is used in water treating to extract the carbonic acid, which brings about the precipitation of the scale-making limestone carbonates down to three grains per gallon or less. Sodium carbonate (soda ash) is used to replace completely the scale-making limestone sulphates by non-scaling sodium sulphate. Ferrous sulphate (green sulphate of iron) is used for the treatment of the last three grains of calcium carbonate so that it will not clog the injector or branch-pipe; this, by converting half of the calcium carbonate into calcium sulphate.

In these plants, these reagents are all fed by regulated streams of water from the pipe which supplies the water wheel. The milk-of-lime box holds 480 gallons of water for a five-hours' supply (at Scotland 400 pounds) and this is fed continuously by a small stream of water entering at the bottom of the lime box and overflowing near the top through a 2-in. pipe to near the bottom of the mixing tank.

Once every hour, an hour's supply of dry hydrated lime is added to the supply in the box. This method produces an hourly variation in the rate of lime feeding, but the stirring in the mixing tank is so thorough and so prolonged (45 minutes) that only a slight variation is found in the water as it overflows from the top of the mixing tank to the bottom of the settling tank.

The dry soda ash rests on a shelf in the soda box and is fed to the mixing tank by a spray. The supply on the shelf is replenished hourly. The sulphate of iron is fed in solution from its box by a small stream which enters at the bottom and overflows near the top.

The best method of feeding any reagent to a treating plant is determined principally by its solubility in water and in all cases the thinner the solution or mixture the better. The arrangement of feeding devices described above is not theoretically perfect, but has been adopted as the result of experience in handling railroad plants which are frequently miles from a repair shop and are seldom operated by skilled mechanics. The uniformity of results is the best proof of the wisdom of the design and method.

The water, with its chemical reactions practically complete and its precipitate ready to settle, arrives at the bottom of the settling tank and there commences to leave its precipitate as the water slowly rises to overflow through the perforated collecting pipe to the treated water pump in the pump room, whence it is delivered to the track tank.

The settling tank is freed of its accumulated sludge once daily by opening for 30 seconds the valves controlling the system of perforated sludge pipes lying in the bottom of the settling tank. The perforations are in the bottom of the sludge pipes, and the branch pipes are connected to the main pipes by street-ells so that they are close to the floor.

The treating plants were built by company forces at an expenditure of approximately \$18,000 for each of the larger plants and \$7,000 for the smaller ones. Since their installation boilers have been free from scale and from leaking, and almost free from foaming. Boiler repairs are now almost nothing and during the entire strike period no boiler troubles attributable to water were reported in this district.

Power Press Code and Head and Eye Safety Code Approved by the A. E. S. C.

The frequency of two of the most serious and most common types of industrial accidents should be greatly reduced through the application of two safety codes which have just been approved by the American Engineering Standards Committee. The Safety Code for Power Presses, Foot and Hand Presses, which has been approved as "Tentative American Standard," is the first national safety code on this subject to be prepared in America. The Safety Code for the Protection of Heads and Eyes of Industrial Workers, which has now received the A. E. S. C. approval as "American Standard" had been approved by the committee some time ago as "Recommended American Practice."

The high speed punch or forming press is one of the most dangerous machines in industry. This code consists of two parts—the first part describing standard requirements and the second consisting of a discussion of press hazards and protective methods and devices.

A statement from the National Committee for the Prevention of Blindness calls attention to Dr. Earl B. Fowler's estimate that there are in the United States approximately 15,000 persons who have been blinded by industrial accidents and that this is almost 15 percent of the blind population of the country. Because of this serious situation the U. S. Bureau of

Because of this serious situation the U. S. Bureau of Standards with the cooperation of the War and Navy Departments began in 1918 the preparation of a head and eye safety code. Several years ago this code was submitted for the approval of the American Engineering Standards Committee and it has since then been the subject of investigation, criticism, and revision.

The Inspection and Insurance of Steam Boilers

By R. J. Furr

The objects of boiler insurance and the work of boiler inspection are well known to our readers, but there are many phases of this form of protection not generally understood. The accompanying article outlines the fundamental principles of insurance, the qualifications of inspectors and the details of external and internal inspections.

THE underlying principle of insurance is protection from loss caused by the unexpected, the unusual or the catastrophe. The fact that steam boilers explode unexpectedly and violently makes their insurance desirable. The inspection service given by insurance companies is thorough and most efficient because they make every effort to prevent boiler accidents and the resultant loss in life and property.

The fact that boilers will explode violently makes their inspection necessary, for the operation of a steam boiler plant is dependent on the boilers, and if an accident occurs to the boilers, the whole plant is crippled. Perhaps a few remarks on boiler explosions will serve to illustrate the enormous damage which may be caused by the explosion of steam vessels of this kind.

UNDERLYING CAUSES FOR BOILER EXPLOSIONS

When a boiler explodes, the first question asked is, what caused it. Answers differ widely and sometimes the cause is unknown. However, one of the most satisfactory explanations of the mechanism of a boiler explosion is known as the Colbrum-Clark theory, which briefly is as follows: An initial rupture, sudden rapid reduction in pressure, the formation of a great quantity of steam in the water, hurling the water at the opening, increasing the latter and shattering the boiler; completion of vaporization of the liberated water projecting the parts to distances depending on the violence of the expansion.

Since the explosion of a boiler is likely to result in injury or death to many people, causing mental anguish and physical pain as well as expense to the plant owner because of the destruction of property and stoppage of the works, inspection is a necessity. In many instances the responsibility of the owner is not slight, as he is held responsible by many states and cities if he uses a boiler of poor design or a boiler which is not regularly inspected, or if he is proved guilty of negligence.

ENERGY CONTAINED IN BOILER UNDER PRESSURE

There are few, indeed, who realize that an ordinary cylindrical boiler when working under a steam pressure of only 150 pounds is possessed of sufficient explosive energy to project and carry it in a perpendicular direction a distance of about three miles. The damage done by the explosion is due to the energy in the hot water. This energy can easily be calculated, and roughly speaking, in one pound of water at 150 pounds steam pressure there are about 10,500 foot pounds of energy, *i. e.*, sufficient force to raise a weight of one pound to a height of about two miles. For example, the total energy stored in a Lancashire boiler 30 feet long by 8 feet diameter with 150 pounds steam pressure is in the neighborhood of 207,600 foot tons, which is sufficient to raise the whole boiler 12,500 feet or more than two miles.

In a boiler full of water and under pressure of steam at 150 pounds absolute which corresponds approximately to 135 pounds pressure gage, a pound of steam occupies 3.012 cubic feet. If the pressure is reduced to 15 pounds absolute, which is slightly above atmospheric pressure, the pound of steam will occupy 26.27 cubic feet, an increase in volume of 873 percent. Water which is generating steam at 150 pounds absolute has a temperature of 358.5 degrees F.; at 15 pounds absolute it has a temperature of 213 degrees. If the pressure on a boiler steaming at 150 pounds is suddenly reduced to that of the atmosphere the expanding steam will increase in volume many times and the heat stored in the water contained in the boiler will evaporate the water into steam as soon as the pressure is reduced. This is the reason that the initial rupture of a boiler may be comparatively small, but the following explosion may be violent. In other words, the tension maintained on the surfaces of the water in the boiler by 150 pounds' pressure prevents the water from boiling until it has reached a temperature of 358.5 degrees, but when the pressure is reduced to that of the atmosphere the water boils at a temperature of 145 degrees less, which causes the water immediately to flash into steam.

A few reasons for boiler failure:

(1) Defective design.

(2) Ignorance as to the amount of pressure the boiler will stand.

(3) Reduction in strength by deterioration.

(4) Defective workmanship and material.

(5) Mismanagement.

(6) Overheating of plates caused by low water, accumulation of scale, oil, mud or other deposit preventing the water gaining access to the plates.

(7) Defective safety appliances.

(8) Obstruction between safety valve and boiler.

No one believes that inspection will absolutely prevent all explosions, but rigid inspection will discover defects that might prevent an explosion. Anyone who has seen torn shell plates, sheared rivets, scattered tubes and wrecked buildings after a boiler explosion is convinced that inspection is necessary. As a profession, boiler inspection may be developed to a high degree.

ATTITUDE OF BOILER USERS TO INSPECTIONS

Too often there is an indifferent attitude among boiler owners and operators toward the value of good boiler inspection, resulting in no inspection whatsoever. Again, there is a lack of hearty cooperation on the part of the owner or the engineer when insured and sometimes manifests itself in deliberate antagonism. The cause may be the disinclination to incur additional expense, and because of this indifference more lives will be lost if all states do not make laws requiring standard boiler designs, compulsory inspection and licensing of engineers and firemen.

Success in boiler inspection work is contingent on the inspector's ability to find defective conditions, to point them out to the assured in a diplomatic and forceful manner which will give the assured a clear understanding of the condition and convince him that the recommended repairs are necessary to prolong the life of the boilers, to reduce the operating costs and to become general instructor to the plant operatives, particularly in mechanical matters.

Frequently, one hears the expression, Mr. ——, who is an engineer or boiler maker, is sure to know all about boilers. In my opinion, based on considerable experience, engineers and boiler makers as a rule are not capable of judging the condition and strength of boilers until after some time with an experienced inspector and a careful study of the boiler code makes them competent to measure up

1.1.27

certain types of boilers (those with which he has come in contact through instruction) and determine the safe working pressure. Certain it is he will be unable to locate all defective conditions, for careful thought and considerable experience is required before he acquires ability to analyze situations and to determine when conditions present a serious hazard. Of course, all boiler makers and engineers do not come under this head as far as inspections are concerned, but certain it is that they are not necessarily qualified for this particular work because of the lack of the theoretical knowledge essential in the design of boilers and judgment required in respect to repairs.

The boiler inspector must know boilers thoroughly, so well in fact that he feels certain that his recommendations or demands are absolutely right. On the other hand, he must not be overbearing, but always open to conviction, and be broad-minded enough to admit error if he finds he has taken an incorrect view because he did not possess a knowledge of all the facts. He must be a close student of human nature and know just how to approach the owner, engineer or those who are in charge in order to get the desired results. The inspector should be, if possible, well informed in different branches of engineering, also topics of the day, so that he may be in position to discuss questions other than those pertaining to boiler inspection, because as a rule a great number of people with whom he has to cooperate know little or nothing regarding boilers, and in order that they can form an opinion of his ability they usually endeavor to discuss some question with which they are familiar. If he shows that he is informed on this and other subjects it is usually conceded that he is reasonably well informed in his profession.

The inspector should be robust, for inspecting boilers is no child's play, but is one of the most fatiguing of occupations. The inspector is often required to undergo severe temperature changes. However, the inspection of boilers is a very healthful occupation because of the exercise and outdoor nature of the work.

VALUE OF REPORTS

The inspector should be capable of expressing himself well both orally and in writing, for only by properly presenting the findings of his inspection to the plant owner can he hope to impress him with the value of his work. The report must also be clear to the heads of his department, so they can properly handle the case. Boiler inspection is a great deal more than reporting the absence of *approved blow-off valves, feed water connections, etc. A boiler with the water column set low, the feed water introduced through the blow-off pipe, and an ancient globe valve on the blowoff line may be a better insurance risk because of the care and attention it receives, than a boiler which is provided with approved appurtenances.

The fact that the blow-off pipe of a boiler is not properly protected is not a sufficient reason to refuse to insure the boiler, but if the blow-off pipe is properly protected but wasted away from corrosion caused by accumulations of wet ashes until it may be dented by a light blow of the hammer, the situation is serious and requires immediate action. The man who reports the unprotected blow-off pipe is following the rule. The man who digs down through the ashes to the horizontal section of the pipe and gives it a good hammer test is the better of the two, he is safe at least; but the man who tests the pipe and then convinces the assured that he should install a new blow-off pipe and properly protect the pipe after it is installed, is a real inspector.

CLASSES OF INSPECTIONS

Boiler inspections are divided into two general classes usually termed external and internal. The external is made without any previous notice to the assured and the inspector's duties are such that the operation of the plant is not interfered with, providing everything is found in order. The internal inspection cannot be made until the boiler is idle and the manhole and handhole plates are removed as well as otherwise prepared for examination. This requires a notice sent the assured some few days in advance of the time set for the inspection. I will first describe the internal inspection and I can assure the readers that finding the boiler is sometimes no small part of the inspector's task. This condition is usually due to records that are in error regarding the location which are furnished him.

On arriving at the plant the inspector usually meets the engineer or other attendants. At this meeting he should endeavor to size up his men because the plant employee can make his task difficult or otherwise, he can also be of inestimable value in giving information regarding the operating conditions which the inspector could not obtain in any other way.

SAFETY PROVISIONS

Adequate means of exit should be provided from the boiler room. This will often prevent a minor accident resulting in the injury of an employee, an expense to the assured or insuring company which could have been prevented. The blow-off connection is a source of such accidents, as the valve is frequently so placed that the person operating it is in a closely confined place with the piping so arranged that a break at any point during the act of blowing off is likely to cut off all means of escape. It is the inspector's duty to recommend the necessary changes to prevent such an occurrence. The steam and water piping as a whole should be carefully examined to see that the proper supports and valves are provided and the arrangement is such that it will not lead to accidents or dangerous conditions of operation. The feed appliances and piping between them and the boilers should be inspected as to their condition and capacity, so that the boilers may at all times be supplied with enough water to meet their maximum capacity.

The steam pipe should be so arranged that no pockets will be formed to trap the condensation, and it should also be so connected that contraction and expansion can take place without undue strain on any of the parts. Many accidents have resulted owing to a lack of precaution in suitably arranging the steam piping. Examination must be made of the attachments and connections for determining the water level, as water columns are frequently found set so low that the safety of the boiler is endangered, and the drain or blow-off connection from the water column is examined to see that its size is ample. The connection from the steam space of the boiler to the top of the water column is inspected to see that there are no connections on this pipe that are required to furnish steam for any other apparatus or that water can be trapped in the pipe. The lower column line to the water space is also examined to see that provision has been made by which the pipe can be examined to determine if it is clear at regular wash-out periods.

If either of the lines is equipped with stop valves they must be of approved type and sealed open, as these conditions will render the indications of the water level inaccurate. The position of the steam gage is noted to see if it is in the correct location as it is frequently so connected to a boiler that the steam comes in direct contact with the spring or it is fastened so as to be exposed to heat from some part of the boiler or smoke flue, either of which conditions renders it inaccurate. The next and most important attachment to be examined is the safety valve, which deserves the closest scrutiny to determine its condition. If the safety valve is equipped with an escape pipe, the inspector must see that it is of ample size, void of valves or other attachments, properly drained and well supported to prevent undue strain on the valve. The method of boiler suspension and the ability of the supports to safely carry the load, require complete data on columns, supporting members, hangers, etc. The determination as to whether each support is carrying its proper proportion of the load for adequate boiler support is as necessary to its safety as the strength in other respects.

INTERNAL INSPECTION

The inspector, after writing the answers asked on his data slip regarding the various parts examined so far, then enters the top manhole with a light, hammer, rule, calipers and depth gage. Since this inspection is assumed to be the first one made of the boiler under question, he must obtain the necessary data for calculating the strength. The distance between the shell and the top of the tubes must be known in order to correctly estimate the amount of bracing required. The number, spacing, and size of the braces at their least cross section on each head must be obtained, together with the type and if they are welded or not. He must know the number and size of rivets attaching the braces to both head and shell, so that the weakest element in the construction can be taken into account in calculating the strength. The thickness of the heads must be ascertained in order to estimate the strength of any unstayed surfaces, calculate the area to be braced and to judge whether a suitable bearing surface has been supplied against which the tubes were expanded. The bands must be carefully examined around the flange for cracks or other defects.

The design of the joint, together with the size and pitch of the rivets, must be obtained so that its strength relative to that of the solid plate may be determined. The size of the rivets is usually judged from the dimensions of their heads and the thickness of the shell. The shell thickness must be known and usually can be measured by means of a depth gage applied along the edges of the plate or at an opening in the shell. The length of the tubes is also obtained. If there is a dome, the details regarding the bracing of the head if flat must be known. If concave or convex the radius of the bump together with its thickness must be known. The diameter, thickness of the sheet, type of joint, together with the size and pitch of the rivets, also the manner of its connection to the shell, must be secured as well as the dimension of the reinforcement around the opening from the boiler to the dome, should this opening be large.

The inspector next carefully examines the condition of the surfaces. The shell may show evidences of pitting, especially just below the water line. The tubes may be pitted or thin from general corrosion. The braces may be weakened by deterioration or they may be loose due to improper fitting or strain. Their soundness may be determined by striking them with the hammer as well as by visual inspection. The shell is carefully sounded to determine if there are indications of cracks or laminations in the material. It is well to sound many of the rivets for tightness. The condition of the upper portion of the boiler as regards to scale, oil or other deposits is noted, for in parts of the country it is not uncommon to find the spaces between the tube against the rear head completely stopped for a considerable Conditions of this kind are likely to lead to distance. serious trouble if not explosions. Oil, regardless of the amount in a boiler, is a serious matter. There is no substance likely to reach the interior of such a vessel that can produce an effect of such seriousness as oil. All openings to outside attachments or connections are examined to see if free, as many serious accidents have been caused by stoppage of the water column connection. When the connections are supplied with a pipe screwed into a part of the boiler or flange riveted to the shell, the inspector must be certain that the screwed joint has been fully made.

Upon coming out of the boiler the inspector places the

data obtained on a data slip. The next point to be examined is the front head relative to corrosion due to improper laying up the boiler, especially if it is fitted with a stack connected directly to the extension sheet, for under these conditions rain may come down the stack during idle periods and the sulphur deposits on the head combined with moisture cause extremely rapid corrosion. Careful examination of the surface to locate any brands or stamps placed on the sheets by the manufacturer is necessary for correct records.

Condition of tube ends and beads if thin or broken, the number of tubes, their spacing and distance between bottom of tube and shell are necessary information to correctly estimate the bracing required. If a manhole is supplied communicating with this part of the structure, he enters it and the usual points to be given attention are soundness of bracing the condition of the shell from corrosion or other defects, the heads and tubes, and to note the amount and kind of scale attached to the surfaces. The blow-off pipe is examined for its proper make-up. If there is no manhole below the tubes, the information just specified is obtained as nearly correct as possible in the upper part of the boiler and also through the hand holes which are usually supplied in the front and rear heads.

INSPECTING COMBUSTION CHAMBERS

The inspector next enters the combustion chamber noting the condition and position of the covering, as the arches generally used at this point are frequently located so high as to cause overheating of the head above the water line. The fusible plug which is located in the rear head must be examined to see that the metal is in good condition. The blow-off pipe must be examined and tested to see if it is sound and free at the bottom. The method of protection and freedom where it passes through the setting wall is also essential to safety. He should carefully observe the kind of fitting and pipe used, for in a number of instances low pressure material is used. The rear tube ends must be examined for leakage, bad beading and corrosion. If defects of this kind are disclosed, the cause must be determined and such recommendations made to eliminate the condition. He next observes the condition of the sheets and seams. If rivets leak, the outside of the boiler usually reveals this fact. Leakage of girth seams can be caused in many ways. If leaking is from scale or other deposits, inspection of the interior already made will generally reveal the cause. Fire cracks are another source of leakage. These can be

Fire cracks are another source of leakage. These can be overcome quite frequently by driving new rivets, chipping and recalking the seams or by removing the rivets, welding the cracks, reaming the holes true and re-driving the rivets.

The location, size and shape of the bridge-wall which forms the rear limit of the grate surface is often the cause or contributes to leakage at girth seams, for in many instances it impinges the flame directly against the seam. Improper boiler supports are also contributing causes. Feeding in the bottom of the boiler through the blow-off connection is another fruitful source of trouble.

The inspector must make a close examination for evidences of leaks coming from the vicinity of longitudinal seams, as any such leak is likely to prove a hidden crack. This defect has been responsible for some of the worst explosions known to steam boilers, and no leak at a longitudinal seam should be considered harmless until so proven. Condition of the setting walls should be carefully considered, particularly with respect to their ability to properly support the boiler. After measuring the grate in order to estimate the number of square feet of grate area, condition of fire door arches and fire linings observed and proper recommendations made, the inspector is ready to test and if necessary to correct the steam gage. Then the inspection is completed.

After the inspection, a discussion with the engineer regard-(Continued on page 22)

The secretary of the Master Boiler Makers' Association has announced that the association will hold its annual convention this year at Hotel Tuller, Detroit, Mich., beginning Tuesday, May 22, and closing at noon Friday, May 25. Ample provision will be made for exhibit space. Additional details of the convention will be given later.

The constant inspection of the materials employed and the workmanship entering into the construction of boilers is vitally important to their subsequent efficiency and safety in service. On the subject of new boiler construction the American Boiler Manufacturers' Association has become extremely interested in developing shop standards of inspection for the member companies that will insure the best construction and uniformity in the field of horizontal boiler fabrication. In accordance with the sentiment expressed in the preliminary discussion of the subject of inspection held at the annual meeting of the American Boiler Manufacturers' Association in June, 1922, a special committee was appointed with L. E. Connelly as chairman to formulate a suitable set of rules for inspection. This committee will make a complete report on the subject at the winter meeting of the association to be held at Hotel Astor, New York, February 12. The subject is one which demands close study and every member should attend the meeting with the intention of entering fully into the discussion and of offering any recommendations that will help the committee in its work.

The subject of horsepower rating of boilers, which has also been investigated by a special committee will be reported upon and discussed. Other reports will be presented on the work of the Uniform Boiler Law Society and the recent progress of the National Board of Boiler and Pressure Vessel Inspectors.

Economy is the first consideration of present and future steam locomotive design. Every item of equipment and every modification in design tending to promote the operating efficiency merits careful study. The latest development in design offering a wide range of possibilities is the method of mechanical drafting of locomotives proposed by H. C. Coppus in a paper read at the annual meeting of the American Society of Mechanical Engineers, and abstracted elsewhere in this issue. The fact that existing locomotives may be equipped with the induced draft fans described with only slight structural modifications and the exhaust steam effectively applied in promoting the overall efficiency immediately makes the suggestion a practical one.

The physical difficulties of securing a fan with sufficient capacity to work economically and, at the same time, small enough to be applied to a locomotive have apparently been overcome in the design described. Some of the direct advantages expected from its use are the reduction of back pressure on the cylinders and a degree of flexibility in drafting not possible with the exhaust nozzle. The constant draft of air through the fuel bed will also tend towards more uniform and complete combustion. Another feature tending towards economy in operation and maintenance is the availability of exhaust steam for use in feed water heaters. The saving in fuel and water from this source and the incidental decrease in boiler repairs, especially in bad water districts are factors to be considered. In addition to feed water heaters, condensers can be used which will make possible the conservation of from 25 to 95 percent of all the feed water carried by the locomotive, depending upon weather conditions and the like.

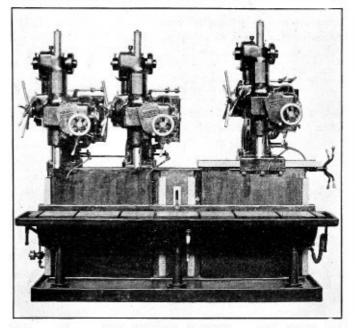

Until locomotives equipped with the system of mechanical draft and economizers outlined have been exhaustively tested in service, it is not possible to determine how wide their subsequent application will be. The discussion on the paper, however, indicated that the subject is of great interest to the mechanical engineers and locomotive designers of the railroads and will undoubtedly be applied directly within a few months by roads acting individually or as a group.

Engineering Specialties for Boiler Making

New Tools, Machinery, Appliances and Supplies for the Boiler Shop and Improved Fittings for Boilers

Special Gang Drill with One Moving Head

A special gang drill has been developed recently with longitudinal movement for the right-hand spindle, as shown in the illustration. A four spindle column is used and

Colburn Heavy Duty Multiple Drill Press with Horizontal Adjustment for One Head

regular four spindle table. The two left-hand heads are permanently placed on the column and have a fixed center distance. Head No. 3 is mounted on a plate having finished ways, this plate being attached to the column.

The third head has a horizontal adjustment of 27 inches and is moved by means of a screw and capstan handle. Provision is made for clamping the head securely in any desired position. The minimum center distance between the second spindle and the adjustable spindle is 27 inches. The maximum distance is 54 inches. The minimum distance between the extreme left-hand head and the adjustable head is 54 inches and the maximum distance is 81 inches. Thus the total range between spindle centers is 27 to 81 inches. Instead of having the finished ways extending only half the length of the column they can be lengthened and extend under the second spindle if desired. A fourth head can also be mounted on the finished ways so as to make a regular four-spindle machine with 27-inch center distances between the spindles. The machine illustrated is a Colburn No. 4 drill press, but the smaller No. 2 size or larger No. 6 size can be arranged in a similar manner.

The driving and feed gears of this drill press are mounted inside of each head and run in oil. The gears are made from chrome nickel steel, hardened and heat treated. The shafts are of large diameter and mounted on ball bearings. Automatic trip is provided. The spindles are double splined to equalize the strain and each spindle has a drilling capacity of 2 inches in solid steel. The distance between the center of the spindle and the face of the column is $12\frac{1}{2}$ inches. The machine is, therefore, rated at 24-inch swing. Supporting brackets are provided under the center and ends of the table. The column and table are heavily ribbed, the table having a three-point bearing in the column.

This multiple drill press is said to have great power, stiffness and rigidity and is one of the many types of heavy duty drills built by the Colburn Machine Tool Plant of the Consolidated Machine Tool Corporation of America. The main offices of this company are in New York City.

Simplicity Features New Valve Design

A new type valve, known as the "Flatplug" valve, is being manufactured by the Everlasting Valve Company, Jersey City, N. J., and distributed by the Scully Steel and Iron Company, Chicago, Ill. The valve includes all the more important features of the "Everlasting" type and, in addition, has advantages not incorporated in former types.

The valve seat, which is rectangular in shape, fits into the bottom bonnet on a circular gasket joint. It is held in place here, as may be seen from the accompanying illustration, by the pressure and a stiff spring. The disk, which is cupshaped, has a sliding contact with the seat at all times. The disk is also held to the seat by the same spring.

In the view of the valve in the left of the illustration the fluid is shown flowing past the cup into the uncovered openings in the seat and so to the outlet. The second view shows the valve in the closed position.

In assembling, the seat is merely pushed into place by hand, no screw threads or other form of fastening being necessary. When taking the valve apart, the seat is removed by pulling it out of the body without the use of tools. When the valve is in its normal position, or on either side or end,

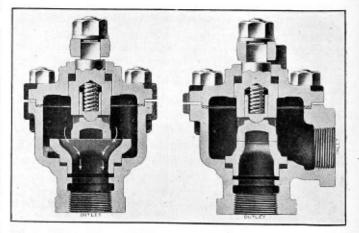

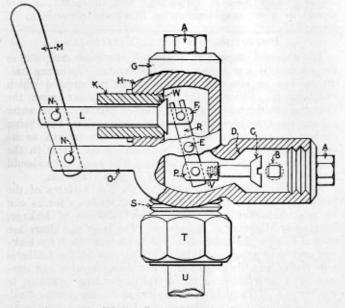

Fig. 1-Valve Open, Fluid Passing Into Uncovered Openings in Seat (left). Fig. 2-Valve in Closed Position

the seat will not fall from place; for when assembled it is held in place by the disk and spring.

In order to make repairs, it is only necessary to remove the top bonnet and all parts are readily accessible. New parts for replacement may be installed without removing the valve from the line or disturbing the piping.

Locomotive Safety Water Gage Valve

An automatic, safety water gage valve, which has given dependable and satisfactory service for more than five years on stationary boilers, has recently been installed successfully on locomotives by the Mattingly Automatic Valve Company, St. Louis, Mo. The action of this valve is as follows, reference being made to the illustration wherein C represents the main valve controlling the passage from

Automatic Water Gage Valve in Open Position

boiler to gage glass. R is a link pivoted on pin E which extends through from one side of the casing to the other. R forms a connection between main value C and auxiliary valve W and causes main valve C to be moved in the opposite direction to that of auxiliary valve W, thus preventing both valves from being seated at the same time. L is the auxiliary valve stem, the inner end of which is connected to link R by means of a fulcrum and pin which fits in the slotted end of link R. Valve stem L slides through bushing K, the bore in bushing K being somewhat larger than the valve stem. This allows a passageway around valve stem L which is controlled by auxiliary valve W, thus eliminating the necessity of any packing around this stem. To the outer end of auxiliary valve stem L is connected a lever Mcalled the operating lever, the position of which indicates the position of the main valve C. When the lever is leaning outward the main valve C is off its seat and when the operating lever is leaning inward it indicates that the main valve C is closed.

The construction of the valve casing, as illustrated, provides a boiler connection at right angles to allow for cleaning the interior of the valve and inserting a rod or wire into boiler through plug B and lower plug A. The portion of casing marked G is offset from the portion marked H to allow for a glass or metallic water glass end being inserted from the top through the upper plug A.

When either the top or the bottom water gage valve is opened, as shown in the illustration, the pressure is admitted around main valve C through the gage glass and into the valve at the opposite end of the glass. This pressure quickly equalizes on each side of the main valve C and at the same time exerts itself against auxiliary valve W and stem Lforcing them outward until auxiliary valve W rests on its seat. In other words, when one valve (either top or bottom) is opened to admit pressure from the boiler, this pressure automatically passes through the gage glass to the other valve and forces it wide open, holding it open. Should either valve be placed in closed position while the other one is open, it will not stay in that position, but will open again. This is due to the pressure acting against the auxiliary valve and stem as above mentioned.

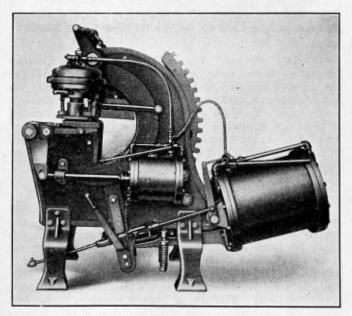

To close the values while pressure is in the glass, move them both to closed position at the same time. This allows both main values C to close communication between the boiler and glass, at the same time unseating auxiliary values W. This allows the pressure in the glass to escape around auxiliary stem L which has no packing around it. Should the gage glass become broken, the pressure will be quickly released off auxiliary value W and the pressure rushing from the boiler will force main values C to their seats instantly stopping the flow of escaping steam and water.

A valuable feature of this valve is the practical impossibility of its sticking or corroding shut. The valve is manually operated and gravity is not depended on to close it. Should dirt or grit become lodged on either valve seat causing a leak, it can usually be dislodged by pushing the operating lever in and letting it fly back.

Heavy Type Pneumatic Flanging Machine

The pressing demand for a pneumatic flanging machine which would successfully flange the heavy plates now being used in the construction of locomotives, prompted the Mc-Cabe Manufacturing Company, Lawrence, Mass., to build the heavy type machine shown in the illustration. This machine will flange cold any thickness of boiler plate up to and including $\frac{3}{4}$ inch. Circular heads, half heads, dished heads, segments of circular heads and straight flanging are flanged cold. Corners varying from $1\frac{1}{4}$ inch radius to 8 inch radius are flanged in one heat and with one complete stroke of the bending ram.

The new McCabe flanging machine is equipped with a patented pneumatic plate clamp. This clamp eliminates most

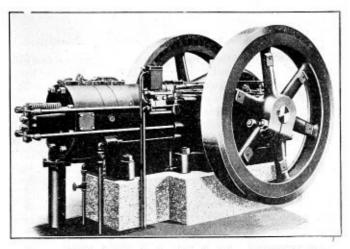

New McCabe Machine Which Flanges 3/4-in. Boiler Plate Cold

of the manual labor that was required in the former models. By adopting this new clamping device, the speed of flanging circular work has been increased over 50 percent. The machine is of cast steel construction; is self-contained; requires no foundation; and can be operated anywhere about the shop within range of the air system. All that is required to put the machine into operation is an air hose (100 pounds pressure) and a jib crane for handling the plates.

The advantages claimed for previous models are retained in this machine and include ability to flange similar pieces with uniform accuracy, convenience of moving from one part of the shop to another, or from one job to another, flexibility so as to handle various steel-plate shapes used in locomotives and car repairs, coupled with ease of operation. There are two operating levers, one controlling the pneumatic clamp or locking arrangement and the other controlling the movement of the piston which in turn moves the flanging arm.

Direct-Injection Oil Engine Driven Compressor

The Price horizontal direct-injection oil engine, manufactured by the Ingersoll-Rand Company, New York, employs the Price system of fuel injection which eliminates the need for a three or four-stage 1,000-pound pressure injection air compressor with intercoolers. A pump of single design provides the force for introducing the fuel into the combustion chamber. Two spray nozzles are employed, so arranged that

Ingersoll-Rand 17-inch by 19-inch Type P Oil Engine

their sprays impinge. The head and combustion chamber are shaped so that their surfaces are at all points parallel to the sides of the fuel sprays, thus preventing the fuel fog from coming in contact with a metallic surface where it would collect as drops and result in imperfect combustion.

Important advantages claimed for the Price oil engine are simplicity, sturdy construction, accessibility of parts, fuel economy, lubricating oil economy and completeness of combustion.

Oil Engine Air Compressor Unit

One of the first applications of the Price direct-injection oil engine has been to drive a direct-connected air compressor unit. This unit, of which the 100-horsepower engine forms the prime mover, has the air cylinder in line with the power cylinder but on the opposite side of the crankshaft. For 100 pounds pressure, a two-stage air cylinder is offered. The air intercooler is mounted below the air cylinder and forms a support for it. The general impression given by the unit is one of symmetry, compactness and durability. For air pressures less than 100 pounds, a single stage air cylinder is offered, which is connected to the oil engine frame by a distant piece. For both single and two-stage work, the air cylinders is double acting which has contributed to the exceptional balance of the machine.

In the 50-horsepower size, the air cylinder is vertical and is mounted on top of the engine, immediately above the crankshaft. By so doing, it has been made possible to mount the unit on a flat car or truck for use in portable work. This construction has not resulted in excessive height, this being kept less than $8\frac{1}{2}$ feet.

The Inspection and Insurance of Steam Boilers

(Continued from page 18)

ing the various points revealed by the examination is necessary in order to direct him in making repairs or bettering the operating conditions. Inquiry should be made as to the maximum steam pressure required to properly operate the machinery used in connection with the plant as this should be given consideration in fixing the pressure to be allowed.

INSPECTING THE BOILER EXTERNALLY

The external inspection, while not nearly so complete as the internal, is a most important inspection. Operating conditions can be observed and such practices stopped which endanger the boilers. On entering the boiler room the inspector should note the gage pressure carried. The water column must be blown to determine its freedom, this being evident by the speed with which the water returns to its original level as well as the behavior of the water in the gage glass, if the boiler is steaming. The gage cocks should be tried to see if they are free and in good condition.

An examination is next made of the fire surfaces of the boiler and the condition of the furnace walls as far as can be seen from the furnace doors for evidence of leakage, bagging or blistering of the plates. The front flue doors are opened to view the tube ends, which are examined for leakage and their general condition. The rear of the boiler is now visited and the condition of the blow-off valve and connection is determined as far as their operating condition is concerned. If there is a cleaning door in the setting wall, it is quite possible to view the fire surfaces and tube ends.

The top of the boiler is next visited. To make certain the steam pressure at that time, he tries the safety valve. With a safety valve of the spring-loaded type and with the steam pressure not over 20 percent less than the pressure for which the valve is set, a very accurate idea of the pressure at which the safety valve will operate can be obtained by testing its freedom by hand. If it does not appear to be properly adjusted, steam is raised until the valve operates in the ordinary manner or until the increase in pressure positively demonstrates that it is set for a pressure in excess of the limit allowed.

The inspector should discuss the important features of the inspection and plant conditions with the employees, for information of great value both to the assured and insuring company is often obtained in this way.

BUSINESS NOTES

The George Oldham & Son Company, Baltimore, Md., has opened a branch office in the National building, 1404 E. Ninth street, Cleveland, Ohio. This office is in charge of W. W. Davidson and C. M. Hartzell.

The Independent Pneumatic Tool Company, Chicago, announces the appointment of Blake C. Hooper, of the Minnesota Supply Company, Pioneer Building, St. Paul, Minn., as special railroad agent in the northwest for the sale of Thor tools.

The Ingersoll-Rand Company and the A. S. Cameron Steam Pump Works announce the opening of a branch office at 718 Ellicott Square Building, Buffalo, N. Y. This new office is equipped to render full service to those interested in air, gas and ammonia compressors, vacuum pumps, turbo blowers and compressors, condensers, oil and gas engines, pneumatic tools, rock drills, centrifugal and direct-acting pumps and other of the numerous products manufactured by these companies.

Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor is given permission to do so.

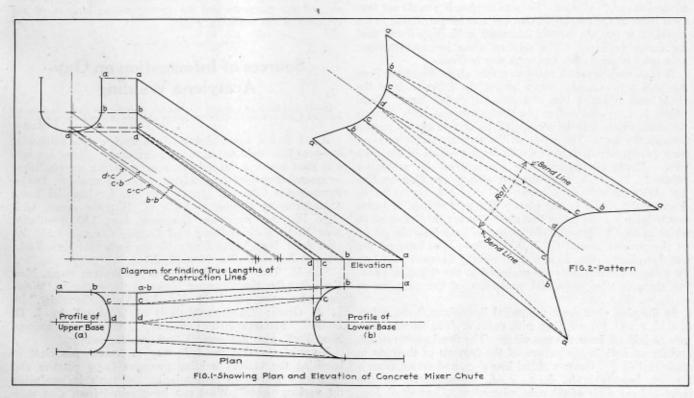

Concrete Mixer Chute

Q .- Please show me how to lay out a concrete mixer chute; also how to lay out bottom of well bucket in two pieces .- J. F. D.

A.—In the solution of this problem it is necessary to show in the plan and elevation, Fig. 1, the relative positions of the openings at each end of the chute, as indicated by the profiles (a) and (b). Then draw in the outline of the sides showing the taper; as a-a, b-b and d-d. Owing to the slight taper in the curved section of the chute along the bottom, it is necessary to find the true lengths of the construction lines for the pattern layout. The curvature of the upper base (a) and lower base (b) are divided into equal divisions as b-c, c-d, etc., the points of division are then projected to the straight lines a-d of the ends of the chute. Construction lines are drawn in from b-b and c-c, etc., in both the plan and elevation. The true lengths of these lines are determined by drawing right angled triangles, using as the base lines a-a, b-b, c-c, d-d, etc., of the plan and the heights as shown projected from the elevation. In the diagram for finding the true lengths all of the true lengths are not indicated, but a sufficient number are shown to give the plan in handling such layouts.

The pattern is developed in Fig. 2, consisting of first drawing the center line d-d. The arc lengths b-c, c-d of the two profiles are used in the stretchout of the ends and the hypotenuses of the diagrams of true lengths, Fig. 1, in developing the contour of the ends. All of the lines are so lettered that it should not be difficult to follow the steps in the layout work.

The bucket problem is not clear to me, as the sketch which accompanied your question did not indicate whether the lip of the conical ends was cut straight or spirally. The construction, Fig. 3, shows the layout with sides cut straight along *a-a* and riveted at the ends. A lap is allowed on one section at the end for riveting the two lip sections together. The pattern development consists of the development of a section of a cone. With a radius equal to *a-b* of the elevation draw an arc *a-b-a* as shown in the pattern. From point *b* in the pattern set off the arc lengths 2-1-a, 2-3-a equal to the corresponding arc lengths of the plan, Fig. 3. Draw in

Figs. 1 and 2-Details of Concrete Mixer Chute Layout

JANUARY, 1923

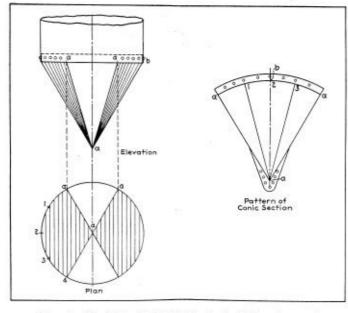

Fig. 3 .- Straight Sided Well Bucket Development

the outer radial lines and allow for laps. If this construction does not answer the purpose, advise us and we shall be glad to give any further help required.

Development of Intersection Between a Cone and Cylinder

Q.--Can you supply me with an answer to the following question? The problem is one to find the intersection between a cone and a cylinder. Please make a plan and elevation and show by development how to obtain the curve of intersection between the cylinder and cone; also develop the pattern for the sylinder, cone and opening in the pattern of the cone as required for connecting a 6-inch pipe.--C. LeB.

A.—Sometime ago a complete short cut method was illustrated in these columns for laying off the views and patterns of the cone and cylinder. I would suggest if you do not save each issue of the magazine, that the articles pertaining to the layouts that you are directly interested in be clipped and filed for future reference. The solution given herewith involves principles of projection and each step is given.

A plan and elevation are drawn first about the center lines x-x and y-y. On the center line of the cylinder draw the circle and divide it into a number of equal parts. From points 1, 2, 3, and 4 draw parallel horizontal lines through the cone which may be considered as cutting planes passed through the cone. The shape of the sections of the cone on these planes are circles, as shown by the circles in the plan view. These circular sections are laid off by projecting points 1_1 , 2_1 , 3_1 , 4_1 from the elevation to the plan on line y-y. With point o as a center and o-1, o-2, o-3 as radii, describe the circles in the plan. The next step is to locate points lying on the miter line as it appears in a plan view, which is done by drawing the horizontal lines from the points on the circular profile (b). Where these lines intersect the corresponding circles, as at b, c, d, e and f fixes the points on the miter. These points are projected to the elevation locating them on the horizontal projectors of the cylinder as a1, b1, c1, d1, e1, etc.

In the plan view draw the radial lines through the points b, c, d, e and f connecting with point o. The patterns can now be laid off from the two views. The development of the opening or hole in the pattern of the frustum of the cone is made in Fig. 2. Draw a radial line $o'-a_{i}$, and set off from a the arc lengths $a_{i},-b_{i}, b_{i},-c_{i}, c_{i},-d_{i}$, as measured on the outer or base circle of the cone, plan view. Connect o', Fig. 2, with the respective points $b_{i},-c_{i},-d_{i}$, etc., thus locating

corresponding radial lines that are intersected by the cylinder. Then points are located by using point o' as a center and drawing arcs from the points *I*, *2*, *3*, *4* to intersect the corresponding radial lines as shown at $a_{,,,}$ $b_{,,,}$ $c_{,,,}$ $d_{,,,}$ $e_{,,,}$ $f_{,,,}$ and $g_{,,,.}$. The length of the upper arc of the pattern is equal to the circumference of the base plus the necessary allowance for lap.

In Fig. 3 the layout is given for the cylinder pattern. The length or stretchout s-s equals the circumference around the

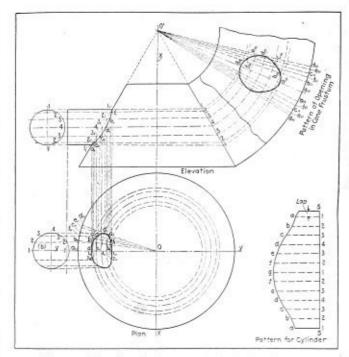

Fig. 1.-Details of Cone and Cylinder Layout

cylinder which distance is divided into the same number of parts as is the cylinder profile. Lengths *I-g*, 2-f, 3-e, 4d, etc., of the pattern equal the corresponding lengths on the cylinder of the elevation, Fig. 1.

Sources of Information on Oxy-Acetylene Welding

Q.--If you know of any one that teaches acetylene welding please let me know as I am anxious to study the proper methods of doing the work. J. M. B.

A.—I do not know of any school teaching the subject of oxy-acetylene welding at the present time. There are several good books on the subject, some of which are published by manufacturers of gas welding equipment, namely: Davis-Bournonville Company, Jersey City, N. J.; Imperial Brass Manufacturing Company, 1200 W. Harrison street, Chicago, Ill.; Air Reduction Company, Inc., 120 Broadway, New York; K-G Welding and Cutting Company, 556 W. 34th street, New York; Linde Air Products Co., New York; Oxweld Acetylene Co., Newark, N. J.

The D. Van Nostrand Company, 8 Warren street, New York, handles the following books on the subject: "Welding and Cutting Metals by Aid of Gases or Electricity," by L. A. Groth; "Modern Methods of Welding," by J. D. Davies. McGraw-Hill Company, 370 Seventh avenue, New York, also has several books on the subject.

I would say that the only way to become proficient in handling the various welding processes is by practice and experience gained in manipulating the torch in producing the various welds. What can be expected from data published on the subject is a knowledge of the nature of materials, gases used, types of joints and methods of procedure in preparing the joints and general instructions along the lines of welding.

Expertness in the work therefore comes from actual experience in handling the equipment and general knowledge gained in the subjects mentioned.

Layout of Oblique Pipe Work

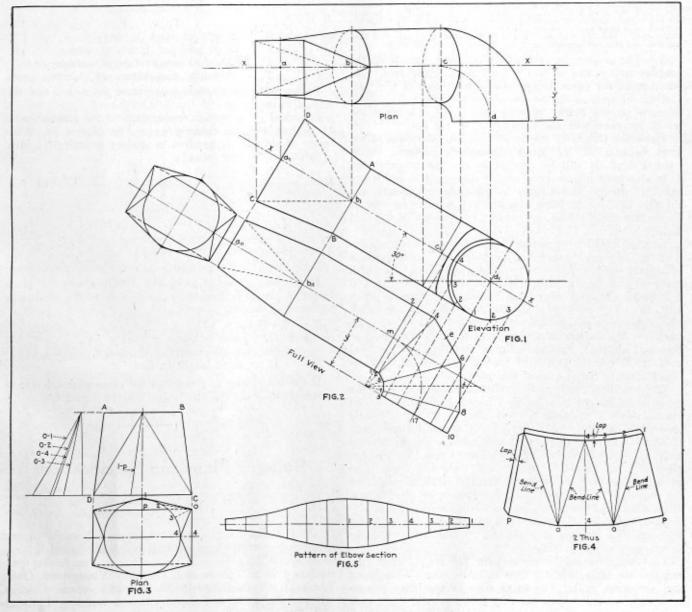

Q.—Please advise how to layout an elbow as per accompanying sketch. Also please advise where I can obtain a volume or two on advanced laying out. I have been laying out for several years and understand projection and triangulation but am far from knowing it all. I have a copy of your book "Laying Out for Boiler Makers," a course in the I. C. S. and all, or nearly all the copies of THE BOILER MAKER for the last several years. I have heard of a party somewhere near Huntington, Pa., publishing a book for layerouts, also something about the Chicago Technical Institute, but believe you can direct me to what I want.—G. A. H.

A.—From your sketch as reproduced in Fig. 1, which shows a plan and an elevation of the connecting pipes, as they are inclined to the horizontal as shown in the elevation at an angle of 30 degrees, the views of the elbow are shown foreshortened in both the plan and elevation. In such constructions the requirement is to show a full view of the connection as given in Fig. 2. Therefore, knowing the measurement y shown in the plan, Fig. 1, simply reproduce a new plan view as constructed at right angles to the elevation. Imagine, for illustration, that a plane is passed directly through the line x-x of the elevation, Fig. 1, and that it is turned about this line to bring it into a plane parallel with the horizontal, thus showing a full view of the elbow connection.

Lay off the center line a_{11} - m_1 , Fig. 2, and from point m which is projected from the elevation, Fig. 1, lay off the distance m-o equal to y of the plan. With o as a center draw the arcs 2-10, m-n and 1-g. Divide either arc into one less than the required number of sections in the elbow, as 2-e, e-f, f-10 on the outer arc. Bisect 2-e, locating point 4 and with the dividers set to e-f space off from point 4 the lengths 4-6 and 6-8. Connect the points 4-6-8 with the center o, thus locating the miter sections of the elbow. The remaining construction of the elbow sections will be understood from the drawing.

In Fig. 3 is the layout of the transition piece. The dimensions are taken from the elevation, Fig. 1, and full view, Fig. 2. In this development triangulation is employed.

In Fig. 4 a one-half pattern is developed of the transition piece, which involves the transfer of the true lengths of the triangles, Fig. 3, and the use of the arcs of the upper and

General Details of Oblique Pipe Development

straight lengths of the lower base. As the construction lines are numbered to correspond with those of Fig. 3 the respective steps in the development are evident. Fig. 5 is the development of the pattern of the elbow sections.

There are several text-books on projection triangulation, and I believe that with your I. C. S. course and the "Laying Out for Boiler Makers" you have sufficient information to handle problems of this kind. A thorough understanding of the principles of projection and triangulation is essential before practical layouts can be handled. The most difficult development is simply the application of these subjects, which involves several steps in the drawing work, to show a complete full view, or development of triangles to obtain the true lengths of foreshortened construction lines.

There is published by the Sheet Metal Worker, 17 East 40th street, New York City, a volume on sheet metal layouts, known as Kittredge's "Sheet Metal Pattern Book." This volume pertains to layouts produced for the lighter sheet metals and it is an excellent treatise.

Stack Proportions

Q.—We have two 125-horsepower return tubular boilers which have individual stacks 34 inches diameter, 60 feet high; boilers have 25 square feet of grate surface each. We have to build new stacks and I have suggested that one stack of larger area be built. From my present supply of information I find that a stack 48 inches in diameter would be equal in volume to the two 34-inch stacks. As the whole job of designing and laying out is left to me I want to be sure of not bungling the job, but there is a formula that the exact size and height of stack can be figured from grate area and heating area and also coal consumption by using these factors.—O. G. M.

A.—The proper size of stack or chimney depends on the amount and nature of fuel to be burned, grate area, temperature of the gases, design and arrangement of the flues and the altitude of the boilers above sea level. The draft depends on the height of stack and the gas temperature, which increases with the temperature of the gas.

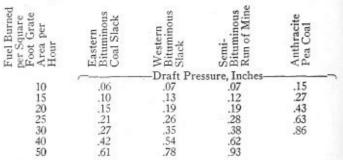

The stack should be higher at high altitudes than at sea level because of the lower atmospheric pressure. With natural draft, it will be affected by the gas temperatures. It is also more intense on clear dry days than in hot sultry weather; due to the changes in atmospheric pressure and the fact that in the latter case the higher moisture content in the air absorbs heat and retards combustion in the fuel bed.

Some authorities proportion the diameter of the stack according to the grate area; thus for watertube boilers the area of a stack at its smallest end should equal at least one-fifth the total grate surface area where the stack is less than 150 feet high. In cases where the stack height is greater than 150 feet, the smallest cross sectional area of the stack should be not less than one-sixth the total area of the grate surface. For boilers of the horizontal return tubular type the stack should be proportioned so that the cross sectional area at the smallest end is 25 percent in excess of the combined cross sectional area of the tubes.

The retarding effect of the draft due to the friction of the gases is equivalent to a lining 2 inches in thickness. The effective area of a stack for both round and square equals $A - 0.6\sqrt{A}$, in which A = Area of stack in square feet.

The height of a chimney should be sufficient to develop a draft greater than that required for its rated horsepower. Generally the height of the stack is assumed taking into consideration the surrounding buildings, draft required for the burning of the fuel and horsepower of the boilers. High stacks are expensive and objectionable from the standpoint of upkeep. Stacks are now rarely built over 150 feet high, as it is cheaper to build two or more smaller stacks in place of one larger one.

The minimum height varies with the fuel, (wood fuel requires the least height), then in order comes bituminous and anthracite coal. The small sizes of the latter require very high stacks to burn the fuel under natural draft conditions. To burn the buckwheat sizes the height of stack required under natural draft would be prohibitive. With mechanical or forced draft high stacks would also be needed, thus to burn 25 pounds of buckwheat coal per square foot of grate area would require a stack at least 175 feet high. The following table gives the draft pressure in inches of water required to burn some coal fuels on hand-fired grates.

When the draft required and the temperature of the outside air and stack gases are known, the required height of the stack may be determined by the formula:

$$H = \frac{P}{\frac{7.6}{T_1} - \frac{7.9}{T_2}}$$

in which: H = Height of stack in feet.

P = Draft pressure, inches of water.

 T_1 = Absolute temperature of outside air.

 T_2 = Absolute temperature of chimney gases. To determine the absolute temperature referred to add 460 degress in each case.

Example: The outside temperature of the atmosphere is 62 degrees and the chimney gases 550 degrees F. What height of chimney is required to produce a draft of 1 inch. *Solution:* By the formula

$$H = \frac{P}{\frac{7.6}{T_1} - \frac{7.9}{T_2}} - \frac{1}{\frac{7.6}{522} - \frac{7.9}{1010}} = 149 \text{ feet.}$$

$$T_1 = \frac{62}{T_2} + \frac{460}{522} = \frac{522}{600} \frac{1010}{1000}$$

$$T_2 = 550 + \frac{460}{1000} = 1010 \text{ degrees.}$$

Kent gives the following formula for stack proportions: If the horsepower of the boiler is given and the stack height is assumed, then the effective area of the stack may be found as follows:

$$E = 0.3 H.P. \div \sqrt{H}$$

in which E = effective area in square feet.

H.P. = horsepower of the boiler.

H = stack height in feet.

If the horsepower is given and the cross sectional area is assumed, the height of the stack may be found from:

$$H = \left(\frac{0.3 \ H.P.}{E}\right)$$

Building Plans and Specifications

Q.—Would you kindly advise us if you can refer us to anyone who has blueprints and drawings suitable for a boiler shop large enough to manufacture boilers up to 72 inches diameter by 18 feet? We have seen a number of good designs in THE BOILER MAKER, but they are too large for the purpose we have in mind.—W. T. F.

A.—For the purpose you have in mind I would suggest that you investigate the industrial buildings erected by concerns specializing in such constructions. For further particulars write to Truscon Steel Company, Youngstown, Ohio; Frank D. Chase, Inc., 645 N. Michigan avenue, Chicago, Ill., and Beling-Bush Company, Drexel Building, Philadelphia, Pa.

Letters from Practical Boiler Makers

This Department Is Open to All Readers of the Magazine —All Letters Published Are Paid for at Regular Rates

Supervision of Boilers in Country Districts Necessary

On June 3 at 10 A. M., a 30-horsepower boiler of the wet bottom locomotive type and located on the Hosmer Farm at Olean, N. Y., exploded. There was no loss of life and very little property damage considering the violence of the explosion.

We made an investigation of the wreckage on the following day and have concluded that it was a miracle that it had not blown up before. The original thickness of the barrel plates and wrapper sheets was 5/16 inch and of the firebox sheets $\frac{1}{4}$ inch. The firebox and wrapper sheets were pitted and grooved in some places so that they were only $\frac{1}{16}$ of an inch thick.

The staybolts in the side sheets were originally 3/4 inch in diameter and were spaced 47/8 inches by 5 inches. The steam gage registered 80 pounds pressure not more than one minute before the explosion but, as the gage was not tested before, as far as records can be found, it cannot have any reliance placed upon its reading. The boiler was also equipped with a lever safety valve but this could not be found.

The barrel of the boiler fractured at the throat sheet near the seams, it being grooved at the throat sheet and pitted so that it was not over 1/8 of an inch thick, the plate also tore at the rivets connecting the barrel and wrapper sheets. The barrel was found about 100 feet ahead of its original setting.

The dome was located over the firebox and the dome, wrapper sheet and outside firebox sheets were found upon a hill elevated about 100 feet and at a distance of 825 feet ahead of its original setting. Investigation showed that five staybolts were broken entirely off on the right side and all the remainder were cracked so that some only held by $\frac{1}{18}$ of an inch.

The firebox proper was found about 275 feet to the left of the original setting and was pitted and grooved excessively. The staybolt heads pulled from most every hole in the firebox. The firebox door was found about 400 feet to the rear and had made a path through the trees showing where it had traveled.

DEFECTS FOUND IN BOILER

In making the examination, the following defects were found: Sheets and tubes wasted and corroded throughout the boiler to a thickness of 1/16 inch in places; three broken braces connecting barrel and flue sheet together; one broken back head brace; five broken bolts and all the rest cracked on the right side; radiating cracks around the staybolts which had been acetylene welded one week previous.

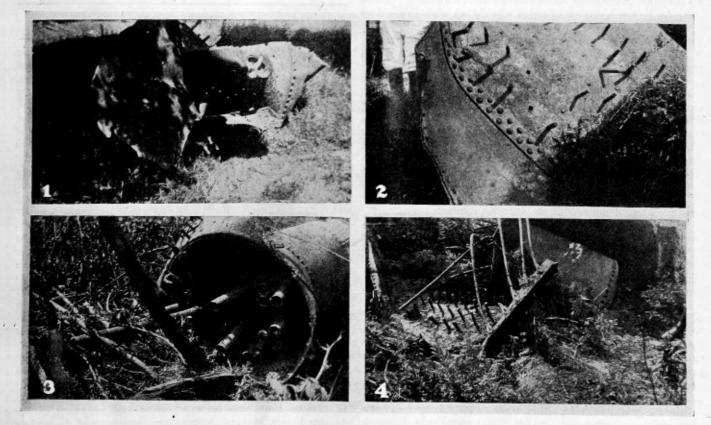

Fig. 1.—View of Firebox After Explosion. Fig. 2.—Sheet from Right Side of Boiler. Fig. 3.—Barrel Sheet and Tubes. Fig. 4.—Dome and Wrapper Sheets

This boiler was about 20 years old, never inspected, poorly constructed and attended to. About one year previous to the explosion a boiler maker applied a patch extending the full length of the firebox and taking in two horizontal rows of staybolts. He informed the owner that the boiler was unfit for service, but the owner did not heed the warning. He also notified the inspector in this district but neither did he make an inspection and condemn the boiler.

At the time of making the repairs, it was found that horse manure was put into the boiler in large quantities to stop previous leakage. The cause of the explosion is very evident and easily determined. The law states that all portable and stationary boilers carrying 15 pounds pressure or over are subject to inspection; also, that the owner or user shall notify the state of the location of the same annually.

There is no record of inspection on the boiler and there are several more right close by which are evidently in the same condition. Summing up the whole matter, we find there are only about 10 state inspectors to cover the entire state and each one covers from four to seven counties, their work covering portable and stationary boilers. They cannot possibly do justice to their work by having so much territory to cover. Country boilers which are in very bad condition compared with those located in the city need inspection very badly. It should be made a law or rule that repairmen must report all boilers they work on, so that all of them could eventually be located.

Olean, N. Y.

C. W. CARTER, JR.

Accuracy in Boiler Making

No doubt many of the readers of THE BOILER MAKER have heard the common expression that a boiler maker never works closer than one-fourth of an inch. Indeed there is a large percentage of boiler makers and layerouts who work closer than one thirty-second of an inch. There are really few layerouts of today who do not work closer than one-fourth of an inch, while of course there are a great many who have the habit of calling one-eighth inch close enough.

I have observed the work of a number of layerouts in various shops and I find that many really work to one sixtyfourth of an inch in laying out holes and find it much easier and quicker. Accuracy is a good habit on anything and an ounce of prevention is worth a pound of cure; the cure being for inaccurate work such things as drift pins, reamers, acetylene burners and sometimes the welders. While I do not mean that a man should waste any extra time to make a hole come to one thirty-second of an inch, yet the expressions as, "Oh, that is all right, you can pin those few holes"; or, "What do you suppose reaming machines are for?"; or, "If we did not have any bad holes we would not need a reamer around the shop," are only too common.

On the one hand, there are cases where each man depends on the next man to make it right. The layerout will let it slip a little, the punch machine man will do the same, the shear man will let it slip from the line, and when the fitter puts it together, he somehow or other gets it there regardless of fair holes, as he also is used to work that requires reaming and pinning before the rivets can be put into the holes. On the other hand, there are cases where the boiler maker will put a job together that has been laid out to perfection and instead of fairing the holes before pulling the bolts tight, he is satisfied to get a bolt here and there, even if he must pin to get the bolt in the hole. He does this instead of looking around and seeing what is holding the job off, fairing it up, and putting pins in the holes to hold it fair while the bolts are being pulled tight. This fairing up of the job makes it look better, makes better rivets and is much quicker than the careless way of fitting up a job and letting the other fellow worry about fair holes.

I have seen many large difficult jobs on which the holes

looked as if they had been drilled through after the work was assembled, but such was not the case. This type of work was only the result of careful and accurate workmanship throughout the shop; *i. e.*, beginning with the layerout and then through the works. This class of work seems to be the result in the most successful shops where riveters drive rivets of various sizes of three-eighths up to one and one-fourth inches in diameter day in and day out, never having to use a pin to get a rivet in the hole except on break-downs where the plates have been scarfed. And so the better class of work, the neater looking work and the cheaper work is the result of accuracy on the part of each one of the many workmen coming in contact with the job.

As almost everyone knows, there are many advantages gained from turning out good work and having men who know how to do the best work. For when a boiler or tank shop turns out a fabrication job that the purchaser intends erecting himself or subletting the erection, many times a haphazard misfit job will give the shop that turned it out a "black eye," and regardless of how much cheaper he may be on other work he has a hard time of landing any good jobs from them. Thus extra good work is somewhat like a silent salesman, landing many a good contract in the future.

I will say however that the shops in the United States today exceed by far any other country in the production of general steel plate work due mostly to the fact that employees and employers in this country as a whole are never satisfied with present arrangements and are always on the lookout for improvements, trying to do more today than they did yesterday, keeping in mind the old saying, "always try to do this job a little better than the last job." This again brings us back to *accuracy*. Here we have still a greater incentive for doing good work: it gives a fellow pride and interest in his work, making the work a pleasure, thus benefiting directly himself.

TRADE PUBLICATIONS

STEEL SECTIONS .- The use of steel sections for overhead shafting and anchorage service is described in a pamphlet issued by the Midwest Steel and Supply Company, New York. The sections comprise box rails, socket inserts and steel stringers. Sectional views of these products with illustrations of various applications are given.

CORROSION .- The subject of pipe corrosion is discussed in Bulletin No. 3-C issued by the National Tube Company, Pittsburgh, Pa. It is agreed by authorities that oxygen holds the dominating position together with the electrochemical theory in causing internal corrosion. An explanation of this action is given in the bulletin together with the details of the mechanism of corrosion in abstracts from papers which have been delivered before various professional societies. Practical means of preventing corrosion are outlined and the results which may be expected from various methods of water treatment and the like.

SPIRAL RIVETED PRESSURE PIPE .- The American Spiral Pipe Works, Chicago, Ill., in a well illustrated catalogue describes the manufacturing process and tests through which various forms of Taylor spiral riveted pressure pipe pass in fabrication. Protective coatings of asphalt and galvanizing material are used for the protection of the pipe. Numerous applications of spiral pipe to industrial uses are included. The catalogue is so arranged that the price lists are easily accessible. Several pages have also been devoted exclusively to a collection of hydraulic tables and charts.

INTERNATIONAL BOILER WORKS .- The International Boiler Works located at East Stroudsburg, Pa., has issued a catalogue outlining the facilities of the plant and products of the company. The plant is one of the most modern in arrangement and equipment in the country for the production of horizontal boilers, vertical boilers, marine boilers, tank and plate fabrication. Complete details of the machinery, process of fabrication with numerous illustrations of the various types of boilers built make up the body of the catalogue.

SELECTED BOILER PATENTS

Compiled by

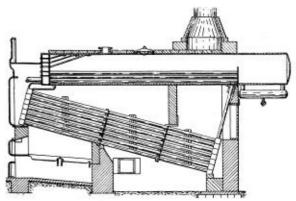

GEORGE A. HUTCHINSON, Patent Attorney,

Washington Loan and Trust Building Washington, D. C.

Readers wishing copies of patent papers, or any further information regarding any patent described, should correspond with Mr. Hutchinson.

1,432,941. WATER PURIFIER FOR STEAM BOILERS. GEORGE J. WOODHOUSE, OF OELWEIN, IOWA.

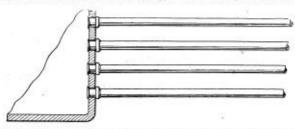

Claim 1.-In combination, a boiler, a separating-drum positioned thereabove having a closed chamber at one end and having a transverse-partition spaced from the other end, the upper part of said partition being removed,

said closed chamber being in communication with a source of water supply, water-tubes positioned in the lower part of said separating-drum with their forward ends in communication with said closed chamber and their rear ends traversing said partition, and water-legs effecting communication between the forward and rear ends of said boiler and the forward and rear ends respectively of the lower part of said separating-drum between said closed chamber and said partition. Three claims.

1,438,596. BOILER. HARVEY HARDING, OF EAST ORANGE, NEW JERSEY.

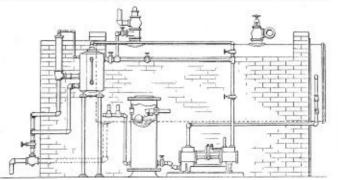

Claim 1.-The combination in a boiler construction, of an apertured tube sheet, flue tubes extending transversely through the apertures of the sheet and secured at one end to the sheet, copper collars lining the apertures of

the tube sheet, and coatings of copper on and exterior of the tubes and extending a distance from the tube sheet and interposed between the said tubes and the copper collars, whereby without interfering with the essential expansion and contraction of the tube connections passage of electric current from the tubes through the water to the collars is prevented. Two claims.

1,435,546. BOILER-FEED REGULATION. JAMES H. MURRAY, OF WATERVILLE, MAINE.

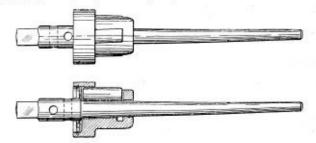

Claim 1.-The combination with a boiler, a feed pump, a regulating device, pipe connections between the boiler and regulating device and between the latter and the feed pump, and a valve controlled by the water level in the

regulating device to control the passage of steam to the pump, of feed water connections between the loiler and the regulating device and comprising two pipes spaced apart vertically and both communicating with the regulating device below the normal water level of the boiler. Thirteen claims.

1.439,569. BOILER TOOL. GRAVES R. MAUPIN, OF MOBERLY, MISSOURI, ASSIGNOR, BY MESNE ASSIGNMENTS, TO THE J. FAESSLER MANUFACTURING COMPANY, OF MOBERLY, MIS-SOURI, A CO-PARTNERSHIP COMPOSED OF JOHN W. FAESSLER, CHRISTINIA FAESSLER, LOUIS E. FAESSLER, AND GRAVES R. MAUPIN.

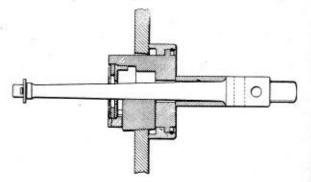

Claim 1.—A boiler tool comprising a tapered mandrel, a cage formed of a solid piece of material, said cage provided on one of its ends with a counterbored enlargement, a cylinderical opening extending centrally through said

cage, said opening adapted to receive the mandrel, a plurality of openings disposed radially to the central opening and diagonally thereto, said openings leing aval in cross section and opening into the central opening and on the outside cylinderical surface of the cage, a plurality of rollers located in said openings, a thrust collar secured to said cage, and a split spring ring for securing said collar to said cage. Two claims.

1,439,622. BOILER TOOL. JOHN W. FAESSLER. OF MOBERLY, MISSOURI, ASSIGNOR, BY MESNE ASSIGNMENTS, TO THE J. FAESSLER MANUFACTURING COMPANY, OF MOBERLY, MIS-SOURI, A CO-FARTNERSHIP COMPOSED OF JOHN W. FAESSLER, CHRISTINIA FAESSLER, LOUIS E. FAESSLER, AND GRAVES R. MAUPIN.

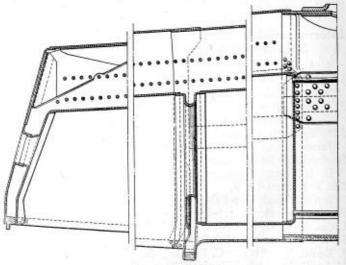

Claim 1.—A boiler tool comprising a cage, a tapered mandrel extending through said cage, rollers mounted in said cage at an angle to its longitudinal axis and capable of being extended through its outer periphery, a

friction collar rotatably mounted on said cage, means carried by the friction collar for holding it on said cage, means carried by the mardrel and adapted to contact with the cage for limiting the movement of the mandrel through said cage, and a roller retainer located within the cage for holding the rollers therein when the mandrel is withdrawn. Three claims.

1,433,378. STEAM BOILERS. WILLIAM F. KIESEL, JR., OF ALTOONA, PENNSYLVANIA.

Claim 1.-An expansion member for connecting the shell sections of a boiler containing the fire box and combustion chamber consisting of two parts welded together, one formed of a strip bent transversely to make a

bellow rib and side flanges, and the other bent to form a continuation of said hollow rib and flanges and extending downward and transversely at one side to constitute the front end of the fire box, substantially as set forth. Three claims.

The Boiler Maker

FEBRUARY, 1923

Equipment for Locomotive Boiler Repair Shops

Arrangement, Types and Capacities of Machines for Use in Carrying Out Major Boiler Work

MOST of the railroad boiler repair shops are equipped to accommodate the locomotives coming within their territory for maintenance but not all of them utilize the most efficient types of machines and the best floor layout of machinery to accomplish the desired results. The handicap thus imposed generally must be overcome by employing an increased staff or by pushing the existing staff harder than would ordinarily be necessary. Some suggestions to overcome certain of the inefficiencies may be gained from a study of the following general details of a typical average shop layout.

BOILER MAINTENANCE IMPROVED DURING PAST YEAR

During the past year, and especially in the last months of 1922, the railroads throughout the country have made good progress in putting their motive power in condition to meet the increased traffic demands. As a measure of this im-

Nors-The photographs used to illustrate this article were supplied by the Niles-Bement-Pond Company, New York.

provement in maintenance, the report of the chief inspector of the Bureau of Locomotive Inspection indicates that locomotive failures, particularly boiler accidents, have decreased materially. The factors entering the improved condition of power include adequate inspection, both by government and railroad staffs, the skilled men in the shops and modern, efficient equipment. The full importance of the last item is now being realized in the smaller shops as it has been for a long time by the larger systems.

Boiler shops are in general given rather less consideration in the matter of layout and equipment than is true of machine shops, for example, and yet on the work of the boiler shop depends the efficiency of the entire machine.

EQUIPMENT REQUIREMENTS FOR AN AVERAGE SHOP

Whether the shop be large or small, certain tools must be included in the equipment to properly handle the boilers that come in for repair. What these tools are and how they may be used to best advantage have been the subject of a great

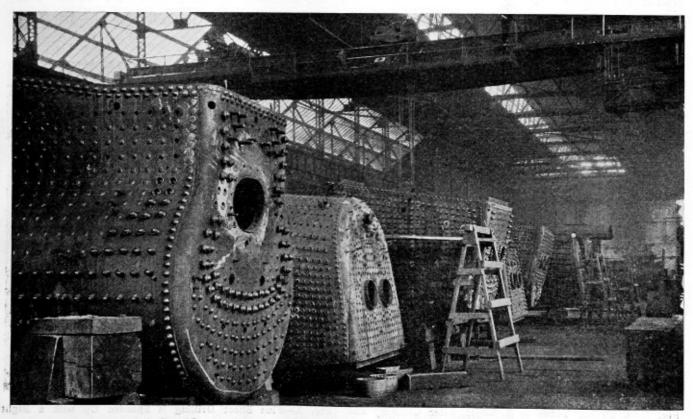

Fig. 1.-Group of Fireboxes Under Process of Repair in a Modern Boiler Shop

FEBRUARY, 1923

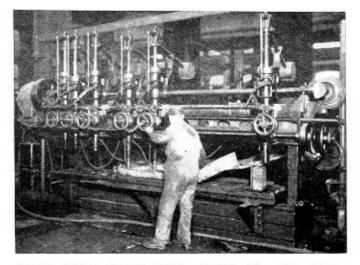

Fig. 2.-Multiple Spindle Drilling Machine Boosts Production

deal of study by both railroad engineers and those of the equipment manufacturers with the result that it is possible to equip a shop with standard tools that will take care of a given number of locomotives in the most efficient manner possible without installing any unessential machinery.

The equipment of the shop must provide for practically all plate work necessary on the locomotive and should therefore include the superheater, tank, cab and sheet metal departments as well as the boiler department. If the shop is of moderate size it should be equipped to take care of the complete construction of the firebox and repairs necessary as well as the construction of a complete boiler in case of emergency.

FACTORS ENTERING SHOP DESIGN

Of prime importance in planning a new shop, or increasing the efficiency of an existing repair plant, is the lighting, both natural and artificial. The results to be expected from the equipment in the shop depend in a great measure on this matter of proper lighting. Another point to consider is the provision of adequate handling facilities for parts to be

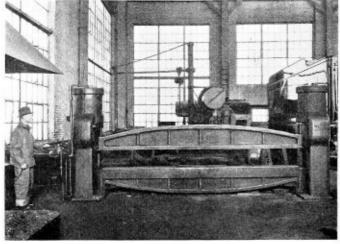

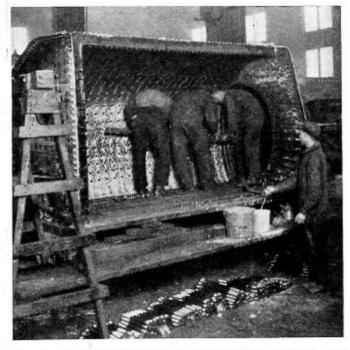

Fig. 4.- A Plate Flanging Machine is Indispensable

moved from the erecting shop or other departments of the plant into the boiler shop. Any weight up to a complete boiler must be provided for. Traveling cranes of various capacities, truck and track arrangements are necessary for this service and, in the boiler shop itself, many jib cranes should be installed adjacent to machines, for they aid production without interfering in any way with the fabrication processes. These of course are installed in addition to the regular crane equipment in the boiler bay.

The location of machinery is of extreme importance but before considering this phase of the subject an idea of the type, size and capacity of the essential machinery will be given.

In the class of heavy equipment, a radial drill for flue sheets and mudrings of at least 6-foot capacity should be installed; a set of bending rolls capable of handling plates at least up to 14 feet by 7/8 inch; a hydraulic riveter for fireboxes and shells and a mudring riveter. In this connection, where it is at all possible, the rivets should be pressure driven. For flanging, a 10-foot flanging clamp and a universal flanging press are necessary. For plate work, an 18-

Safe Ending

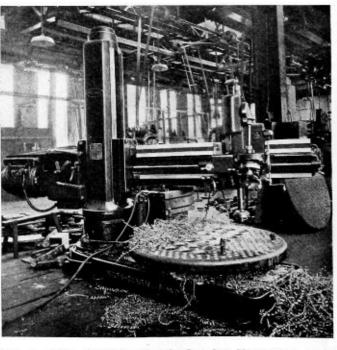

Fig. 3.-Replacing Tubes in a Boiler After Cleaning and Fig. 5.-Flue Sheet Drilling is Speeded Up with a Right Line Radial

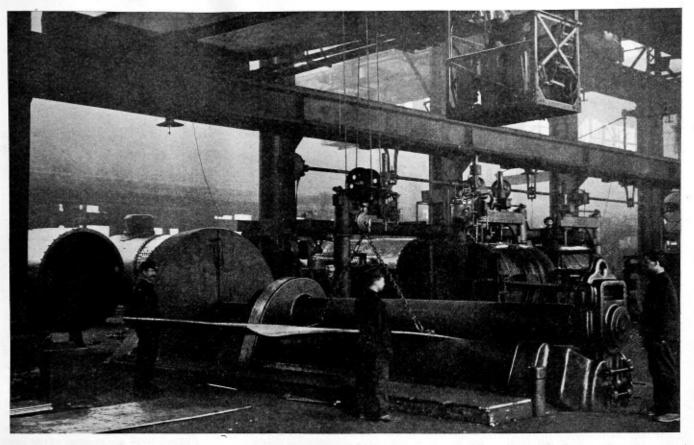

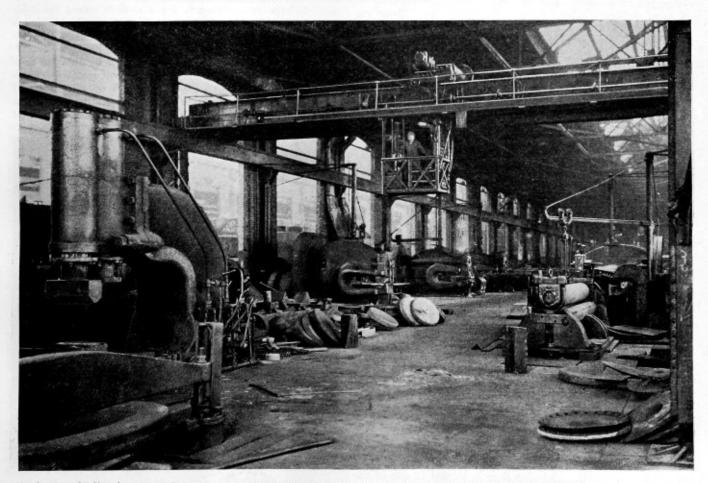

Fig. 6 .- Heavy Bending Rolls Provide for the Boiler Shell and Heavy Tank Work

FEBRUARY, 1923

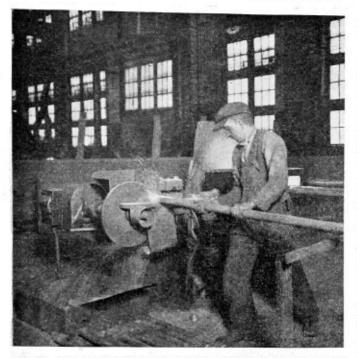

Fig. 8.-The Hot Saw is a Necessity in the Flue Department

inch horizontal punch, 66-inch vertical punch and a 66-inch vertical shear should be provided.

Staybolt work requires a double staybolt cutter for $1\frac{1}{2}$ inch bolts, a 4-spindle drill, a two-head $1\frac{1}{2}$ -inch bolt shear, a 2-inch bolt pointer, a bar iron shear, a 17-inch engine lathe for crown stays and the like. There should also be a hand milling machine for squaring staybolts. About the only other essential in machine equipment is a two-wheel dry grinder for miscellaneous grinding and a single spindle sensitive drill for general service. A complete small tool outfit, pneumatic and electric, as well as oxy-acetylene and electric cutting and welding apparatus are a necessary part of the shop equipment.

Flanging and forge fires are of course required adjacent to the flange press and the staybolt department.

MACHINERY FOR TANK AND PLATE WORK

In the section for tank and plate work a universal plate cutter, having a 48-inch throat and capacity for one-inch plate, to be used in tank and cab plates, ashpan and miscellaneous fabrication are essential. A 48-inch vertical punch, a 10-foot by 7%-inch plate bending rolls and one for 6-foot by 1/2-inch plate are necessary. The latter is used for cabs and ashpans. In the pneumatic machine equipment of this section are a portable pneumatic riveter and a 10-foot pneumatic flanging clamp. A 7-foot diameter open fire should be built in to serve the flanger.

The flue department should have a high capacity flue cleaner or rattler, a 2-inch pipe cutting and threading machine, a safe end cutting off machine, a hot saw and expander, a flue welder, welding furnaces, grinding rack, testing rack and an accumulator and pump for testing. All of this equipment will assist materially in boosting shop production. The capacities might vary to meet special requirements but, in general, the size of machines given is ample for regular work.

SHOP LAYOUT OF MACHINERY

The question of the proper placing of machines in relation to the general scheme of production and to each other will materially affect the smooth and efficient operation of the shop. Generally the boiler shop is located in one of the bays of the main shop and at no great distance from the erecting floor so that traveling cranes or trucks are able to handle parts back and forth without relaying them.

At one end of the boiler shop the plate storage and layout section is located from which plates are conveyed into production. The first question that occurs in planning the layout of machinery is which group of machines should be located adjacent to the layout floor. The flue work and the tank and plate work can well be segregated as sub-departments and will be discussed later. The flanging and drilling department for the heads and the boiler barrel section will also be considered as sections of the shop.

The work must go through the shop in a straight line and without being shuttled back and forth in any department. Small work should be handled by jib cranes from one machine to the next process without requiring the service of the main or auxiliary cranes. Auxiliary lifts on the main crane are essential; for speed and economy in handling, it should not be necessary to use the heavy cranes for shifting materials of light weight.

LAYOUT OF A TYPICAL SHOP

In the layout of a well designed, modernly equipped shop for example on one of the larger systems, the grouping of machines is approximately as follows:

Near the plate layout and storage department are placed a general service flanging press and a flanging clamp with the plate furnace between so that the jib cranes located adjacent to each machine are able to pick up plates to be flanged from the laying out section and serve them to the fires or presses.

In the next group of machines are included a horizontal punch, a vertical punch and a vertical shear, each served by a jib crane, the arcs of which overlap the range of the others so that handling of plates from one process to the next is accomplished with a minimum of manual labor. In this same division of the shop is a radial drill served by a jib crane. Thus in this section are located all the machines that are necessary for carrying the flat plate work through to the point of assembly in the firebox or boiler.

Ranged along the wall side of the shop in order to take advantage of the natural daylight are the small machines used in connection with the preparation of staybolts and crown stays. These machines include the regular equipment found in most shops—an engine lathe and power shear, bolt

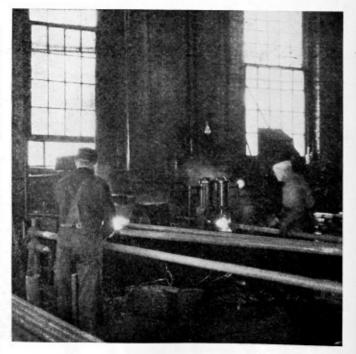

Fig. 9.-Welding Furnaces and Pneumatic Welders in Action

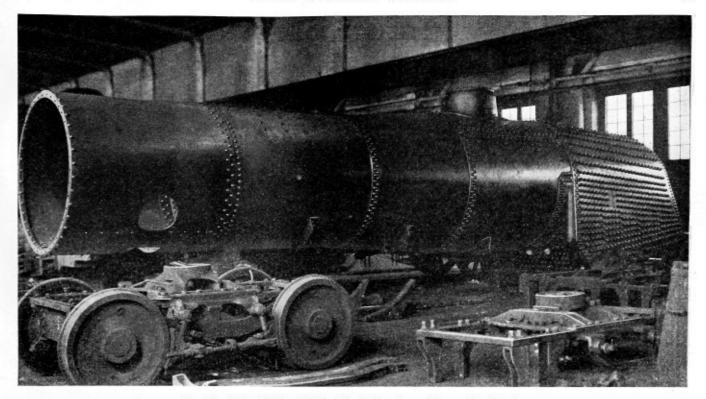

Fig. 10 .- The Finished Boiler Ready for Assembly on the Trucks

pointer, a two-head bolt shear, a four-spindle drill and a staybolt cutter. In addition, there are a dry grinder, a hand drilling machine and a service drill adjacent to the staybolt machines.

In this shop the flue section is located next in the order of departments and, as this is actually a section accomplishing an independent process in the scheme of production, the most important consideration is that it shall be adjacent to the assembly. In this department the layout of machines depends largely on the type of equipment used; that is, whether the welding machines are pneumatic or electric in operation.

The flue department layout is a complete study in itself; as it has been thoroughly discussed in previous issues of THE BOILER MAKER, it will not be repeated at this time.

There remains, however, the boiler barrel work to be completed and the machines for this are arranged in a section of the bay next to the flue department. A feature of this section is that an individual overhead crane serves the department which includes the bending rolls and the hydraulic riveter.

With the three sections working simultaneously the material reaches the assembly floor at a rate designed to meet the repair requirements of the shop and, after assembly and hydrostatic test, the completed boiler can be carried to the erecting floor according to the shop schedule arranged.

DETAILS OF TANK DEPARTMENT

There remains only the tank and plate department which is closely allied to actual boiler work. The various plate cutters, punches and bending rolls, drills and riveters are assembled as a unit in the shop and served by numerous jib cranes which make the department quite independent of the main cranes, except for handling finished cab assemblies and the like.

In the matter of small tools, electric and pneumatic, a shop should be completely equipped and care taken in the maintenance of such tools. In the tool room, testing devices should be provided for air tools as well as master gages for maintaining a high degree of accuracy in taps and dies. Complete oxy-acetylene and electric welding and cutting tools are of great importance in the conduct of repair work.

Adequate storage facilities in sheltered and convenient locations should be provided for plates, flues, superheater units, staybolt iron, firebrick and other materials entering into construction or repair work.

Conference on Proposed Safety Code For Plate and Sheet Metal Working

A conference is called by the American Engineering Standards Committee to determine whether there shall be

(1) A national safety code for the forging industry,

(2) A national safety code for plate and sheet metal working.

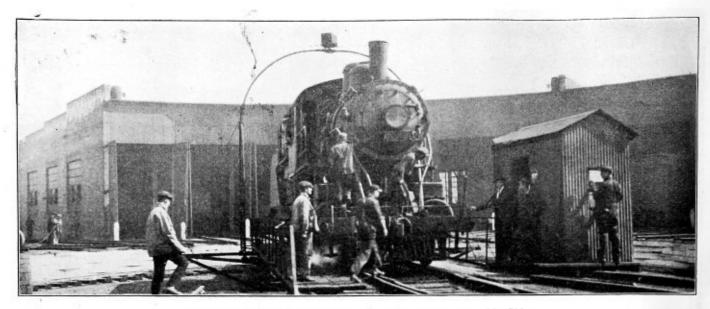

This conference will be held Saturday, February 17, at 9:30 a. m., in the board room of the American Society of Mechanical Engineers, 29 West 39th street, New York City.

The conference is called at the request of the Safety Code Correlating Committee, which has had the subject under consideration for some time as a result of proposals made to it that there should be such codes. After considerable preliminary study of the subject, the correlating committee recommended that the decision should be arrived at through a thoroughly representative conference of all interested bodies.

Committee Changes of the Master Boiler Makers' Association

Secretary H. D. Vought, of the Master Boiler Makers' Association, has announced that the vacancy in the chairmanship of the committee on law of the association caused by the death of James T. Goodwin will be filled by Thomas F. Powers, third vice-president of the association. The committee on memorials will be made up of George N. Riley, P. J. Conrath and J. W. Kelly.

The secretary wishes to remind the chairmen of the various committees that reports must be in his office by March 1 in order to prepare them for advance distribution to the members.

Erie Railroad Enginehouse at Jersey City, from Turntable Side

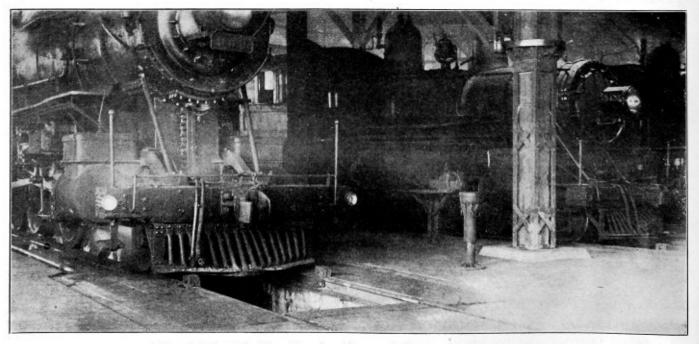

Repair Facilities at New Erie Enginehouse

Description of Locomotive Boiler and Machine Repair Shop of New Jersey City Engine Terminal

THE Erie Railroad has recently completed a new engine terminal at Jersey City, N. J., which includes a 21stall enginehouse, machine shop and other facilities, the construction of which was carried on "under traffic." It replaces an old layout which was destroyed by fire and was built on the old site without interference with operation, the old turntable and radial tracks being kept in use for the turning and servicing of both passenger and yard locomotives. The new building is a combination of a radial type 105-foot enginehouse and a rectangular building. The old enginehouse was of timber construction with 21 stalls served by an 80-foot turntable.

The Jersey City enginehouse is primarily for the servicing of the commuter engines, although all of the New York division passenger locomotives and a few yard locomotives are also handled there. About 200 engines are turned daily at Jersey City which, in connection with the congested layout, presented a problem that was easily rendered serious by the loss of the old enginehouse.

The new layout is a rectangular shaped building, having

Boiler Washout Section, Showing Depressed Drains, Post Cranes, Etc.

straight walls on three sides and the customary inner circle of doors facing the turntable. It is of brick and concrete construction with a timber superstructure of the shed roof type modified to fit the rectangular shape at the corners and where joining into the machine shop and the repair bay monitor. There are 21 stalls, divided into three sections of seven stalls each, one section adjoining and actually being a part of the eight-track repair bay of the monitor type. In one corner of the rectangular house beyond the radial section is located a large machine shop, the boiler and engine room, forges, air compressors and pumps, hot air heating equipment and the offices. A similar corner, although smaller, at the other end has been utilized for the washroom, shower baths, and lavatories, and above this, in a small second floor, are located the lockers. A lean-to adjoining the north wall of the repair bay houses the pumps, tanks and other machinery for a complete boiler washing system.

The repair bay is of the monitor type with a steel superstructure fabricated from floor beams, chords, etc., taken from an old steel bridge across the Susquehanna river. This work was done by company forces, the erection being handled by the bridge gangs. A 15-ton electric traveling crane will be installed in this section of the building, provision having been made in the design and construction for this purpose. The crane bay is 42 feet $7\frac{1}{2}$ inches wide from center to center of posts and runs the full length of this section. A Whiting hoist of 200-ton capacity has also been installed in this section in conjunction with four new concrete pits. Other crane and hoisting facilities consist of a series of six post cranes of 16-foot radius installed at convenient points throughout the house.

The structure is heated by a modern installation of heating coils and blower discharging into a concrete air duct situated below the floor and around the outer circle. This duct is tapped between each two stalls by lines of vitrified clay pipe which carry the heated air to the engine pits. Wherever the enginehouse tracks cross the duct, the upper slab has been reinforced and, in addition, the running rails are carried in a double rail trussed construction.

ELECTRICALLY EQUIPPED FOR ECONOMICAL OPERATION

The power used in the enginehouse for machine shop, boiler repair and other uses, is purchased from an outside source supplying two-phase energy at 2,300 volts, and 60 cycles which is stepped down to 220 and 110 volts according to needs.

On the inside of the street wall, two 100-watt lighting units are installed between stalls and so arranged that the light beams from each will cross each other, both also being inclined downward to an angle of about 15 degrees from the horizontal. A single unit of this type is mounted on the door posts. Facilities for arc welding are furnished by two Wilson two-man sets delivering sufficient current for four welders through cables tapped at each stall and terminating in a 150-ampere charging receptacle. The welder simply plugs in his welding lead at the proper receptacle, removing it when he has completed his work.

This type welding machine is of great value in the shop.

The majority of the machine tools are belt-driven from an overhead line shaft operated by a 50-horsepower, 220-volt, two-phase motor with a 30-horsepower motor in reserve which can be substituted immediately by throwing on a belt. Two large turret lathes, a blower fan, and a large Ingersoll-Rand air compressor unit have individual motor drives. The latter unit is of the duplex, two-stage, constant speed type with a capacity of 1,574 cubic feet, the regulation of the supply being accomplished by a five-step clearance control which loads or unloads the compressor in five successive steps, according to needs. The motor is a 260-horsepower synchronous motor operating on 2,300 volts. The plant supplies air at 100-pounds pressure for use in the electro-

pneumatic interlocking plant, for charging train lines and for various shop and enginehouse requirements.

The air line to the enginehouse stalls is carried on brackets with other pipe lines suspended from the rafters and following around the building 30 feet inside of the doors. There are five distinct lines, aside from the steam line, consisting respectively of a 3-inch air, a 4-inch cold water, a 4-inch filling, a 4-inch washout and a 5-inch blow-off line. Each pit has individual connections.

Shop Equipment

The repair shop is well arranged and well equipped for the work to be performed, which consists entirely of light running repairs. Should heavier repairs be required, a locomotive is sent to the North Shop on the other side of the tracks. At the entrance from the enginehouse to the shop there is a toolroom which serves all the men whether working in the shop or on locomotives. Adjoining this on the same side is a double blacksmith forge with a blower, two anvils and a trip hammer. A $3\frac{1}{2}$ -inch bolt threader is also placed on the same side of the room in a convenient position.

Engine lathes are arranged in line along the street side of the shop. These range in size from 14 inches by 6 feet to 36 inches by 20 feet. In front of the lathes is a 60-ton rod press, a double-end emery wheel grinder, a 42-inch drill press, a $4\frac{1}{2}$ -foot radial drill, a 28-inch shaper, a 24-inch vertical turret lathe, and a 42-inch vertical boring mill.

LIST OF SHOP TOOLS

The various machine tools installed in the shop include:

60-ton rod press.
4½-ft. Mueller radial drill press.
28-in. Smith & Mills shaper.
20-in. by 3-in. double-end emery wheel grinder.
42-in. drill press.
24-in. Bullard vertical turret lathe.
42-in. Colburn vertical boring mill.
14-in. by 6-ft. Cisco engine lathe.
17-in. by 8-ft. National engine lathe.
18-in. by 8-ft. National engine lathe.
18-in. by 8-ft. National engine lathe.
28-in. by 12½-ft. Boye & Emmes engine lathe.
36-in. by 20-ft. New Haven engine lathe.
35-in. dams bolt threader.
Trip hammer.
Buffalo forge blower.
Double blacksmith's forge.
Two anyils.

The Insulation of Boilers and Heated Surfaces*

By Wm. N. Allman

IN the insulation of locomotive boilers the one very important feature is to conserve the heat and thereby reduce the loss by radiation to a minimum. The value of such insulation is therefore a matter of importance.

The unit of heat is a B. t. u. There is no insulation that is 100 percent efficient, but the real object of insulation is to prevent to the highest degree the flow of heat to the outside surrounding air from the boiler surface. The conductivity of the material determines the rate of flow with a given difference in temperature. A smaller number of heat units (B. t. u.) will flow through an insulating material with a low conductivity than one with a high conductivity.

The efficiency of an insulating material is expressed by a percentage which represents the percent saving which would be realized by insulating the boiler with such a material over what would be lost if the surface were left bare. The efficiency is then obtained by subtracting the heat loss of the insulated surface from the heat loss of the

*From the Railway Mechanical Engineer.

heat loss from the bare surface. Expressed as a formula, this would be as follows:

$$E = \frac{U - I}{U}$$

where; U = Heat loss in B. t. u.—bare surface I = Heat loss in B. t. u.—insulated surface

E =Efficiency of insulation

uninsulated or bare surface, and dividing the result by the by referring to Table II the following efficiencies are obtained by interpolation:

	sq. ft. per year	
1½ in, thick lagging. 2 in, thick lagging. 2½ in, thick lagging. 3 in, thick lagging.	t 232.4 t 235.5	

This shows that even the thinnest insulation will show a large saving by preventing the escape of heat from the surfaces.

				TAB	LE I.					
B.t.u, per square foot per	hour		00 deg. 150 de 15.2 360.0		250 deg. 737.8	300 deg. 978.0	350 deg. 1,269.4	400 deg. 1,614.0	450 deg. 2,050.6	500 deg. 2,590.0
				TAB	LE II					
Thickness of	50 deg.	100 deg.	Tempe 150 deg.	rature difference 200 deg.	250 deg. Per Cent	hot surface 300 deg. Efficiencies	and surroundin 350 deg.	g air 400 deg.	450 deg.	500 deg.
1 in	86.25 89.32 91.19	82.36 87.40 90.16 91.95 93.22	83.90 88.53 91.08 92.69 93.83	85.25 89.49 91.85 93.32 94.37	86.48 90.37 92.53 93.87 94.82	87.60 91.16 93.12 94.38 95.25	88.70 91.94 93.71 94.87 95.67	89.64 92.65 94.27 95.31 96.06	90.56 93.32 94.80 95.73 96.40	91.48 93.97 95.31 96.14 96.75

In Table I the figures represent the loss in B. t. u. which would be expected with bare or uninsulated surfaces for temperatures ranging from 0 to 500 degrees F.

Table II represents the efficiencies of an 85 percent magnesia boiler lagging in thicknesses from 1 inch to 3 inches. It is highly important that material thick enough be applied in order to secure the best results. Another important feature is to cover every square foot of exposed surface. By this is meant the firebox area as well as the shell of the boiler. While a number of railroads have not adopted the practice of covering the exposed area of the outside firebox sheets, it is a mistake to allow them to go uninsulated when it is considered that there is an enormous heat loss which may be saved.

By referring to the figures contained in Table III, it can be readily seen what this loss amounts to in the course of a year.

To determine the amount of heat saved by the application of 85 percent magnesia lagging, we may consider a locomotive boiler carrying a boiler pressure of 200 pounds per square inch, the corresponding temperature being 388 degees F. Assuming an outside temperature of 70 degrees F., we obtain a difference in temperature of 318 degrees F. Referring to Table I, the loss under these conditions would be 1,079.0 B. t. u. per hour per square foot, and for coal having an average thermal content of 13,000 B. t. u. this would equal a waste of 249.0 pounds of fuel as shown in fourth column of Table III for each square foot of surface per year under the conditions as shown; namely, 300 days of 10 hours each. TABLE III

	Difference between	1	Waste of coal	Number of sa
Steam Steam pressure temper- gage ature	temperature of steam and sur- rounding air F.	Loss per sq. ft. per hr. (B.t.u.)	lb. per sq. ft. per year based on 300 days of 10 brs. each	ft. of surface that wastes a ton of coal in one year

By the application of 85 percent magnesia sectional lagging with its high insulating value, the major portion of this loss may be saved and converted into useful work, and

Stamping Ohio State Boilers

'HE Ohio boiler inspection law was amended April 29, 1921; section 1058-17, under the captions "Insurance,

Special Inspectors" and "Commissions," which refers to inspectors who are authorized to make inspections for the state of Ohio; and section 1058-23, under the caption "Boilers Which May Be Installed," which refers to the stamping of boilers for use in the state of Ohio.

The original law provided that no person shall act as a general or special inspector unless he had taken an examination before the Ohio Board of Boiler Rules, as specified in the law. The amendment of April 29, 1921, provides that persons may be authorized to act for the state either as a general inspector or as a special inspector if he has passed a written examination approved by the Board of Boiler Rules.

Section 1058-23 of the old law provided that boilers shall be stamped "Ohio Standard." The amended law of April 29, 1921, has stricken out this specific provision and provides that boilers shall be stamped in accordance with the rules formulated by the Board of Boiler Rules.

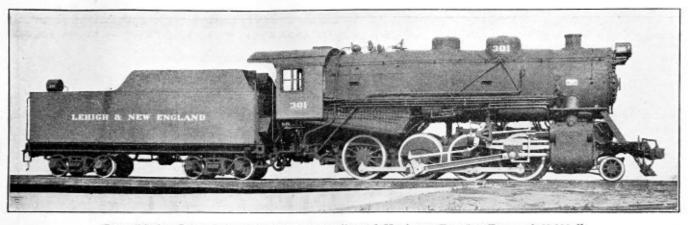

These two amendments were made in view of placing the boiler inspection department in the position that it could cooperate with the other states by the interchange of inspectors' commissions and the acceptance of boilers stamped other than "Ohio Standard."

The first meeting of the Ohio Board after the required 90-day period had elapsed was August, 1921. At this meeting, it was necessary for the Board to provide for the stamping of boilers, as there were no requirements for stamping at this time, and the following resolution was passed unanimously, covering both the question of inspectors and the stamping of boilers. This rule was not put into effect, due to the unfortunate condition which arose of the changing of the department heads at this same time, but hereafter this resolution of the Ohio Board will be complied with:

"It was a animously agreed that our rules be amended. Part 3, "It was commonsty agreed that our rules be amended. Fart 3, Sec. 1, paragraph 1, page 44, fourth line after the words 'Ohio Standard' insert the words 'or National Board,' and in fifth line, after the words 'Ohio Standard' insert the words 'or National Board.' And in paragraph 9, page 46, after the words 'Ohio Standard' insert the words 'or National Board.' It being under-stood that this change in no way affects the building and stamping boilers under Ohio Standard requirements as heretofore, but merely permits the use of boilers in this state that bear the apmerely permits the use of boilers in this state that bear the ap-proved stamping of the National Board of Boiler and Pressure Vessel Inspectors as outlined in the constitution and by-laws of the National Board.

The coal caved per

Consolidation Locomotive Weighing 301,500 lb. and Having a Tractive Force of 68,200 lb.

Powerful Consolidation Locomotive for the L. & N. E.

Well Proportioned Boiler, Unusually Heavy Weight and High Boiler Capacity Feature New Locomotives

COMPARATIVELY few locomotives of the 2-8-0 type have been built during recent years for use on American railways. While this was a popular type of freight locomotive for a long period, it has largely been superseded by the Mikado type because of the increased depth of firebox and length of boiler barrel, with correspondingly increased boiler capacity, which can be obtained when a trailing truck is added. However, the Consolidation locomotive is still a highly desirable type where high tractive force combined with low total weight is the important factor as it is where heavy trains, moved at slow speeds, comprise the bulk of the traffic. By careful designing, a boiler of sufficient capacity can be obtained for such service if road clearance does not impose too many restrictions.

Conditions on the Lehigh & New England are especially suited to the operation of Consolidation type locomotives. Since the road is close to the coal mining section fuel is relatively cheap. The vertical clearance of 15 feet $8\frac{1}{2}$ inches gives room above the driving wheels for a boiler of large diameter with a deep throat sheet.

The four Consolidation type locomotives built by the American Locomotive Company which this road has placed in service recently are excellent examples of well-designed engines to meet special conditions. Weighing 301,500 pounds with 279,000 pounds on the drivers, they are the heaviest Consolidation locomotives ever constructed. The Lehigh & New England locomotives have boilers with a larger grate area and more heating surface, which is reflected in the increase of 6,600 pounds in weight.

The height from the rail to the center of the boiler is 10 feet 4 inches and to the top of the stack is 15 feet $8\frac{1}{2}$ inches. The firebox is $126\frac{1}{8}$ inches long by $96\frac{1}{4}$ inches wide, while the height from the bottom of the foundation ring to the crown sheet is $83\frac{1}{2}$ inches at the front and $57\frac{1}{4}$ inches at the back, which gives a fair firebox volume and sufficient space for the application of a brick arch. There are 301 2-inch tubes and 50 $5\frac{3}{8}$ -inch flues. The total evaporative heating surface is 3,666 square feet, of which 271 square feet is in the firebox. The superheater has 901 square feet heating surface. The rated boiler capacity is 2,420 horsepower, or 88 percent of the cylinder power, which is 2,755horsepower.

Two of these locomotives are hauling coal trains of 3,500 cellent results were obtained, due largely to the he gross tons from Lansford to Pen Argyl, a distance of 54 operation of the Baltimore & Ohio Railroad officials.

miles, part of which is up a 0.5 percent grade, at a speed of approximately 20 miles per hour. Two others are running out of Pen Argyl and handling 690 gross tons up a 2.75

percent grade without difficulty. While no test runs have been made, it has been observed that these locomotives are free steamers, of ample boiler capacity and consume a conservative amount of fuel.

The leading dimensions, weight distributions and proportions of these locomotives are given in the foregoing table.

Smoke Abatement Work Progressing

The smoke abatement work at Grafton, W. Va., conducted by Osborn Monnett and L. R. Hughes, under the supervision of O. P. Hood, chief mechanical engineer of the United States Bureau of Mines, has been brought to a close. Excellent results were obtained, due largely to the hearty cooperation of the Baltimore & Ohio Railroad officials.

Details of Views Used in Developing a Cupola Blast Pipe

\$

Method of Laying Out a Cupola Blast Pipe

Development of Sections of the Pipe With Details of the Various Section Patterns

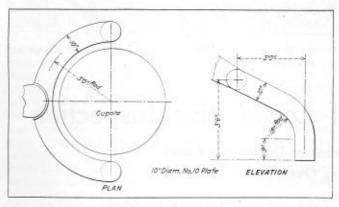

By C. B. Lindstrom

THE problem of developing the double twist occurring in the layout of the cupola blast pipe shown in the accompanying illustration is rather a difficult one and offers an excellent chance to our readers for working out a solution.

In developments of this character there are several steps in the layout that must be made in order to obtain the full view of the connecting pipe sections, the true angle between them and the amount of twist that one section must be turned on the others so as to give the required position of the pipe, otherwise the sections of the elbow would all be in the same plane.

Development of Full Views for Sections B and C

The center arcs in the plan and elevation, Fig. 1, are divided as required for the number of elbow sections, thus

Problem in Cupola Layout

locating the axes 1-2, 2-3, 3-4 and 4-5. To illustrate the method of developing the full view of sections B and C and the true angle between them, the axis 3-4 in the plan is revolved about point 4 as a center to bring the line parallel with the front plane. The vertical projection of the line is shown in the elevation at 3,,-4', which is its true length. In revolving the axis 3-4 also assume that the axis 2-3 is revolved with it, thus bringing its projection in the revolved position at 2',-3' in the plan and at 2,,-3,, in the elevation. Extend the line 3,,-4 in the elevation and at right angles to the line draw an end view of the axes 3,,-4' and 2,,-3,,. The axis 3,,-4' in such a view is a point and the line 2-4 for the axis 2,,-3,,. The point 2 is back from the axes 3-4 a distance equal to x as shown in the plan.

The diagonal view, Fig. 2, is drawn at right angles to axis $3_{,,-4'}$ of the elevation, Fig. 1, thus projectors are drawn respectively from $2_{,,-3_{,,-3_{,+1}}}$ and 4'. The axis $3_{,,-4'}$ is drawn in Fig. 2 perpendicular to these projections and at right angles to this line the end view is reproduced.

The axis of the end view 2-4 is now revolved until it lies perpendicular to 3-4 as shown by its projection 4-2'. Point 2' is then projected to intersect the projector drawn from the point 2, of the elevation, Fig. 1 to Fig. 2, thus locating point 2 on this line. Connecting the points 2 and 3,, 3,, and 4, establishes the full view of the axes. Bisect the angle between the axes and connect the bisector t with point 3,... The miter lies in the plane of this line. Draw the outline of the elbow sections parallel with their axes and divide the circle in the end view into equal divisions, thus establishing the points a, b, c, d, e, f and g. Project these points parallel with 3,,-4 to intersect the miter line.

PATTERN LAYOUT OF SECTIONS B and C

The pattern development for part of each elbow section as it affects their line of intersection is shown in Fig. 3. To complete these patterns it is necessary to lay off the miter lines between the adjoining pipe sections, for example, to finish the pattern B the miter between sections A and B must be laid off, and to finish pattern C the miter between sections C and D must be established and in addition the twist or arc length that section C must be turned on its axis with respect to D in order to produce the required fall in section D; otherwise the two pipes would lie in the same plane. In regard to the upper sections of A and B this condition does not arise since the pipes lie in a plane perpendicular to the front plane as shown by the projection of their axes in the elevation, Fig. 1.

Figs. 4, 5 and 6 show the correct relationship between pipes C and D, and how the full view, true angle and twist are obtained. With reference to Fig. 4, plan view, the axis 3-4 is again revolved to lie parallel with the front plane, and axis 4-5 is also revolved with it, occupying the position 4,-5,. In the elevation their projections are indicated at 3,,-4-5,,. An end view is drawn at right angles to 3,,-4 and on the line drawn from 5,, to the end view the distance Y is laid off from the center line of the circle. The distance Y shows how far the point 5 is back of the line 3-4 as indicated in the plan, Fig. 4. A full view of the pipes' axes is produced by drawing a diagonal elevation, Fig. 5, in the same manner as explained for Fig. 2. The end view is also reproduced in Fig. 5 and the axis 4-5 of this view is revolved to bring it at right angles to the axis 3-4, thus bringing the line into line o-o. The point 5 is then projected to intersect the line drawn from 5,, of Fig. 4 to Fig. 5, thus locating the point 5a. Connect points 3-4 and 4-5a and bisect the angle between the lines so as to establish the miter line. About the axes in the full view lay off the outline of the pipes.

The pattern for C may now be completed as shown in Fig. 6. The upper part being transferred from Fig. 3. The pattern for D, that is, the part adjoining section C on the miter can also be laid off from Fig. 5. The amount of twist that C is turned on its axis with respect to D is equal to the arc length p as measured between the points 5 and 5, ,, of the end view, Fig. 5; this distance is located in the pattern for D in its relative position.

Cylindrical Pipe and Conical Connection Layout

The principles applied in this example are applicable to any form of oblique cylindrical pipe and conical connections. Considerable study and visualizing are necessary in order to handle layouts of this kind successfully. There are other ways of installing the pipe sections. Some mechanics may produce the true length of pipes and miter and place an additional seam in each of the sections as a slip joint for revolving the pipes until the required twist is secured. This method means additional cost on account of the increased number of joints.

Fig. 1.—Results of a Low Water Explosion in Which the Water was Ten Inches Below the Top of the Crown Sheet at the Time of the Accident

Report of the Bureau of Locomotive Inspection

Boiler Explosions and Casualties During the Fiscal Year Show Great Decrease Over Former Reports

THE outstanding feature of the annual report of the chief inspector of the Bureau of Locomotive Inspection for the year ending June 30, 1922, is that better maintenance of motive power to meet the requirements of the Interstate Commerce Commission rulings has resulted in a marked decrease in the number of accidents and fatalities from failure of locomotives. This is especially true of the boilers and appurtenances where the number of accidents reported—273—is very favorably contrasted with the 342 of the preceding year. Abstracts of the report as presented by A. G. Pack, chief inspector of the Bureau, follow:

The data contained in this report cover all defects on all parts and appurtenances of the locomotive and tender including the boiler, found and reported by our inspectors, together with all accidents as reported under section 8 of the law and the accidents report act of May, 1910, caused by the failure of some part or appurtenance of the locomotive or tender, including the boiler.

The tables have been arranged so as to permit comparison with previous reports as far as consistent. They show the number of locomotives inspected, the number and percentage of those inspected found defective, and the number for which written notice for repairs was issued because of not meeting the requirements of the law, with the total number of defects found and reported. They also show the number of accidents, with number of persons killed and injured, caused by the failure of some part or appurtenance of the locomotive and tender, including the boiler and appurtenances thereof. There is also given by railroads a brief summary of the nature and cause of all accidents, with number of persons killed and injured, as disclosed by investigation.

NUMBER OF LOCOMOTIVES INSPECTED, NUMBER FOUND DEFECTIVE

		Year	ended J	une 30

		Yea	r ended	June 30	

Number of accidents	1921	1915	1912
	342	424	856
	51	13	91
	379	467	1.005

A summary of all accidents and casualties during the year ended June 30, 1922, as compared with the year ended June 30, 1921, covering the entire locomotive and tender and all of their parts and appurtenances shows a decrease of 15.4 percent in the number of accidents, a decrease of 48.4 percent in the number killed, and a decrease of 11.3 percent in the number injured.

It was apparent during the latter part of the fiscal year that most, if not all, of the carriers were putting forth great efforts to put their locomotives in condition to meet the requirements of the law and the best possible operating condition. Since the law became effective in 1912, 664 boiler explosions resulting in the death of 385 persons, and the serious injury of 1,106 others, have occurred.

During the fiscal year there were 33 boiler explosions re-

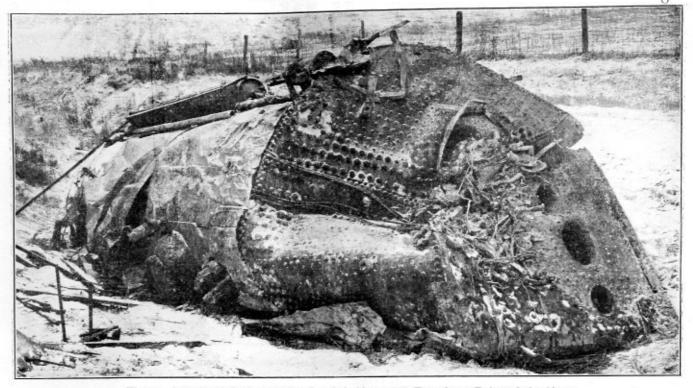

Fig. 2 .- Wreck of Boiler Which Landed About 350 Feet from Point of Accident

sulting in the death of 22 persons and the serious injury of 56 others, a substantial reduction as compared with the preording year. Most of these explosions were caused by overheating of the crown sheet, due to low water. In many instances contributory defects were found, while in others no contributory cause could be assigned. Proper inspection and repair of all parts and appurtenances of the locomotive, including the boiler, are essential to safe and efficient operation, especially the firebox, water feeding and indicating appliances, together with thorough boiler washing as often as water conditions require, and the removal of scale and sediment from the interior of the boiler, which cause heating surfaces to overheat, crack and weaken, and frequently cause failure with serious results.

In my ninth annual report an illustrated report of investigation, covering tests made to determine the action of water in the boiler with its effect on the water-indicating appliances was given. Reference to these tests was also made in my tenth annual report, which investigations established that gage cocks, when screwed directly into the boiler, do not correctly indicate the general water level in the boiler while steam is being rapidly generated and escaping from the boiler. It was recommended that a suitable water column, to which should be attached three gage cocks and one water glass, be applied to the boiler, with an additional water glass applied on the left side or boiler backhead. It is felt that these recommendations together with the increased attention given to the water-indicating appliances as a result of our report, and our personal efforts have largely tended to decrease the number of so-called "crown sheet failures" or boiler explosions. Water columns, as recommended, have been applied to practically all new locomotives constructed during the past two years, and on a large number of old locomotives on most of the large railway systems throughout the country, and it is gratifying to advise that, with very few exceptions, the mechanical and other officials have accepted these recommendations and are carrying them out in varying degrees, and it is hoped that they will be carried out in the near future by all carriers without the necessity of being compelled to do so by an order of the commission.

Accurate knowledge of the general water level in the boiler is essential under all conditions of service to safe and economical locomotive operation.

Investigation of accidents during the year, where the fusion or autogenous welding process was involved, supports our position previously taken that the process has not yet reached a state of perfection where it can be safely depended upon in boiler construction and repair where the strain to which the structure is subjected is not carried by other construction which conforms to the requirements of the law and rules, nor in firebox crown-sheet seams where overheating and failure are liable to occur, nor its excessive use in repairing long and numerous cracks in side sheets.

GRATE SHAKING APPARATUS INVOLVED IN ACCIDENTS

A large number of accidents have been caused by defective grate-shaking apparatus, the majority of which were caused by the shaker bar not properly fitting the fulcrum lever. This condition on many roads has been brought about because of no standard design being maintained, making such parts interchangeable. We have records of many such accidents where permanent and fatal injuries resulted. Therefore it should be required that all carriers adopt a standard whereby shaker bars can be made interchangeable on all of their locomotives with a proper fit.

So that the chief operating officers of the carriers might be kept informed of the condition of their locomotives, as disclosed by our inspections, a transcribed report showing in detail the defects found has been sent to them each month; also informing them of the locomotives for which special notice for repairs was issued as required by section 6 of the law, because of defects constituting violations thereof.

During the year 148 applications were filed for extension of time for removal of flues, as provided in rule 10. An investigation disclosed that in 17 of these cases the condition of the locomotive was such that no extension within the purpose and intent of the law could be properly granted. Fifteen were in such condition that the full extension requested could not be authorized, but an extension for a shorter period, within the limits of safety, was allowed. Six extensions were granted after defects disclosed by our investigation had been repaired. Nine applications were withdrawn by the carriers for various reasons, and the remaining 101 were granted for the period requested.

In accordance with rule 54 there were filed 1,508 specification cards and 5,519 alteration reports necessary in determining the safe working pressure and other required data for the boilers represented. These specification cards and alteration reports have been carefully analyzed in order to determine whether or not the boilers covered were so constructed as to be in safe and proper condition for service, and that the stresses were within the limits required. Numerous discrepancies were found and corrective measures taken immediately.

WORK OF THE INSPECTORS

By request of the commission, inspectors of this bureau spent 200 days in special work during the year, and during the fiscal year 1921 spent 962 days in connection with the transportation act, 1920, and the interstate commerce act, the expense of which was borne from the general appropriation which materially assisted us in avoiding a deficiency in the appropriation made to carry out the purpose of the locomotive boiler inspection law as amended.

In order to keep within the appropriation it has been necessary to curtail materially the travel of our inspectional force in the performance of their required duties, and to curtail the stenographic, clerical, and other office assistance furnished the chief inspector and his assistants to the detriment of the service.

To adequately carry out the purpose of the law a material increase in the number of inspectors and a material increase in the appropriation should be made so as to fully perform the duties required.

No formal appeal from the decision of any inspector, as provided in section 6 of the law, was filed during the year,

Fig. 3.—Firebox after Explosion, Showing Crown and Flue Sheets Folded Back Against Door Sheet

FEBRUARY, 1923

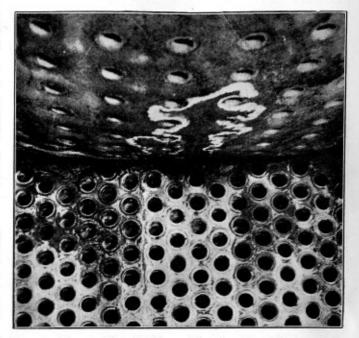

Fig. 4.—Crown Sheet Failure, Showing Sheet Pocketed to Depth of 14 Inches

which again demonstrates that good judgment was exercised by them in the performance of their duties.

In my ninth and tenth annual reports certain recommendations were made for the betterment of the service as required by section 7 of the act. Some of these suggestions are in part as follows:

I am convinced from experience of the necessity and wisdom of these recommendations. Therefore they are respectfully renewed and reasons therefor given :

First. That the act of February 17, 1911, as amended, be further amended to provide for additional inspectors and increased compensation, and to provide for a sufficient appropriation to adequately carry out the purpose of the law.

That all locomotives not using oil for fuel have a mechanically operated fire door so constructed that it may be operated by pressure of the foot on a pedal or other suitable device located on the floor of the cab or tender at a proper distance from the fire door, so that it may be conveniently operated by the person firing the locomotive.

This recommendation is based on the results of many investigations of boiler failures of such character as to permit the steam and water contained in the boiler at the time of the accident to be discharged into the firebox, many times being directed toward the fire door.

That a power-reversing gear be applied to all locomotives and that air-operated power-reversing gear have a steam connection with the operating valves conveniently located in the cab, so arranged that in case of air failure steam may be quickly used to operate the reversing gear.

That a power grate shaker be applied to all coal-burning locomotives.

This appliance has been in use for a number of years and tried out very thoroughly, and was adopted as standard by the standardization committee of the United States Railroad Administration, composed of 14 very prominent superintendents of motive power and railroad mechanical officials.

That all locomotives be provided with a bell so arranged and maintained that it may be operated from the engineer's cab by hand and by power.

That all locomotives where there is a difference between the readings of the gage cocks and water glass of 2 or more inches under any condition of service be equipped with a suitable water column, to which shall be attached three gage

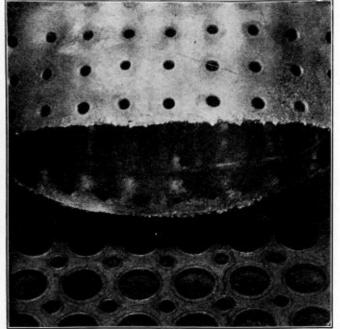

Fig. 5 .- Failure of a Welded Crown Sheet Patch

cocks and one water glass, with not less than 6 inches, preferably 8 inches, clear reading and one water glass with not less than 6 inches, preferably 8 inches, clear reading on the left side or back head of the boiler.

Water glasses should be so located, constructed, and maintained that they will register the approximate general water level in the boiler under all conditions of service and show within 1 inch a corresponding level, and so maintained that the engineer and fireman may have under all conditions of service a clear view of the water in the glass from their respective and proper positions in the cab.

Gage cocks should be located within easy reach of the engineer from his proper position in the cab while operating the locomotive, extension handles to be applied if necessary to accomplish this. All gage cocks to be supplied with suitable nipples that will directly discharge into a properly constructed and located drain or dripper that will convey the discharged water to near the cab deck or floor, nipples to be not less than one-half inch nor more than 1 inch above the dripper or drain and kept in correct alignment.

Gage cocks and water glasses are now universally used for gaging the water level in the boiler; and since the two appliances located on the same boiler do not show a corresponding level under operating conditions it is clear that one or the other is incorrect and therefore misleading.

Investigations have clearly established that gage cocks when screwed directly into the boiler do not correctly register the proper water level over the crown sheet. It is very important that at least two appliances attached separately be employed for this purpose so as to form a double check and so as to have one appliance in case of failure of the other while on the road and away from points where repairs can be made.

Should any other appliance than the water column or water glass be invented which will safely and correctly indicate the water level in the boiler, due consideration can be given. The requirements herein recommended should be complied with the first time the locomotive is shopped for classified repairs, as established by the United States Railroad Administration.

The accompanying illustrations Figs. 1, 2 and 3 show the result of a boiler explosion due to low water, which caused the death of three persons and the serious injury of another.

while running at an estimated speed of 35 miles per hour. The line of demarcation indicated that the water was 10 inches below the highest part of the crown sheet at the time

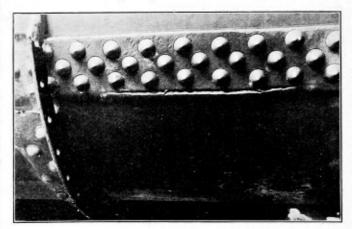

Fig. 6.—Rupture of Patch Applied to the First Course Longitudinal Seam in the Boiler Barrel

of the accident. The boiler appurtenances were damaged to such an extent that their previous condition could not be determined.

Fig. 4 shows a crown-sheet failure, due to low water. The crown sheet was overheated practically its entire length, and pulled away from 297 radial stays, pocketing to a depth of 14 inches. The gage cocks were screwed directly in the back head, and the bottom gage cock entered the boiler through a tee iron, directly behind and close to a brace lug, while the top gage cock entered the boiler through the webb of the tee iron.

Investigation disclosed that this locomotive was permitted to go into service with water foaming badly, which should not have existed had the boiler been washed as often as water conditions required; a requirement of rule 45.

OVERHEATING OF CROWN-SHEET

In Fig. 5 is shown a crown-sheet failure, due to overheating, resulting in serious injury to four persons. A patch had been applied in the crown sheet, with seams autogenously welded, and the transverse seam between the patch and crown sheet failed for its entire length of 48 inches. The line of demarcation, caused by overheating, showed that the water at the time of the accident was about 13% inches below the highest part of the crown sheet.

The water glass had been broken two days prior to the accident and the locomotive used without repairs or replacement. Evidence showed that the boiler was very dirty and the water foaming badly prior to the accident. Of 58 crown stays which pulled away from the sheet 22 were practically without threads either on the stay or in the sheet. The lowest reading of the water glass and the lowest reading of the gage cock were only 134 inches, respectively, above the highest part of the crown sheet.

Had the law and rules and our previous recommendations in connection with the water glass and gage cock applications and autogenous welding in the so-called "low water zone" been properly complied with, it is entirely possible that this accident would have been avoided.

Fig. 6 shows a rupture which occurred in the barrel of a boiler carrying 180 pounds steam pressure, causing the serious injury of one employee. The rupture occurred in a patch which had been applied to the first course longitudinal seam, creating an aperture 22 inches in length, with a maximum width of three-sixteenths inch. The patch was five-eighths inch in thickness and was applied with a triple-riveted lapjoint seam, and had been offset where it joined the original sheet.

The rupture was the final result of an old progressive

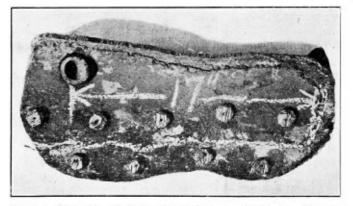

Fig. 7 .- Back Head Patch Which Failed with Serious Results

crack, $41\frac{1}{2}$ inches in length, developing from the interior of the boiler just below the bottom line of rivets and in the offset portion covered by the lap of the original sheet.

The breathing action of the boiler evidently caused this patch to crack where it was offset, leaving only one-sixteenth inch material intact just prior to the failure.

This accident demonstrates the necessity for great care in inspection of the interior of the boiler at required intervals. It is, indeed, fortunate that the results of this failure were not much more serious.

Fig. 7 shows patch applied in the boiler back head by the autogenous welding process, the seam on one side of which

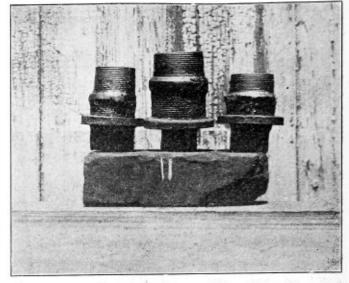

Fig. 8.—Graphite Accumulation on These Plugs Prevented Them from Being Tightened in Their Seats

suddenly failed for a distance of 17 inches, seriously scalding the engineer, compelling him to leave the cab of the locomotive through the side window while hauling a passenger train at an approximate speed of 35 miles per hour. The fireman escaped injury by leaving the cab through the left front window. The conductor noticed that the train was passing the station where it should have stopped, and pulled the emergency valve, thus applying the brakes and stopping the train.

WASHOUT PLUG DEFECTS

Fig. 8 shows three washout plugs on which graphite and other substances had been allowed to accumulate, forming shoulders which prevented the plugs from being properly screwed in and tightened.

Since the law was enacted 194 accidents, resulting in the death of 10 persons and serious injury of 247 others, have been caused by washout and arch-tube plugs blowing out. In all cases washout and arch-tube plugs should be maintained and properly fitted so that they can be screwed in to prevent leakage and the possibility of blowing out while under pressure.

The locomotive from which these plugs were removed had special notice for repairs issued, as required by section 6 of the law.

Properties of Boiler Plates

TESTS have been conducted recently by the United States Bureau of Standards, Washington, on the properties of various grades of boiler plate through the range of 20 to 465 degrees C. The tests have been conducted to determine the effect of blue and cold work, variations in the rate of loading, elastic overstrain, and the subsequent behavior of overstrained steel with time. The result of this work has been published in Technologic paper No. 219.

The paper describes the special apparatus employed in making high temperature tensile tests and the difference in behavior of steel noted at various ranges. It was found that the proportional limit of several grades of plates does not decrease with the first rise in temperature, but is either maintained at about room temperature or increased before the final decrease occurs. The increased strength produced by rolling cold or blue heat is maintained through a considerable temperature range, but these effects may be removed by annealing. Other tests are described in detail in this pamphlet.—*Iron Trade Review*.

The Design and Proportioning of Flue Sheets

Free Circulation of Water of More Importance in the Design than Providing Maximum Flue Heating Surface

By C. E. Lester

ONE of the greatest difficulties met with in the design of boilers is the proportioning of the flues and parts connected with them to meet given requirements. The necessity for a fixed ratio of heating surface to grate area and boiler capacity causes limitations that offtimes adversely affect the efficiency and economical operation of flues.

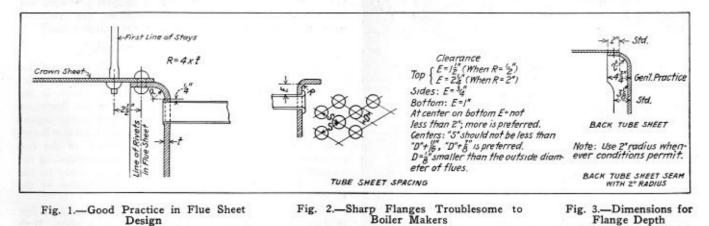

For example—the theoretical necessity for flue heating surface requires the close spacing of flues and the utilization of the greatest area possible of the back flue sheet embraced between the crown and side sheets and above the throat sheet for the installation of flues.

SPACING OF FLUES

Generally, flues are spaced on diagonal lines which permits of close spacing and gains the widest ligament possible between flues. This, however, narrows the vertical space bedesign leaving out about 50 flues would not have affected the steaming qualities of the locomotives and would have materially lessened the leakage and other troubles.

In design recognition, in a degree, has been taken of the necessity of keeping flue holes away from the back flue sheet flange, particularly at the top; that is, placing the holes a sufficient distance from the flange to prevent, or, at least, to retard the cracks from the flue holes to the flange. In the more modern types the radius of the sheet flange has been increased from $\frac{1}{2}$ inch to 2 inches in an effort to prevent cracks, yet they are still in evidence though not to the extent that they were with the sharper flanges. It seems that the larger radii gives the best results.

The accompanying illustrations show some practices in back flue sheet design that have been and still are with various minor modifications, deemed good. Fig. 1 illustrates

tween the flues retarding the free passage of precipitating solids to the belly of the boiler and hastens the time when such an accumulation affects the passage of the heat to the water. This, naturally, somewhat shortens the period of economical operation. Intimate knowledge of many instances when locomotives steamed freely with over 10 per cent of the flues stopped up, mediocre fuel, and under various traffic and grade conditions, leads the writer to express the conviction that in various types of locomotive boilers flue heating surface should be sacrificed for wider ligaments between flues. This will allow freer circulation and freer passage of solids in the water and by the bottom flues farther from the grate line.

AN EXAMPLE OF ACCUMULATION OF SOLIDS

I have in mind among other locomotives of various types one particular series of locomotives of the 2-10-2 type equipped with a special brick wall that were very free steamers under even the most adverse conditions of service, yet by reason of the short distance between the grates and the bottom flues there were always from 50 to 100 flues stopped up in spite of numberless changes in the draft appliances and thorough flue cleaning. Such conditions while apparently not affecting the efficiency of the locomotives from a haulage viewpoint did materially affect the cost of maintenance, as they were prolific sources of trouble for the boilermakers by reason of the conditions mentioned. A change of flue sheet

a radius that is four times the thickness of the back flue sheet and the top of the top flue set ¹/₄ inch below that. This is believed to be good practice yet without wishing to appear radical I favor still greater radii for back sheets of large high pressure boilers.

SHARP FLANGES NOT GOOD PRACTICE

Fig. 2 illustrates a sharp flange that is found mostly in very small or old boilers. This practice has nothing to commend it with the exception of allowing the designer to stick in another row of flues across the top. It actually is a trouble maker for boiler makers.

This section also illustrates the side and bottom limits as well as the minimum and maximum flue hole centers. It is felt that if flue heating surface could be sacrificed enough to increase the width of this ligament to at least $\frac{1}{4}$ inch that better flue service would be obtained and the evaporative efficiency would not be lessened materially. The fact that flue heating surface is but about 20 percent the value of the firebox heating surface prompts the expression that a few flues less would not be noticed.

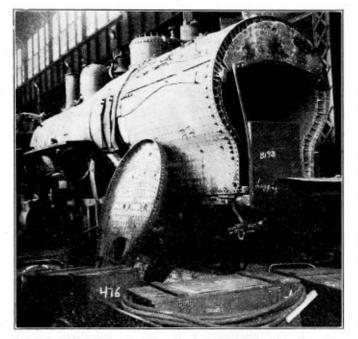

Fig. 3 simply shows some very acceptable dimensions for flange depth and rivet line of a back flue sheet with a 2-inch radius flange.

This has been used to good advantage on recent locomotives.

Burning Out Staybolts with Gas

S TRIKING results in burning out bolts of all kinds with the oxyacetylene torch are now being accomplished, and, on boiler work such as shown in the illustration, the cutting torch proves especially valuable. In the shop where the photograph was taken, one operator specializes on this work. In burning out staybolts, he first melts a hole in the center of the bolt a little deeper than the thickness of the boiler sheet, then giving the hand and torch a rotary motion. This completely cuts off the staybolt inside the sheet leaving a conical end on the cut-off bolt. The shell of the old bolt, left in the sheet, can then be carefully removed with a hammer and chisel without damaging the thread. In the case of rivets, experience has shown it best to burn a good sized hole completely through the rivet, then driving out what is left of the head and shell, releasing the sheets.

In an actual test the operator referred to has burned out 253 rigid staybolts in 66 minutes, or at a rate of almost four a minute. In another case where firebox side sheets were

On Jobs Like This the Gas Cutting Torch for Burning Out Rivets and Staybolts Saves Money

to be renewed, 1,038 flexible staybolts and 392 rivets were burned out in 15 hr. 10 min. by this one operator. Considerable skill is needed in the manipulation of the torch, in order not to burn the tip or run into the sheets or mud ring, especially when burning out long bolts or rivets. It is said that frame bolts up to 8 in. long can be burned out with a torch, the length of bolt removable in this manner depending upon its diameter. The torch is also used to cut out superheater flues, a set of 43 flues being cut out in 55 min. by one operator, whereas it takes about $2\frac{1}{2}$ hours with the more common machine method. Other operations economically performed include cutting out front-end netting plates, and ashpan sheets. Flue sheets can be scarfed at the rate of $12\frac{1}{2}$ ft. an hour.

The illustration shows a method of renewing fireboxes by removing the back head, made feasible largely by the development of gas cutting of staybolts and rivets. The particular advantage of this method is that the complete firebox can be removed without taking the boiler from the frame, or drilling the outside wrapper sheet rivets and removing the complete boiler back end, as is sometimes done. This effects an important saving in time and labor. In the case illustrated, the rivets and staybolts holding the back head, together with all other rivets and staybolts holding the firebox were quickly and economically burned out with the gas cutting torch. A total of 1,670 rigid and flexible staybolts on this entire job were burned out by one man in 16 hours. There are 278 rivets in the back head, 270 in the mud ring and 93 rivets in the flue sheet, making a total of 641 rivets burned out in 12 hours, also by one man. A comparison of these figures with the time required to cut out rivets and staybolts by former methods will quickly show the advantage of the gas cutting torch for this work.

Investigation of Strength of Welded Pressure Vessels

O^{NE} of the many difficult problems confronting the Boiler Code Committee of the American Society of Mechanical Engineers in its effort to draw up satisfactory codes governing the construction of unfired pressure vessels was that of welding. Rules applicable to riveted constructions do not always apply to fabrication by welding.

The problem is seriously complicated because of the small amount of scientific data upon which to base proper requirements for safety without placing unjust restrictions on the use of welding. Wide differences of opinion prevailed not only among the members of the committee, the insurance companies and inspectors, but also in the industry itself.

ACCEPTABLE TESTS DEVELOPED

A hydrostatic and hammer test was finally proposed for determining whether a vessel was safe for the purpose designed. The American Bureau of Welding, which is the advisory committee on welding research for the American Welding Society and the National Research Council, organized a pressure vessel committee to cooperate with the Boiler Code Committee in determining the adequacy of the test proposed. Eight manufacturers placed at the disposal of the committee some 40 tanks and enough funds to carry on the work. These tanks have been tested to destruction by the U. S. Bureau of Standards.

The shells of most of the tanks were 6 feet long and 2 feet in diameter, and made of 3%-inch mild steel plate. Both electric and oxyacetylene welding were used. The hydrostatic and hammer test developed that the welded pressure vessel, according to the regular formulæ for working pressure, has a factor of safety of about 6.

A remarkable feature of this undertaking is the rapidity of accomplishment. The first meeting of the committee was held in New York on August 17, and a plan outlined. The tanks called for in the program were immediately built by manufacturers distributed widely (one of them on the Pacific Coast), and shipped to the Bureau of Standards in Washington. Most of the tanks arrived by the first of December. Under the supervision of Dr. H. L. Whittemore, Chief of Section VII-1, Physical Tests of Structural Materials Division, who is also chairman of the committee, testing was started December 4 and carried on continuously to January 10. Many visitors, including members of the Boiler Code Committee, insurance inspectors, tank manufacturers, American Welding Society and National Research Council, have witnessed tests. A report is being compiled and will soon be published. This program including tanks, testing and incidentals, involved a sum of \$15,000.

The manufacturers cooperating in this work are: York Manufacturing Company, Pfaudler Company, Elyria Enameled Products Company, Union Carbide and Carbon Corporation, DeLaVergne Machine Company, Coast Culvert & Flume Company, Brunswick-Kroeschell Company, and Vilter Manufacturing Company.

Recent Improvements in Watertube Boiler Design

British Engineers Develop Two New Types of Watertube Boilers in which Water Circulation is Greatly Increased

By T. Sington

E NGINEERING developments, improvements and extensions during recent years have resulted in a demand for greater boiler efficiency, as the older types, although admirably suited to former conditions, have not been equal to the most recent demands for greater steam pressures and higher superheat. Vastly increased wages in Europe due to the war, as well as alarmingly higher prices for coal and other necessary materials have literally compelled engineers to seek for relief in boiler improvements. Many factors have combined to necessitate further steps in the evolution of boiler design; larger electric power stations, greater size, an increased speed of shipping, electrification of railways and so on.

The most recent boiler improvements, briefly described below, are an attempt to provide for these requirements. The improvements do not constitute new boilers, or types; the principles on which they are based have been known for some years and have stood the test of experience. The new steam generator is a modified watertube boiler of which in its improved form there are two types, one with a longitudinal drum and the other with a cross drum; the former is suitable for smaller sizes and the latter for boilers of larger capacity; both are of the sectional header class, the main distinctive features common to both are the downcomer pipes, the reservoir mud drum and the enlarged nipples, also the straight headers.

To quote an expert on boiler design, the headers are straight, rectangular and larger in area than usual by forty percent, affording freer circulation to the steam and water and making cleaning easier than in the case of the sinuous type. As it is not necessary to stretch the material in construction to the same degree as in the sinuous headers, the thickness of the straight headers is more uniform; moreover, it is a simple matter to make the joints between the straight headers airtight. The headers are connected to the drums by nipple tubes, which are 28 percent larger in area than is usually the case, a point which increases the safe and steady steaming capacity of the boiler.

MUD DRUM DESIGN

The reservoir mud drum has to be considered in connection with the downcomer pipe, which leads to it from the circulation drum. The function of this pipe—one, two or more are fitted according to the evaporative capacity of the boiler—is to secure positive circulation from the main steam

Electric Boiler for Heating Trains

A RECENT paper, presented by Sir Vincent Raven before the Institution of Mechanical Engineers in England, describes an electrically heated steam boiler designed by C. Orme Bastian, for the heating of trains on the electrified section of the North Eastern Railway, England. The problem to be solved arose in connection with the heating of rolling stock which passes from ordinary steam track over an electrified section. In the United States, this is usually done with an oil-fired boiler to provide the necessary steam. The equipment designed by Mr. Bastian has been entirely successful and it would not be surprising to find and water drum through the mud drum to the headers and tubes. Usually the internal diameter of the downcomer pipe is about eight inches so that the risk of choking by deposit or incrustation is altogether negligible. In the position it occupies it is not subjected to excessive temperature. Each pipe is solid drawn and is flanged at each end so that it may be bolted to the stand pipe and riveted to the steam drum. This arrangement enables the downcomer pipe to be readily detached if necessary.

WATER FREELY CIRCULATES IN MUD DRUM

By means of the downcomer pipe all the water is circulated through the mud drum, which efficiently collects and retains the deposit, which would otherwise be distributed through the headers, or to the steam generating surfaces; the drum is of ample dimensions and is readily accessible for cleaning. The water flows from it through short connecting nipples to the back headers, providing a full supply of water to the bottom rows of tubes first; moreover, the flow is in the right direction along the tube, upwards and outwards.

As the tubes nearer the fire play the most important part in steam generation, the correct mode of water supply is of great importance. The improved boiler, it is asserted, surpasses all others as regards this point. In the longitudinal drum type the headers are connected to the drum by curved nipples directly expanded into holes in the drum. These holes are compensated for by a doubling plate, thus avoiding the weakness of a cross-box with a large opening in the shell and a considerable flat surface. To facilitate the removal of soot by blowers the watertubes are only staggered about one inch.

The outstanding result of the general design of the improved boiler, to again quote an expert, is that with large downcomer pipe, the large nipples and straight headers, a free, natural and positive circulation is secured. This feature, combined with the ample steam and water capacity, enables the boiler to respond readily to overload demands. The renewal and the cleaning of tubes are not only exceptionally simple on account of the tubes being straight and easy of access, but the necessity for either is reduced by the peculiarities of circulation mentioned above. Expansion and contraction stresses are also greatly minimized, as all parts liable to considerable changes in dimensions are free to adjust themselves to an unusual degree.

some similar method of train heating eventually substituted for the oil-fired boilers in this country.

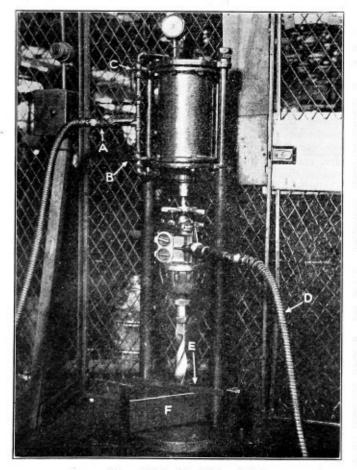

The electric boiler installed on the new North Eastern locomotive is 3 feet 4 inches in diameter and 3 feet 4 inches long; it is capable of supplying enough steam for the largest train handled in ordinary service.

The construction of the boiler is extremely simple, being of the ordinary multi-tubular type, without any of the usual accessories. There are 144 tubes, into each of which is introduced a quartz tube, 3⁄4 inch in diameter; inside of each tube is a close spiral heating element of resistance wire. Wound in this way the wire is free from the risk of developing hot spots; something which must be carefully guarded against under the special conditions. So satisfactory is the design claimed to be that the firm of Bastian & Allen is willing to build electric boilers even on direct current lines up to 3,000 volts. Simple but adequate means are taken to insure satisfactory connection with the elements and to prevent damage to the quartz tube by vibration. The tube is mounted on a mica washer in the end of a hollow porcelain terminal, which is held by spring pressure to the terminal plate of the boiler. There are cases where steam has to be applied at places remote from any point where a fuel-fired boiler can be conveniently or safely placed. Under conditions in which the electrically fired boiler can be placed where it is needed, thereby eliminating all pipe losses, it may prove the most economical as well as the handiest solution. The electric boiler has proved satisfactory under conditions of vibration and shock.

Air Motor Testing Device

IN view of the large number of pneumatic motors used in railroad shops it is essential that they be kept in good repair and operating as near as possible at maximum efficiency, otherwise there will be a large aggregate loss of time and effort in doing the work.

Various forms of brakes have been developed for testing air motors but results obtained with this form of apparatus are not wholly reliable since the motor spindle is not subject to pressure as in actual service. The apparatus shown in the illustration has been developed at the McKees Rocks shops of the Pittsburgh & Lake Erie for the purpose of testing motors under actual working conditions. As shown in the illustration the device is simple, consisting of an 8-inch air brake cylinder mounted in a vertical position between two heavy rods secured in a substantial base casting. The upper ends of the rods are turned down to $1\frac{1}{2}$ inches in diameter

Home-Made Air Motor Tester

to accommodate the special cylinder heads which serve to hold the cylinder in place. The lower sections of the vertical rods are retained at their original diameter of 2¹/₄ inches.

For purposes of test, a motor is mounted in the device as shown, being guided at the drill by crossbar E and resting on test block F. Air is supplied to the cylinder through the flexible hose on the left and valve A. Valves B and C are threeway cocks so arranged that when B is closed and C opened, for example, air is admitted on top of the cylinder and exhausted from the bottom. This forces the piston down on top of the air motor with a pressure indicated by the gage and which can be regulated to any desired amount. Air is supplied to the motor by means of hose D, and after the test is over the motor can be released by closing valve C and opening valve B. There is approximately 100 pounds' pressure on the shop line.

For testing, the air motor is set up as illustrated with a 2-inch drill in the socket, the drill point resting on test block F. Pressure is applied slowly until the air motor is pulling to capacity. The revolutions per minute can then be counted and the pressure noted. The pressure required to stall the motor can also be noted, and, provided the condition of the drill point as regards sharpness is kept constant, this pressure will be a measure of the efficiency of the air motor. If the motor does not come up to the requirements it can be overhauled and the difficulty corrected. This apparatus proves very valuable for a comparative test of different motors as a measure of their efficiency under actual working conditions.

Work of the A. S. M. E. Boiler Code Committee

THE Boiler Code Committee meets monthly for the purpose of considering communications relative to the Boiler Code. Any one desiring information as to the application of the Code is requested to communicate with the secretary of the committee, C. W. Obert, 29 West 39th street, New York, N. Y.

The procedure of the committee in handling the cases is as follows: All inquiries must be in written form before they are accepted for consideration. Copies are sent by the secretary of the committee to all of the members of the committee. The interpretation, in the form of a reply, is then prepared by the committee and passed upon at a regular meeting of the committee. This interpretation is later submitted to the council of the society for approval, after which it is issued to the inquirer.

Below are given the interpretations of the committee in cases Nos. 408 to 410 inclusive, as formulated at the meeting of December 8, 1922, and approved by the council. In accordance with the committee's practice, the names of inquirers have been omitted.

CASE No. 408. *Inquiry*: What thickness is required under Par. M-3 of the Code for Miniature Boilers for the plate forming heads which are not an integral part of the boiler? The thickness for heads which have riveted construction is not definitely specified in this paragraph.

Reply: It is the opinion of the Boiler Code Committee that the term "riveted shells" in the first sentence of this paragraph is intended to cover heads, in case they are not used as tube sheets.

CASE No. 409. Inquiry: Is it permissible, under Par. M-11 of the Code for Miniature Boilers, to weld on to the shell a half-coupling for the reinforcement to give the necessary four full threads?

Reply: It is the opinion of the committee that the reinforcing may be accomplished only by a riveted pad or its equivalent, or by building up the thickness of the plate by (Continued on page 56)

The article on modern boiler shop equipment appearing in this issue of the magazine presents to our readers a plan of shop layout and machinery that has given excellent results in efficient locomotive boiler construction and repair work. The machines mentioned and their arrangement are only intended to suggest possible improvements in modernizing existing shops when new equipment is required and in aiding the design of a new maintenance plant of moderate size.

This introduction of the subject of machine and small tool requirements in the boiler shop offers our readers an excellent opportunity to express their ideas on what a well equipped shop should include in its equipment and the best method of promoting operating efficiency by properly locating the machines with relation to each other. We will be

glad to receive comments on this subject and such letters will be published at regular rates.

The decrease in locomotive accidents during the fiscal year covered by the recent report of the chief inspector of the Bureau of Locomotive Inspection is a notable one. The improvement was most marked in the case of boiler explosions, which were reduced in number and in violence. The thirty-three boiler explosions occurring did, however, cause the death of twenty-two persons and the serious injury of fifty-six others.

Proper and adequate inspection followed by the careful observance of instructions in the repair of defects will still further reduce the number of accidents. To properly carry out the inspection work involved in the supervision of the motive power of the entire country, more inspectors are required and the chief inspector's recommendation that a sufficient appropriation be made to assure a competent and efficient staff should receive support by the Interstate Commerce Commission.

The additional recommendations embodied in the report on mechanically operated fire doors, power reversing gears, power grate shakers, water level indicating devices and the like should receive the careful attention of every individual connected with the equipment and maintenance of locomotives.

In attempting to reduce the hazard of oil country boilers, the Boiler Code Committee of the American Society of Mechanical Engineers proposed at the annual meeting of the Society in December that the diameter of the steam dome on such boilers be restricted to one-half the diameter of the boiler shell. Before this time no limit was placed on the size of the dome and, as a consequence, in designing for maximum steam space without increasing the cost, domes were built having diameters almost as great as the boiler itself. The openings in the shell were, consequently, so great in these instances that the strength of the entire unit was reduced below the point of safety. Undoubtedly many of the serious field accidents might be traced to this inherent weakness.

Even with the opening in the shell much smaller than the dome diameter, the strength is not materially increased since the line of rivets holding the dome to the shell marks a point of weakness which increases with the size of the dome. The reinforcing effect of the dome flange, although strengthening the boiler to a slight extent, cannot be depended upon to make up for the weakness in the shell.

At a public hearing in January, held by the Boiler Code Committee to give the manufacturers of boilers for use in the oil fields an opportunity of discussing the proposed restrictions, the concensus of opinion seemed to be that the proportion of five-tenths imposed too great a burden in the construction of these boilers and that the limit of dome diameter should be increased to six-tenths that of the shell.

The matter is still open for discussion but will be definitely settled within a short time by the Boiler Code Committee. The opinion of the committee is that the six-tenths allowance is liberal enough and that any increases in the dome size above this point will greatly lessen the safety of the boiler. Greater steam space might be obtained by increases in dome height or other modifications in the design of these boilers.

Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor is given permission to do so.

Ninety-Degree Elbow—Heavy Plate Construction

Q.-Would you please have some of the readers who have had experience on elbows show how the holes are laid off so as to bring the ends 90 degrees apart? On this job there was an angle iron ring on each end. The elbow is to be used for an air blast so the circumferential seams have to run the same way as the air. Both end pieces are of the same diameter. In the method I used, I worked with the neutral diameter, but the sides never came around to 90 degrees. The elbow was short 9/16 inch. The holes came fair, but the ends were not square. We had to put a turn-buckle to bring the ends square, and then the holes were away out. The boss said "one more chance."-W.F.

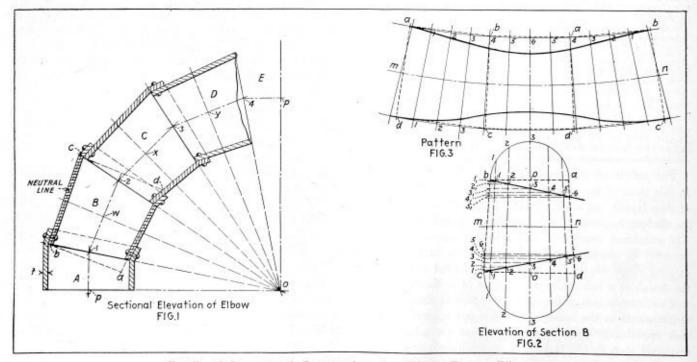

A.—The construction of one section of the elbow is given which will indicate the method of projection ordinarily applied in layouts of this kind. The plate thickness t, Fig. 1, is enlarged to show the tapered connections to better advantage. Lay off first the right angle p-o-p making the distance o-p equal to the depth of the elbow measured to the center of its openings. With o as a center draw the arc p-p and divide the arc into one less than the number of sections required in the elbow, thus locating the points w-x-y. Bisect the arc lengths w-p and y-p which locates the points 1 and 4. From point 1 set off the point 2 equal to pw, likewise locate the point 3. Connect o-1, o-2 and o-3 with straight lines on which lie the meters between the sections.

Consider the flow of air or gases to pass through the elbow in the direction shown by the arrow; in which case the elbow should be so installed that the gas travel is not affected by the overlapping plates at the joints. Fig. 1 shows the correct position of the joints to meet this requirement.

The next step in the construction is to draw the center line of each elbow section as p-i, which is at right angles to o-p and i-2 which is at right angles to o-w and passes through point w. The axis 2-3 is perpendicular to x-o and passes through point x and 3-4 is perpendicular to y-o. The sections of the elbow are drawn in so that they taper in which case the difference between the respective ends is equal to 2 plate thickness as indicated in Fig. 1:

From Fig. 1 the pattern layout is obtained by first constructing a frustum of a cone of which the elbow section is a part, as shown at *a-b-c-d* of section B, Fig. 1. This section is reproduced in Fig. 2. In cases where the taper is slight a convenient and short method of laying off a pattern for frustum of a cone is shown in Fig. 3. The pattern of the frustum is essential in this development for obtaining the elbow pattern.

In Fig. 3 reproduce three sections of the frustum a-b-c-d,

Details of Layout and Construction of a Ninety Degree Elbow

FEBRUARY, 1923

Fig. 2, which is drawn to the neutral line of the plate thickness. Through the points a-b-a-b at the small end draw in the camber line and through d-c-d-c at the large end draw the camber for the large base. The line m-n in Fig. 2 bisects o-o and the corresponding position of m-n is drawn in Fig. 3. In Fig. 2 semi-circles are described from point o for the upper and lower base profiles of the frustum. They are then divided into equal parts and construction lines drawn in as shown. On the camber lines, Fig. 3, lay off the stretchout for the upper and lower bases by setting off the arc lengths 1-2, 2-3, etc., of the semi-circles, Fig. 2. Then in Fig. 3 draw in the radial lines 1-1, 2-2 and 3-3, etc. Where the miter lines, Fig. 2, intersect the radial lines at 1-2-3-4, etc.,

lines I-I, 2-2, 3-3, etc., of the elbow section. At right angles to the line o-o and from points 1-2-3-4 and 5 draw lines to intersect the outer element of the frustum as at 11, 21, 31, etc. The true lengths of the development lines for the elbow pattern are then transferred from Fig. 2 to Fig. 3, taking the respective lengths from the base line m-n, Fig. 2, and laying them off from m-n of Fig. 3. The lap for the riveted joint must be allowed and the holes spaced off equally. The rivet line on the opposite end of the pattern is spaced into the same number of parts but the pitch will be less on account of the end being smaller so as to fit into the larger end of the adjoining section. This completes the more essential steps in this layout.

locates the points for determining the true lengths of the

Annealing Large Steel Castings

Q.-I am interested to know whether it has been the custom of your readers to anneal the stakes of bull riveters with the idea of preventing crystallization and breakage. Any information which you have on this point will be much appreciated.-C. W. E.

A .- Annealing of steel castings is an essential process used in producing a finer quality of cast material. Annealing affects the physical or structural form of the metal, reducing the coarser sections to a finer grain, thereby increasing its strength. In the formation of large castings such as the stake of a hydraulic riveter the annealing is done by allowing the metal to cool slowly in the mold, which is called flask annealing.

I am not aware of subsequent annealing being performed after the castings of such size are made. If it were done the process would require special equipment for handling the work. Special types of stakes are made, as for example a machine-turned solid forging of steel that is heat treated. Such machines are used for extreme riveting conditions requiring a long reach.

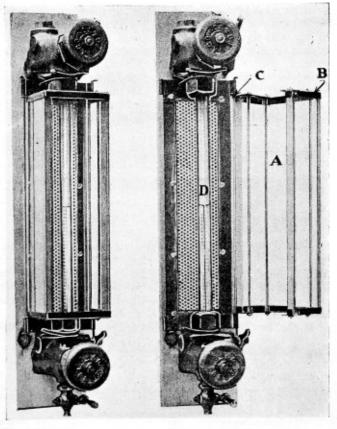

Guards for Water Gage Glass

Q.--I would like to have some information on the following subject: Our Safety First Committee insists that the water gage glass on a boiler should be covered with ½-inch mesh screen to keep the glass from flying into the attendants' eyes should it burst while under pressure. I do not have the late code. Do they make any reference to this? In my opinion this part of the boiler should be kept uncovered.--W. N. S.

A .- The A. S. M. E. boiler code contains no requirements for a protective water gage device of the type you describe or for any other type of this kind, except the automatic shut off valves on water gages.

The glass gage guard shown in the accompanying illustration meets the requirements of the department of safety appliances, Department of Labor and Industry, State of Pennsylvania.

This device is intended to protect the eyes of boiler room attendants against bursting gage glasses. The guard is made of a special grade of glass a which is held in position by a brass frame b and hinged at the back with bolts c. The hinge construction permits the protector to be opened to the right or left for installing a new gage glass. Observation of

Closed and Open Positions of Water Gage Glass Guard

the water level is readily made through the glass protector. This device is made by Reiber-Gibbs Company, Pittsburgh, Pa.

Calculating Strength of Plain Vertical Fireboxes

Q.--Why are the furnace sheets of vertical tubular boilers in which the furnace sheet is under 38 inches in diameter arranged with staybolting, the stays being pitched so as to place a greater load on same than is allowable in the A. S. M. E. Code rules, and the thickness of the plate such that requires no bracing for the pressure carried on the boiler? Following is an example, the data taken from a boiler of this kind, which will more clearly explain my inquiry: Furnace length, 27 inches; thickness of plate, 34 inch; diameter of stay-bolt at top of threads, 34 inch; diameter of furnace, 32 inches; pressure carried, 100 pounds; pitch of staybolts, 7½ inches by 8 inches. A. S. M. E. Code rule to be used where the length exceeds 120 times the thickness of the plate. $4250 \times T^2$

4250 × T²

$$=\frac{4250\times 1}{L\times D}$$

P

in which: P = allowable working pressure. D = outside diameter of furnace. L = length of furnace in inches. T = thickness of furnace walls in 16ths of an inch.

This problem worked out allows a working pressure of 4250×36

- = 177 pounds, nearly, without any staybolting. 27×32

The load on the staybolt is $100 \times 7\frac{1}{2} \times 8 = 6.000$ pounds, and the allowable working load on a $\frac{1}{2}$ -inch staybolt calculated from the root of the threads is 3.142 pounds at 7,500 pounds stress per square inch. Now the following is what I cannot understand: The above boiler was built to safely carry a pressure of 177 pounds on the furnace sheet without staybolting, yet the furnace is staybolted, thereby taking the load off of the furnace and placing it upon the staybolts, the load on the staybolts being considerably above that which is allowed.—W. S.

A .- Circular furnaces for small vertical boilers can be made of plate heavy enough to carry the working pressures usually allowed on such pressure vessels. The furnace, however, is generally made of light material and stayed to give a more rapid heat transmission than is obtainable with heavier plate. The pressure acting on the firebox tends to collapse it, and, according to the A. S. M. E. Boiler Code, "A plain cylindrical furnace exceeding 38 inches in diameter shall be stayed in accordance with the rules governing flat surfaces." For smaller diameters, as previously stated, where lighter materials are used and which would not carry the desired working pressure, the furnace is stayed as a flat surface.

In your example, the length of the furnace is 27 inches, which does not exceed 120 times the thickness of plate, because $27 \div .375 = 72$; therefore the formula (a) of Par. 239 should be used instead of formula (b).

Formula (a) is as follows:

$$P = \frac{51.5}{D} \left[(18.75 \times T) - (1.03 \times L) \right],$$

where: P = maximum allowable working pressure, pounds per square inch. D = outside diameter of furnace, inches. L = length of furnace, inches. T = thickness of furnace walls, in sixteenths of an inch.

Substituting the values given in the example:

 $P = \frac{51.5}{32} \left[(18.75 \times 6) - (1.03 \times 27) \right] = 136.35$ pounds per square inch.

With a plate thickness of 3%-inch, the furnace of this size 32 inches in diameter and 27 inches long will carry safely a steam pressure a trifle over 136 pounds; therefore, it was unnecessary to stay the furnace, as you state.

If the furnace is stayed as a flat surface, the formula

$$P = C imes rac{t^2}{p^2}$$
 should be used,

- in which: $P = \max$ and $P = \max$ allowable working pressure, pounds per square inch. C = 112, for stays screwed through plates not over $\frac{1}{16}$ such thick with ends riveted over. t = thickness of plate in sixteenths of an inch. $p = \max$ maximum pitch measured between straight lines passing through the centers of the staybolts in the different rows which lines may be horizontal, vertical or inclined, inches.

Using the pitch of stays, which is given as 71/2 by 8 inches, and substituting the pitch, 8 inches, which is the

greatest, the allowable working pressure equals 112
$$\times \frac{-}{64}$$

63 pounds per square inch. The maximum pitch allowed by the A. S. M. E. rules for a working pressure of 100 pounds per square inch when the plate thickness is 3%-inch, is 63% inches in cases where the surface is stayed as a flat surface. Using this dimension to determine the pressure on the stay, we have $6.375 \times 6.375 \times 100 = 4,053$ pounds. The required diameter of stay taken at the root of the thread to support this pressure is found as follows:

The allowable stress on an unwelded staybolt less than twenty diameters in length, screwed through the plates, with ends riveted over is 7,500 pounds per square inch.

The pressure on the stayed surface divided by the allowable stress on the staybolt gives the required cross sectional or net area of the stay as taken at the root of the thread. Thus, $4,053 \div 7,500 = 0.544$ square inch.

The corresponding diameter at the root of the thread equals

$$\sqrt{\frac{0.544}{0.7854}} = .832$$
 inch.

The depth of thread on stays having 12 threads per inch United States Standard is 0.108. The overall diameter of staybolt equals 0.832 + 0.108 = 0.94 inch, which is a trifle greater than 0.9375 or 15/16 inch.

In your example, the stays are too small and the pitch is too great. This may seem unreasonable on account of the fact that the shell will carry safely a greater pressure unsupported. In using the stays, the problem is changed since the load is transferred to the stays. Therefore, in staying cylindrical vessels the plate and stays must have a strength sufficient to carry safely the maximum allowable pressure.

Distortion of Water Tubes in Yarrow Boiler

 Ω_{-} I have been a reader of your valuable magazine for several months, and find that it contains some very interesting information. I am a boiler maker in the Navy and on a repair ship. I have had twenty-five years' experience at the trade, five years of which have been in the Navy on repair ships, and I have been up against some very complicated jobs, but one job in particular has gotten my goat, as the saying is. This job is on a Yarrow builer, in which I have renewed a nest of 30 tubes twice, and have had a lot of trouble with the brick work; also this nest of tubes is located 8 rows in from the fireside up in the right back corner. I have renewed them twice, and each time after a few hours' run, each one of these tubes bags and the brick. All this trouble occurs after the boiler has been steaming for a few hours. I have reported the cause as being due to unequal expansion in the drums, as this trouble is about 3 feet from the top drum, and the tubes bag about the same place, while 11 other tubes are straight and even. I have had several arguments with the engineer about this, and he says there is no such thing as unequal expansion in a Yarrow boiler. Of course I cannot tell him what I think, but I do know that somebody is wrong.--E. L. A.

A .--- In all types of boilers, whether firetube or watertube, the boiler materials are subjected to stresses arising from expansion and contraction of the metals. This condition is due to the temperature changes, as for illustration, the tubes and plates directly in contact with the intense heat from the fire will expand more than those further from it. Subsequent cooling of the metal causes contraction and the continued expansion and contraction, or breathing action, results in the plate cracking near riveted seams, and between tube ligaments, also in leaky tubes, rivets, stays and distorted tubes. From observation of the operation of boilers under great stress, it has been found that steel corrodes more rapidly than steel under less stress.

The tubes in Yarrow boilers nearest the fire being subject to the greatest heat and as they are longer than those in the interior of the tube nest, they have a greater expansion and consequently are subjected to a greater compressive stress.

To illustrate further the extent of tube expansion, consider that the temperature of the tube material in the fire is 300 degrees F., tube length equals 10 feet, or 120 inches, and coefficient of expansion equals .0000065, then the total increased length of the tubing due to expansion of the metal, equals $300 \times 120 \times .0000065 = .234$ inch. As the upper tube drum also expands, additional compressive stress occurs on the tubes. The tube expansion is the same for all tube sizes and thicknesses, but varies with tube length and temperature. From the foregoing, it is evident that if the tubes are rigidly fixed with no provision for expansion, heavy bending stress occurs.

Since the steam and water drums do not permit the tubes to expand freely, the practice employed in some designs of water tube boilers is to bend the tubes slightly near the junction of the drums and tubes.

With boilers that have been in service for some time, sudden distortion indicates scale.

Tank Bottom Layout Correction

On page 361 of the December issue of the height on plate No. 6 of Fig. 2 should have been 4 feet 434 inches instead of the dimension 3 feet 914 inches indicated. This value is obtained from the solution of the triangle $\sqrt{30^2 - 6^2} = 29$ feet 434 inches. The distance C is 25 feet so the height x = 29 feet $4\frac{3}{4}$ inches - 25 feet = 4 feet $4\frac{3}{4}$ inches.

Smoke Abatement Work Progressing

The smoke abatement work at Grafton, W. Va., conducted by Osborn Monnett and L. R. Hughes, under the supervision of O. P. Hood, chief mechanical engineer of the United States Bureau of Mines, has been brought to a close. Excellent results were obtained, due largely to the hearty cooperation of the Baltimore & Ohio Railroad officials.

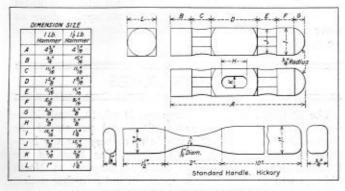

Letters from Practical Boiler Makers

The Proper Type of Hammer for Testing Staybolts

This subject, which was brought up several months ago, is an interesting one to all boiler makers and inspectors. Of course there are several kinds and varieties of hammers used for testing staybolts, but the hammers in the accompanying sketch were used and adopted as standard by one of the largest railroad concerns in the United States.

We use two different hammers, the 1 pound and the $1\frac{1}{2}$ pound. The 11/2 pound hammer is used to detect broken or cracked flexible staybolts or bolts in the crown sheet. The

2

į

1 pound hammer is used to detect cracked or broken bolts of the solid type located in the door and side sheets. We also use a handle in the hammer as shown by the sketch with a very thin cross section located about 3 inches from the hammer. These hammers give very satisfactory results, but we use different methods in order to get the defective bolts in different types of engines.

As a matter of fact, the hammer is not the only main requirement in order to obtain good results, for a great deal depends upon the person doing the inspecting. One person has the ability and requirements to make a lawyer, but in any other capacity he would not do so well, and the same holds good in regard to boiler inspectors. If one is not adapted to the position, it is useless for him to try to become an expert as such.

In my opinion, in going over a boiler on a staybolt test, the inspector cannot get all the broken and cracked bolts. I have witnessed inspectors undergoing examination who were classed as good, but the results they obtained varied, some locating only one defective bolt while others located as high as 12 to 14. Some bolts which they marked as broken or cracked were of the flexible type and were merely unseated.

In our larger type of boilers, we apply a 100-pound cold water test as soon as it enters the shop for repairs. In this manner we are able to get very good results in locating defective bolts, especially in the crown sheet.

TESTING FLEXIBLE BOLTS

To test flexible bolts, we remove all caps and strike the head of the bolt two or three good smart blows so as to finish

the break if possible; then we take a round nose tool and strike the head first on one side then on the other, twisting it so that in case it is fractured it will break loose. I have seen several tell-tale holes leaking on hydrostatic tests, but have very seldom seen an inspector locate the same while testing the bolts from the firebox side of the boiler.

In striking a staybolt, if the hammer gives a quick rebound, the bolt is all right, but if it does not rebound and apparently sticks to the bolt it is cracked or broken. One must not depend altogether on the rebound, but upon the sense of hearing as well; a fractured bolt gives off a dead sound and is very often easily detected by one standing close to the inspector at the time.

The Federal government requires that staybolts tested with water in the boiler must have at least 50 pounds pressure, otherwise the water must be drained and the test made, in which case the vibration of the sheet will indicate any unsoundness; the latter test is preferable. Olean, N. Y.

C. W. CARTER, JR.

Extreme Examples of Bad Workmanship From An Inspector's Records

Some of the methods used in repair work are decidedly questionable and the inspector runs across some rather dangerous practices in his every-day experience. Fortunately the following extreme examples of bad workmanship which the writer has found in some of his trips are not common, but it is interesting to see to what extent individuals will go to hurry along a given job.

In one boiler where it was rendered difficult to get the flues out of the boiler through their own hole, especially in the case of flues in the outside or bottom rows, the man on the job cut them off and allowed them to drop out of the way into the bottom of the barrel.

Another instance where a staybolt had been drilled by mistake the drilled hole was filled with electric weld and a new head also was formed by the electric welding process.

Bulges in arch tubes have been known to be heated by the acetylene flame and the bulge driven back with the help of a flatter.

Cracks in the side sheet that were anywhere from 1/4 inch to 2 inches in length were calked without any other work being done to them.

Electric welds were applied to firebox sheets and surfaces without properly cleaning the sheets or surfaces.

Patch seams were merely seared over by electric weld without going to the very inner surface and working out as is necessary to obtain a good job.

Possibly some such work as the following would explain many of the firebox failures reported from time to time:

Cracks across the seam of the rear flue sheet where the flue sheet intersects the crown sheet were V'd out and welded. These cracks were anywhere from 20 inches to 32 inches long and there were also radiating cracks from the flue holes to the crack that were not touched.

One method of making tubes fit sometimes when small flues and superheater flues are cut too short by about 3% inch to 1/2 inch. In such an event a hot bar of iron is placed in the flues and when the flues expand to the proper distance they are clinched over and held in place.

Broken and cracked radials and staybolts are not always taken out of the boiler but leaky telltale holes are plugged so they will not give evidence of defects. It is the inspector's practice to rap only about 4 rows wide along the intersection of the side and crown sheets.

It seems to be the practice in some shops to get the engines out and going no matter what the conditions or hazards may be. Generally in such cases the roundhouse foreman has no more idea about the characteristics of a steam boiler than a kindergarten scholar would have.

An engine comes into the shop with a pressure ranging from 100 to 150 pounds of steam and within three-quarters of an hour it has been blown down and extremely cold water allowed to be put into the boiler thereby producing severe strains and stresses upon the boiler.

I have never yet with my three months' experience in a shop of this type seen the radial or crown bolts or staybolts tested as required by the law or even seen the crown bolts tested at all.

Boilermakers who have any pride in their work will at once condemn the above mentioned practices, yet they are carried on daily. Now that the Interstate Commerce Commission has ordered an inspection and investigation of locomotives and cars, will they allow such practices as those outlined to continue or will the rules and regulations be lived up to and enforced rigidly? Not being any too familiar with the machinery end, I have paid very little attention to this work, but I do know that the same way of doing things is carried on. The argument for an adequate governmental inspection staff is a good one.

New York.

INSPECTOR.

Photographs of Fire Tube Boilers

Just a short time ago the writer was asked by a prominent technical publication to write an article on steam boilers.

I wrote the article and of course I wanted to illustrate it. I wanted to show the difference between watertube and firetube boilers by means of actual photographs, and so wrote a number of letters to manufacturers of both kinds of boilers asking for photographs.

The manufacturers of watertube boilers responded immediately, offering me a variety of pictures, some of which I asked for. But the manufacturers of firetube boilers, for some reason or other, didn't have any photographs. They offered to furnish cuts, or electrotypes of cuts already on hand, but cuts were out of the question because of the policy of the publication. I was unable to get a single photograph that I could use.

This, I believe, should be of interest to manufacturers of firetube boilers. Progress cannot be made without consistent advertising. To advertise the firetube boiler properly it must be shown time and again in our trade papers. The manufacturers of watertube boilers were willing to go to considerable expense to have their boilers shown. Why shouldn't the same apply to firetube boilers? There is nothing about a firetube boiler to be ashamed of. Why not advertise it a little more? N. G. NEAR.

Newark, N. J.

Stamping Ohio State Boilers

(Continued from page 38)

"Whereas, The National Board of Boiler and Pressure Vessel Inspectors, organized for the purpose of standardizing exam-inations of applicants for certificates of compentency as inspectors of steam boilers; for the issuing of commissions to such inspectors; and for the uniform stamping of steam boilers; has completed its work; therefore,

"Be it Resolved, That the Ohio Board of Boiler Rules hereby approves of and will accept written examinations conducted by any political subdivision of the United States which is a member of the National Board of Boiler and Pressure Vessel Inspectors.

Due to the fact that this resolution permits the installation of boilers that are constructed in accordance with the A.S.M.E. code and stamped with the facsimile of the National Board, this department requests that the data on boilers stamped with the National Board stamp be filled out on the Standard A.S.M.E. forms and that the old Ohio Standard forms only be used when boilers are built in accordance with the Ohio Code and specifically stamped "Ohio Standard."

Work of the A. S. M. E. Boiler Code Committee

(Continued from page 50)

welding, and that the welding of the half-coupling on the outside of the plate is not permissible under this requirement.

CASE No. 410. Inquiry: Is it the intent of Par. M-16 of the Code for Miniature Boilers that non-ferrous metal shall be used for the valve seat and also that the lifting device shall be of non-ferrous metal, as are required by Pars. 282 and 283 of the Power Boiler Section of the Code?

Reply: Attention is called to the fact that where the Rules of the Code for Miniature Boilers do not apply, those as above referred to in the Power Boiler Section of the Code are applicable.

BUSINESS NOTES

The Standard Conveyor Company, North St. Paul, Minnesota, has acquired the rights, titles and patents of the "Brown Portable" line of portable machinery for the handling of packed and loose materials. The plant of the Brown Portable Conveyor Machinery Company at North Chicago will be continued in operation until further notice.

Royal E. Terhune has been placed in charge of the Northern New Jersey sales territory of the Uehling Instrument Company, Paterson, N. J. Mr. Terhune was formerly associated with the Uehling laboratories and is well qualified to cooperate with power plant operators on the subject of power plant economy.

The Mine and Smelter Supply Company with branches through the west has taken over the distribution of Wilson plastic arc welders and Wilson welding metals. This company maintains branch offices in Denver, Salt Lake City and El Paso.

E. S. Lammers has returned to the employ of the Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., and will be in charge of controller sales in the industrial department. Since 1919, when he left the employ of the Westinghouse Company, until the present he has been test engineer for the National Tube Company, Lorain, Ohio.

The Conveyors Corporation of America, Chicago, Ill., has acquired the manufacturing rights of the Green steam jet ash conveyor from the Green Engineering Company, East Chicago, Ind. All orders for replacement parts and extensions to the Green conveyor will be filled by the Conveyors Corporation of America.

The American Engineering Company, Philadelphia, Pa., manufacturers of Taylor stokers and other equipment, has taken over the Standard Crane and Hoist Company and the manufacturing rights to the mono-rail electric hoist formerly known as the Standard. H. S. Valentine, chief engineer of the Standard Crane and Hoist Company, is directing the sales and supervising the manufacture of the hoists for the American Engineering Company.

TRADE PUBLICATIONS

AIR FILTERS .- A new edition of the Midwest Steel and Supply Company (New York) catalogue, covering the apparatus made by this company for handling dirt and dust problems, and air filtration for industrial plants, will be distributed within a short time.

BOILER CAPACITY .- A folder outlining three features of Heine boilers-economy, flexibility and capacity-has been distributed by the Heine Boiler Company, St. Louis, Mo. An installation of oil-fired Heine boilers, in which these features accomplish excellent results in cutting down cost, is given as a notable example.

INDUSTRIAL LIGHTING .- A new series of six bulletins on systems of lighting for various industrial uses has been issued by the Edison Lamp Works of the General Electric Company, Harrison, N. J. These bulletins cover the lighting of textile mills, pulp mills, woodworking plants, street lighting and the like. Former issues of lighting bulletins have been revised and brought up to date and may be obtained upon request.

CONICAL MILLS .--- Conical ball and pebble mills and their application to the field of grinding and pulverizing are described in catalogue No. 13 issued by the Hardinge Com-pany, New York. The various methods of grinding for metallurgical purposes, the manufacture of cement, and in the fuel field are taken up in detail with an illustrated description of the construction of Hardinge mills and their applications. Specifications and applications of these mills are included in the bulletin.

SEAMLESS BOILER TUBES .- The manufacture, properties and uses of "Shelby" seamless hot rolled boiler tubes are detailed in Bulletin No. 12 of the National Tube Company, Pittsburgh, Pa. One of the most important uses for seamless steel tubing is in boilers and until late years cold drawn tubes were found more satisfactory than those made by other processes. However, the process of hot rolling has been so far developed that tubes made by this process are becoming more generally used. Tables of properties of "Shelby" tubes and other useful data are contained in the Bulletin.

SELECTED BOILER PATENTS

Compiled by

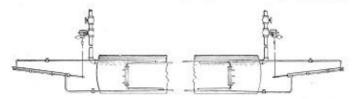

GEORGE A. HUTCHINSON, Patent Attorney, Washington Loan and Trust Building

Washington, D. C.

Readers wishing copies of patent papers, or any further information regarding any patent described, should correspond with Mr. Hutchinson.

1,440,521. FEEDING WATER TO BOILERS. ROGER W. AN-DREWS, OF WASHINGTON, DISTRICT OF COLUMBIA, ASSIGNOR TO NORTHERN EQUIPMENT COMPANY, OF ERIE, PENNSYL-VANIA, A CORPORATION OF PENNSYLVANIA.

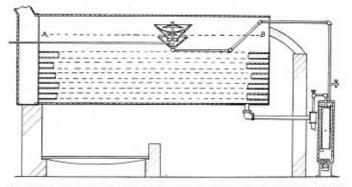

Claim 1.--A method of feeding water to boilers consisting in passing water into the boiler at two remote places, and in causing the relative

amounts of water passed therein to correspond to the relative levels of the water in the boiler adjacent the two places. Four claims.

1,440,103. METHOD AND MEANS FOR PURIFYING WATER FOR STEAM BOILERS. JAMES D. REEKIE, OF DULUTH, AND GEORGE M. CROSSEN, OF MINNEAPOLIS, MINNESOTA.

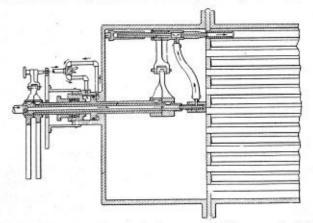

Claim 1.-The method of purifying water for steam boilers, consisting of causing the precipitation of scale-forming minerals in the feed water by heating the feed water within the boiler before said feed water has mixed with the

main body of boiler water, trapping the oil from said feed water within the boiler before either said oil or said feed water have mixed with the main body of boiler water, drawing said feed water and mineral precipitates out of said boiler, returning the feed water approximately free of said precipitates to the main or free body of water within the boiler, and occasionally blowing said trapped oil out of said boiler. Three claims.

1,441,431. TUBE CLEANER. JOHN F. KIRGAN, OF PHILLIPS-BURG, NEW JERSEY, ASSIGNOR TO INGERSOLL-RAND COM-PANY, OF JERSEY CITY, NEW JERSEY, A CORPORATION OF NEW JERSEY.

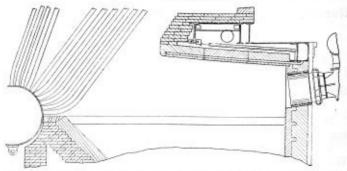

Claim 1.-In combination with a casing having a plurality of tubes and a chamber surrounding the ends of said tubes, a cleaning device adjustably

mounted in said chamber and selective means including separate indicia corresponding to individual tubes for effecting alignment of said cleaning device with individual tubes to be cleaned. Nineteen claims.

1,442,105. ARCH FOR THE FIREBOXES OF BOILERS. WILLIAM J. STOOP, OF WHEELING, WEST VIRGINIA.

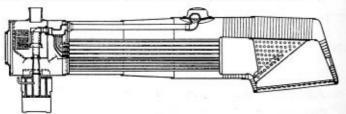

Claim 1.—An arch for the fireboxes of boilers, comprising a plurality of relatively-spaced parallel supporting bars arranged in approximately horizontal position over the firebox, an arch facing consisting of a plurality of courses of alined blocks, each course occupying the space between adjacent

bars and having the blocks thereof receiving support from the latter, the blocks of each course having therein passages which communicate to form a continuous ingoing and return duct for air whereby said blocks are cooled, an air-supply conduit located adjacent to the outer ends of said courses and having communication with the inlet end of the ingoing branch of each cooling duct, said cooling ducts having their discharge ends opening above said courses adjacent to the rear ends of the latter, and passages for conducting air discharged from said ducts away from the arch. Seven claims.

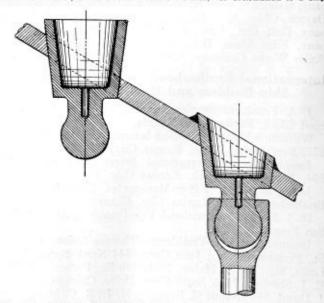

1,435,496. FEED-WATER SUPERHEATER FOR LOCOMOTIVES. LELAND G. PLANT, OF CHICAGO, ILLINOIS.

Claim 1.— A locomotive boiler and front-end with the conventional arrangement of diaphragm, exhaust nozzle, einder screen and stack for the continuous discharge of hot gases, vapors and einders, in combination with a feed-water superheater, through which the boiler is fed; said superheater being composed

of many closely spaced water-tubes exposed within, and together occupying substantially all of, the conventional space between said screen and the blast from said nozzle; said screen converting the front-end cinders into a blast of scouring particles that pass between the closely spaced tubes and keep them clean; primary water-feeding-and-heating means positioned upon the exterior of the boiler and supplying the superheater with feed-water at temperatures that suppress the condensation of front-end-vapors thereon; and, means enabling the removal of solids from the interior of the superheater. Eighty-nine claims.

1,435,733. SHEET CONNECTION FOR STEAM-BOILER STAY-BOLTS. ARTHUR F. PITKIN, OF SCHENECTADY, NEW YORK. Claim 1.—In a steam boiler staybolt structure, the combination, with a steam boiler sheet, of an end connection member, for articulation to a stay-

bolt, said member having a tubular body, the top of which is parallel with the boiler sheet, in which it is adapted to be secured, and which is inclined relatively to its axial line. Four claims.

THE BOILER MAKER

MARCH, 1923

Condensed Rules for Inspecting Locomotive Boilers

By W. R. Hedeman⁺

Many of our readers are inspectors and are, therefore, well informed on exactly what is required of a locomotive boiler to make it a serviceable machine. However, the condensed outline of inspection procedure given below may be of general interest to them. For those who wish to become inspectors and for the men in the shop the information should be of very practical value for it indicates the points on which the inspectors will be most strict in their examinations and also the method of making repairs.

F OR convenience in carrying out locomotive inspections and for reference purposes the following outline of the work of a boiler inspector is given:

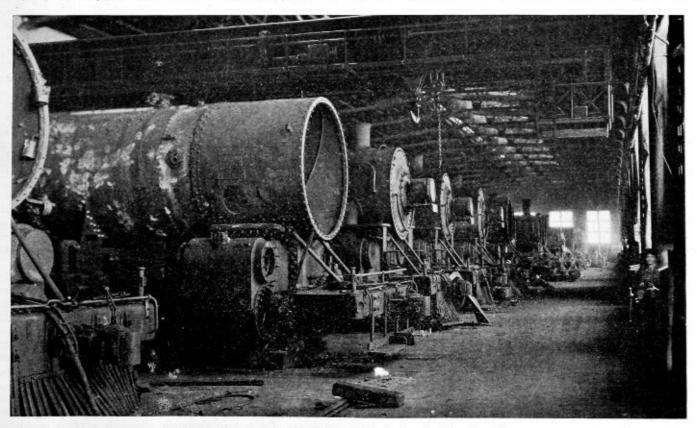

The most important features of each of the rules governing locomotive boiler requirements are condensed so that it is possible for an inspector at a glance to determine the correct procedure to be followed in all classes of inspection.

The responsibility for the basic design and maintenance of the boiler lies of course with the railroad over which the locomotive operates. For this reason the proper officials must be kept informed of the results of all inspections and closely checked up on the fulfilment of the suggestions made

*This article was prepared from a summary of inspection rules and should only be considered as a guide to procedure. The official law and rules should be consulted for specific details of inspection requirements. TChief Draftsman, Baltimore and Ohio Railroad at Baltimore, Md. for the improvement of the safety of their motive power. The chief mechanical engineer or a competent engineer holding an equivalent position in the organization of the road generally determines the safe working pressure for a given locomotive and any change incorporated after the engine has been in service should come from his office in accordance with the requirements of the government inspectors.

On all locomotives after the first of the year 1923 a factor of safety of 4 is allowed in the design and any calculations carried out in determining the strength or working pressure are to be based on this factor.

The stress allowed on braces built before January 1, 1915, is 11,250 pounds per square inch. While on boilers built after that date only 9,000 pounds per square inch is permitted. In the case of staybolts on locomotives built before

View of Boilers Under Process of Stripping in Erecting Shop

1915 the same stress allowance is permitted as in the case of braces, but on all constructed since that time 7,500 pounds per square inch has been made the maximum allowable stress. When new firebox and wrapper sheets are applied to boilers in the case of locomotives built before 1915 the stays and braces have to be changed in size and spacing or both to conform to the reduced stress requirement on locomotives of recent construction.

INSPECTION OF PLATES

At present, plates which do not show plant inspection and government test figures are limited to a tensile stress of 50,-000 pounds per square inch which figure is to be used in design and repair calculations. Untested iron has an allowable stress of 45,000 pounds per square inch. Where plates have been tested, the figures stamped are to be used in calculations.

Iron rivets in single shear have an allowable stress of 38,000 pounds per square inch and in double shear 76,000 pounds. Steel rivets in single shear have a working stress of 44,000 and in double shear 88,000 pounds per square inch.

The responsibility for the maintenance of locomotives in good condition rests with the chief mechanical officer in charge at any point where inspections are made and it is his duty to see that the required inspections are made when due. These inspections of course are made by company inspectors who examine an engine in detail when it comes in from the road for repairs. The reports from roundhouse foremen and road service records, as well as the record of the last flue removal and the government inspection report are of use in determining the necessity for repairs. Not until the locomotive has reached the shop, however, is an opportunity given for a complete examination. Once it has been placed on the pit, while it is being stripped, the boiler is inspected for cracks and fractures and, if the flue reports indicate that they have not been removed within the maximum period allowed, their replacement must be included in the work performed. Not only at the time of complete general repairs should the boiler be examined for cracks, pitting, and the like, but whenever a sufficient number of flues are removed to allow a careful study of the condition of the boiler.

FLUE REMOVALS

The present rule for compulsory flue removal is after 48 months' service, provided the time was covered in five consecutive years. Actually many roads, especially where the water supply is bad, are obliged to remove flues after comparatively few months of service.

Whenever cracks occur in the barrel of a boiler such defects must be corrected immediately. Lap joint seams should be carefully inspected at frequent intervals for possible cracks or grooving.

Fusible plugs, if used, are to be removed and cleaned every 30 days and reported on the proper inspection form.

The exterior of the boiler is of course inspected before put in service and also whenever the jacket and lagging are removed. If it has not been necessary to remove the lagging for any other purpose within a period of five years it is then required with one exception—boilers in service before April 7, 1919, have a two-year extension allowance which makes the period seven years. After this, they go back to the fiveyear period. All boilers built after the above date are governed by the five-year rule. In addition, the lagging must be removed whenever it is considered necessary by railroad or government inspectors.

TESTING BOILERS UNDER PRESSURE

In considering the tests required, the original service test of 25 percent above working pressure is the first in importance. After this, the boiler must be tested under a corresponding water pressure every 12 months. At the time of the hydrostatic test the interior should be inspected as thoroughly as possible by removing the dome cap. The standpipe should also be removed, if necessary, in order to enter the boiler. A competent authorized representative of the railroad company must personally witness the tests and examine the boiler while it is under hydrostatic pressure. When repairs are complete, further tests are necessary. The boiler should be fired up and steam raised to the working pressure. At this time the boiler and appurtenances must be examined carefully. Cocks, valves, seams, bolts, rivets, and the like, must be tight and any defects which develop repaired at once.

STAYBOLT TESTS

Rigid staybolts should be inspected at least once each month and immediately after the hydrostatic test. In examining, tap each bolt with a suitable type hammer and determine the broken bolts from the sound or the vibration of the sheet. The proper testing of bolts is a matter of training and experience on the part of the inspector. It generally demands long practice in acquiring the skill necessary to test bolts with judgment. When the boiler is filled with water there must be at least 50 pounds pressure on. The staybolt test is preferred when the boiler is empty, no pressure being exerted.

In the case of flexible staybolts with caps, remove the caps at least once every two years and also when required by government or railroad inspectors and examine the bolts thoroughly. Firebox sheets must be examined at least once each month to determine if there is any bulged portion or other indication of broken staybolts. Hammer test these bolts at each hydrostatic test period as in the case of the rigid bolts. This must be done when the pressure at least equals the working pressure. This inspection has to be entered in the special form required for bolts.

Flexible staybolts without caps are inspected at the same time and under the same conditions as the rigid bolts with the boiler under a hydrostatic pressure equal to the working pressure. A notation is made of their condition on the standard staybolt form.

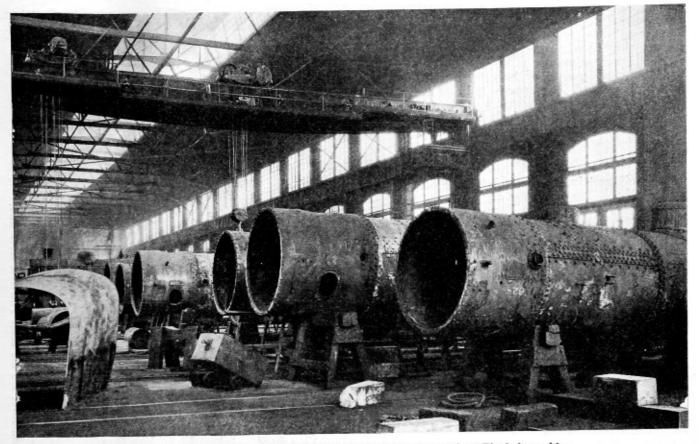

In connection with the staybolt requirements it must be remembered that a boiler is not allowed in service with two adjacent staybolts broken or with plug bolts. Three or more bolts broken or plugged in a circle 4 feet in diameter will make it necessary to take the engine out of service until they are replaced. Where five or more bolts are plugged or broken in the whole boiler the same ruling applies.

Telltale holes 3/16 inch in diameter and $1\frac{1}{4}$ inches deep must be drilled in the end of all rigid staybolts shorter than 8 inches in length. These holes must be kept open at all times.

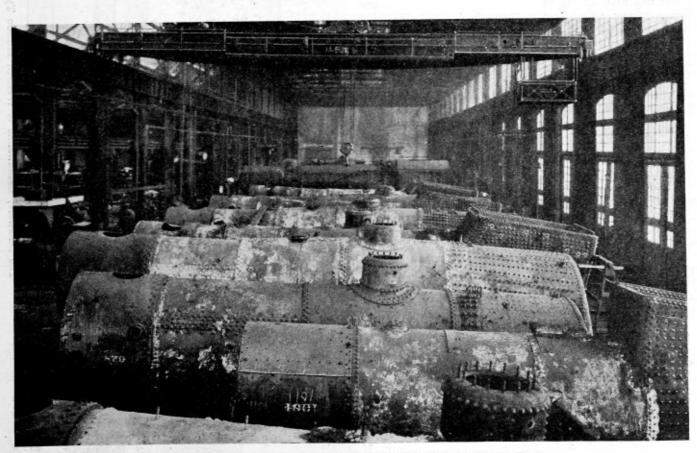

At least one correct-reading steam gage should be installed on each boiler and so located that it will be kept cool and within easy reading distance of the engineer. With the gage, a siphon must be present of sufficient capacity to prevent steam from entering the gage. This pipe should enter the boiler direct and be kept tight. The siphon and pipe should be cleaned as well as all connections each time the steam gage is tested. The steam gage must be tested every three months or at any other time that an irregularity is reported.

At this point in the discussion of inspection it may be well to mention the location of the numbers used to identify the boiler pressure in reports and the like. The metal badge plate is found on the back head in the cab, the lagging and jacket being cut away so that the plate may be readily observed. The allowable steam pressure is stamped on this plate. On the front of the dome cap the builders' number or proper serial number assigned to the locomotive by the operating company is stamped.

At least two safety valves are to be installed on each boiler with sufficient capacity to prevent the building up of pressure in excess of 5 percent above the allowable working pressure.

Boilers Nearing Completion and Ready for Inspection Before Final Assembly

The Assembly Section of the Boiler Shop in a Modern Repair Plant

They must be set to pop at not over 6 pounds above the working pressure. In setting, two steam gages are used, one in full view of the person setting the valves. If these gages vary more than 3 pounds they should be removed, tested and corrected before attempting to set the valve. The gages should be tested immediately before setting the valves or changing the setting. The water level in the boiler should not be above the highest gage cock when the valves are set. The valves should be inspected under steam at least once every three months and, in addition, whenever any defects or inaccuracies are noted.

WATER GLASSES AND GAGE COCKS

The requirement for water level indicating devices is that there shall be at least one water glass on every boiler and that the lowest gage cock and lowest reading of the water glass shall not be less than 3 inches above the highest point of the crown sheet. Two valves or shut-off cocks are equipped with each water glass, one at the top and one at the bottom connection to the boiler. A drain cock must also be attached to the water glass and all located so they can be speedily opened or closed by hand.

The recommendations on water level indicating devices made to the Interstate Commerce Commission by the Chief Inspector of the Bureau of Locomotive Inspection in his latest annual report amplify the above requirement. All locomotives where there is a difference between the readings of the gage cocks and the water glass of two or more inches under any condition of service should be equipped with a suitable water column to which is attached three gage cocks and one water glass with not less than 6 inches, preferably 8 inches, clear reading and one water glass with no less than 6 inches, preferably 8 inches, clear reading on the left side of the back head of the boiler.

Water glasses should be so located and constructed that they will register the approximate general water level in the boiler under all conditions of service and show within one inch a corresponding level and must be so maintained that the engineer and fireman may have a clear view of the water in the glass under all conditions of service from their respective and proper positions in the cab.

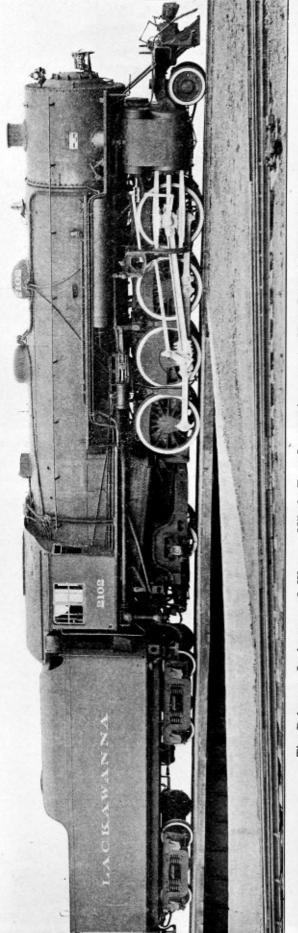

The spindles of the cocks are to be removed at least once a month and the spindle and cock thoroughly cleaned of scale and sediment. The water glass should be blown out before each trip. To prevent accidents from flying glass in case of a disaster of any kind a suitable shield should be placed over all tubular water and lubricating glasses. A lamp should also be installed to reflect on the water level indicators so that the level may be under constant observation at all times.

The injectors must be kept in good condition, free from scale and tested before each trip. The checks, delivery pipe, tank hose and valves should also be maintained in good condition and kept free from leaks and any foreign matter that would in any way obstruct the flow of water.

Flue plugs should be drilled with a center hole not less than 34 inch in diameter and tied together with rods not less than 5% inch diameter. In case of trouble with flues the plug should be removed and the flue repaired at the first convenient point.

Boilers should be washed out at least once every thirty days or oftener if the water conditions require it. All washout plugs, arch tube and water bar plugs are to be removed when the boiler is washed. The purpose of frequent washouts for arch and water bar tubes is to keep them free from scale and sediment and to permit free steaming. The records for washouts must be kept in order at all times.

It is important that all valves, cocks, joints, and the like, on the back head be kept tight so that no steam will be admitted in the cab to obscure the vision of the driver. If (Continued on page 84)

Mikado Type Locomotives for the Lackawanna

General Construction and Boiler Details of the Most Powerful Mikado Locomotives Ever Built

WITH the addition of 40 new Mikado heavy type locomotives to the motive power of the D. L. & W. for helper and pusher service, as well as for regular road duty, the contemplated electrification of a 40-mile stretch of road near Scranton, Pa., has been indefinitely postponed.

Coal trains are made up and taken through solid from Scranton to the west or to the seaboard, the necessary additional helper and pusher service being given out of Scranton. The new Mikado locomotives with the helper service mentioned are now hauling trains of 2,900 tons through from Scranton to Secaucus yards, near Hoboken.

With these powerful locomotives a larger tender is used, the capacity having been increased from 10,000 gallons of water and 12 tons of coal to 12,000 gallons of water and 14 tons of coal. This increased capacity enables the locomotives under ordinary conditions to take a train to the summit east of Scranton without taking water and to run 130 miles from Scranton to Secaucus yard without taking coal.

The 40 new locomotives for the Delaware, Lackawanna & Western are noticeably heavier than those already in service and in terms of tractive force are the most powerful Mikado locomotives ever constructed. They were designed by the American Locomotive Company to meet the special traffic conditions on the D. L. & W. and were built at the Schenectady Works. These engines bear the road numbers of 2101 to 2140 inclusive. Their weight in working order is 356,500 pounds and their normal rated tractive force is 67,700 pounds. Being equipped with boosters having a rated tractive force of 11,500 pounds the total available tractive force for starting or heavy pulls is 79,200 pounds or 17 percent over that of the locomotive cylinders alone. The locomotive cylinders are 28 inches by 32 inches and the driving wheels are 63 inches in diameter.

The D. L. & W. has been a user of heavy Mikado locomotives in the past, having purchased 74 locomotives of the 1200 class which are essentially alike. The last order from this design was for 10 locomotives placed in 1920. These were also built by the American Locomotive Company. A comparison of the dimensions, weights, and proportions of the two designs will be found in the accompanying data table.

BOILER DETAILS

The diameter of the boiler was increased from 841/4 inches to 90-5/16 inches, inside the first ring, while the length of the firebox was increased 121/8 inches without change in width, the grate area thereby being increased from 63.2 square feet to 70.4 square feet. The length over the tube sheets of 18 feet was retained but the number of 2-inch tubes was decreased from 303 to 300 and the number of 5-3.8 inch flues increased from 43 to 50. The total evaporative heating surface was increased 3.9 percent while the increase in superheating surface was 16.75 percent. In the new locomotives the superheating surface is 25.2 percent of the evaporative heating surface, a liberal allowance. Superheated steam is used not only for the main cylinders but also for the booster, the connection for the latter being made from the outside steam pipes. A combination exhaust stand is used for the locomotives and the booster cylinders.

A comparison between the calculated cylinder horsepower, and the calculated boiler horsepower shows they are practically the same and would indicate that these locomotives could be relied upon to be excellent steamers. The estimated coal rate when working at full capacity is 130 pounds per square foot of grate per hour. Stokers are provided, those for the new engines being furnished by The Elvin Mechanical Stoker Company.

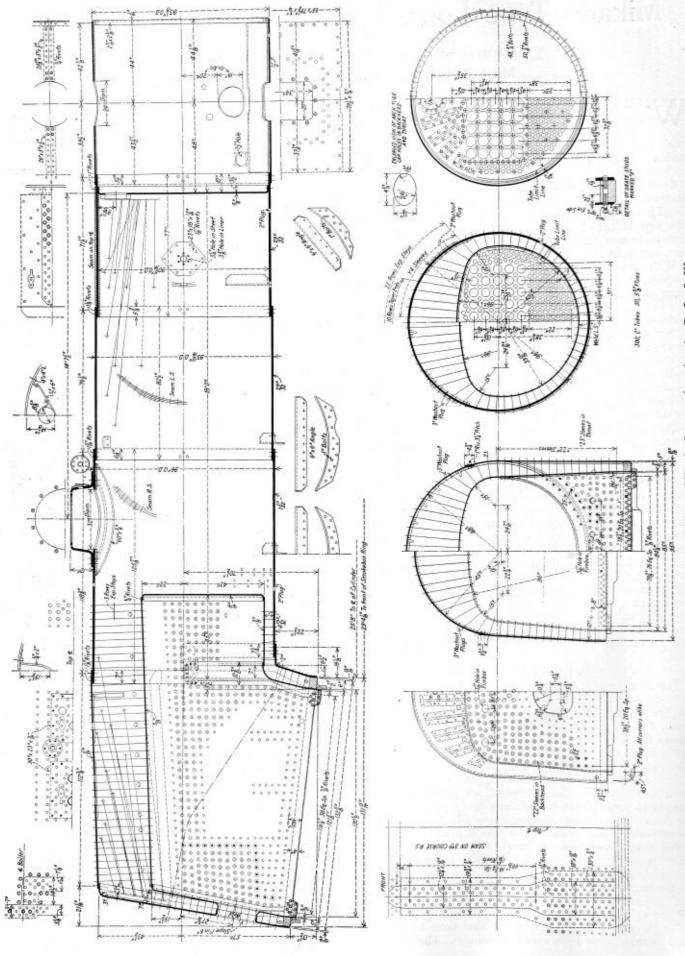

The height of the new D., L. & W. Mikado locomotive is 15 feet $4\frac{1}{8}$ inches, the extreme width 11 feet, and the coupled length of locomotive and tender 84 feet $5\frac{1}{2}$ inches. The smoke stack is 18 inches in diameter and the single exhaust nozzle 7 inches in diameter.

In addition to the booster, Elvin mechanical stoker and Baker valve gear other special equipment on these locomotives includes the Alco power reverse gear, power grate shaker, automatic fire door of the Butterfly type, Pyle electric headlight and Cleveland low water alarm.

These D., L. & W. Mikado locomotives will naturally be compared with those for the New York Central Lines, one of the most striking designs brought out in 1922 and for which orders were placed for 191 for the various roads comprising that system. The New York Central engines weigh 334,000 pounds, in working order, have 28-inch by 30-inch cylinders, and 63-inch driving wheels. They also are equipped with boosters and have a total rated tractive force of 74,500 pounds or 63,500 pounds without the booster. Other heavy Mikado type locomotives recently ordered are those for the Central of New Jersey weighing 342,500 pounds, having 27-inch by 32-inch cylinders and a rated tractive force of 59,000 pounds and those for the Northern Pacific weighing 337,000 pounds, having 28-inch by 30-inch cylinders, and a rated tractive force of 57,000 pounds. But few Mikado locomotives having a tractive force of over 60,000 pounds have been built.

American Machinery Market in Asia

"XPORTS to the Far East have increased sevenfold in five years, with every indication of continued rapid expansion. A most startling development in the foreign market for American industrial machinery is revealed in an exhaustive report on machinery markets in Asia by W. H. Rastall, chief of the Industrial Machinery Division of the Department of Commerce, just issued by the Bureau of Foreign and Domestic Commerce. Mr. Rastall for some years prior to and including 1911 was engaged in selling industrial machinery in Asia. In 1918-21 he revisited the Orient as trade commissioner of the Department of Commerce, on a special investigation of the machinery markets there, and found that the trade had developed tremendously in the decade between his visits. The unchanging East, says Mr. Rastall, is changing rapidly and profoundly. During the last three years Asia has absorbed as much machinery as it would have taken in five decades if measured by the standards of 1915. Within three years, these markets have absorbed some \$178,000,000 worth of American industrial machinery.

The importance of export trade to the average American machinery manufacturer is increasing very rapidly. It was not many years ago that the domestic market absorbed easily almost all the domestic production, and the rapid development of the home territory provided a satisfactory increase in the domestic demand. This situation is changing, and year by year it is becoming more necessary to cultivate outside markets if business is to show a satisfactory expansion.

While an era of depression followed the boom years of 1918-20, indications are that the trade will largely readjust itself by 1924 and that the volume will never fall back to the level of pre-war days. Before leaving Asia Mr. Rastall asked several of the machinery dealers to estimate the level at which it would settle down, and they replied that it would not be less than 60 to 70 percent of the volume of 1920.

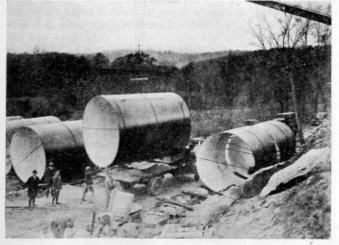

On the whole it appears that we can expect to export to Asia during the next few years an average of \$40,000,000 to \$50,000,000 worth of industrial machinery, and foreign sales managers will presumably be justified in developing their organizations to correspond to this basis.

The details of the Asiatic market, problems of selling, advertising, financing, shipping, packing, are discussed at length by Mr. Rastall, who has a wide practical experience as a salesman in these markets, as well as an expert knowledge of machinery.

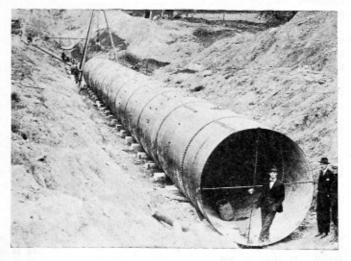

Mr. Rastall is now chief of the Industrial Machinery Division of the Department of Commerce, and is in a position to make his report of exceptional value to exporters by continued service. The Industrial Machinery Division is in constant communication through American trade commissioners, commercial attaches, and otherwise with the markets of Asia, so that its information is at all times right up to the minute, and any problems which are not conclusively covered in the present report can be handled through correspondence with Mr. Rastall.

The Department of Commerce report is available to all boiler manufacturers and others interested through any district or co-operative office of the Bureau of Foreign and Domestic Commerce or through the Superintendent of Documents, Government Printing Office, Washington, D. C.

BOILER INSURANCE AND INSPECTION.—On page 16 of the January issue of THE BOILER MAKER an article on "The Inspection and Insurance of Steam Boilers" was published under the name of R. J. Furr. Credit for the source of a great deal of the data in this article is due S. F. Jeter, chief engineer of the Hartford Steam Boiler Inspection and Insurance Company, who presented a paper on this subject some time ago before the Insurance Institute of Hartford.

Boiler Manufacturers Hold Mid-Winter Meeting

American Boiler Manufacturers' Association Surveys Current Business Conditions and Broadens the Scope of Activities

THE regular winter meeting of the American Boiler Manufacturers' Association opened at 10 A. M. February 12 at the Hotel Astor, New York City, with about 35 members of the association in attendance. A. G. Pratt, president of the association, opened the meeting with a statement of the general status of the industry as he had found it since the June meeting. At the mid-winter meeting a year ago, held in Pittsburgh, signs were evident that the pendulum of business would swing back from the period of depression and good business follow. The last few months of the year have borne out this prediction and business at the present time in the boiler manufacturing industry is better than it has been at any time since early in 1920. Orders on hand indicate that this period will continue well into the summer at least. The present advances in prices of plate, bars, tubes and pig will necessarily increase costs. It is very essential that the members of the boiler manufacturing industry keep their businesses absolutely in order, utilizing the best available methods of organization and cost accounting in order to meet either continued good business or a falling off in business.

The coming months will probably bring an increase in the cost of material. Men for both skilled and unskilled positions in the boiler shop are scarce, this condition in certain sections causing somewhat of a hardship on the manufacturers.

GENERAL CONDITIONS IN THE INDUSTRY

The officers of the association have been active in the routine and special work of the organization and the scope of the activities is gradually increasing. The majority of the members of the association should take a more active part in the conduct of its affairs, especially in the discussions held at the meetings. In order to obtain a general idea of the condition of the industry, the president suggested that the roll of the association be called, each senior representative present outlining the general conditions of business with his company, the size of the plant, the number of men employed, the status of production in relation to normal conditions, the outlook for new business and any special comment on conditions that might suggest themselves for discussion.

The response to this roll call indicated that the plants all over the country were working at from 50 to 85 percent of the normal production. Orders have been in good volume for the last few months of the year 1922 and, in most cases, the production for January of the present year was still better. Practically all of the companies have orders booked which will keep them active for five or six months. None of the members were willing to predict what conditions might be expected after that time.

Under this discussion of conditions, the question of training young men for responsible positions in the industry was suggested and this among other vital questions must at some time sooner or later be given careful consideration. In certain sections the question of the shortage of unskilled labor also requires settlement.

Most of the companies are buying material only as it is needed, very few having provided a surplus during the period of low prices. The cost of increases in material is reflected by increases in the cost of the finished product. Many companies have taken on the fabrication of special plate and tank work in addition to regular boiler construction and have found this phase of the industry an excellent means of maintaining their plants on a fairly normal basis. A few concerns have gone in extensively for the manufacture of portable type boilers and steam heating boilers with marked success.

REPORT OF SECRETARY-TREASURER

Following this outline of business conditions, the secretary, H. N. Covell, gave a brief summary of the financial standing of the association and of the work of the membership committee. At present the treasury has a satisfactory balance and is on a firm foundation. A number of applications have been received for membership in the association, one of them coming from Canada and still others are in prospect. There are at present 73 active boiler manufacturing companies on the roll of the association, 22 associate member companies and one honorary member. The association should include in its membership every important boiler manufacturing concern in this country and the existing membership should make every effort to interest others in the work of the association and induce them to become members.

WORK OF THE UNIFORM BOILER LAW SOCIETY

E. R. Fish of the Heine Boiler Company, as a representative of the association on the A. S. M. E. Boiler Code Committee and on the Uniform Boiler Law Society, was called on to make a report of the activity of these organizations. He stated informally that the work of each was progressing rapidly; that at present the Boiler Code Committee was very active in revising the Code to take care of the rules governing the materials and construction of boilers in accordance with changes that have occurred since the Code was last revised. This revision will be completed within a month and will then be published by the Society. (These revisions have been appearing in THE BOILER MAKER as they are released by the A. S. M. E.) The question of rules for unfired pressure vessels has occupied the attention of the committee for some time, and several public hearings have been held on the proposed Code. The use of welding, which is extensive in this branch of the industry, has prevented an agreement on the rules by the various companies engaged in this work. However, within the last month or two a series of tests have been conducted on various types of welded tanks under the auspices of the United States Bureau of Standards in Washington. It is hoped that the results of these tests will indicate the degree of dependence which may be placed on welded tanks and, after the report of the tests has been considered by the interested organizations, a final draft of acceptable rules will be prepared by the Boiler Code Committee and finally adopted.

The Uniform Boiler Law Society has been active in promulgating the adoption of the Boiler Code in various states not having already accepted its provisions as standard. At present Charles E. Gorton, chairman of the administrative council of the Society, is working in conjunction with the legislatures of several states on various points which have come up in connection with the adoption of the Code by these states. In this work it has been found more advantageous for the states to pass enabling legislation calling for the appointment of commissions or inspection departments having the powers of adopting and enforcing the A.S.M.E. Code rather than to have the Code in a modified form placed on the statute books. In the latter case any changes from time to time that might be made in the Code itself to keep it abreast with developments and improvements in boiler construction could only be made by legislative action after a great deal of discussion and lapse of time. If the Code is enforced by a commission such changes may be adopted without the action of the legislature.

Mr. Fish outlined the points of difference between the work of the Boiler Code, the Uniform Boiler Law Society and the National Board of Boiler and Pressure Vessel Inspectors and the excellent work each is doing in its respective field. The Code deals with fundamental rules of construction only, the Uniform Boiler Law Society with the promulgation of the Code and the National Board of Inspectors with the uniform observance of the rules of construction and inspection by the states which have adopted the Code.

Massachusetts, which is the only state having in effect adopted the Code, but which still retains certain individual rules at variance with similar rules of the Code, is taking up the matter of revising the statutes to conform in every point with the Boiler Code. The meeting to discuss the matter is scheduled for March 21.

METHOD OF RATING BOILERS

W. C. Connelly, chairman of the Commercial Committee, gave a special report on the proposal of rating boilers on the basis of square feet of heating surface instead of the present horsepower basis. In order to gain an idea of the sentiment of the members on this matter a questionnaire was submitted some time ago, asking for opinions. The results of the questionnaire are contained in a report which was read at the meeting. This report indicated the necessity of a standard basis for rating power as the variance was very marked in the methods used throughout the country. The term "horsepower" should be defined and the relation between it and square feet of heating surface standardized. There also should be a definite understanding of what constitutes heating surface in the boiler.

In brief, the report states that there were about 45 replies to the question of how to define the basis of boiler rating, horsepower or square feet of heating surface. Twenty-one firms answered that they rated their boilers by horsepower, eight by square feet of heating surface, 14 stated that they used both methods and one did not reply. In the case of watertube boiler manufacturers, practically all designated 10 square feet of heating surface as equivalent to one horsepower. The horizontal return tubular manufacturers designated from 10 to 12 square feet as equivalent to a horsepower. Manufacturers of the locomotive type boiler gave from 8 to 12 square feet, and the vertical type from 9 to 12 square feet and of the Scotch type from 7 to 12 square feet. With the exception of the builders of watertube boilers, no stand-ard understanding of the term "horsepower" apparently exists.

On the question of specifying the boiler rating in proposals, most firms use both horsepower and the square feet of heating surface as a basis. The next few questions were designed to gain an idea of the sentiment of the members in standardizing the matter of rating either on one basis or the other. Most firms stated that they would be willing to adopt the standard practice established by the majority. The definition of what constitutes heating surface was brought up in the questionnaire, the question having arisen as to whether in calculating the heating surface only that portion of the boiler having water on one side and hot gases on the other should be included. Thirty-nine firms favored this understanding of the rule. The question of including integral economizers in computing the heating surface of the boiler or whether such economizers be mentioned as a separate item in the specifications brought forth the reply that in most cases the economizer is considered as a separate item.

In the discussion that followed the reading of this report

it appears that opinions varied in determining the heating surface on whether the inside or outside diameter of the tubes be used in the calculations. It was suggested by G. W. Bach that the committee check the standards of the American Society of Mechanical Engineers and others who have considered this matter and present the facts at the next meeting.

It developed that the Power Test Code for boilers, which is now being compiled, will state what constitutes heating surface and on what basis boiler ratings will be made. The question of economizers will also be covered by the Power Test Code. It is believed that the word "horsepower" will be eliminated from the Code as this basis is illogical as applied to boilers since the co-relation between boiler and prime mover has disappeared.

Many clients of the horizontal return tubular boiler manufacturers understand the horsepower rating better as a basis for specifying boilers and the best method of procedure in these cases is to use the square feet of heating surface rating and also indicate the horsepower rating at the same time. It would be advisable to establish the relation of 10 square feet or some other figure agreeable to the majority as the relation between heating surface and horsepower.

The committee at this time did not feel called upon to make any definite recommendations as to rules establishing a basis for boiler ratings, but indicated that the discrepancy in practice required action looking towards standardization. The meeting voted that the committee be continued and, after investigating the matter further, make recommendations at the June meeting.

Related Industries Committee

No formal report was made by the Related Industries Committee. It was pointed out that at the last meeting of the joint committee with the Stoker Manufacturers' Association the question of power plant manufacturers, builders of pumps, economizers and the like being asked to co-operate with the boiler association was brought up. There are many subjects of common interest between these manufacturers and the builders of boilers and stokers and a great deal might be gained by their active co-operation. It would be of advantage to have the manufacturers of superheaters and economizers represented on the Related Industries Committee. Since the principal superheater companies are already associate members, it is possible for them to be placed on this committee and the manufacturers of economizers invited to become associate members of the association. This matter was referred to the executive committee for action.

REPORT OF THE STOKER COMMITTEE

A. G. Pratt, chairman of the stoker committee, asked for an expression of opinion on the value of the data sheets now being exchanged with the stoker companies. Practically every case where the reports were being made have proved extremely helpful in saving delays and alterations which often occurred before the association actively co-operated with the stoker manufacturers. The work of the drafting room is greatly facilitated by the use of the data sheets. A. G. Pratt suggested that the members present check up their staffs to determine whether these reports are being used as extensively as they might be.

Another matter discussed at the last meeting of the Stoker Manufacturers was the necessity of establishing the proper dimensions for the diameter and height of stacks. This subject was referred to the joint committee and the findings of this committee will be referred to the association at the June meeting.

Another subject which requires discussion is the proper relation between the grate area and the heating surface for hand-fired boilers.

The industry has in general adopted cost accounting sys-

tems of one form or another in accordance with suggestions made by the committee during the last two or three years.

In the absence of the chairman of the committee, S. H. Barnum told briefly of the budgeting system outlined by the Chamber of Commerce of the United States. A pamphlet describing budgeting was sent out to the members some time ago. The basis of suggestions made is that an organization should be laid out to accomplish a given amount of production and, if necessary, such an organization could be expanded to take care of peak production over short periods. This is infinitely better than for an organization to be developed for a peak production and then required to operate at a somewhat lower level.

Before the next meeting it is hoped that an idea may be given of what the members have done in the matter of budget systems.

RULES FOR INSPECTION

S. H. Barnum also presented a report of the committee representing the American Boiler Manufacturers' Association on a sub-committee of the A. S. M. E. Boiler Code. This committee informed Charles S. Blake, chairman of the sub-committee of the Boiler Code, of the action taken at the June meeting by the manufacturers' association with reference to rules for inspection and boiler tolerances. In the report to the Boiler Code sub-committee it was stated that, with the exception of four changes in the phrasing, the balance of the report was entirely satisfactory to the association.

Charles S. Blake, chairman of the Boiler Code sub-committee, replied to this report that the suggestions of the association would be acted upon. A further report on the subject will be made at a later meeting.

G. W. Bach read an extensive report of the action taken at the recent meeting of the Smoke Prevention Association at which standard setting heights for horizontal return tubular boilers were proposed. These standards were prepared after a study of conditions in the middle west and cannot be considered as acceptable standards for the entire country. The smoke department did not indicate a willingness to co-operate with the boiler manufacturers or with other bodies in establishing standards which would be acceptable to all those interested.

The report of the Boiler Manufacturers' Association on minimum setting heights presented at the June meeting is a much better standard for the association to follow where the jurisdiction of the Smoke Prevention Association does not extend. If it were possible to influence the Smoke Prevention Association to consider or adopt the standards proposed by the manufacturers, the basis would be better than their own since the heights were determined for a variety of different types of fuel in addition to the other considerations entering the problem. The matter was finally left with the committee to suggest that such action be taken by the Smoke Prevention Association.

W. A. Drake outlined in brief the status of the steam heating boiler construction among manufacturers. Few manufacturers keep data on the various installations made but an attempt will be carried out before the annual meeting to collect sufficient data on the subject to present information on both power and heating boilers in tabulated form. The members of the association will give the committee all the information available so that the report will be of the greatest value when finally compiled.

STANDARDIZATION AND SIMPLIFICATION

On October 2, 1922, the Department of Commerce of the United States requested that a committee of the American Boiler Manufacturers meet with representatives of the Department in Washington to discuss the possibilities of simplification and standardization in the boiler industry. Since the representatives of the Department of Commerce were not informed on boiler manufacturing problems to any great extent a memorandum was presented giving the general details of various type watertube and firetube boilers the members of the association manufacture. No statistics were available showing the total boilers manufactured or the number of firms building boilers. The export business was reported as small. Many difficulties prevent the general adoption of standards since most boilers are made to order and not on a production basis. It was pointed out to the Department of Commerce, however, that the association is aiming in every possible direction towards standardization of general construction rules and the inspection of boilers as evidenced by their co-operation with the American Society of Mechanical Engineers, Boiler Code Committee of the A. S. M. E., the National Code of Boiler and Pressure Vessel Inspectors and the Uniform Boiler Law Society with the Stoker Manufacturers' Association, the Smoke Prevention Association, and others.

This outline of the activities of the association was well received by the Department of Commerce, its representatives not realizing that the matter of simplification had been so thoroughly gone into by the boiler manufacturers. No criticisms or suggestions were offered and the Department volunteered its services in any manner which would aid the Association in furtherance of its work on standardization.

From time to time the association is being requested to send representatives to meet with other associations and it is found that the prestige of the association is very rapidly growing.

A report on the progress of the Standardization of Bolt Nut and Rivet Proportions Committee was read by F. G. Cox. So far this committee has not taken up the matter of rivets for boiler work but will probably at one of its early meetings reach this point in its considerations. It is felt that the best interests of the industry will be well taken care of when this division of the subject is discussed.

Following this, the sentiment of the association was established in regard to various matters of interest to the industry which are being considered by Congress, including the Hull bill, the immigration laws and others.

Reports on the progress of the National Board of Boiler and Pressure Vessel Inspectors were read. These papers are given below.

Manufacturers Adopt National Board Stamping Service By Joseph F. Scott

A^T the last annual convention of your association, a report of the activities of the National Board of Boiler and Pressure Vessel Inspectors was delivered to you and at this convention a schedule of graduated prices was adopted covering the filing of manufacturers' data reports, such prices being based upon the horsepower of boilers.

Since then we have communicated with the various boiler manufacturers who operate under the A. S. M. E. Code and the secretary reports that there has been a very noticeable increase in the number of boiler manufacturers who are now operating in cooperation with the secretary's office of the National Board of Boiler and Pressure Vessel Inspectors. The results have been very satisfactory from a financial standpoint, in fact revenues have increased to such an extent that operation and maintenance of the secretary's office is very nearly self supporting and no doubt it will be self supporting from now on owing to the attitude that the boiler inspection department of the state of Ohio has assumed since C. O. Myers has once more assumed the office of chief inspector. No doubt you have received a letter circulated by Mr. Mvers sanctioned by H. C. Witter, Director of the Department of Industrial Service of Ohio (published on page 38, February issue of THE BOILER MAKER) and this letter explicitly sets forth the operation of the boiler regulations in relation to the provisions of the National Board of Boiler and Pressure Vessel Inspectors.

The loss of Ohio since the organization of the National Board has seriously affected the progress of the National Board but with the additional boilers that will be registered in the office of the secretary of the Board through Ohio not only will the additional money received be ample to take care of expense of the secretary's office but will enable us to hold a convention annually which is badly needed.

If there are any suggestions or recommendations to be made that will assist in improving the activities of the National Board and which are in harmony with the Boiler Code Committee of the A. S. M. E., such recommendations will be gladly received. I might suggest further that in the functioning of the National Board with the various manufacturers and others interested should any improved suggestions occur, the person offering such suggestions should forward same in writing to the secretary's office. With this method we will gradually arrive at a point of cooperation in our activities which will naturally tend to produce prompt results and overcome delays and misunderstandings.

Progress Report of the Board of Boiler and Pressure Vessel Inspectors

By C. O. Myers

THE National Board of Boiler and Pressure Vessel Inspectors actively launched its program to secure one stamp, a uniform enforcement of the code, and uniform approval of specific designs of boilers, about 18 months ago. Today all of these ambitions have not been realized, but wonderful progress has been made toward securing one stamp, and not a great deal has been done toward perfecting the others, as we are moving slowly, making sure of our ground before going further. With the stamping question once solved the rest will be easy, as the settling of this question interlocks the various states and keeps them into close contact with one another.

The problem of stamping is one of the principal objects, and one which needed our first attention. We have given practically all of our time to this question, and we are pleased to say that we have a system of registering and recording A. S. M. E. boilers that no state need fear a counterfeit code boiler, if it bears the National Board fac-simile. We have a system of registering and commissioning inspectors that makes it almost impossible for an incompetent person to inspect a code boiler and stamp it with the National Board stamp. Every precaution possible is imposed on the inspector, as we realize that upon him rests the responsibility of interpreting and applying the code as the code committee intended it.

We are in hopes that before another year goes by that our treasury will be in shape to take care of a meeting of members of the Board, at which time I am sure that this movement will be understood well enough that all the kinks can be straightened out.

At your mid-winter meeting four years ago I called your attention to what might happen in one of the code states without a system of regulation. Two years later a law was passed in the face of a protest from a committee of your association, which brought about a condition much worse than was anticipated, and the department has degraded to the extent that it is little better than a nuisance to all parties who must deal with them. Certain concessions were granted to your committee under a pressure that saved the department from going under altogether.

Le Divit La plans

The practical demonstration of what has happened in a well organized state in less than 18 months should be warning enough for all of us to know, what to look for should this happen in several of the other code states. A well organized National Board will tend to stabilize conditions of this kind, and reduces the effect considerably.

With reference to the code states and municipalities that have officially adopted the National Board stamp, it is easier for me to give those who have not accepted, and they are Michigan and Missouri. The chief inspector of Michigan personally advised me that it is not necessary to stamp boilers Mich. Std., and that all that is required is the A. S. M. E. symbol. In the state of Missouri it is necessary to have the law amended, and steps are being taken to have this done.

At your annual meeting last June it was recommended that the registration fee be reduced. These fees were reduced beginning July, 1922, in accordance with your recommendations and it has proven that this was a wise move. Prior to the reduction of the fees there were registered altogether 503 boilers by 18 concerns; since then there were 2,664 boilers registered by 26 concerns.

We were operating at a loss until October, and since that time we have been just about holding our own, and with a little increase in registration fees over and above that received for the last three months the National Board will become a self supporting institution.

While it has been a rather long struggle we feel that the National Board at the present time is thoroughly established, to accomplish the work for which it was brought into being, especially if we are given the wholehearted support of those which the National Board benefits.

Repairs Under Pressure*

TWO fatal accidents that occurred recently were directly due to the highly dangerous practice of attempting to repair boilers, steam pipes, and other closed vessels and objects while they are under pressure. We have repeatedly warned against this practice and the hazard has often been pointed out in other ways; but the frequency with which accidents from this cause continue to occur is discouraging, and it is evident that this very real danger is often ignored, or at least receives too little consideration.

One of the accidents to which we refer occurred in connection with a watertube boiler. This boiler is one of a battery, and had been shut down for a time. In the process of putting the boiler in service again, steam had been raised to a pressure of 130 pounds, but the boiler had not been cut in on the line. A leak was discovered around one of the tube-caps in the front water leg, and the attendant tried to "roll in" the cap. The cap was of a somewhat unusual type, and during the operation it was pushed in, and a stream of boiling water under 130 pounds pressure rushed out directly into the attendant's face. The man was hurled against a coal pile about twelve feet distant, and almost instantly killed.

In the other case, two men were attempting to stop a leak at the flange of a reducing tee on a steam-pipe line. They had put a packing ring or gasket in place and were tightening the bolts which compress the gasket between the flanges. This caused the steam pipe to pull out of the tee, and the parts separated a distance of about eight inches. The escaping steam blew one of the men off from a timber on which he was standing and into a concrete wheel-pit. The other man was blown from a ladder, but was able to go to the boiler room and have the steam shut off. On returning to the scene of the accident it was found that the first man was fatally scalded. He was removed to a hospital but died within a short time. It is said that previous attempts had been made

Boiler Welding Practice on the Southern Pacific*

Electric Arc and Gas Welding Processes Used Extensively for General Boiler Repairs at the Sacramento Shops

A LTHOUGH much has been written concerning the application of electric arc and oxy-acetylene welding we have yet much to look forward to, as during the last few years an unusually rapid advance has been made in both of these methods of welding and they have now become recognized as an art very essential to many industries and particularly essential to the railway industry.

In the tube shop every day hundreds of various sizes and lengths of boiler tubes are repaired. Autogenous welding makes it possible to reclaim many tubes which otherwise, on account of the deep pitting, it would be necessary to scrap. These are reclaimed by filling in these pits by welding with either the oxy-acetylene or electric arc; this operation restores them to serviceable condition, making them practically as good as new tubes. A number of tubes reclaimed in this way are shown in Fig. 1. Many of the larger size tubes from 4 inch to $5\frac{1}{2}$ inch diameter that are beyond repair due to excessive pitting are split the full length of tube with the oxyacetylene torch and flattened out (Fig. 2). The plate thus obtained from the tube is used for various purposes. Practically all the larger tubes scrapped are thus reclaimed.

Boiler work develops an extensive field for both the oxyacetylene and arc welding processes. When the inside firebox must be removed, instead of cutting it out as we were formerly forced to do with drills, hammers and chisels, the oxy-acetylene process is now employed. The work is performed not only quicker and cheaper but with less hard labor and with more satisfactory results. In fabricating the new firebox to replace the old one removed we find in laying out the sheets that form it, that numerous irregular shapes develop. Formerly the trimming of these sheets was performed under the power punch. They are now cut with the oxy-acetylene torch which reduces the cost and saves considerable time.

The question of whether the welding together of all the sheets in the firebox is better than the riveted process is now under consideration. We have partly welded fireboxes now in service and their performance so far is all that could be expected and we believe that by employing the long flange so that the weld is made between two rows of staybolts, almost perfect results can be obtained. The welding of these seams can be performed with either the oxy-acetylene or electric arc process. Fig. 3 illustrates the method of preparing the seams for welding and in Fig. 4 the completed welds.

In removing the mudring from the boiler we very often find the bottom of the ring in poor condition due to corrosion. The sharp corner of the mudring in many instances is eaten away. We build up the corners and all flat surfaces where corrosion has taken place. Such a job is shown in Fig. 5.

After the inside firebox is removed from the boiler the staybolts still remain in the outside wrapper sheet. To remove these bolts the oxy-acetylene torch is employed to burn the bolt half way through the sheet; the bolt is then hot enough in the sheet so that it can be worked out by a helper who uses a short length of pipe for this purpose. This method of removing staybolts from side sheets is fast and is an improvement over the old method of drilling them out.

We apply a great many flexible staybolts to locomotive boilers, the sleeves of which were formerly screwed into the outside wrapper sheet, which is rather an expensive opera-

*Abstract of a paper presented before the San Francisco section of the American Welding Society, by H. J. McCracken and F. J. Hickey.

tion. The new style sleeve is ball scated and welded to the wrapper sheet by the electric arc process (Fig. 6). The oxyacetylene process could not be employed on this class of work as on account of the diffused heat, the sleeve and sheet would have a tendency to warp. A particularly advantageous feature of the electric arc weld is afforded through the concentration of the intense heat in a small area enabling it to be applied just where it is needed without heating up so much of the adjacent material.

In welding firedoor seams the practice of some roads is to prepare the door hole seam as ordinarily done for plugs or rivets and then lap weld the flange to the back head. The method followed by the Southern Pacific is to butt the flanges of the back head and door sheet, and weld with either the electric arc or oxy-acetylene process. We have been following this process for several years and have never experienced any trouble with this method of welding these door holes.

When the bottom of the tube sheet is badly corroded and cracked it can be repaired. If the welding process was not available we would find it necessary to remove the entire sheet, which would cause considerable delay and add greatly to the cost of making repairs to this boiler. The repairs are made by cutting out the lower section of the sheet leaving the dry pipe and header in place and welding in a new section (Fig. 7).

Defects that develop in the firebox sheets are repaired with both oxy-acetylene and electric arc processes where new half side or tube sheets are applied. The defective parts are cut out with the oxy-acetylene torch and the electric arc is employed almost exclusively in welding in the sheets.

Another operation in which the electric arc has been employed to great advantage in railroad shops is in the maintenance of boiler tubes. Tubes are applied in the boiler in the usual manner and placed in service. After they have been in service a certain period or when they show signs of leaking the locomotive is held and the tubes are given a thorough working, then the sheets are roughened or sand blasted and the tubes welded to the sheet (Fig. 8). We find this method has given excellent results.

There are many other articles repaired in the boiler shop by the electric arc and oxy-acetylene processes. An example is a bail for a dragline bucket. This bail came in the boiler shop broken in several places. We applied a 1 inch reinforcing plate on the bottom side and welded it all around on inside and outside edges with the electric arc process thus insuring a strong durable job which will stand up to the very heavy service imposed upon it.

Fig. 9 shows a patch welded in outside side sheet of a locomotive boiler, also shows new bottom portion of outside wrapper sheet welded at top edge, full length of firebox.

Patches in boilers now welded in place were formerly applied with rivets or plugs and the joints very often interfered with other parts of the machinery. The welded joint overcomes that difficulty, the seams being practically same thickness as the sheet.

Fig. 10 shows the preparation and method of holding sleeves while welding, and Fig. 11 shows flexible staybolt sleeves welded on a locomotive boiler. After holes are drilled and countersunk to suit sleeves the surface surrounding the holes is cleaned and roughened, which breaks away all scale and dirt on sheet and gives the welder a chance to do a much better job than would otherwise be possible.

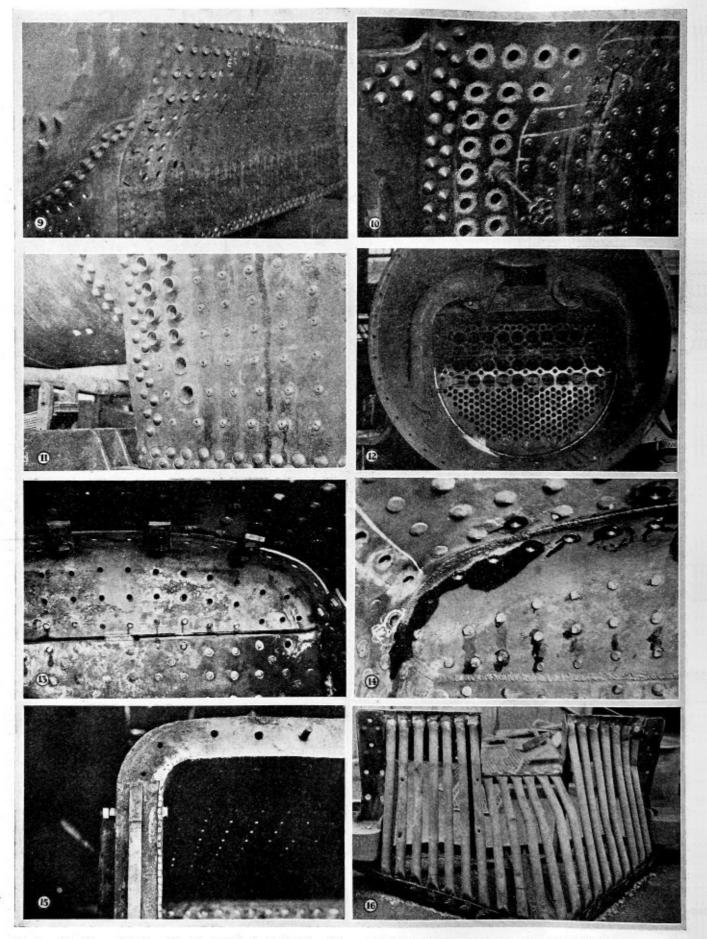

Fig. 9.—Side Sheet Patch. Fig. 10.—Method of Holding Sleeves While Welding. Fig. 11.—Sleeves Welded in Place. Fig. 12.—New Section Welded in Flue Sheet. Fig. 13.—Patch at Top of Door Sheet. Fig. 14.—Door Sheet After Welding. Fig. 15.—Mud Ring Welding Repair. Fig. 16.—Welding Used to Advantage on Tube Work of This Kind.

Both superheater and small flues are electric welded around the beads, which method we have been following in all our shops for some time with very satisfactory results. As all railroad mechanical men know there has been very little if any improvement made in the method of applying and setting flues for the past 30 years or more, and flues will leak, very often causing delay to a train.

Welds across the center of front flue sheet on 2-10-2 class locomotives are shown in Fig. 12, the lower portion of the sheet being new.

A method of applying a patch to the top of a door sheet is shown in Fig. 13. The patch was necessary on account of lap cracks and because the sheet was pitted in the knuckle. This patch as shown has been tack welded in several places in order that bolts and clamps may be removed. The same door sheet after welding is shown in Fig. 14. The most successful applications of welding undoubtedly have been in places where thorough supervision and training of welders have been carried on. No matter what kind of material is to be welded, or what the type of welding is, the reliability of the weld rests in a large degree with the operator.

Careful examination and inspection of the welded joint is of the utmost importance. There are certain factors which determine the physical characteristics of the weld. First examination of the weld by visual means. Second—The edges of the deposited metal should be chipped with a cold chisel or tried with a calking tool to determine the relative adhesion of deposit. Third—Pulling apart welded sections cut from the finished product. Fourth—The bending or breaking test. Tests should be made frequently to check up the operator's work.

Second Revision of the A. S. M. E. Boiler Code

Continuation of Proposed Changes in Provisions Dealing with the Construction of Power Boilers

THE first section of the revised Boiler Code was published on page 233 of the August, 1922, issue of THE BOILER MAKER; the second section appeared on page 281 of the October issue. Below a continuation of the work of the committee on revision is given.

In the course of the Boiler Code Committee's work during the past four years, many suggestions have been received for revisions of the Power Boiler Section of the Code, as a result of the interpretations issued and also of the formulation of the Locomotive Boiler and Miniature Boiler Codes. In order that due consideration might be accorded to these recommendations, the Committee began in the early part of 1921 to devote an extra day at each of its monthly meetings to the consideration of the proposed revisions. As a result of this many of the recommendations have been accepted and revisions of the paragraphs formulated.

The revisions which have met the approval of the Boiler Code Committee are here published. It is the request of the Committee that these revisions be fully and freely discussed so that it may be possible for anyone to suggest changes before the rules are brought to final form and presented to the Council for approval. Discussions should be mailed to C. W. Obert, Secretary to the Boiler Code Committee, 29 West 39th street, New York, N. Y., in order that they may be presented to the Boiler Code Committee for consideration.

The revisions here published are limited to the paragraphs appearing in the 1918 Edition of the A.S.M.E. Boiler Code, and the paragraph numbers refer to the paragraphs of similar number in that edition. For the convenience of the reader in studying the revisions, all added matter appears in small capitals and all deleted matter in smaller type.

PREAMBLE :- ADD THE FOLLOWING TO THE PREAMBLE :

The committee does not express opinions on types of boilers or apparatus, nor approve or disapprove of any general design or establish working pressures that may be carried for specific designs. For example, should a boiler be submitted by a trade name or that of the manufacturer for approval of the boiler code committee, the boiler code committee would not express its approval or disapproval. The boiler code committee would, however, stand ready to interpret any one of the rules of the code as applied to the <u>Note-Matter</u> in small caps-added matter; matter in brackets-to be deleted. BOILER, BUT IT WOULD NOT SET THE PRESSURE THAT COULD BE CARRIED NOR PASS ANY OPINION IN REGARD TO THE MERITS OF A BOILER OR APPARATUS.

PAR. 1 REVISED:

1 Specifications are given in these Rules for the important materials used in the construction of boilers and where given, the materials shall conform thereto. IF, IN THE DEVELOP-MENT OF THE ART OF BOILER CONSTRUCTION, OTHER MATE-RIALS THAN THOSE HEREIN DESCRIBED BECOME AVAILABLE, SPECIFICATIONS FOR THE SAME MAY BE SUBMITTED FOR CONSIDERATION AND APPROVAL.

PAR. 11 REVISED:

11 Pressure parts of superheaters, separately fired or attached to stationary boilers, unless of the locomotive type, shall be of wrought steel, PUDDLED OR KNOBBLED CHARCOAL WROUGHT IRON, or cast steel of Class B grade, as designated in the Specifications for Steel Castings.

PAR. 19 ADD THE FOLLOWING TO THIS PARAGRAPH:

For plates over 1 in. In thickness, where the sheet is heavier than ordinarily required in order to afford greater strength of tube-hole ligaments, the butt straps may be proportioned in accordance with the required thickness, but in no case may they be less than one-half the plate thickness.

PAR. 21 REVISED:

21 Tubes for Watertube Boilers. The maximum allowable working pressures for tubes used in watertube boilers shall be for the various diameters and gages measured by Birmingham wire gage, as given in Table 2. REDRAWN PIPE NOT TO EXCEED $1\frac{1}{2}$ INCH STANDARD PIPE SIZE WHICH MEETS THE PIPE SPECIFICATION, MAY BE USED FOR WATER-TUBE BOILERS FOR A WORKING PRESSURE NOT TO EXCEED 200 POUNDS PER SQUARE INCH, WHEN SCREWED IN THE SHEET, PROVIDED THE WALL THICKNESS IS AT LEAST 50 PERCENT GREATER THAN THE WALL THICKNESS REQUIRED BY TABLE 2.

PAR. 182 ADD THE FOLLOWING TO REVISED FORM AS PUB-LISHED IN THE JULY ISSUE OF MECHANICAL ENGINEERING:

THE BACK PITCH OF TUBE HOLES OR RIVETS SHALL BE MEASURED EITHER ON THE FLAT PLATE BEFORE ROLLING, OR ON THE MEDIAN LINE AFTER ROLLING. PAR. 185 REVISED:

185 When shell plates exceed 9/16 inch in thickness in horizontal-return-tubular boilers, the portion of the SHELL plate [s] forming the laps of the circumferential joints, where exposed to the fire or products of combustion, shall be planed or milled down as shown in Fig. 8, to A THICKNESS OF NOT OVER 1/2 inch [in thickness], provided the requirement in Par. 184 is complied with.

PAR. 187 CHANGE PARS. 187 AND 188 TO PARS. 188a AND 188b and Insert a New Par. 187 as Follows:

187 Seamless Construction. DRUMS, SHELLS OR DOMES MAY BE OF SEAMLESS DRAWN CONSTRUCTION WITH OR WITH-OUT INTEGRAL HEADS PROVIDED THE MATERIAL FROM WHICH THEY ARE FORMED CONFORMS TO THE REQUIREMENTS OF ANY ONE OF THE SPECIFICATIONS IN THE CODE FOR SHELL MATERIAL.

PAR. 193 CHANGE PAR. 193 TO PAR. 192d AND INSERT NEW PAR. 193 AS FOLLOWS:

193 IN APPLYING REINFORCING PLATES TO THE DRUMS OF WATERTUBE BOILERS TO STRENGTHEN THE SHELL WHERE THE TUBES ENTER, THEY SHALL BE RIVETED TO THE SHELL. AND THE TUBES SHALL BE EXPANDED INTO THE INNER AND OUTER PLATES SO THAT THE RIVETS AND TUBES WILL HOLD THE PLATES TOGETHER IN ACCORDANCE WITH THE RULES FOR STAYED SURFACES.

THE SPACING OF THE RIVETS WITH RESPECT TO THE TUBES SHALL CONFORM TO PAR. 199 FOR STAYED SURFACES. USING A VALUE OF 135 FOR C, AND SHALL BE BASED ON A UNIT PRESSURE EQUAL TO THE PRESSURE THAT CAN BE CAR-RIED BY THE INNER PLATE WITH A FACTOR OF SAFETY OF 5.

(NOTE: WHERE A REINFORCING PLATE IS INSIDE THE STEAM DRUM IT IS THE INNER PLATE; WHERE IT IS OUT-SIDE AND THERE IS NO INNER REINFORCING PLATE, THE UN-REINFORCED SHELL OF THE DRUM IS THE INNER PLATE,)

THE TENSION IN RIVETS AND TUBES SHALL CONFORM TO PARS. 220 AND 232.

THE COMBINED DRUM SHELL AND REINFORCING PLATE OR PLATES SHALL HAVE A FACTOR OF SAFETY OF NOT LESS THAN 5 IN THE LIGAMENTS, WHEN CALCULATED IN ACCORDANCE WITH PAR. 192, ALSO IN RIVET CONNECTIONS. WHEN REIN-FORCING PLATES OR BUTT STRAPS ARE EXPOSED TO FLAME OR GAS OF THE EQUIVALENT TEMPERATURE, THE JOINTS SHALL BE PROTECTED THEREFROM.

PAR. 195 REVISED:

195 [Convex Heads.] The thickness required in an unstayed dished head with the pressure on the concave side, when it is a segment of a sphere, shall be calculated by the following formula:

$$t = \frac{5.5 \times P \times L}{2 \times TS} + \frac{1}{8}$$

where;

- t = thickness of plate, inches.
- P = maximum allowable working pressure, pounds per square inch.
- TS =tensile strength, pounds per square inch. L = radius to which the head is dished, inches.

Where two radii are used the longer shall be taken as the value of L in the formula.

Where the radius is less than 80 percent of the diameter of the shell or drum to which the head is attached the thickness shall be at least that found by the formula by making L equal to 80 percent of the diameter of the shell or drum.

[Concave Heads.] Dished heads with the pressure on the convex side shall have a maximum allowable working pressure equal to 60 percent of that for heads of the same dimensions with the pressure on the concave side.

When a dished head has a manhole opening, the thickness as found by these Rules shall be increased by not less than 1/8 inch over that called for by the formula. Where a dished head has a flanged opening supported by an attached flue, the increase of 1/8 inch in thickness is not required. IF MORE THAN ONE MANHOLE OPENING IS INSERTED, THE MINIMUM DISTANCE BETWEEN THE OPENINGS SHALL BE NOT LESS THAN ONE-FOURTH OF THE OUTSIDE DIAMETER OF THE HEAD.

PAR. 199 REVISED:

199 The maximum allowable working pressure for various thicknesses of braced and stayed flat plates and those which by these Rules require staying as flat surfaces with braces or staybolts of uniform diameter symmetrically spaced, shall be calculated by the formula:

$$P = C \times$$

where

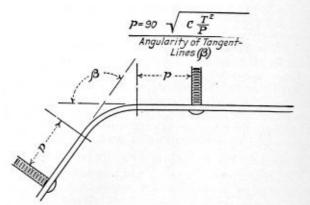

P = maximum allowable working pressure, pounds per square inch.

 T^2

p2

- T = thickness of plate in *sixteenths* of an inch.
- p = maximum pitch measured between straight lines passing through the centers of the staybolts in the different rows, which lines may be horizontal, vertical or inclined, inches.
- C = 112 for stays screwed through plates not over 7/16 inch thick with ends riveted over.
- C = 120 for stays screwed through plates over 7/16 inch thick with ends riveted over.
- C = 135 for stays screwed through plates and fitted with single nuts outside of plate OR WITH INSIDE AND OUTSIDE NUTS, OMITTING WASHERS.
- C = 150 for stays with heads not less than 1.3 times the diameter of the stays, screwed through plates or made a taper fit and having the heads formed on the stays before installing them and not riveted over said heads being made to have a true bearing on the plate.
- C = 175 for stays fitted with inside and outside nuts and outside STEEL washers where the diameter of washers is not less than 0.4 p and thickness not less than T.

FOR STAYS AT THE UPPER CORNERS OF FIREBOXES THE PITCH FROM THE STAYBOLT NEXT TO THE CORNER TO THE POINT OF TANGENCY OF THE CORNER CURVE SHOULD BE.

If a flat boiler plate not less than 3/8 inch thick is strengthened with a doubling plate covering the full area of the stayed surface and securely riveted thereto and having a thickness of not less than $\frac{2}{3}T$, then the value of T in the formula shall be three-quarters of the combined thickness of the boiler plate and doubling plate but not more than one and one-half times the thickness of the boiler plate, and the value of C given above may also be increased 15 percent.

Макси, 1923

When two sheets are connected by stays and but one of these sheets requires staying, the value of C is governed by the thickness of the sheet requiring staying.

Acceptable proportions for the ends of through stays with washers are indicated in Fig. 14.

FIG. 14 REVISE SIDE EXPLANATION TO READ:

Not less than $2\frac{1}{2}$ Diameters of Bolt AS MEASURED ON THE OUTSIDE OF THE THREADED PORTION but must be 0.4 Pitch of Stays if C = 175.

PAR. 196 REVISED:

196 When dished heads are of a less thickness than called for by Par. 195, they shall be stayed as flat surfaces, no allowance being made in such staying for the holding power due to the spherical form. If a dished head is formed WITH A FLATTENED SPOT OR SURFACE FOR THE ATTACHMENT OF A CONNECTION OR FLANGE, THE DIAMETER OF THE FLAT SPOT SHOULD NOT EXCEED THE VALUE OF p AS GIVEN IN THE FORMULA IN PAR. 199 OR IN TABLE 4, FOR THE PRESSURE AND THICKNESS OF HEAD INVOLVED.

PAR. 200 REVISED:

200 Staybolts. The ends of [screwed] staybolts or STAYS SCREWED THROUGH PLATES, shall be riveted over or upset by equivalent process OR FITTED WITH NUTS. The outside ends of solid staybolts, 8 inches and less in length, shall be drilled with a hole at least 3/16 inch diameter to a depth extending at least 1/2 inch beyond the inside of the plates, or hollow stavbolts may be used. On boilers having a grate area not exceeding 15 square feet, or the equivalent in gas- or oilfired boilers, the drilling of staybolts is optional. Solid staybolts over 8 inches long, and flexible staybolts of either the jointed or ball-and-socket type, need not be drilled. Staybolts used in waterlegs of watertube boilers shall be hollow or drilled at both ends, irrespective of their length. ALL STAY-BOLTS NOT NORMAL TO THE STAYED SURFACE SHALL HAVE THREE ENGAGING THREADS OF WHICH ONE SHALL BE A FULL THREAD.

PAR. 208 REVISED:

208 The diameter of a screw stay shall be taken at the bottom of the thread or WHEREVER IT IS OF [provided this is] the least diameter.

PAR. 212 REVISED:

212a The maximum allowable working pressure for any curved stayed surface subject to internal pressure shall be obtained by the two following methods, and the minimum value obtained shall be used:

- First, the maximum allowable working pressure shall be computed without allowing for the holding power of the stays, due allowance being made for the weakening effect of the holes for the stays OR RIVETED LONGITUDINAL JOINT OR OTHER CONSTRUCTION EXCEPT HAND-HOLES. To this pressure there shall be added the pressure secured by the formula for braced and stayed surfaces given in Par. 199, using 70 for the value of C.
- Second, the maximum allowable working pressure shall be computed without allowing for the holding power of the stays, due allowance being made for the weakening effect of the holes for the stays OR RIVETED LONGITUDINAL JOINT OR OTHER CONSTRUCTION EXCEPT HAND-HOLES. To this pressure there shall be added the pressure corresponding to the strength of the stays for the stresses given in Table 5, each stay being assumed to resist the steam pressure acting on the full area of the external surface supported by the stay.

PAR. 212b ADD THE FOLLOWING TO THIS PARAGRAPH:

The above formula applies to the longitudinal center section of the wrapper sheet, and in cases where E is reduced at another section, the maximum allowable working pressure based on the strength at that section, may be increased in the proportion

THAT THE DISTANCE FROM THE WRAPPER SHEET TO THE TOP OF THE CROWN SHEET AT THE CENTER, BEARS TO THE DISTANCE, MEASURED ON A RADIAL LINE THROUGH THE OTHER SECTION, FROM THE WRAPPER SHEET TO A LINE TANGENT TO THE CROWN SHEET AND AT RIGHT ANGLES TO THE RADIAL LINE. (SEE FIG. $14\frac{1}{2}$.)

PAR. 216 REVISED:

216 Stays shall be used in the tube sheets of a firetube boiler if the distance between the edges of the tube holes exceeds the maximum pitch of staybolts for the corresponding plate thickness and pressure given in Table 4. That part of the tube sheet which comes between the tubes and the shell need not be stayed, if the GREATEST distance [to the nearest tangent common to two tube holes when] measured ALONG A RADIAL LINE FROM THE INNER SURFACE OF THE SHELL TO THE CENTER POINT OF THE TANGENT COMMON TO ANY TWO TUBE HOLES ON THE SHELL SIDE OF SUCH [on any radius of the tube sheet that intersects the tangent between the] holes does not exceed 1.25 TIMES THE [this] maximum pitch OF STAYBOLTS FOR THE CORRESPONDING PLATE THICKNESS AND PRESSURE GIVEN IN TABLE 4 [by more than 3 inches]. The tube holes to which a common tangent may be drawn in applying this rule shall not be at a greater distance from edge to edge than the maximum pitch referred to.

PAR. 218 REVISED:

218 When STAYS ARE REQUIRED the portion of the head S below the tubes in a horizontal-return-tubular boiler SHALL BE SUPPORTED BY THROUGH STAYS WITH NUTS AT THE FRONT HEAD. WHERE a manhole opening is provided [with] the flange of which is formed from the solid plate and turned inward to a depth of not less than three times the required thickness of the head, measured from the outside, the area to be stayed as indicated in Fig. 16, may be reduced by 100 square inches. [The surface around the manhole shall be supported by through stays with nuts inside and outside at the front head.]

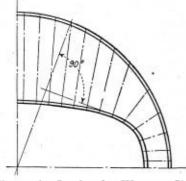

Fig. 14¹/₂.—Staying for Wrapper Sheet of Locomotive Boiler

The distance in the clear between the bodies of the braces, or of the inside braces where more than two are used, shall not be less than 10 inches at any point.

TABLE 5 PLACE AN ASTERISK AFTER THE WORD "DIAMETER" EACH TIME IT APPEARS IN THIS TABLE, AND INSERT THE FOLLOWING NOTE AT BOTTOM OF TABLE: "DIAMETERS TAKEN AT BODY OF STAY.

PAR. 230 ADD THE FOLLOWING TO THIS PARAGRAPH:

IN A FORM OF REINFORCEMENT FOR CROWN SHEETS WHERE THE TOP SHEET OF THE FIREBOX IS A PART OF A TRUE CIRCLE NOT EXCEEDING 120 DEGREES IN ARC, AND IS BRACED WITH ARCH BARS EXTENDING OVER THE TOP AND DOWN BELOW THE TOP ROW OF STAYBOLTS AT THE SIDES, THESE ARCH BARS BEING RIVETED TO THE WATER SIDE OF THE CROWN SHEET THROUGH THIMBLES, THE MAXIMUM ALLOWABLE WORKING

$$P_1 = 10,000,000 \frac{b \times d^3}{b \times D^3}$$

WHERE

.

b = net width of crown bar, inch

d = depth of crown bar, inch

p =longitudinal pitch of crown bar, inch

 $D \equiv$ outside diameter of furnace, inch.

Provided that the maximum allowable working pressure must not exceed that determined by the formula for furnaces of the adamson type, in par. 242 when L is made equal to p, and also provided that the diameter of the holes for the staybolts in the crown bars does not exceed $\frac{1}{3}$ b, and the cross-sectional area of the crown bars is not less than 4 square inches, par. 199 would govern the spacing of the staybolts, rivets or bolts attaching the sheet to the bars, and par. 212b the size of the staybolts, rivets or bolts.

PAR. 231 REVISED:

231 Maximum Allowable Working Pressure on Truncated Cones. a Upper combustion chambers of vertical submerged tubular boilers made in the shape of a frustum of a cone when not over 38-inch diameter at the large end, may be used without stays if computed by the rule for plain cylindrical furnaces (Par. 239) making D in the formula equal to the diameter at the large end; provided that the longitudinal joint conforms to the requirements of Par. 239.

b When over 38 inches in diameter at the large end, that portion which is over 30 inches in diameter shall be [fully] supported by staybolts or gussets. IF SUPPORTED BY STAY-BOLTS PAR, 212D SHALL APPLY. IF SUPPORTED BY GUSSETS THE SPACING OF THE RIVETS ATTACHING THE GUSSETS TO THE COMBUSTION CHAMBER SHALL NOT EXCEED THE STAY-BOLT SPACING GIVEN BY PAR, 212D. [to conform to the provisions for staying flat surfaces. In this case.] The top row of staybolts shall be at a point where the cone top is 30 inches or less in diameter.

In calculating the pressure permissible on the unstayed portion of the cone, the vertical distance between the horizontal planes passing through the centers of the rivets at the cone top, and through the center of the top row of staybolts shall be used as L in Par. 239, and D in that paragraph shall be the inside diameter at the center of the top row of staybolts.

PAR. 239 REVISED:

239 PLAIN CIRCULAR FURNACES. THE FOLLOW-ING RULES APPLY IN GENERAL TO UNSTAYED CIRCULAR

FURNACES:

- a-1 The longitudinal joint may be riveted or lap welded by the forging process, or the furnace may be of seamless construction
- a-2 The longitudinal joint if riveted shall have an efficiency greater than

$P \times D$

$1,250 \times T$

- a-3 The walls shall not be less than 5/16 inches thick
- a-4 BUTT STRAP SEAMS SHALL BE USED ONLY WHERE THEY ARE PROTECTED FROM CONTACT WITH THE FIRE
- a-5 THE FURNACE MAY BE OF ANY LENGTH OR HEIGHT

PRESSURE SHOULD BE DETERMINED BY ADDING TO THE PAR. 240 OMIT THIS PARAGRAPH AND REPLACE BY THE MAXIMUM ALLOWABLE WORKING PRESSURE FOR A PLAIN FOLLOWING:

240 THE FOLLOWING RULES APPLY SPECIFICALLY TO . UNSTAYED CIRCULAR FURNACES 12 INCHES IN DIAMETER AND OVER:

- A 12 INCHES TO 18 INCHES OUTSIDE DIAMETER, INCLUSIVE.
 - b-1 A RIVETED LONGITUDINAL JOINT MAY BE OF THE LAP TYPE
 - b-2 The maximum allowable working pressure for furnaces not more than four and a half diameters in length or height shall be determined by formulae a and b as follows:
 - a WHERE THE LENGTH DOES NOT EXCEED 120 TIMES THE THICKNESS OF THE PLATE

$$=\frac{01.0}{D}$$
 [(18.75 × T) - (1.03 × L)]

b Where the length exceeds 120 times the thickness of the plate; $4250 \times T^2$

$$P = \frac{4,250 \times 1}{L \times D}$$

WHERE

P

- P = MAXIMUM ALLOWABLE WORKING PRESSURE, POUND PER SQUARE INCH
- D = OUTSIDE DIAMETER OF FURNACE, INCHES
- L = total length of furnace between centers of head rivet seams (not length of a section), inches
- $T=\mbox{thickness}$ of furnace walls, in sixteenths of an inch
- b-3 The maximum allowable working pressure for furnaces over four and one-half diameters in length or height shall be determined in accordance with par. 241.

B OVER 18 INCHES OUTSIDE DIAMETER TO AND INCLUDING 30 INCHES INSIDE DIAMETER.

- c-1 A riveted longitudinal joint may be of the lap type
- c-2 The MAXIMUM ALLOWABLE WORKING PRESSURE SHALL BE DETERMINED BY FORMULAE *a* AND *b* IN A; IF OVER SIX DIAMETERS IN LENGTH OR HEIGHT, *L* IN THE FORMULA SHALL BE TAKEN AS SIX TIMES THE DIAMETER.

C OVER 30 INCHES INSIDE DIAMETER TO AND INCLUDING 36 INCHES INSIDE DIAMETER.

- d-1 A RIVETED LONGITUDINAL JOINT MAY BE OF THE LAP TYPE PROVIDED THE FURNACE DOES NOT EX-CEED 36 INCHES IN LENGTH OR HEIGHT
- d-2 IF THE LENGTH OF A HORIZONTAL FURNACE EXCEEDS 36 INCHES AND THE JOINT IS RIVETED, A BUTT AND SINGLE OR DOUBLE STRAP CONSTRUCTION SHALL BE USED AND SHALL BE LOCATED BELOW THE GRATE
- d-3 The maximum allowable working pressure shall be determined by formulae a and b in a; if over six diameters in length L in the formula shall be taken six times the diameter.

D OVER 36 INCHES INSIDE DIAMETER TO AND INCLUDING 38 INCHES OUTSIDE DIAMETER.

- e-1 When riveted the longitudinal joint of a horizontal furnace shall be butt and single or double strap construction and shall be located below the grate
- e-2 The maximum allowable working pressure shall be determined by formulae a and b in A; if over six diameters in length L in the formula shall be taken as six times the diameter.

[Additional revisions of the A.S.M.E. Boiler Code will appear in the April issue of THE BOILER MAKER.]

That the demand for boilers is better now than at any time since the peak production of the early months of 1920 was the general sentiment expressed at the mid-winter meeting of the American Boiler Manufacturers' Association, held February 12 at the Hotel Astor, New York City. Not only has the business of boiler construction been improving rapidly but all signs indicate that the volume will continue for at least six months. Practically all plants are now averaging about 75 percent of their normal activity and several show a production above this figure.

The fact that the majority of companies are ordering material only as it is needed and not relying on reserve supplies indicates that the increased demand for boiler construction will be reflected in a steady volume of orders for material produced by the supply companies. Incidentally, plate, tank and steel heating boiler fabrication have been found an excellent source of new business by several companies.

It developed at the meeting that men are needed in increas- Boiler Manufacturers' Association, H. ing numbers for both skilled and unskilled positions in the man street, Brooklyn, N. Y.

shops. This should prove a great incentive to young men who have recently entered the industry and to the older men who have been holding minor positions in the shop. There are ways and means available for such individuals to fit themselves for the more important work that requires special study and experience if they are willing to spend the time and effort required in training for advancement. As a matter of fact the opportunities in the boiler manufacturing industry for men with ambition has never been better.

An important question brought up at the American Boiler Manufacturers' Association meeting for discussion was the matter of establishing a standard basis for rating boilers. With the exception of the manufacturers of watertube boilers, no common understanding exists of the number of square feet of heating surface that is equivalent to one boiler horsepower. Manufacturers of the various other type boilers differ to a wide extent in their usage of the equivalent heating surface values for boiler horsepower.

Heating surface in a boiler has been defined as a surface having water on one side and heated gases on the other. It is understood that the Power Test Code of the American Society of Mechanical Engineers will establish the exact definition of heating surface and will eliminate the term "boiler horsepower" from the Code as having lost its significance in modern methods of boiler design and operation.

The term "horsepower" as a means of rating boilers is familiar to many clients of horizontal return tubular and other power boiler manufacturers in specifying boiler units and should, therefore, be continued. However, the relation between heating surface and boiler horsepower should be definitely established so that all estimates for bids may be made on the same basis.

The work of investigating this matter more fully will be carried out by a committee of the American Boiler Manufacturers' Association and definite action will probably be taken on the matter at the June meeting which will be held at "The Homestead," Hot Springs, Va., June 4, 5 and 6. All members of the association who did not attend the winter meeting should be prepared to express an opinion on the subject when it is again brought up for discussion.

From the many invitations received by the American Boiler Manufacturers' Association to co-operate with allied associations and to maintain representation on the committees of various societies working towards simplification or standardization in the industries, it is evident that the prestige and influence of the association are rapidly increasing. However, there are many important boiler manufacturing concerns in the country which do not belong to the association and, as the interests of the entire industry are being served by its efforts, these companies should lend their support to the work of the association. Immediately after the recent meeting of the association the secretary forwarded membership applications to all present members with the request that they interest other concerns in the work of the organization. All companies wishing to obtain detailed information on the matter may communicate with the secretary of the American * Boiler Manufacturers' Association, H. N. Covell, 191 Dike-

Engineering Specialties for Boiler Making

New Tools, Machinery, Appliances and Supplies for the Boiler Shop and Improved Fittings for Boilers

Waste Heat Economizer and Circulating Device

A new waste heat economizing and circulating device is being put on the market by the Mitchell Boiler and Engineering Company, Mitchell, Indiana.

The device consists of a front and rear header with water tubes connecting them, disposed at the sides in the space between the boiler and its setting.

All material and details of construction conform to the boiler code of the American Society of Mechanical Engineers, and the various state laws.

The front header is attached to the boiler by two $2\frac{1}{2}$ inch connecting pipes. The rear connections are made by two $2\frac{1}{2}$ -inch connecting pipes from the top of the rear header to each side of the boiler at the water level. The rear header is provided with two 2-inch blow-off pipes, and the regular boiler blow-off is connected to the bottom of the outside of the rear header. The thickness of the plate and staybolts conform to the safe working pressure of the boiler.

For each tube hole in the sheet of each header there is a corresponding hole in the outside sheet fitted with a hand plate.

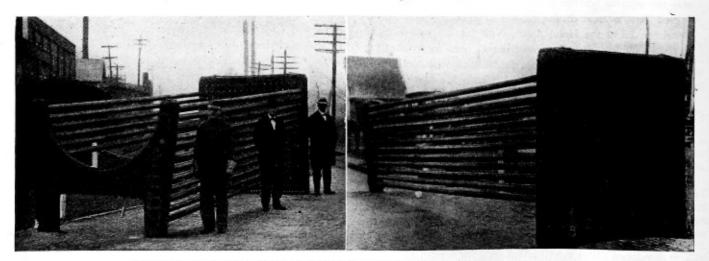

Each unit is shipped in a knocked-down condition, the separate parts being the assembled headers, the separate tubes, connecting pipes, and boiler flanges. Each unit for a boiler already set is made to the measurements of the boiler setting. When ready to be installed the boiler front is taken down, front arch removed and rear wall removed. The headers are then placed in position and hand plates removed. The tubes are entered through the hand holes, either at front or rear, and rolled in as with any other water tube boiler. The connections to the boiler are then made and hand plates replaced. The unit is then ready for the hydrostatic test.

When the regular boiler front is replaced, and a thin wall built up at the rear to protect the rear sheet from cold air, the entire unit is invisible, except the hand plates. In aiding circulation the device functions so that the water travels from the economizer into the boiler from the top of the rear header; thence out of the boiler proper, through connecting pipes, to the bottom of the front header; thence back through the tubes at each side into the rear header, and then out from the top of it to the boiler again, and so the circulation continues.

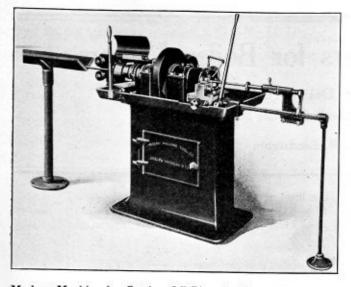

Cutting-Off Machine Provided With Roller Feed

The machine for cutting off pipe, tubing and solid bars, made by the Modern Machine Tool Company, Jackson, Mich., has recently been provided with a double live roller feed. This arrangement, applicable to 2-inch and 3-inch machines, feeds the stock through the spindle against an automatic stop for gaging the length of pieces to be cut off. The automatic stock stop is of the same general design as the old one, but is operated from the tube block. A plate, adjustable to take care of the tool setting for different sizes of stock, is attached to the right-hand side of the tool block and arranged with a lug to catch and rock the rocker block shown between the tool block and frame. As the tool block is moved out, removing the tool from the cut, the last 1/8 inch movement, the lug catches the rocker shaft and, through the lever and cam, rotates the stock stop throwing it out 3/16 inch. As soon as the tool block is fed in to start the cut, the spring brings the stop back to place clear of the work so that it will not wear and the work can drop away from the tool.

The double live roller feed for feeding stock through the spindle is driven through worm and gears from the cone pulley shaft. As the machine is slowed for large stock, it also slows up the speed of the feed. The feed rolls run continuously. They are so trunnioned and connected with the collet control lever shaft that the in-movements of the collet control lever opens the collet and brings the roll simultaneously up to the stock. A slight further pressure on the collet

Two Types of Water Tube Economizers for Horizontal Return Tubular Boilers

MARCH, 1923

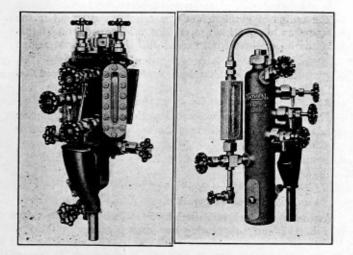

Modern Machine for Cutting Off Pipe, Tubing and Bar Stock

control lever feeds the stock through the spindle against the stop. The back movement of the collet lever throws the rolls clear of the stock and closes the collet.

The collet control has been changed by placing the control lever in a vertical position, with a toggle action applied in such a way as to do away with the greater part of the friction encountered on the old machine. The collet control lever operates a great deal easier than on the old machine even with the added work of controlling the feed. Moreover, the operator is saved three or four motions and one step for every piece he cuts off. This is evidently an important factor in working up large amounts of piping or bar stock as frequently is necessary in large railroad shops and particularly production departments.

Water Columns for Locomotive Boilers

The two types of water columns illustrated are made by the Nathan Manufacturing Company, New York, and have been tested satisfactorily under actual service conditions. The type W-O-A water column (right) with tubular glass, which complies with recommendations contained in the last annual report of the chief inspector, Bureau of Locomotive Inspection, occupies but a minimum of space on the boiler. The body of the column is drawn in at the lower end and the cross section is reduced, without, however, interfering with

Nathan Type W-B and Type W-O-A Water Columns, Fitted with Reflex and Tubular Water Glasses Respectively

the necessary volume of water entering the column. By this construction the column is fitted close to the back head, with sufficient room for substantial connection to the water space of the boiler. A further variation in the bottom extension of the water column is secured by elongated pads, thus permitting of application to almost any boiler. If necessary, special lengths may be provided for unusual installations.

Another feature of this type is the method of attaching the gage cock to the body of the column. By doing away with the usual shank of the gage cock, the distance which the spindle of the gage cock protrudes has been materially reduced. The gage cock is so constructed that it may be removed and replaced quickly with steam in the boiler. The water gage attached to the column and the column itself are provided with necessary drain valves for draining the water gage or the column, independently of each other.

The type W-B water column (left) differs from the one previously described in that it contains two reflex gages instead of the tubular gage. This type is a self-contained water column, comprising within itself the gage cocks and the water gage, eliminating the pipe connections and joints necessary with independent water gages attached to the column. It is equipped with reflex gages, with glasses embedded in the body of the column and so placed that the water level may be observed from both the engineer's and the fireman's side.

A special provision that will be appreciated is the bonnet attached to the upper and lower valve controlling the respective water glass compartments. These bonnets are provided with warning ports which will blow at all times except when the valves are wide open.

BUSINESS NOTES

W. A. Day has been appointed manager of sales for the territory north of the Ohio river for the Casey-Hedges Company, Chattanooga, Tenn., manufacturers of boilers, with headquarters in the Marquette building, Chicago.

At a recent meeting of the stockholders of the American Boiler Tube Thimble Company, Providence, R. I., the following officers were elected: President, William J. Greene; vice-president, Thomas P. Himes; treasurer and general manager, J. D. Cameron; secretary, M. E. Murray.

Several changes in the branch offices of the Westinghouse Electric & Manufacturing Company have been announced by W. S. Rugg, general sales manager of that company. C. V. Woodward has been appointed manager of the Baltimore, Md., office and F. C. Reed has been made manager of the Huntington, W. Va., office. R. J. Ross has been appointed assistant manager of the transportation division of the Philadelphia office, and W. F. James has been appointed manager of the industrial division of the Philadelphia office, succeeding R. F. Moon, who has resigned to accept the vicepresidency of the Atlantic Elevator Company, of New York.

The Uehling Instrument Company, Paterson, N. J., has appointed Charles J. Schmid in charge of sales in Greater New York and Long Island with headquarters at Paterson. Mitsui & Co. have just been appointed exclusive representatives in Japan and China. The head office of Mitsui & Company is at Tokio and its New York City branch office is at 65 Broadway. John E. Arnold, 15½ South Fourth street, Tulsa, Okla., has been appointed agent in charge of territory in the state of Oklahoma, and H. R. N. Johnson, 917-A Marquette avenue, Minneapolis, Minn., has been appointed agent, whose territory includes Minnesota, North Dakota and South Dakota.

Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

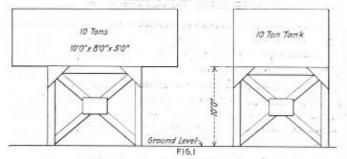

Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor is given permission to do so.

Tank Support Calculations

Q.-Will you please publish in THE BOILER MAKER explanation for calculating the supports required for water tanks as shown in Figs. 1 and 2. The supports in both cases are of angle sections. Size and number of bolts, size of angles, plates, etc., to be given in calculations.-L.T.

A.—In the determination of structural members for the support of tanks, calculations involving the properties of structural sections are applied. For beams the strength is calculated by first finding the bending moment. Then the *section modulus* required in the beam is obtained by dividing

Cross Beam Type of Tank Support

the bending moment in inch tons by the safe stress of the material which for tension and compression is taken at 16,000 pounds per square inch. A beam is subjected to both compression and tension stresses. For a load uniformly distributed the bending moment is found from the formula:

 $W \times L$

in which;

W = the load in pounds on the beam.

L =length of beam in inches.

In the problem, Fig. 1, where the beams are of different lengths, say 10 feet for the long beams and 8 feet for the shorter, a greater load or deflection arises in the short beam. The load in such a case is determined, in Fig. 3, as follows:

$$=$$
 $=$ $=$ $=$ $=$ 0.3

 $8^4 + 10^4$ 14,096

The load of 10 tons being uniformly distributed, each beam will carry the following loads:

On each 10-foot beam, $10,000 \times 0.3 = 3,000$ pounds. On each 8-foot beam, $10,000 \times 0.7 = 7,000$ pounds.

	moment of the 8-foot bean ,000 \times 8 \times 12	n equals
8	= 84,000	pounds.
0	84.000	
'he section n	odulus equals — = 3	5.25.
	16,000	
rom the stri	uctural handbooks a chang	el with t

From the structural handbooks a channel with the section modulus 5.25 has a depth of 7 inches and weighs 93⁄4 pounds per foot length approximately.

For a 10-foot span the bending moment equals

Section modulus = $\frac{1}{16,000}$ = 2.81. In this structure use

the same size beam as for the 8-foot length.

Wall Supported Type of Tank

DESIGN OF POSTS

In the calculation of the post supports the factors known as the radius of gyration and the ratio of the length to the least radius of gyration are applied. For structures of this kind the latter should not exceed 120 times the least radius of gyration. The load on each support is $\frac{20,000}{4} = 5,000$

pounds.

1011410

The length of the unsupported section of post in this case equals 9 feet = 108 inches. The unit stress in the post is determined from the formula 16 000 = 70^{-1} in which:

determined from the formula 16,000 - 70 -, in which;

l = 108 inches, length of post.

r =least radius of gyration.

Assuming a 3-inch by 3-inch by 5/16 inch angle, the value of r = 0.92 and substituting the known values in the for-108

mula the unit stress equals $16,000 - 0.70 \times \frac{1}{0.92} = 7,000.$

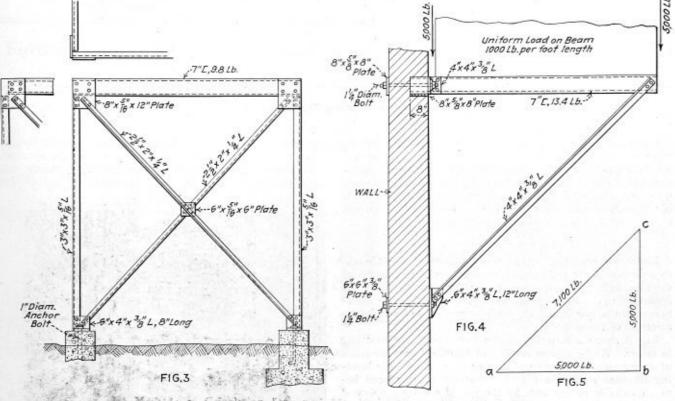

The load on the support equals 5,000 pounds by dividing the load by the unit stress gives the cross-sectional area of 5,000

the member required or $\frac{0,000}{7,000} = 0.7$ square inch. From

the structural tables the area available in a 3-inch by 3-inch by 5/16-inch angle equals 1.78 square inches, which shows

bolt 7%-inch in diameter is sufficient. Cross sectional area of 7%-inch bolt equals $7\%^2 \times 0.7854 = 0.6013$.

 $0.6013 \times 16,000 = 9,620$ pounds unit tension stress a 7%-inch bolt will safely stand. The rivets in the angle connections are in shear. The safe stress allowed in shear equals 10,000 pounds per square inch. The greatest shearing load in this case is 5,000 pounds. The gusset plates are

Methods of Calculating Structural Members for Different Type Tank Supports

that the angle supports are heavy enough. Tie angles are used to hold the beams in alimement as indicated in Fig. 31

DESIGN OF BRACKET SUPPORTS

The calculation of the beam for the bracket support, Fig. 2, is figured in a similar way. In this example the load of 10 tons is carried by two 8-foot beams. One end of each beam is set in the wall and the other end supported by angles connected to the wall by angle anchors. One-half of the load acts on the outer end of the beam, tending to pull out the end set in the wall, and to crush the diagonal angle supports. The size of the channel may be determined as already explained for Fig. 3. The unit stress in the diagonal angles is determined generally by the stress diagram, Fig. 5. Lay off the load of 5,000 pounds along the lines *a-b* and *b-c* to scale. The diagonal *a-c* is the stress on the diagonal angle which equals in this case 7,100 pounds. The length of the support in this case equals $\sqrt{8^2 + 8^2} =$

fore the radius of gyration equals $\frac{1}{120} \times 12 = 1.23$. From

the tables of structural properties an angle 4 inches by 4 inches by 3% inch weighing 9.8 pounds per foot length meets the requirements.

The end of the beam in the wall should be held by an anchor bolt to resist a pull of 5,000 pounds. The safe tension stress per square inch considered is 16,000 pounds so a riveted to the angles and channel in Fig. 3 with four 5%-inch rivets. The cross sectional area of the 5%-inch rivet is 0.3068 square inch.

 $0.3068 \times 10,000 = 3,068$ pounds.

 $3,068 \times 4 = 12,272$ pounds shearing value of rivets.

In Fig. 4, two 5%-inch rivets are used to carry the shear load of 5,000 pounds as $3,068 \times 2 = 6,036$ pounds shearing strength.

Bending Pipe and Boiler Tubes

Q.—Would you please inform me through your Question Column of the rule for bending waterubes for a two-drum waterube boiler, to be bent to 36-inch radius; for instance, as in the two-drum bent tube boiler as made by George W. Ladd Company, or Eric City Iron Works? Please show how this is done and how one may find the center points whereby to inscribe the proper arcs. T. T. P.

A.—Small pipe of tubes $2\frac{3}{2}$ inches in diameter and smaller can be bent cold by hand. Larger sizes are usually bent under pressure or by heating the metal at the point of bend. For hand bending use an arrangement as in the case of plank *a*, Fig. 1, inclined at a suitable angle in which is bored a hole to suit the diameter of the tube. A small clearance sufficient to allow the tubing to pass through the plank is allowed. When tubes 2 inches and larger are bent by this means, the tube section is liable to flatten and the inside of tube at the bend is likely to sink. To avoid this as much as possible the bend should be forced slowly to allow the metal to gradually form the required curvature. The bend should be made uniformly by shifting the tube at equal short spaces, thereby making the bend to a small degree throughout the entire length of the bend.

Three Forms of Bending Devices for Tubing

Curved formers are used for hot bending. One of the types suitable for this purpose is shown in Fig. 2. The base a is bolted to a substantial frame or table and the tube is inserted to engage with the hole b which holds the tube in place while the tube is bent over the curved form c. In hot bending, the tube section will flatten a trifle and the outside curved section will stretch, thinning the wall of the tube.

USING ROLLER FORMERS

Roller formers, Fig. 4, are better adapted for this work, as a more uniform bend can be made without deformation of the tube wall. The pipe a is inserted between the quadrant b and roller c. In bending, the pipe is pulled in the direction of the arrow d and the lever is pushed forward in the direction of arrow e.

Fig. 3 shows a watertube boiler with bent tubes partially installed. Where a large number of tubes are bent the manufacturer employs for this particular type a hydraulic bending machine shown in Fig. 5. The tubes are placed between suitable rollers and, by the use of a former operated under hydraulic pressure, the tubes are formed to the required

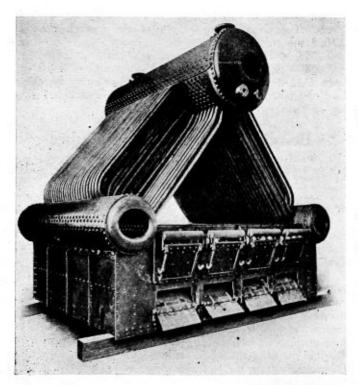

Fig. 3.-Watertube Boiler with Bent Tubes Under Process of Installation

curvature. All tubes are bent to a templet according to respective sizes indicated on the band opposite the operator.

In figuring the length of pipe for an inside radius, calculate the length to a radius equal to the inside radius plus

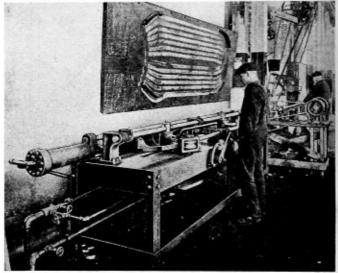

Fig. 5 .- Type of Hydraulic Tube Bending Machine

one-half of the outside diameter of the pipe or tube. The length of the tubing in the bend would then depend on the arc length on the center of the tube.

Repairs Under Pressure

(Continued from page 69)

to stop this same leak, but they had not been successful. It is also stated that the joint was defective, and that to prevent similar accidents in the future, the entire pipe line was soon to be dismantled and examined.

Wherever this article comes to the attention of a man who is accustomed to repair vessels of any kind under pressure, we sincerely hope it may be the means of influencing him to discontinue the practice. We know very well that work of this sort is often done without disastrous results; but there are plenty of examples of fatal cases, and no man who persists in following the practice can tell when his turn may come. Neither has any employer a right to ask a man to risk his life in this way. Delays and shut-downs may cause extra expense, but this should not be considered where human life is endangered.

Letters from Practical Boiler Makers

This Department Is Open to All Readers of the Magazine —All Letters Published Are Paid for at Regular Rates

Firebox Type Boiler Failure Caused By Low Water

A FTER reading an account of a boiler explosion at a saw mill at Edge Hill, Pa., the writer being a commissioned boiler inspector visited the scene of the disaster in order to investigate and if possible ascertain the cause of the explosion. I first interviewed the owner of the

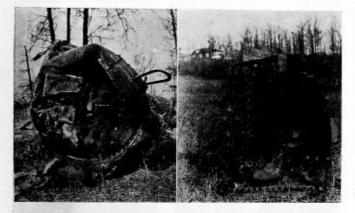

Fig. 1.—View of Smokebox End of Boiler and Tube Sheet 350 Yards from Point of Explosion

plant in an endeavor to obtain information as to the operating conditions, but was unsuccessful, the owner stating that he did not know anything about the boiler, not even the amount of pressure carried or allowed on it.

After interrogation on other points the owner informed me that the boiler had never been inspected by an authorized inspector since coming into his possession, and stated that he had purchased the boiler about six years ago, at which time he understood it to be about one year old.

I then visited the wreck and found the boiler to be of the

portable threshing machine type with engine mounted on boiler shell; 36 inches diameter; 11 feet 10 inches overall length, estimated from the condition at about 12 years old; 0.25 inch shell plate, double riveted lap joints, 0.3125 inch tube sheet, pitch of rivets in longitudinal seam 3.25 inches, giving a joint efficiency of 72.8 percent. The boiler was equipped with a 2 inch lever safety valve which was found on the lot near the exploded boiler. The valve stem and

Fig. 3.—Defective Fusible Plug in Crown Sheet Which Contributed to Seriousness of Failure

other portions of the valve were carefully examined and found to be in good working condition.

A mark was found on the lever indicating the position of the weight. The lever was numbered 80 pounds but as no weight or ball was found or any other means of ascertaining just what weight was on the lever at time of the accident it is assumed that same was set to blow at 80 pounds pressure.

The boiler was blown a distance of about 100 feet into the air then describing an arc fell in a lot on the opposite side of a highway about 300 feet distant from its original

Fig. 2.-Crown Sheet of Boiler and Firebox and Barrel Near Scene of Disaster

location, and about 25 feet from a bungalow. Part of the tube sheet was found about 250 yards farther than the boiler itself and in a line of the same direction as that taken by the boiler. The crown sheet was found about 100 feet from the original location of the boiler and in a direction directly opposite from that taken by the boiler. The fusible plug was in the original position, but fusible metal was removed and a 3% inch bolt had been substituted, Fig. 3. The crown sheet shows evidence of excessive overheating, the sheet being very much burned. No evidence of rivet failure is indicated but the plates show a clean shear in every instance.

The explosion was undoubtedly caused from low water as evidenced by the condition of plates. This is substantiated by testimony from residents, who state that the engineer was attempting to feed water into the boiler at the time of the explosion, but boiler ruptured before completing his action. The engineer was instantly killed and the owner of the plant has since died of injuries received, while two other persons are in the hospital, seriously injured. There is no doubt that if the boiler had received periodical inspection by an authorized inspector this condition of the fusible plug would have been detected and ordered removed and a proper type plug substituted, which would have undoubtedly prevented this disaster with its consequent loss of life and property damage. I have also learned since the investigation that the "engineer" of this outfit was a teamster before taking charge of boiler.

Philadelphia, Pa.

F. W. JAMES.

Relative Safety of Firetube and Watertube Boilers

In general, the watertube boiler is safer than the firetube boiler because of the fact that the former does not store so much water. The late Dr. Robert H. Thurston, Dean of Sibley College, Cornell University, figured that in a plain cylindrical boiler under 100 pounds steam pressure, enough energy is stored to throw the boiler to a height of over three and one-half miles in case of an explosion. This is because hot water contains so much energy and because there is so much water in cylindrical boilers. He said: "A cubic foot of heated water under a pressure of from 60 to 70 pounds per square inch has about the same energy as one pound of gunpowder." This is one of the reasons why the watertube boiler is so often given the preference to the firetube boiler.

Firetube boilers are generally large in diameter. The greater the diameter the greater must be the thickness of the metal to withstand the given pressure and consequently the greater the weight of steel necessary and the greater the cost. The watertube boiler again has the advantage in that the drums of watertube boilers seldom exceed 48 inches in diameter, hence the plate thickness is never excessive.

The tubes of the watertube boiler always come in contact with the most intense heat. However, since these tubes are comparatively small in diameter and of great strength they have a high factor of safety, much higher than the usual factor of safety of a firetube boiler, the thick shell of which is exposed to the most intense heat.

Also, in the watertube boiler there are no compressive stresses whatever. Pressures always act from within, both in the drums and in the tubes, consequently all metal is in tension. In the firetube boiler the tubes are in compression and are always liable to collapse, especially when they become thin or when made in large diameters.

While it is true that watertube boilers sometimes explode, such explosions are almost invariably less dangerous than firetube boiler explosions. Watertube boiler explosions sel-dom occur due to weak drums because the drums are well protected from intense heat. If there is any breaking or bursting at all it is usually a tube, and tube failures are seldom serious.

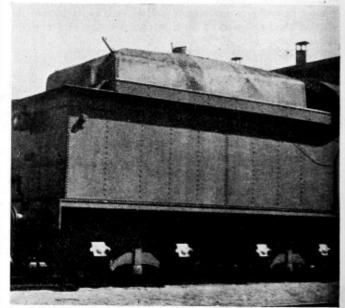

We would like to hear from our readers on the side of the firetube boiler. Newark, N. J.

N. G. NEAR.

Oil Tank Explosion on a South American Railroad

ARELESSNESS of any kind in the operation or maintenance of locomotives is sure to cause trouble. The following incident, which occurred on a South American railroad, illustrates this truth very aptly.

The attendant started to determine the amount of oil in the tank by means of a measuring rod with a naked flare

Oil Tank Failure Caused by Carelessness in Observing Precautions When Filling

lamp for light. The result was a bad explosion. The rod was kept in a loose guide in the top of the tank and, of course, the hot gases escaping around it became ignited the moment they came in contact with the light and followed through into the tank with the result shown.

The tank was torn from its seating, also from the strengthening brackets inside, top and bottom, and made useless for further service. W. T.

Colombia, C. A.

Condensed Rules for Inspecting Locomotive Boilers

(Continued from page 62)

there are any leaks the lagging should be removed and the trouble located.

A monthly inspection report should be filed with the district Interstate Commerce inspector and a copy of this report carried in the cab. An annual report must also be filed with the district inspector. A specification card and any changes on it are approved by the chief mechanical officer of the road and a copy filed with the chief inspector for each boiler. Any change in the boiler must be reported in thirty days to the chief inspector of the Board of Locomotive Inspection.

In the case of a boiler failure causing a serious injury or death of any person, the chief inspector at Washington should be informed by wire immediately.

TRADE PUBLICATIONS

TOOLS FOR BOILER MAKING.—The J. Faessler Manufacturing Company, Moberly, Mo., has issued catalog No. 36 containing a complete descriptive list of all tools produced by this company. Details of roller flue and tube expanders, sectional beading expanders, flue cutters, patch bolt countersinking tools, etc., are contained in the catalog, in each case illustrations, tables of sizes and price lists being included. The company also maintains a department for designing tools for special requirements and difficult tube installations.

OIL BURNERS.—F. J. Ryan & Company, Philadelphia, Pa., has just issued bulletin 1B entitled "Mircs Oil Burners," containing a large amount of information of value to industrial users of oil-burning equipment. Essential factors in the efficient burning of fuel oil are pointed out; also the effect of relative air and oil pressures. Two sets of curves are illustrated from which the correct size of burner and necessary amounts of air needed for correct combustion can be determined. Details regarding the construction and operation of the Mircs burner are also included.

PIPE PRODUCTS.—The products of the Whitlock Coil Pipe Company, Hartford, Conn., consisting of apparatus formed from pipe and tubing, or parts so formed, are described in a conveniently referenced pamphlet issued by this company. The products are divided into four classes—bent and welded piping for high pressure steam and fluids, coils of pipe and tubing which are made continuous by welding or brazing together the required number of pieces, welded receivers for storing fluids under high pressure and tubular heat exchanging devices.

FEED WATER TREATMENT.—The scientific handling of serious water problems confronting both railroad and industrial users of steam boilers is the subject of a brief but forceful little booklet recently issued by the Dearborn Chemical Company, Chicago. This booklet shows (1) the complete mineral analysis; (2) study of plant equipment and operating conditions; (3) expert advice and assistance from the standpoint of practical power production engineering; (4) followed up with laboratory control after treatment is installed.

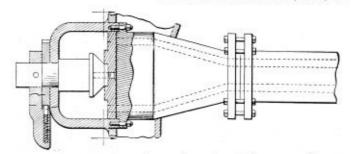

SELECTED BOILER PATENTS

Compiled by SEORGE A. HUTCHINSON, Patent Attorney, Washington Loan and Trust Building Washington, D. C.

Readers wishing copies of patent papers, or any further information regarding any patent described, should correspond with Mr. Hutchinson.

1,443,878. FLUE BLOWER. ROBERT E. JACKSON AND EDWIN M. JENKINS, OF PRINCETON, WEST VIRGINIA.

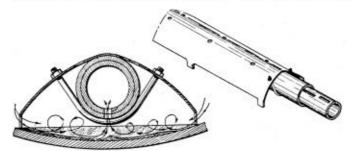

Claim 1. A flue blower adapted to be arranged transversely of a boiler in alinement with a row of flues, and being provided with a plurality of

passages corresponding in number to the number of flues, means for connecting said passages to the ends of the flues, a pipe connected to a source of compressed fluid, and means for connecting any one of said passages to said pipe. Six claims.

1,445,591. BOILER CLEAN-OUT DEVICE. MIKE HUFFMAN, OF DES MOINES, IOWA.

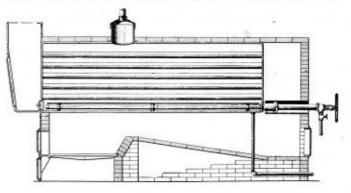

Claim .- The combination with a boiler clean-out device of the class described, of a deflector plate secured to the boiler clean-out device having

its top inclined downwardly and outwardly toward the bottom of the boiler, and its edges spaced from the bottom of the boiler, and circulating openings formed in said plate, and supporting legs at the edges of the plate to engage and rest upon the bottom of the boiler.

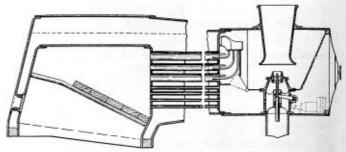

1,445,592. STEAM BOILER CLEAN-OUT DEVICE. MIKE HUFF-MAN, OF DES MOINES, IOWA.

Claim 1.-In a device of the class described, in combination with a steam boiler of a supporting and coupling device designed to be permanently fixed in the rear wall of a boiler and provided at its forward end on the interior

of the boiler with projecting lugs, two pipes, one within the other designed to be inserted in the bottom of the boiler and being provided with openings that may be brought into alinement with each other, one of said pipes being provided with notches to receive said lugs and the other of said pipes being capable of rotation relative to the first, a pipe connected to the supporting and coupling device at the rear end, and means extending through the said rod and connected to the rotatable one of said pipes for holding said rotatable pipe rearwardly, and for providing means whereby the said rotatable pipe may be turned, for the purposes stated. Three claims. 1,437,719. MEANS FOR CONTROLLING THE OPERATION OF STEAM BOILERS. VIRGINIUS Z. CARACRISTI, OF BRONXVILLE, NEW YORK, AND CHARLES H. SMOOT, OF SOUTH ORANGE, NEW JERSEY; SAID SMOOT ASSIGNOR TO RATEAU BATTU SMOOT ENGINEERING CORPORATION, OF NEW YORK, N. Y., A CORPORATION OF DELAWARE

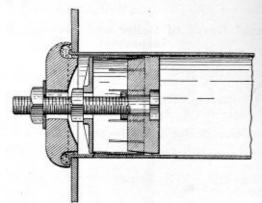

Claim 1 .- In combination with a locomotive having a variable exhaust nozzle, pressure responsive means operatively connected to the movable ele-

ment of the exhaust nozzle and to different sources of pressure in the locomotive to thereby automatically actuate the movable element of the exhaust nozzle and vary the emission area of the nozzle orifice in direct proportion to variations in pressure at the several pressure sources. Nine claims.

1,444,351. BOILER TUBE STOPPER. LETTERIO MARTINO, OF EVERETT, MASSACHUSETTS.

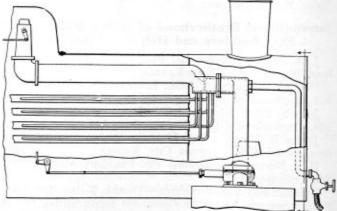

Claim 1.-In a device of the kind described, a plug for a tube comprising a wedge-piece, a slotted sleeve, adapted to engage the wedge surface of said

wedge-piece, means for adjusting said wedge-piece and said sleeve with relation to each other comprising a plate adapted to engage one end of said sleeve, a bolt, and a nut on said bolt adapted to engage said plate within the tube and force said sleeve onto said wedge-piece. Two claims.

1,443,970. SUPERHEAT LOCOMOTIVE. HARRY M. WILLIAMS, OF LITTLE ROCK, ARKANSAS, AND JOHN W. DEAN, DECEASED, LATE OF LITTLE ROCK, ARKANSAS, BY RUTH L. DEAN, ADMIN-ISTRATRIX.

Claim.-A locomotive, including the boiler, smoke box and cylinder steam chests, in combination with a superheater, a steam supply pipe connecting said boiler and said superheater, a main throttle therein, steam pipes con-

necting said superheater and said steam chests, auxiliary throttles arranged in said pipes, a cross-connection communicating with each of said steam chests, a supply pipe for said cross-connection communicating with one of said superheat steam pipes above the throttle therein, a valve in the last said pipe, a steam pipe coupling for a burner, and a pipe for supplying superheated steam thereto, said pipe being connected to the opposite superheat steam pipe from that to which the cross-connection supply pipe is connected, and above the throttle therein substantially as described.

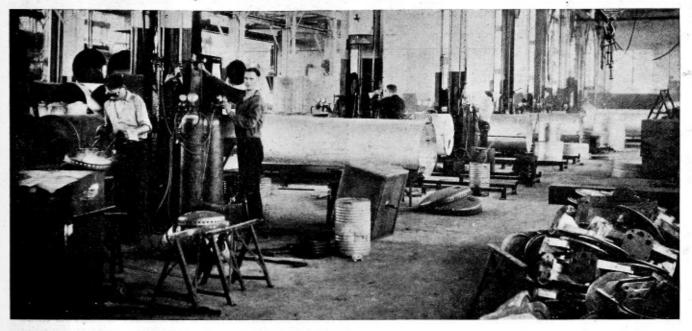

Fig. 1.-Section of Tank Shop Devoted to Welding

Fabricating Storage Tanks by Oxy-Acetylene Welding

The various processes of autogenous welding have become widely adopted in the manufacture of unfired pressure vessels and storage tanks. The following article deals with the methods employed by one producer of gasoline storage tanks to speed up the output and increase the economy of operation of his plant. Many boiler manufacturing companies during the past three years have gone extensively into the production of plate and tank work and the practices outlined here may suggest ways and means of boosting production as well as the proper procedure for the men in the shops to follow in the use of oxy-acetylene welding.

THE advantages of oxy-acetylene welding for production are no less great than for reclamation and repair. Evidence of this is presented by one of the country's foremost manufacturers of oil and gasoline storage systems who fabricates tanks of various descriptions entirely by oxyacetylene welding.

PRODUCTION METHODS

There are several dominant factors in the production of light sheet metal products of this type, including the welding shop layout, preparation of the sheets for welding, welding practices, handling of material and testing and finishing. The proper attention to these factors determines to a large degree the quality and cost of the welded pieces.

The conduct of the welding shop and the production methods used at this manufacturer's plant are the result of years of experience and have proven to be efficient and economical. All material is prepared for welding in the metal forming department. As the manufacturer has numerous other lines of metal products besides the storage systems the equipment of the forming department serves with equal advantages the other shops of the plant.

FABRICATING UNDERGROUND STORAGE TANKS

Galvanized iron sheets are rolled along the short dimension for large underground storage tanks, three such sheets forming the sides of a tank. When the sheets are rolled this way rather than into cylinders, as is often done, tanks are built without circumferential seams, a style of tank construction preferred by this manufacturer.

The end sheets for this type of tanks are dished and flanged and holes for pipe connections are punched in the side and end sheets by the forming department. For lubricating oil storage tanks 3/16-inch steel sheets are bent into a "U" shape on power driven presses. The round holes for pipe connections are then punched, and the large square hole is cut with an oxy-acetylene cutting blowpipe.

RECTANGULAR TANK CONSTRUCTION

Steel sheets for other types of rectangular tanks are also formed by bending once or twice, depending on the type and purpose of the tank. For small types of round storage tanks galvanized iron sheets are rolled into cylinders so that only one longitudinal seam is necessary to join the sides. Neither the steel nor galvanized iron sheets are beveled or otherwise

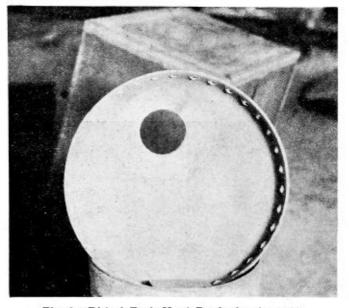

Fig. 2.-Dished Tank Head Ready for Assembly

prepared for welding, except to be formed. Great care, however, is taken by the forming department because unless the sheets are prepared exactly in accordance with specifications, the welders are slowed up and the quality of their work is lowered by the necessity of working on poorly prepared or misformed metal.

LAYOUT OF WELDING SHOP

The welding shop is located in the same building as the forming and finishing departments. The welding stations are in a row and in line along a crane way, between columns on which acetylene pipe line connections are hung and to which oxygen cylinders are attached. Circulating space is maintained on each side of the line of stations for the delivery of formed material from one side and so the welded pieces can be moved out from the other side.

WELDING EQUIPMENT

A 500-pound carbide capacity Oxweld low pressure Duplex generator furnishes the supply of acetylene gas for 18 welding

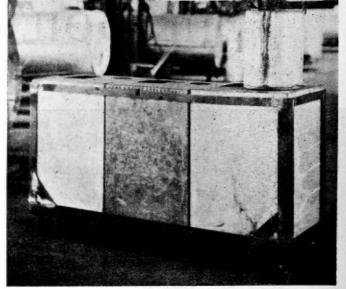

Fig. 3 .- Oil Storage Tanks Ready for Welding

stations, the average number operated at one time. Oxweld low pressure welding and cutting apparatus and Linde oxygen are used. To facilitate the handling of round storage tanks, several stations are equipped with racks consisting of a track fixed to the floor on which a car travels parallel to the position in which the welder works. The cars are equipped with rollers, so that an operator can revolve a tank in either direction or move it horizontally through its entire length, which makes it possible for him to weld at any point on the tank without changing his position. With this system every motion is productive.

An overhead crane is used to convey the material to the welding stations and to move the welded work out to the testing and finishing departments. It is the practice to have the welding shop work on only one type of tank at a time. Each operator is trained to weld with equally good results on the different types of tanks, which enables the entire force of the welding shop to be concentrated on one product until the entire production has been completed. This system con-

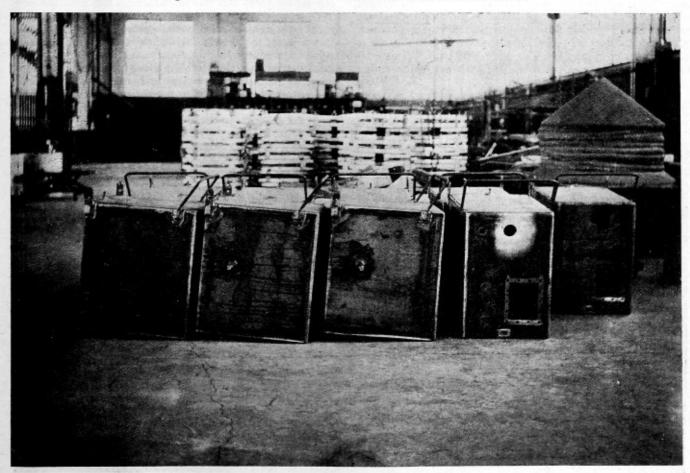

Fig. 6.-Lubricating Oil Storage Tanks of An All-Welded Type

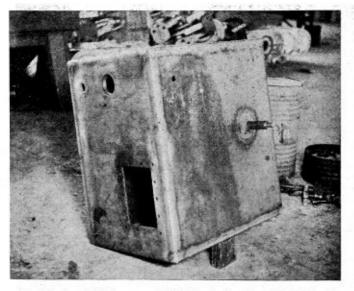

Fig. 7 .- All Seams on This Tank Are Butt Welded

tributes toward better welding and quicker handling and inspection with a consequent saving in production cost.

Galvanized iron storage tanks of various capacities form the principal product of the welding shop. Fabrication of the larger sizes proceeds as follows:

Three rolled sheets are clamped to a form and are tack welded into place. Then the form is removed, but the clamps are left in place until the welding is completed, to aid in counteracting the tendency of the sheet to expand while the welding is in progress. The side seams are then welded, a drawn iron welding rod being used as a filler. When the sides are completed the tank ends which have been flanged are welded to the side sheets and then the pipe connections or nipples are welded into the holes that have been punched. One operator does all the welding required on a tank, so it is only necessary to handle a unit twice—the prepared material into the welding, and the fabricated tank out to the testing and finishing department.

The galvanized iron tanks shown in Figs. 4 and 5 are for gasoline. They are built of 12-gage sheets, are about 10 feet long, 3 feet in diameter and have a capacity of 10 barrels. This type and size of tank contains nearly 50 linear feet of welding.

The mobile oil storage tanks like the type illustrated in Figs. 6 and 7 are made of 2 "U" shaped sheets fitted together to form six sides. The 8 edge seams are butt welded. These tanks are built of 3/16-inch steel sheets, are about 23 inches long, 27 inches deep and 18 inches wide. They are a representative all-welded product, as the axles are welded to the sides, inside and out, and the handles, lugs, fittings, collars and brackets are welded to the tank body. All welded carriers for batteries of rectangular galvanized iron tanks are built of 2-inch angle iron. Tanks used in this are formed of galvanized iron sheets bent four times with a welded side seam and bottom. Several small sizes of round oil storage tanks are built of 16-gage galvanized iron sheets rolled into cylinders. These also have a welded side seam and bottom. Tanks of this type are for use in filling stations and garages, for the storage of small quantities of oil.

The principal requisite of a storage tank is, of course, permanent tightness. The tanks are, therefore, carefully tested, as an important part of the production. This is carried on as a separate step after the welding is completed and before the tanks are painted with waterproof paint or otherwise finished. Testing is done with compressed air or water. All openings in the tank are closed except the one through which about five pounds of pressure is applied. Then the seams are gone over with soap suds and thoroughly cleaned before shipment. The workmanship in this plant, however, is of such a high order and the welding is so closely supervised that leaks very rarely occur. By following closely recognized good welding methods and practices, such as penetrating the full depth of the steam, building up-joints where additional strength is required and using only the best materials, a high standard of work is easily maintained.

In all the years that this manufacturer has used the oxyacetylene process he has never received a complaint of a welded tank leaking, either at the welded joint or in the base metal adjacent to the weld. Although other joining processes have been tried out in this plant, actual tests have demonstrated that oxy-acetylene welding alone consistently produced leak-proof joints. The flexibility and economy of the process have further made it possible for the manufacturer to produce better tanks at less cost than it was possible to build by the old methods formerly employed.

Types of Flue Expanders Used in British Shops

Roller Type Expanders Have Replaced Sectional Tools for Locomotive Boiler Flue Work

By A. Wrench

N the following article, the writer (who has for several years been in charge of a number of boiler makers using tube expanders) endeavors to enumerate several types of tube expanders used in England, for locomotive boilers. Unlike the practice in America, the roller type of tube expander is almost exclusively used in England. Many years ago, the sectional drift or expander was used, but this was rather a crude tool, as will be seen by the sketch, Fig. 1. The four sections were not held by a spring, but had to be inserted in the tube in sections or held round the drift by the operator. The tubes used at that time were principally copper and brass in copper tube plates, and were not beaded but flared and ferruled.

The sectional expander shown in Fig. 2 was an improvement on that previously mentioned and good results were obtained from prossering. This expander consists of three sections of cast steel and a tapered circular drift, the sections being held together by rubber bands. The cap of this expander is designed to pass over the tube ends and rest against the tube plate. This was a much better arrangement than the solid cap of the expander shown in Fig. 1.

It was some considerable time after steel tubes were generally adopted in this country that the roller expander came into use. The general type of this expander is shown in Fig. 5.

VARIATIONS IN DESIGN

All of these expanders for small tubes have three rollers but vary somewhat in design. The one illustrated consists of tapered mandril, roller box and three rollers. The mandril is fitted with a long nut, with which to force out the mandril by turning against the box. The roller box is fitted with a cap which rests against the tube plate, and which is capable of being adjusted by means of a set screw. The rolls are tapered the same as the mandril, with the taper reversed when in position. The expanding is done by driving the mandril with a wooden mallet and turning with a rachet. The expander is quite successful in use and is supplied in sizes from 11/4 inch to 23/8 inch, advancing in 1/8 inches. It is rather expensive and its weak point is the screws at the end of the roller box, which are continually breaking.

Figs. 3 and 4 show the type of expander and rotator used

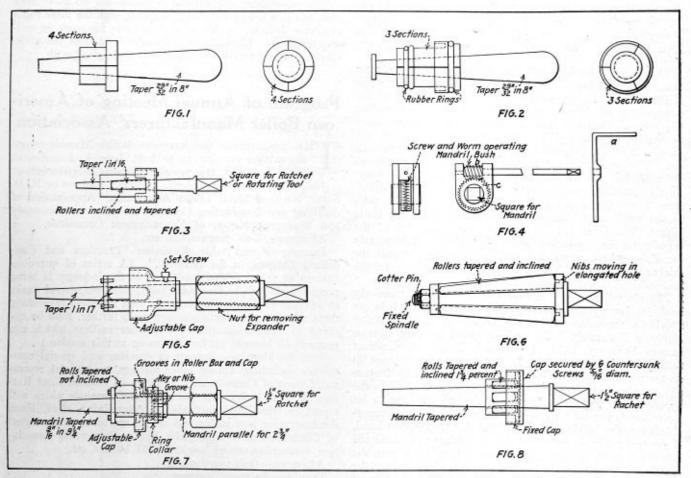

Fig. 1.-Sectional Drift Expander. Fig. 2.-Sectional Expander Prosser. Fig. 3.-Three Roller Expander for Superheater Tubes. Fig. 4.-Tool for Rotating Expander in Superheater Header. Fig. 5.-General Service Tube Expander. Fig 6 .- Three Roller Expander for Tapered Holes. Fig. 7 .- Three Roller Superheater Expander. Fig. 8 .- Six Roller Expander for Large Flues

when working in a confined space, such as the steam header of a superheater. In this expander, the rolls are inclined slightly, to enable them to pull tight, without the use of a mallet, and the cap is secured by screws at the back end of the tool. The method of rotating is seen from the sketch, Fig. 4, the handle (a), turning worm (b), which operates the bush (c), containing the square for the mandril.

The expander shown in Fig. 6 is used for tapered holes, and will expand tubes of various sizes. The rollers are tapered and inclined and are fixed in the roller box by means of nibs at each end, which are fitted in elongated holes.

The inclination of the rolls enables the expander to pull tightly into the tube without hammering and, as the expanding proceeds, the expander passes further into the tube. The rollers of this expander sometimes break owing to their length and the inclination. It is self-contained and efficient, but should only be used on tube plates which have tapered holes.

When large superheater flues were first fitted, the design of the roller expander used for small tubes was followed. Several alterations were necessary, but the design in general was the same.

A superheater flue expander of the three roller type is shown in Fig. 7. The cap of this expander is made in two pieces and is adjustable by means of a number of "V" grooves cut in both halves of the cap, and also on the roller box. The cap is fitted with a ring collar, which has a small stud fitted in the center. This stud passes down a slot in the cap and engages in a circumferential groove in the two halves of the cap. The cap is adjusted by removing the ring collar and moving the two parts of the cap either backwards or forwards one, two, or more grooves. It should be understood that the grooves are not cut spirally, as a thread, but each one cut separately. This enables the cap to remain stationary against the tube sheet, while the roller box is turning. This prevents the cap from rubbing against the copper tube-sheet round the tube.

The original size of superheater flues is 4 inches, but after being in service for a considerable time, the holes get much bigger. When reamed out to 51% inches the sheet is near the scrapping point. Liners are fitted to tube holes exceeding 43/4 inches. Owing to this variation in size, it is necessary to employ two sizes of flue expanders, 4 inches and $4\frac{1}{2}$ inches, and there are usually two sizes of rollers to fit each box. The larger rollers can only be used when the holes in the roller box have become worn. A large size is also made for the smokebox end, which is usually 51/4 inches in diameter. The large sizes permit the use of the same size rolls as the small ones, the spindle and roller box being made bigger. The large nut on the end of the mandril of the superheater flue expanders is not of much use as frequently the distance between the nut and the roller box exceeds the thickness of the nut. The usual practice is to drive out the mandril by hammer blows on the nut.

The six roller expander, Fig. 8, is now being extensively used for large flues. This expander was discussed in an article by the writer, which was published in the Railway Engineer September, 1921, and reprinted in THE BOILER MAKER February, 1922. It is much cheaper to construct than the type shown in Fig. 7. It automatically tightens up on the mandril being turned, owing to the slight inclination on the rollers and is removed by turning the mandril in the opposite direction. It is important that the inclination on the rollers is not too great, or the rollers will become immovable before the flue is properly expanded. On the other hand, if the inclination is too small the time taken to expand the flue is too great. Differing from some expanders in use, the one shown on the sketch has a cap hollowed to fit over the tube end onto the flue sheet, this cap being fixed with six set screws through the cap into the box. This enables all tubes to be expanded through the same length. This is obviously a disadvantage where tube-sheets of various thicknesses are used, but in England most tube-plates are 1 inch thick, which

allows the use of a fixed cap instead of an adjustable one. The rollers used are 15/16 inch diameter at the small end, against 15% inch diameter in the 3 roller type. This size of roller is used for the three sizes of expander in use, only the roller box and mandril being increased in size.

It has been found advantageous to grind the mandril in preference to turning, as the smooth surface thus obtained enables the expander to be withdrawn more easily.

In America, the sectional expander is used extensively, but this type would not be very suitable for terminal use where copper tube sheets are used, as frequently the flue holes are found to be in bad shape.

The three roller expander has been found to be very suitable for oval holes, as the mandril will bear on the rollers as they move out of the true circle, by the mandril moving eccentrically in the box.

The six roller expander allows the two rolls passing over the longer diameter to ride loose, the other four bearing on the tube and keeping the mandril central.

It has been stated that the three roller expander causes bad shaped holes, but this is not so. Frequently when superheat flues are reported leaking in a running shed, six or seven will be found leaking out of twenty-four.

The expanding of these by any type of expander will disturb the plate, and tend to distort adjacent holes. The writer's experience is that those holes in the top corners of the tube-plate are found to be most badly out of shape and in most cases these holes have only been expanded when fitted new. Upward expansion of the tube-plate, and compression where girder stays are used, account for misshapen flue holes in many cases.

The superheater flue expanders illustrated do their work well, but it is not practicable to dispense with the three roller expander entirely, as this is most suitable for work in railway terminals. The six roller expander is suitable for workshop use where round holes have only to be dealt with.

Program of Annual Meeting of American Boiler Manufacturers' Association

"HE program for the American Boiler Manufacturers' Association meeting to be held June 4, 5 and 6 at The Homestead, Hot Springs, Virginia, is given below:

June 4-Morning-President's address. Address by H. D. Sayre, National Metal Trades Association. Appointment of Auditing and Nominating Committees. Report of secretary and treasurer. Report of Entertainment Committee.

Afternoon-Golf tournament, etc.

Evening-Round table discussion "Practices and Conditions Existing in the Industry." (A series of questions concerning practices and conditions in the industry is being prepared and will be forwarded to all members several weeks in advance of the meeting in order that members may study them over, prepare for discussion and, further, thus be enabled to make suggestions as to other matters which can properly be brought up for discussion at this session.)

June 5-Morning-Reports of standing and special committees including, among other matters, report and recommendations of Commercial Committee on Standardized Ratings of Steam Boilers; the Joint Stoker Committee which will report on simplified methods of determining stack sizes, demonstrating how tables and charts are to be used; report of Committee on Contact with Smoke Prevention Association, concerning setting heights, HRT boilers, etc.

Afternoon-Golf tournament.

Evening-Informal banquet. June 6-Morning-The Cost Accounting Committee re-Reports of Auditing Committee and Nominating Dort. Committee. Election and installation of officers. Miscellaneous business. New business. Adjournment,

A Great Boiler Explosion in Old Austria

Battery of Four Boilers Completely Destroyed by Explosion Caused by Low Water and Overheating

By John Jaschke

O^{NE} of the greatest boiler explosions ever occurring on the European continent happened on December 21, 1914 at Brüx in Bohemia—now Czechoslovakia. Since July 25, 1887, when the 22 boilers of the Friedrichshütte exploded, no explosion so disastrous as this has happened.

There was a battery of four combined cylindrical boilers

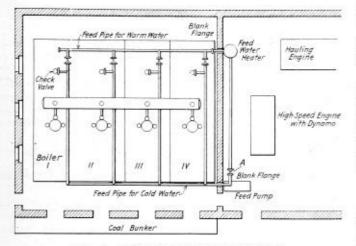

Fig. 1.-Boiler Plant of Brüx Colliery

in the boiler house of the plant Prinz Eugen, a colliery at Brüx, as shown in Fig. 1. The design of such a boiler is given in Fig. 2. Each boiler consists of three cylindrical drums, an upper drum 59 inches in diameter, 31 feet in length, two lower drums each $31\frac{1}{2}$ inches in diameter, 28 feet in length, connected with double flange nozzles $235\frac{1}{6}$ inches in diameter.

On the upper drum there is a dome $31\frac{1}{2}$ inches in diameter, $31\frac{1}{2}$ inches in length.

DETAILS OF CAPACITY

Across the four boilers there was a steam receiver. All the boilers were of 75 horsepower rating which worked at a pressure of 114 pounds per square inch, at 100 percent load. The longitudinal seams of the upper drum were double riveted, all other seams were single riveted. All seams were lap joints.

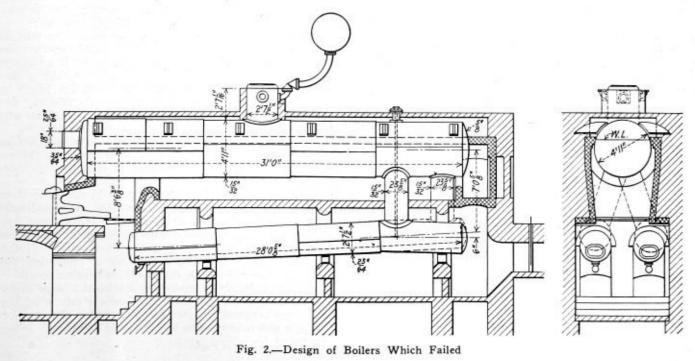

The boilers were built in 1899 by Bolrano, Tedesco and Company in Schlan. All boilers since their erection had been repaired and partly renewed.

Three of the four boilers were working and the fourth was in reserve. On the day of the explosion, boiler No. 1 was cold and blown out. Each boiler was required to work four weeks under pressure, after that time it was cleaned, both inside and outside. The feed water did not form any scale but only mud. The steam has to do work in generators and colliery engines, hauling engines, etc. The steam was partly used for heating purposes.

BOILER FEEDING EQUIPMENT

For feeding the boilers an injector and a steam pump were installed. There were two feeding devices, one for cold and one for heated water. Each could be worked by itself. For blowing out, each lower drum had an elbow; the right being closed by a cock, the left by a blank flange. The boiler could only be emptied, when it was cold. The blank flange was used because it could be kept tight easier than a cock.

On the day of the explosion the boilers were operated by two men, an experienced fireman and his apprentice, who was to be examined in a short time. The apprentice went out at 5 o'clock in the afternoon and the fireman remained alone.

93

The explosion occurred on December 21, 1914, at a quarter past five in the afternoon. The boiler house and the engine house were completely destroyed. Ruins and parts of the roof were blown for some distance onto the right of way of a railroad in the neighborhood. By luck no men were working. Fortunately no one was at the loading place and no train passing the plant at the time. The fireman was killed, another man badly injured who died the following night. The body of the fireman was found in the stokehold standing upright covered by ruins.

The location of the parts of the boilers is shown in Fig. 3. The first and second courses of the upper drum from boiler No. 2 were blown a distance of about 200 feet. Three boilers standing under pressure were exploded, the fourth boiler being out of the line was turned over.

Boiler No. 2 exploded first, due to lack of water. The fireplate became overheated and burst. This plate was seen to be red hot a short time after the explosion. Two strips of 28 inches breadth, glowed, the space between being dark and covered with a layer of mud. The upper drums of boilers Nos. 3 and 4 were pushed

The upper drums of boilers Nos. 3 and 4 were pushed to the right and therefore the flanges of the nozzle broke and both boilers exploded. Boiler No. 1 was blown against the chimney and turned over, no crack in it being visible. Boiler No. 1—No destruction.

Boiler No. 2—This boiler was blown into six pieces, i.e., three courses of the upper drum with the dome and the left

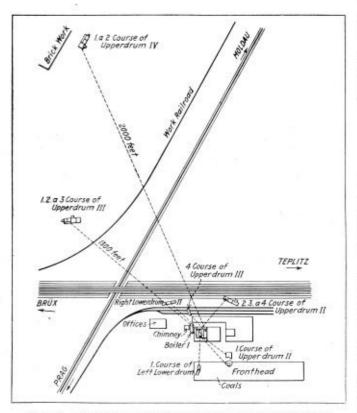

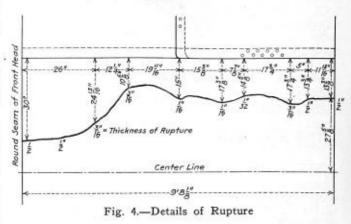

Fig. 3.-Location of Parts of Boilers After Explosion

connecting nozzle; the right lower drum; the greater part of the left lower drum; the first course of the upper drum; the dished fronthead; the last course of the left lower drum.

Boilers Nos. 3 and 4—Both boilers were blown into four parts; the two lower drums; upper drums divided into two parts.

The steam valve of the feed pump and the injector was found closed, therefore at the time of explosion they could not have been in operation. The pump and the injector were tested and both found in good order. Two days before the explosion occurred, the feedwater heater became loose and the valve A was closed. But this valve was also loose and the feedwater was passed through the heater in the blowout pipe and therefore two blank sheets were inserted.

It was a habit of the fireman to keep all feeding valves

open and to regulate the water flow with valves in the stokehold. He did not notice that the water was low in boiler No. 2 and so did not regulate the valves. The boiler became empty and the fire plate began to glow and overheat.

The fire plate burst for the length in the solid plate and not in the seam. The middle part of the rupture was as sharp as a knife for a length of about six feet, Fig. 4.

Boiler No. 2 exploded first. The fireplate cracked on the left hand side, so that the boiler was blown to the right. Only boilers Nos. 3 and 4 turned with the nozzles as centers. The nozzles cracked and both the boilers exploded. The steam from boiler No. 2 blew boiler No. 1 against the stack.

Stretching Boiler Tubes*

By W. Stevenson

S TRETCHING of boiler tubes on repair work or new work under construction injures the tubes by the stretching of the metal and may endanger the lives of the boiler operators or of any persons who may be in the vicinity of the boilers in the event of the tubes rupturing. The stretching of the tubes is performed in the following manner:

A sufficient length is allowed at one end. The tube is then expanded in place, the expander removed and the tube flared and heated. A long pipe or bar is heated in a furnace and then placed into the tube. The tube expands to the point of the least resistance, and when sufficient length is secured, the heated bar is withdrawn from the tube and the opposite end is flared and expanded before the metal has any possible chance of shrinking to its original position.

Naturally, under these conditions the tube sags and a strain is brought upon the tube close to the head. Moreover, the sagging makes it difficult to clean out the tube properly.

These conditions can be avoided only in the boiler shop by laying out the boiler plate so as to allow sufficient length for a standard size tube. Furthermore, it is important that a strong back be applied to each head and the tube sheet properly leveled before any tubes are expanded. If the tube-sheet flange should be slightly out of proportion, the next longest tube should be cut to suit the required length.

If a boiler already in service has developed a bulge in the tube sheet or headers and if the standard size tube which the boiler was designed for does not come within the required length, a new tube of extra length should be ordered.

*From a recent issue of Power.

Can the Scotch Boiler Be Improved?*

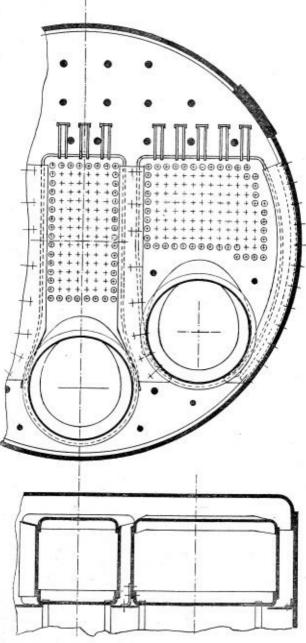

Details of Alterations Effected in the Scotch Boilers of a Large Steam Yacht with Beneficial Results

THE return tube marine boiler, generally known as the Scotch boiler, has had practically the same form for over forty years, and seems to have reached its final stage of development, but it is hoped to be able to show in this article that it can be improved in such a way as to increase its efficiency considerably.

There has always been a tendency to prime, due to irregularity in the circulation, and anything that will steady the circulation currents, or cause them to follow one direction only, will reduce this tendency to carry water over with the steam. Various forms of circulating devices have been fitted, outside the boiler itself, which take water from below the furnaces and return it to the boiler at a higher level, or from the front to the back, all of which, while minimizing the trouble, do not entirely remove it, and prove that there is room for improvement in the design of this class of boiler.

Now, the cause of any current in the water inside a boiler is due to a difference of temperature, the hotter water rising and the cooler falling, so that the water below the line of the grates is always much lower in temperature than that between and above the tubes. This difference of temperature often causes very severe strains, especially when getting up steam from cold, so that seams in the neighborhood of the bottom and back often need re-calking.

The hottest surfaces in the boiler are the furnace crowns and the back-plates of the back connections, so if no water can pass from the front to the back of the back connections, in a horizontal direction, from the level of the bottom of the furnaces to the level of the top row of tubes, a very rapid and energetic circulation is set up in a

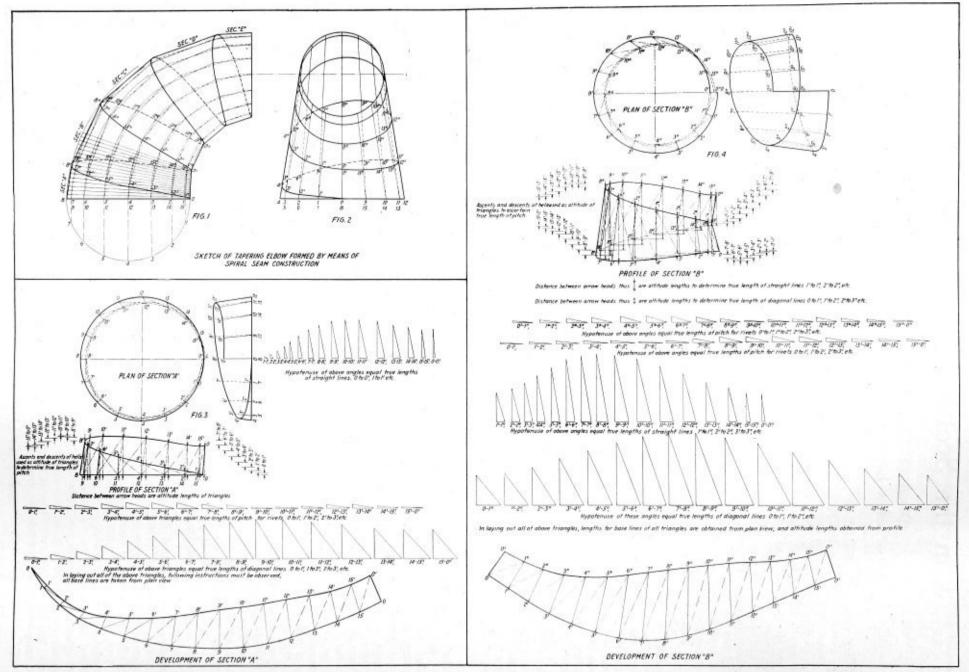

Scotch Boiler Fitted with Special Circulating Baffles

vertical direction between the sides and back of the back connections and the shell and back-end plates of the boiler, the only source of supply for this current being the water below and between the furnaces. It passes over the top of the back connections towards the front, passes downwards *From the January issue of The Marine Engineer and Naval Architect. yacht would often stay at a port for a week or more at a time, fires being raked out and the boilers allowed to go cold. When getting up steam again the boiler maker always had to do some re-calking to all three boilers not fitted with baffle plates, the other one never required anything doing (Continued on page 114)

between the groups of tubes and between the outside vertical rows of tubes and the shell plates to supply the rising currents produced by the furnace crowns, the tubes and the back-plates of the back connections. This current is set up as soon as the fires are lighted, it is always in the same di-

rection and is maintained as long as there is any fuel burning.

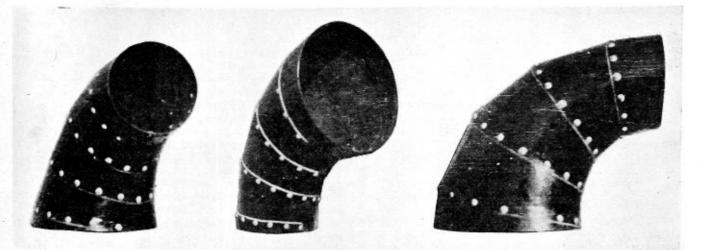

The necessary baffle plates can be secured, as shown in the accompanying drawing, by angle irons to the shell plates and rest against the front tube-plates of the outside back connections, as a watertight joint at this point is not a necessity. Between adjacent back connections the baffle plate is secured by means of stays riveted to the wrapper plate of one, and rests against the tube plates of both. The baffle plates cause no temperature strains whatever, and do not interfere with the scaling of the boiler. A large steam vacht, built at Wilmington, Del., had four boilers with two furnaces in each. One of these boilers was fitted with baffle plates, as described, but the other three were left without any. When in commission the following results were obtained :--- When raising steam from cold the fires had to be lighted in the three boilers without the baffle plates one hour before the fires were lighted in the remaining boiler, in order that all four should show steam at the same time. When steaming at 10 knots, the boiler with the baffle plates could furnish all the steam the engines required, whereas two of the other boilers were necessary for the same service, one alone could not be made to supply steam encugh; moreover, it primed so much that there was danger of wrecking the engines. The one boiler fitted with the baffle plates was never known to prime, not even in rough weather. When cruising, the

General Details of Tapering Elbow Built Up on a Spiral Development

.

Three Views of the Spiral Sheet Layout of a Transition Elbow

Development of a Spiral Seam Elbow

Details of the Layout of Patterns for a Tapering Elbow Built Up in a Helical Form

By C. A. Chincholl

HENEVER the talk or gossip in a boiler shop drifts into the channels of laying out it generally snags on the problem of laying out, or developing the stretchout of a one-piece helical or spiral seam, tapering elbow. This is exactly what happened in our shop during the noon hour of a day last winter while we were assembled about the flange fire. During the discussion, someone asked the writer if he thought he could lay out an elbow according to certain specifications. I informed them as I had never before attempted it, I would not say. But I did tell them the first opportunity that would present itself I would try to lay out and assemble the elbow under discussion. The elbow shown in the accompanying illustrations was the result of my efforts. The actual size is 12 inches in diameter at the large end tapering to 8 inches. The laying out was very satisfactory as in the assembling every rivet hole showed up fair as a die. It was constructed of number 12 gage sheet steel, in order that the thickness of the plate might receive its share of consideration in the development.

Thinking the readers of THE BOILER MAKER would be interested in the laying out of this form of elbow and perhaps prove of benefit to some, I have in the following lines with the aid of sketches, endeavored to outline a simple explanation so that it might also be used by the trade apprentices.

METHOD OF DEVELOPING THE PATTERN

In developing the pattern or layout of this elbow it is first necessary to locate the rivet line or seam as shown in Figs. 1 and 2. This is obtained in the same manner as the laying out of the helical or spiral on any cylinder. The lines necessary to lay out the helical seam on the elbow, will be found in the lower section of Fig. 1. They are self-explanatory so no detailed description will be given.

Particular attention must be paid to the prime marks of the different numbers, they are of paramount importance, and must in no instance be overlooked.

By referring to Fig. 1 you will notice it has been divided into five sections as A, B, C, D and E. This is only to simplify the laying out, as the pattern complete will be in one piece. Each revolution of metal is here taken as a section. Numbers 0 to 16 inclusive represent the bottom circumference of section A. Numbers 0 to 0' inclusive represent the top rivet line of section A and also the bottom rivet line of section B. Numbers 0' to 0" inclusive represent the top rivet line of section B and the bottom rivet line of section C and so forth to section E.

STARTING THE LAYOUT

Beginning the layout with section A, sketch from Figs. 1 and 2, the section marked A and develop the plan of section A as in Fig. 3. In referring to Fig. 3 you will observe two dotted circular lines parallel to each other. This is where the thickness of plate is taken care of. If the elbow is to be made of number 12 gage plate, the inner circular line is set 3/32 inch from the outer line. If 1/4-inch plate is used, set the line 1/4 inch in from the outer line. After you have taken care of the thickness of plate in the above manner, the outer line is disregarded and the work done from the inner line. The next step is to draw diagonal lines on the plan and profile sketch as from 0 to 1', 1 to 2', 2 to 3', etc. We next must obtain the true lengths of all the lines in the plan and the profile views, by use of the triangle. No true lengths need be ascertained for lines 0 to 1, 1 to 2, etc., as these are simply one-sixteenth part of the circumference of the largest diameter or base of the elbow.

In the plan view, 0' to 1', 1' to 2', etc., will not serve as the true pitch of rivets, so we must take the space each pitch ascends or descends in the profile view. Use this as the altitude of the triangle and the distance or space between 0' to 1', 1' to 2', etc., in the plan view as the base of the triangles. The hypotenuse will be the true pitch of the rivets.

Erecting True Length Triangles

In erecting the triangles the base lines are taken from the plan view and the altitude or heights of the triangles are obtained from the profile. After all the true lengths are found we are now ready to develop the pattern or layout for section A. Starting at 0, or the first one-sixteenth part of section A, we will disregard diagonal line 0 to 1', and start the layout by drawing angle 0, 1' and 1, taking the true lengths from the triangles previously prepared. We now are ready for the next space; set the dividers at the true length of 1' to 2' and with 1' as center, describe an arc; set the dividers at the true length of the diagonal line 1 to 2' and intersect the arc at 2'. Now set the dividers one-sixteenth of the circumference of the base, or 1 to 2, and draw the arc with 1 as center. Intersect this arc with the true length of the straight line 2' to 2, using 2' as center. This will complete one-eighth of the development of section A. Advance in this manner until straight line 0 to 0' is reached; this is the first line in developing section B and completes the development of section A.

DEVELOPING THE SECOND SECTION

We now start the development of section B, taking the true length of the rivet pitch 0' to 1" and with 0' as a center describe an arc. Intersect this arc with the true length of the diagonal line 0 to 1" using 0 as center and intersection at 1". Use true length of rivet pitch 0 to 1', describe arc using 0 as center. Intersect this arc with the true length of the straight line 1' to 1", using 1" as center. This will complete onesixteenth part of section B. Taking the true length of the rivet pitch 1" to 2" and 1" as center, describe an arc; intersect this arc with the true length of the diagonal line 1' to 2" using 1' as center and the intersection at 2". Use the true length of the bottom rivet pitch 1' to 2'. Describe arc using 1' as a center; intersect this arc with the true length of the straight line 2' to 2" using 2" as center and intersecting at 2'. This completes the development of one-eighth of section B. Advance in the same manner until straight line 0" to 0' is reached. This is also first line of development in section Cand completes layout of section B.

The development of sections C and D is arrived at in same manner as the development of section B. Development of section E the same as section A, so that detailed description of the development of sections C, D and E will not be given.

In referring to tables of triangles in Figs. 3 and 4 it will be noticed three tables are shown in Fig. 3 and four tables are necessary in Fig. 4, the development of section B. This is necessary in order to ascertain the true lengths of the rivet pitch on top and bottom circumference line. In the development of section A, Fig. 3, we use one-sixteenth of the circumference for each pitch and no triangles are necessary.

Any misunderstanding that may arise, while working on above described layout will be cheerfully taken care of in the columns of The Boiler MAKER by the author.

Master Boiler Makers' Convention

THE fourteenth annual convention of the Master Boiler Makers' Association will be held at the Hotel Tuller, Detroit, Mich., May 22-25. A special committee, of which Leonard C. Ruber is chairman, will report on rules for standards and recommended practice. The other topics which will be reported upon with the names of the chairmen of the committees, follow:

"Are the new combustion chamber boilers as easy to maintain as the straight standard firebox?" Henry J. Raps, chairman.

"Finished material (boiler plates) should be sound and free from cracks, surface flaws and laminations, and no hammer dressing, patching, burning or electric welding is allowed." Charles P. Patrick, chairman.

"What are the best methods of detecting defective boiler sheets in the shop before going to the laying out bench and being put into service?" John J. Keogh, chairman.

"Hammer testing of staybolts on our modern locomotive boilers is now one of the most important duties of local boiler inspectors. What is the most up-to-date hammer for testing staybolts? Give shape and weight. Is it better to hammer test staybolts while the boiler is empty or when it is under hydrostatic pressure?" J. A. Holder, chairman.

"What is the standard method of applying flues in locomotive boilers; also in stationary boilers? Give each item separately in its regular order: (1) How should ends of flues be prepared? (2) Preparation of flue holes in sheets. (3) Copper ferrules, thickness and width. (4) Give length of flue projecting through sheet at both ends. (5) Tightening flues in sheet. Give standard tools for rollers, prosser tools, beading tools." Albert F. Stiglmeier, chairman.

"Is the use of automatic stokers on locomotive engines injurious to the firebox sheets? Do the firebox sheets crack more readily in a stoker-fired engine than in a hand-fired locomotive?" H. A. Bell, chairman.

"Care of watertube stationary boilers." J. J. Davey, chairman.

"Steam leaks and the bad effects on the boiler plate." D. A. Lucas, chairman.

"The life of the superheater tube and the number of safeends that should be applied before they are cut down for a smaller boiler." J. P. Malley, chairman.

"What experience has been had in connection with the electric weld heater?" John W. Holt, chairman.

Nation-Wide Conference of Foreign Traders to Meet in New Orleans

W ITH registrations already received from 21 states and two foreign countries, plans for the New Orleans Foreign Trade Convention, May 2-3-4, are rapidly taking shape.

Emphasis will be laid on the importance of European markets to American foreign trade and prosperity. The opening session of the convention will consider a report on "European Conditions Today," specially prepared for this meeting by a committee of the National Foreign Trade Council.

In this same session, Dr. Jeremiah W. Jenks, Alexander Hamilton Institute, will discuss "European Progress During the Year." Some of the barriers encountered in trading with Europe will be described by W. F. Gephart, First National Bank of St. Louis; while methods of trading under abnormal conditions and in the face of depressed exchange, will be outlined by A. C. Kains, president of the Federal International Banking Company, New Orleans.

Delegates to the Foreign Trade Convention will be taken over the harbor of New Orleans on May 5, prior to the formal opening, as guests of the Port Commission.

Repairing Locomotives for Economy

PRACTICALLY all railroad shops are now crowded to their full capacity with locomotives undergoing repairs.

With insistent demands for motive power and with forces in many cases still disorganized from the strike, the situation is very trying to the foremen. When work is rushed, there is always a tendency to neglect details, and for that reason every foreman should impress upon his men that a locomotive poorly repaired usually wastes many times the amount that is saved by rushing it out of the shop. Some mechanics fail to realize how their work affects the operation of the locomotives, and the lack of such knowledge often leads to serious mistakes. For example, a boiler maker repairing ash-pans found that the section over the trailer wheel was sometimes cut by the flange on the trailer tire. To overcome the trouble, he raised the entire ash-pan closer to the mudring, not realizing that by so doing he was reducing the efficiency of the boiler and decreasing the capacity of the locomotive. Few men, unless they have had considerable experience, understand the necessity for accurately locating the stack and alining the exhaust nozzle so that the jet will be exactly in the center. Foremen should also impress upon the men the importance of careful work in applying cylinder and valve rings, in setting valves properly, in fitting up superheater units and steam pipes so that they will stay tight, and in fact all work that affects steam consumption. The price which the

Home-Made Equipment for the Boiler Shop

By C. E. Lester

IN every issue of the trade magazines I look with interest for new devices or kinks in shop operation where "the other fellow" has accomplished results in a new or better way. I find all too few suggestions and frequently wish that the other fellow would "loosen up" with his ideas and publish some of the thousand and one new kinks that are

developed daily. Perhaps others feel as I do and with this thought in mind I am submitting a few drawings of some home made devices of proven worth that are in almost daily use in a railroad shop. I claim none of them as my own; however, I see merit in them and I believe that others may care to make use of them.

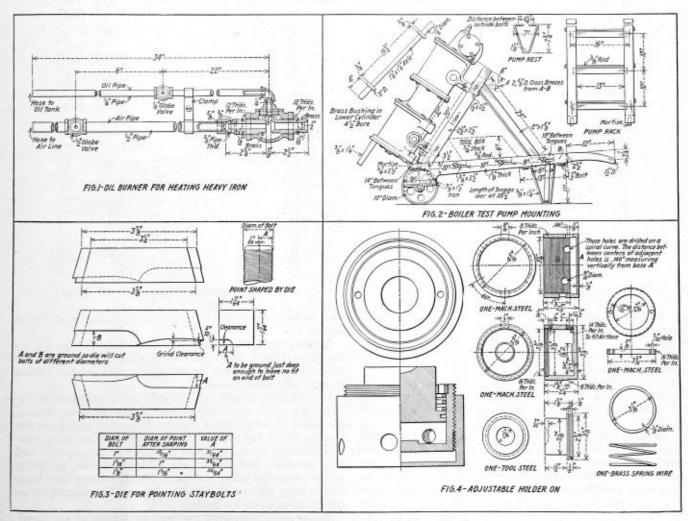

Fig. 1 illustrates a large oil heater for mudring corners, throat sheet connections and other heavy work that gives an railroads pay for coal at present ranges from \$3 to \$6 per ton, so the cost of fuel for a single trip with a large locomotive may be from \$60 to \$120. Giving the shopmen an understanding of the cost of locomotive fuel and the extent to which slight errors may affect the coal consumption, should have a good effect in making them more accurate in their work, and insure that locomotives which have received repairs will operate with maximum economy.—*Railway Mechanical Engineer*.

excellent heat. This tool is made from a globe valve body with some special brass fittings and common pipe and fitting —all of which may be found in any railroad shop.

In Fig. 2 is given a method of mounting a boiler test pump. The use of a 9 inch air pump bushed down on the air end for a boiler test pump developed the necessity for some convenient arrangement to make it portable. By mounting the pump on a two wheeled truck as illustrated the pump can readily be moved to its destination; the truck may also mount a tool box in which the fittings, gaskets, test gage, etc., are carried.

Fig. 3 illustrates dies for pointing staybolts. It will be observed that the contour of the die eliminates interference with the first thread on the bolts.

An adjustable holder-on and its details are given in Fig. 4. This tool can be made in any machine shop from rough stock or scrap axles or wrist pins and will be found invaluable for holding on rivets in narrow water spaces such as the flue sheet legs.

Easily Built Devices for Railroad Shop Service

Boiler Design in Relation to Maintenance*

Factors Entering Design and Construction of British Locomotives and Their Influence on Upkeep and Repair Problems

By A. E. Kyffin

I N this paper it is not intended to consider the boiler in its functions as a steam producer, the object being to call attention to some of the more important details of locomotive type boilers in which considerable diversity of practice exists, and which, while they are but parts of the boiler, yet have an important bearing on the life and maintenance of it as a whole, more especially when considered from the running shed and repair shop point of view.e

TUBE ARRANGEMENT

Apart from the water-space stays there is no part of a boiler which causes more anxiety and trouble than the fire-

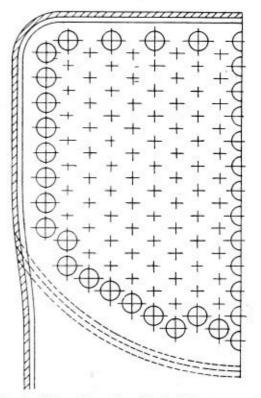

Fig. 1.-Tubes Shown in a Vertical Arrangement

box tubeplate, and the extent and frequency of the trouble depends to a large extent on the arrangement of the tubes in this plate.

Broadly, there are two systems of arranging tubes, namely, vertical and horizontal rows, as shown in Figs. 1 and 2.

The claim generally made for the first system is, that by reason of the tubes being directly under one another there is less opportunity for scale to collect, and also that the steam bubbles are not impeded in their upward course; but when the two outer rows are considered in their relation to the flange of the plates it would seem that the small section presented by the aggregate of the bridges of metal offers but small resistance to the flexure of the plate due to the expansion of the tubes, and thus cracks are more readily developed than is the case with the far greater section offered at the outer

*Paper read before the Institution of Locomotive Engineers at Manchester, England, November 3, 1932

rows with the horizontal rows of tubes. This is sometimes recognized and every other tube pitch left out in some designs. Many examples exist in which designers have crowded far too many tubes into the boilers with a view to getting "paper" heating surface, with the result that the bridges in the tubeplate are often as small as $\frac{5}{5}$ inch; this not only leads to cracks at an early stage, but makes it next to impossible to remedy such cracks by the usual methods, as there is not sufficient metal to tap into. A further fault with such crowding is, that unless the water is very good the spaces between the tubes are rapidly made up, as it is next to impos-

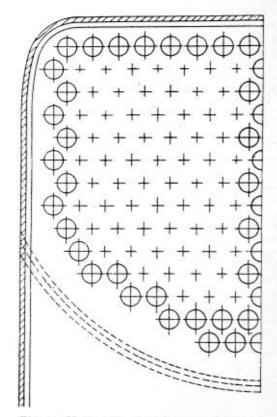

Fig. 2.-Horizontal Arrangement of Tubes

sible to wash out, however ample the provision made for so doing.

Another fault often found, which also follows from the desire to get a lot of tubes in, is the placing of tubes right into the radius of the flange of the plates; this practice cannot be too severely condemned.

If tubes were spaced so as to give say, a minimum of 78inch bridge and were kept at least a tube diameter clear of the radius of the flange of the plates, there is little doubt but that the life of tubeplates would be prolonged and many anxious moments spared to those in charge of the engines; and it is extremely doubtful if, over a length of time, the boiler would prove any worse a steamer, for all railway men know that a large percentage of the tubes can be plugged before the steaming capacity drops.

Tubes are often placed too near the bottom of the barrel, with the result that washing out cannot be satisfactorily done and the circulation of the water along the bottom of the barrel into the front leg of the firebox is impeded; in most cases the bottom row and the outer tubes of the row above could be left out with advantage.

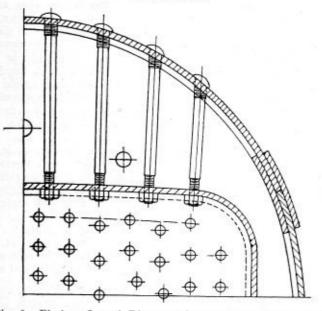

Fig. 3 .- Firebox Stayed Direct to Shell with Straight Bolts

The last mentioned arrangement, which is by no means unknown, brings out in an acute degree the question of palm stays to the tubeplate, as the distance between the top row of water-space stays and the nearest tubes is considerable.

Although there are instances of boilers without palm stays, their place being taken by combining a small radius in the throat plate and the raising of the top row of water-space stays to the utmost, yet in most cases they are used in some form, but their record of breakage is very high and many different forms have been evolved to mitigate the trouble, such as anchoring them several feet away from the tubeplate to give flexibility, and even of articulating them. In some designs the forged stay, into which the copper stay is screwed, stops short of the tubeplate by 1-inch or even more, whereas in other examples the forged stay is brought right up to the plate, each form having its advocate.

Another practice in palm stays is used on a few railways,

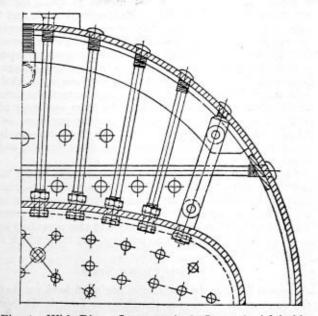

Fig. 4 .-- With Direct Stays an Arch Crown is Advisable

namely, the provision of what are practically longitudinal stays between the tube plates along the barrel bottom; this system however, makes the washing out of the barrel more difficult and the stays are difficult to replace.

With the growth of boilers the practice of providing stays to the tube plates in the tube area has increased to some extent, these being usually in the form of solid rods, although stay tubes, after marine practice, are sometimes found. The

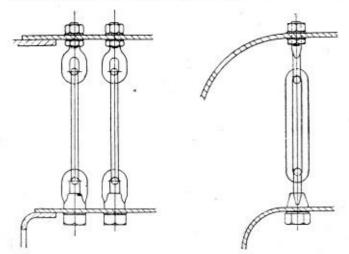

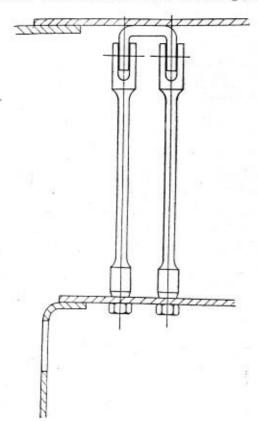

Fig. 5.-Two Methods of Staying Without Screwed Stays

need for such stays is questionable in view of the enormous holding power of tubes, and it would be valuable information if evidence could be produced that tube leakage had been reduced or the life of the tube plate prolonged by their use.

WATER SPACE STAYS

Many efforts have been made by designers to either eliminate or render these less liable to breakage, the best

known of the devices for doing away with stays being the Jacob-Schupert firebox; but as this form of construction does not lend itself to fireboxes carried between the frames it need not be considered in connection with British locomotives. Concerning the second class, in American practice, to some

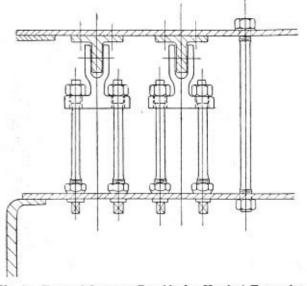

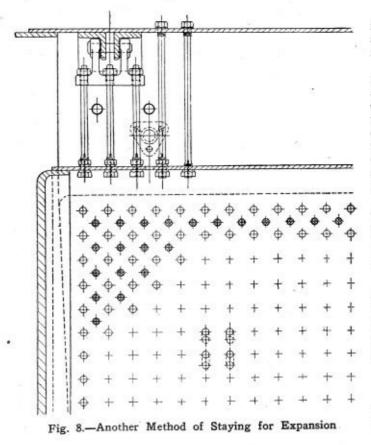

Fig. 7 .- Type of Stays to Provide for Vertical Expansion

extent at least, flexible stays of the Tate type are fitted either to the whole firebox or more commonly to the breakage area. To the best of the author's belief, these have not been tried in Great Britain, and it would be interesting to know why.

Locomotive engineers seem to have settled down to the practice, with copper fireboxes, of using plain copper stays, but there is by no means any standard as regards the diameter of such and areas supported by them. When boiler pressures were about 160 pounds, the usual rule was to use

about 1-inch diameter stays supporting an area of about 16 square inches, but with the rise in pressures the area has naturally been reduced and in some cases $1\frac{1}{2}$ -inch diameter stays used, either throughout the firebox or in the top rows; but it is questionable whether the latter is advisable, as it means that a very large stay has to be put in for renewals, and even a $1\frac{1}{2}$ -inch stay is a comparatively rigid bar which offers considerable resistance to the bending action imposed by the upward expansion of the firebox. It would be instructive if two boilers were made identical in all respects, saving that one should have, say, 1-inch stays spaced as widely as possible, and the other, say, $3\frac{1}{4}$ -inch stays spaced to suit the permissible tensile stress on the stays and a record kept over a period of the stay failures and the extent of the bulging of the plates.

It is highly desirable that water-space stays be made as long as possible, even if the firebox width, and therefore the number of tubes, suffer slightly; also more consideration should be given than is often the case to the angle at which the stays enter the copper plate, as a bad angle of entry tends towards leaky stays.

An interesting method of endeavoring to mitigate the breakage of stays in the area at the top front corners of the side plates is employed by two large railways the author is acquainted with, namely, the provision of an additional stay

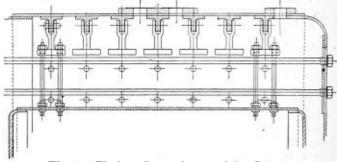

Fig. 9.-Firebox Stays Arranged in Groups

in the center of each ordinary spacing (see Fig. 8); but this arrangement would appear only to have the effect of rendering this area very rigid.

In the boilers of many locomotives built in this country for overseas lines the water-space stays have detector holes about $\frac{1}{4}$ -inch diameter drilled in them, either for a distance of about $1\frac{1}{4}$ inch—that is, far enough to bring the hole into the water space—or else drilled right through and the outer end laid over or filled with a copper plug. Provided the water is reasonably good, these holes show the presence of fractured stays, but with water which rapidly deposits scale the fracture, which ordinarily is of slow development, is filled up as it grows and the object of the hole is defeated.

On the question of whether it is best to turn the threads off the portion of the stays between the inner and outer plate or to retain them opinions differ, as many engineers adopt the one form and many the other, but it seems reasonable to argue that the turned-down stay is the more flexible, and is also less liable to collect scale.

The pitch of stays in relation to the flanges of the tubes and door plates, foundation and firehole rings, requires attention, and many examples can be found in which the stays are brought unnecessarily close to such parts, thus preventing the firebox from breathing freely and also providing areas in which scale can readily accumulate, but from which it is difficult to clean it.

FIREBOX CROWN STAYS

Even at this late day locomotive engineers have not decided the question as to whether the Belpaire form is the best or not: thus while many large boilers of this type are built, there is also a large number of the round-topped variety; but if the latter gives perfect results, why do engineers continue to build the Belpaire box, which is undoubtedly heavier and more expensive? The answer to the question whether one type is better than the other can only be given by engineers who have both types under their supervision as regards running and repairs.

The roof bar or girder stay, while far from dead, is not so much used—for main line engines—as before; it is heavy, and it cannot be denied that it seriously hinders the cleaning of the firebox top and is an admirable collector of scale. The alternative is, of course, the direct stay commonly in the form of a bolt screwed into the steel firebox shell top and the copper plate, being riveted over at the steel plate and nutted under the copper (see Fig. 3); but it is not unusual to have nuts both above and below the latter.

If plain direct stays are used, it is good practice to arch the crown of the copper box and arrange the stays radially so as to get as many full threads of the stays in both plates, but especially in the steel plate, as the stay end is riveted over at that end, Fig. 4, which gives the cross section of the two boxes-one with radial stays and the other with vertical stays.

There are many other forms of roof stays devised to obviate the disadvantages of screwing the stays into the outer plate, some of which are shown in the accompanying sketches, Figs. 5 and 6. These all have their good features, but all are more expensive than the plain stay.

It is usual to provide for the upward expansion of the tubeplate by arranging for the front two, three or even four rows of vertical stays to have a certain amount of free vertical movement, most commonly by attaching them in groups of twos or threes in a tee sling supported from the outer wrapper plates, Figs. 7 and 8; there are, of course, other devices such as the provision of a few rows of stays of the types shown in Figs. 5 and 6. Cases are not uncommon in which such expansion stays are fitted above the back or door plates of fireboxes, but as this plate is rigidly attached to the shell plate by the firehole, the need for such flexible stays is questionable. One British railway, at least, builds all its boilers with the firebox crown stays slung in groups, as in Fig. 9.

(To be continued)

Second Revision of the A. S. M. E. Boiler Code

Continuation of Proposed Changes in Provisions Dealing with the Construction of Power Boilers

THE first section of the revised Boiler Code was published on page 233 of the August, 1922, issue of THE BOILER MAKER; the second section appeared on page 281 of the October issue; and the third on page 73, of the March issue. Below a continuation of the work of the committee on revision is given.

In the course of the Boiler Code Committee's work during the past four years, many suggestions have been received for revisions of the Power Boiler Section of the Code, as a result of the interpretations issued and also of the formulation of the Locomotive Boiler and Miniature Boiler Codes. In order that due consideration might be accorded to these recommendations, the Committee began in the early part of 1921 to devote an extra day at each of its monthly meetings to the consideration of the proposed revisions. As a result of this many of the recommendations have been accepted and revisions of the paragraphs formulated.

The revisions which have met the approval of the Boiler Code Committee are here published. It is the request of the Committee that these revisions be fully and freely discussed so that it may be possible for anyone to suggest changes before the rules are brought to final form and presented to the Council for approval. Discussions should be mailed to C. W. Obert, Secretary to the Boiler Code Committee, 29 West 39th street, New York, N. Y., in order that they may be presented to the Boiler Code Committee for consideration.

The revisions here published are limited to the paragraphs appearing in the 1918 Edition of the A. S. M. E. Boiler Code, and the paragraph numbers refer to the paragraphs of similar number in that edition. For the convenience of the reader in studying the revisions, all added matter appears in small capitals and all deleted matter in smaller type.

PAR. 248 COMBINE THIS PARAGRAPH WITH PAR. 249 AND INSERT FOLLOWING NEW PARAGRAPH:

CUTTING OF PLATES

248 PLATES MAY BE CUT BY MACHINING, PUNCHING, SHEARING OR CUTTING BY THE ELECTRIC ARC OR GAS, PRO-VIDED ENOUGH METAL IS LEFT AT ANY UNFINISHED EDGES TO

MEET THE REQUIREMENTS OF PARS. 249, 253, AND 257. Par. 250 Revised:

250 A firetube boiler WITH TUBES UNDER 5 INCHES DIAMETER shall have THE [both] ends of the tubes FIRMLY [substantially] rolled and beaded, or rolled and welded at the firebox or combustion-chamber end, AND ROLLED AND BEADED AT THE OTHER END. IN THE CASE OF TUBES UNDER 14 INCHES DIAMETER, THE TUBES MAY BE EXPANDED BY THE PROSSER METHOD IN PLACE OF ROLLING. IN THE CASE OF TUBES 5 INCHES IN DIAMETER AND OVER, THE TUBES SHALL BE SECURED BY RIVETING OR OTHER APPROVED METHOD AT BOTH ENDS. IF WELDED, THE WELDING SHALL BE AROUND THE EDGE OF THE BEAD OR IF THE TUBE IS NOT BEADED THE TUBE SHEET SHALL BE CHAMFERED OR RECESSED TO A DEPTH AT LEAST EQUAL TO THE THICKNESS OF THE TUBE. IN NO CASE SHALL THE TUBE END EXTEND MORE THAN 3% INCH BEYOND THE TUBE SHEET.

PAR. 251 REVISED:

251 The ends of all tubes, suspension tubes and nipples shall be flared not less than $\frac{1}{8}$ inch over the diameter of the tube hole on all watertube boilers and superheaters, or they may be flared not less than $\frac{1}{8}$ inch, rolled and beaded, or flared, rolled and welded. WHERE SPECIAL REDRAWN PIPE AS PROVIDED IN PAR. 21 IS USED FOR TUBES IN WATERTUBE BOILERS, THE MINIMUM NUMBER OF THREADS SHALL CON-FORM WITH THE VALUES GIVEN IN TABLE 8. THE CLOSED ENDS OF THE STUB TUBES SHALL BE WELDED BY THE FORGING PROCESS.

FIG. 20 CHANGE NOTE AT BOTTOM OF FIGURE TO READ: Dimensions OF FINISHED HEADS may be larger or 1/10 smaller than those shown. Fillets under heads may be used but are not required. CHANGE CAPTION TO READ: Acceptable Forms of FINISHED Rivet Heads.

PAR. 253 REVISED:

253 Drilling of Holes. All holes in braces, lugs and sheets for rivets or staybolts shall be drilled, or they may be punched, at least $\frac{1}{8}$ inch less than full diameter for material not more than 5/16 inch thick, AND AT LEAST 1/4 INCH LESS THAN FULL DIAMETER FOR THICKER MATERIAL, NOT MORE THAN 5% INCH THICK.

HOLES SHALL NOT BE PUNCHED IN MATERIAL MORE THAN 5/8 INCH THICK.

FOR FINISHING THE RIVET HOLES, THE PLATES, BUTT STRAPS, BRACES, HEADS AND LUGS SHALL BE FIRMLY BOLTED IN POSITION BY TACK BOLTS, FOR FINAL DRILLING OR REAM-ING TO FULL DIAMETER.

THE FINISHED HOLES MUST BE TRUE, CLEAN AND CON-CENTRIC.

PAR. 255 REVISED:

255 Rivets. Rivets shall be of sufficient length to completely fill the rivet holes and form heads at least equal in strength to the bodies of the rivets. Forms of FINISHED rivet heads that will be acceptable are shown in Fig. 20.

PAR. 256 REVISED:

Rivets shall be SO DRIVEN AS [machine-driven 256 wherever possible with sufficient pressure] to fill the [rivet] holes preferably by a MACHINE WHICH MAINTAINS THE PRESSURE UNTIL NO PART OF THE HEAD SHOWS RED IN DAY-LIGHT [and shall be allowed to cool and shrink under pressure]. Barrel pins fitting the holes and tack bolts to hold the plates firmly together shall be used. A rivet shall be driven each side of each tack bolt before removing the tack bolt.

PAR. 257 REVISED:

257 Calking. The calking edges of plates, butt straps and heads shall be beveled to an angle not sharper than 70 degrees to the plane of the plate, and as near thereto as practicable. Every portion of the UNFINISHED [sheared] surfaces of the calking edges of plates, butt straps and heads shall be planed, milled or chipped to a depth of not less than 1/8 inch. Calking shall be done with a [roundnosed] tool of SUCH FORM THAT THERE IS NO DANGER OF SCORING OR DAMAGING THE PLATE UNDERNEATH THE CALKING EDGE.

PAR. 258 REVISED:

258 Manholes and Handholes. An elliptical manhole opening shall be not less than 11 by 15 inches, or 10 by 16 inches in size. A circular manhole opening shall be not less than 15 inches in diameter. A handhole opening in THE SHELL OF a boiler OR DRUM, the greatest dimension of which exceeds 6 inches, shall be reinforced in accordance with the rules for manholes.

PAR. 260 REVISED:

260 Manhole frames on shells or drums when used shall have the proper curvature, and on boilers over 48 inches in diameter shall be riveted to the shell or drum with two rows of rivets, which may be pitched as shown in Fig. 21. The strength of manhole frames and reinforcing rings shall be at least equal to the tensile strength (REQUIRED BY PAR. 180) of the maximum amount of the shell plate removed by the opening and rivet holes for the reinforcement on any line parallel to the longitudinal axis of the shell through the manhole, or other opening. WHEN A FLANGED MANHOLE FRAME IS USED THE FLANGED PORTION OF THE FRAME MAY BE CONSIDERED AS REINFORCEMENT UP TO A HEIGHT (h) OF THREE TIMES THE FLANGE THICKNESS (SEE FIG. 201/2).

PAR. 261 REVISED:

261 The strength of the rivets in shear on each side of a manhole frame or reinforcing ring shall be at least equal to the tensile strength of the maximum amount of the shell plate removed by the opening and rivet holes for the reinforcement on any line parallel to the longitudinal axis of the shell, through the manhole, or other opening, SUCH AS THOSE CUT FOR STEEL NOZZIES AND BOILER FLANGES, OVER 3-INCH PIPE SIZE.

PAR. 268 REVISED:

268 Threaded Openings. ALL PIPE THREADS SHALL CON-FORM TO THE AMERICAN PIPE STANDARD AND ALL [a pipe] connections 1 inch in diameter or over shall have not less than the number of threads given in Table 8.

If the thickness of the material in the boiler is not sufficient to give such number of threads, the opening shall be reinforced by a pressed steel, cast steel, or bronze composition flange, or plate, so as to provide the required number of threads.

When the maximum allowable working pressure exceeds 100 pounds per square inch, a NOZZLE OR SADDLE FLANGE [connection] riveted to the boiler to receive a flanged fitting

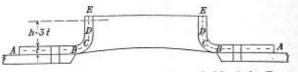

Fig. 201/2 .--Cross-Section of Flanged Manhole Frame

shall be used for all pipe openings over 3-inch pipe size.

IF SPECIAL REDRAWN PIPE, NOT TO EXCEED 11/2 INCH STANDARD PIPE SIZE, MADE FROM LAPWELDED IRON OF PUDDLED STOCK AND TESTED TO 1,000 POUNDS HYDRAULIC PRESSURE, IS USED IN WATERTUBE OR PORCUPINE BOILERS FOR A WORKING PRESSURE NOT TO EXCEED 200 POUNDS PER SQUARE INCH, WHEN SCREWED IN THE SHEET, WHICH HAS A WALL THICKNESS AT LEAST 50 PERCENT GREATER THAN THE WALL THICKNESS REQUIRED BY THE CODE FOR TUBES OF WATER-TUBE BOILERS, THE MINIMUM NUMBER OF THREADS SHALL CONFORM WITH THE VALUES GIVEN IN TABLE & AND THE CLOSED ENDS OF THE STUB TUBES MAY BE WELDED BY THE FORGING PROCESS.

PAR. 269 REVISED:

269 Safety Valve Requirements. Each boiler RATED TO DIS-CHARGE OVER 2,000 POUNDS OF STEAM PER HOUR AT THE ALLOWED PRESSURE SHALL HAVE TWO OR MORE SAFETY VALVES WHEN THE GENERATING CAPACITY OF THE BOILER EXCEEDS 2,000 POUNDS PER HOUR. THE METHOD OF COM-PUTING THE STEAM GENERATING CAPACITY OF THE BOILER SHALL BE AS GIVEN IN PAR. 421 OF THE APPENDIX [except a boiler for which one safety valve having a relieving capacity of 2,000 pounds per hour or less, is required by the rules].

PAR. 272 REVISED:

272 ALL safety valves shall be so CONSTRUCTED THAT NO SHOCKS DETRIMENTAL TO THE VALVE OR TO THE BOILER ARE PRODUCED [of such a type that] AND SO THAT no failure of any part can obstruct the free and full discharge of steam from the valve. Safety valves may be of the direct spring-loaded pop type with seat and bearing surface of the disk inclined at any angle between 45 degrees and 90 degrees to the center line of the spindle. The valve shall be rated at a pressure 3 percent in excess of that at which the valve is set to blow.

Safety valves may be used which give any opening up to the full discharge capacity of the area of the opening at the base of the valve, provided the movement of the valve is gradual so as not to induce lifting of the water in the boiler.

[All safety valves shall be so constructed that no detrimental shocks are produced through the operation of the valve.] Weighted lever safety valves shall not be used.

PAR. 273 REVISED:

273 Each safety valve 1 INCH SIZE AND LARGER shall be plainly marked by the manufacturer IN SUCH A WAY THAT THE MARKINGS WILL NOT BE OBLITERATED IN SERVICE. The markings may be stamped on the body, cast on the body, or stamped or cast on a plate or plates permanently secured to the body, and shall contain the following:

a The name or identifying trademark of the manufacturer b The nominal diameter

c The steam pressure at which it is set to blow (d Blow down, or difference between the opening and closing pressures)

(e) d The weight of steam discharged in pounds per hour at a pressure 3 percent higher than that for which the valve is set to blow

-(f) e A.S.M.E. Std.

PAR. 274 REVISED:

274 The MINIMUM AGGREGATE [total] relieving capacity of ALL OF the safety valve or valves required on a boiler shall be not less than that determined on the basis of 6 pounds of steam per hour per square foot of boiler heating surface for watertube boilers. For all other types of power boilers, the total relieving capacity shall be not less than that determined on the basis of 5 pounds of steam per hour per square foot of boiler heating surface. IN MANY CASES A GREATER RE-LIEVING CAPACITY OF SAFETY VALVES WILL HAVE TO BE PRO-VIDED THAN THE MINIMUM SPECIFIED BY THIS RULE AND IN EVERY CASE THE REQUIREMENT OF PAR. 270 SHALL HOLD.

[For boilers with maximum allowable working pressures above 100 pounds and on the basis of 3 pounds of steam per hour per square foot of boiler heating surface for boilers with maximum allowable working pressures at or below 100 pounds per square inch.]

The heating surface shall be computed for that side of the boiler surface exposed to the products of combustion, exclusive of the superheating surface. In computing the heating surface for this purpose, only the tubes, fireboxes, shell, tube sheets and the projected area of headers need be considered. The minimum number and size of safety valves required shall be determined on the basis of the total relieving capacity and the relieving capacity marked on the valves by the manufacturer. WHERE THE FIRING CONDITIONS ARE CHANGED TO INCREASE THE RATE OF STEAM GENERATION, THE SAFETY VALVE CAPACITY SHALL BE INCREASED TO MEET THE NEW CONDITIONS AND BE IN ACCORDANCE WITH PAR. 270.

PAR. 275 REVISED:

275 IF THE SAFETY VALVE CAPACITY CANNOT BE COM-PUTED, OR IF IT IS DESIRABLE TO PROVE THE COMPUTATIONS, IT [Safety valve capacity] may be checked in any one of the three following ways, and if found insufficient, additional capacity shall be provided:

[remainder of paragraph unchanged]

PAR. 276 REVISED:

276 When two or more safety valves are used on a boiler, they may be either separate or twin valves made by mounting individual valves on Y-bases, or duplex, triplex or multiplex valves having two or more valves in the same body casing. The valves shall be made of equal sizes, if possible, and in any event if not of the same size, the smaller of the two valves shall have a relieving capacity of at least 50 percent of that of the larger valve.

PAR. 277 REVISED:

277 The safety valve or valves shall be connected to the boiler independent of any other steam connection, and attached as close as possible to the boiler, without any unnecessary intervening pipe or fitting. SUCH INTERVENING PIPE OR FITTING, IF USED, SHALL NOT BE LONGER THAN THE FACE TO FACE DIMENSION OF THE AMERICAN EXTRA-HEAVY IRON FLANGED TEE FITTING OF CORRESPONDING SIZE SHOWN IN TABLE 17 AND FIG. 33. Every safety valve shall be connected so as to stand in an upright position, with spindle vertical, when possible.

PAR. 278 REVISED:

278 Each safety valve shall have AT LEAST A full-sized direct connection to the boiler. No valve of any description shall be placed between the safety valve and the boiler, nor on the discharge pipe between the safety valve and the atmosphere. When a discharge pipe is used, it shall be not less than the full size of the valve, and shall be fitted with an open drain to prevent water from lodging in the upper part of the safety valve or in the pipe. EACH VALVE SHALL HAVE AN OPEN DRAIN TAPPED FOR DRIP PIPE THROUGH THE CASING BELOW THE LEVEL OF THE VALVE SEAT. IN THE CASE OF FIRE-TUBE BOILERS, THE SAFETY VALVE OPENINGS SHALL BE NOT LESS THAN THOSE CORRESPONDING TO SAFETY VALVES HAVING THE INTERMEDIATE LIFTS AND CORRESPONDING RE-LIEVING CAPACITIES GIVEN IN TABLE 15.

PAR. 279 REVISED:

279 If a muffler is used on a safety valve it shall have sufficient outlet area to prevent back pressure from interfering with the proper operation and discharge capacity of the valve. The muffler plates or other devices shall be so constructed as to avoid any possibility of restriction of the steam passages due to deposit. When an elbow is placed on a safety valve discharge pipe, it shall be located close to the safety valve outlet or the pipe shall be securely anchored and supported. All safety valve discharges shall be so located or piped as to be carried clear from running boards or working platforms used in controlling the main stop valves of boilers or steam headers.

Where discharge pipes are used, THEY SHALL BE AS SHORT AND AS STRAIGHT AS POSSIBLE AND the cross-sectional area at any point shall be at least equal to the combined areas of the discharge outlets of the valves discharging therethrough. Ample drainage shall be provided at or near each safety valve and where the water of condensation may collect.

PAR. 280 REVISED:

280 When a boiler is fitted with two or more safety valves on one connection, this connection to the boiler shall have a cross-sectional area not less than the combined area BASED ON THE NOMINAL DIAMETERS of all of the safety VALVE CONNECTIONS [valves with which it connects].

PAR. 281 REVISED:

281 Safety valves shall operate without chattering and shall be set and adjusted as follows: To close after blowing down not more than 4 PERCENT NOR LESS THAN 2 PERCENT OF THE SET PRESSURE, BUT NOT LESS THAN 2 POUNDS IN ANY CASE. [4 pounds on boilers carrying an allowed pressure less than 100 pounds per square inch gage. To close after blowing down not more than 6 pounds on boilers carrying pressures between 100 and 200 pounds per square inch gage inclusive. To close after blowing down not more than 8 pounds on boilers carrying over 200 pounds per square inch gage]

PAR. 282 REVISED:

282 To insure the valve being free, each safety valve shall have a substantial lifting device by which the valve may be raised from its seat at least 1/16 inch when there is no pressure on the boiler. The valve should not be lifted UNLESS THERE IS SUFFICIENT STEAM PRESSURE ON THE BOILER TO BLOW ALL DIRT AND SCALE CLEAN FROM THE SEAT.

PAR. 286 REVISED:

286 A safety valve over 3-inch size, used for pressures greater than 15 pounds per square inch gage, shall have a flanged inlet connection. The dimensions of flanges subjected to boiler pressure shall conform to the American Standard given in Table [s] [16 and] 17 of the Appendix [for the pressures therein specified], except that the face of the safety valve flange and the nozzle to which it is attached may be flat and without the raised face for pressures up to and including 250 pounds per square inch. For higher pressures, the raised face shall be used.

PAR. 287 REVISED:

287 When the valve body is marked [with the letters A.S.M.E. Std.] as required by Par. 273, this shall be a guarantee by the manufacturer that the valve conforms to the details of construction herein specified.

PAR. 289 REVISED:

289 Every safety valve used on a superheater, discharging superheated steam, shall have a steel body INCLUDING ALL PARTS WHICH COME IN CONTACT WITH THE STEAM BE- TWEEN THE INLET AND OUTLET, with a flanged inlet connection, and shall have the seat and disk of nickel composition or equivalent material, and the spring fully exposed outside of the valve casing so that it shall be protected from contact with the escaping steam.

PAR. 290 REVISED:

290 Every boiler shall have proper outlet connections for the required safety valve or valves, independent of any other outside steam connection, the area of opening to be at least equal to the aggregate [nominal] area BASED ON NOMINAL DIAMETERS of all of the safety valves to be attached thereto. An internal collecting pipe, splash plate or pan may be used, provided the total area for inlet of steam thereto is not less than TWICE [one and one-half times] the aggregate area of the CORRESPONDING NOMINAL DIAMETERS OF THE attached safety valves. The holes in such collecting pipes shall be at least 1/4 inch in diameter and the least dimension in any other form of opening for inlet of steam shall be 1/4 inch.

PAR. 299 CANCEL PRESENT WORDING OF REVISION AS PUB-LISHED IN JULY ISSUE OF MECHANICAL ENGINEERING AND SUBSTITUTE THE FOLLOWING:

299 Fittings. FLANGED CAST IRON PIPE FITTINGS INCLUD-ING THOSE FOR STEAM AND FOR FEED WATER AND WHERE THE PRESSURES DO NOT EXCEED 160 POUNDS SHALL CON-FORM TO THE AMERICAN STANDARD GIVEN IN THE APPENDIX. IF THE FITTINGS ARE BELOW THE WATER LINE THEY SHALL BE EXTRA HEAVY.

For pressures exceeding 160 pounds per square inch, fittings more than 2-inch pipe size or equivalent cross-sectional area, shall be of cast or forged steel. (See Pars. 9 and 245.) The dimensions of the flanges and drilling shall conform to the american standard given in table 17.

For pressures exceeding 250 pounds per square inch, the flange thickness, and the thickness of the bodies shall be increased to give at least the same factor of safety as the fittings specified in the table, when used for the maximum pressures permitted in the code.

The face of the flange of a safety valve, as well as that of a safety valve nozzle, may be flat and without the raised face, for pressures not exceeding 250 pounds but shall have the raised face for higher pressures.

The number of bolts in a flange may be increased, provided they are located on the standard bolt circle. Other exceptions are noted in Par. 12. Tables 16 and 17 do not apply to flanges on the boiler side of steam nozzles, or to flanges left by the manufacturer as part of the boiler; and do not apply to fittings designed as part of the boiler.

PAR. 306 REVISED:

306 Each superheater shall be EQUIPPED [fitted] with AT LEAST ONE DRAIN SO LOCATED AS WILL MOST EFFECTIVELY PROVIDE FOR THE PROPER OPERATION OF THE APPARATUS. PAR. 311a REVISED:

311*a* On all boilers except those used for traction and portable purposes, when the maximum allowable working pressure exceeds 125 pounds per square inch, each bottom blow-off pipe shall have two valves, or a valve and a cock, and such valves, or valve and cock, shall be of extra heavy CONSTRUCTION [except that]. On a boiler having multiple blow-off pipes, a single master valve may be placed on the common blow-off pipe from the boiler, in which case only one valve on each individual blow-off is required. Two INDE-PENDENT VALVES OR A VALVE AND A COCK MAY BE COMBINED IN ONE BODY PROVIDED THE COMBINED FITTING IS THE EQUIVALENT OF TWO INDEPENDENT VALVES OR A VALVE AND A COCK SO THAT THE FAILURE OF ONE TO OPERATE COULD NOT AFFECT THE OPERATION OF THE OTHER. PAR. 312 REVISED:

312 A bottom blow-off pipe when exposed to direct furnace heat shall be protected by fire-brick, OR OTHER HEAT RESISTING MATERIAL SO ARRANGED THAT THE PIPE MAY BE INSPECTED [a substantial cast iron removable sleeve or a covering of non-conducting material].

PAR. 314 CANCEL PRESENT WORDING OF REVISION AS PUB-LISHED IN JULY ISSUE OF MECHANICAL ENGINEERING AND SUBSTITUTE THE FOLLOWING:

314 THE FEED WATER SHALL BE INTRODUCED INTO A BOILER IN SUCH A MANNER THAT THE WATER WILL NOT BE DISCHARGED DIRECTLY AGAINST SURFACES EXPOSED TO GASES OF HIGH TEMPERATURE, OR TO DIRECT RADIATION FROM THE FIRE, OR CLOSE TO RIVETED JOINTS OF SHELL OR FURNACE SHEETS.

PAR. 315 OMIT FIRST SECTION OF REVISION AS PUBLISHED IN AUGUST ISSUE OF MECHANICAL ENGINEERING, AND RETAIN LAST SECTION OF PARAGRAPH AS FOLLOWS:

315 In Fig. 22 is illustrated a typical form of flange for use on boiler shells for passing through piping such as feed, surface, blow-off connections, etc., and which permits of the pipes being screwed in solid from both sides in addition to the reinforcing of the opening in the shell.

PAR. 316 CANCEL PRESENT WORDING IN BOILER CODE AND REPLACE BY SECOND SECTION OF REVISED PAR. 315 AS PUBLISHED, AS FOLLOWS:

316 In THESE AND other types of boilers where both internal and external pipes making a continuous passage are employed, the boiler bushing or its equivalent shall be used.

PAR. 321 REVISED.

321 The water connections to the water column of a boiler [shall be of brass] WHEN PRACTICAL, shall be provided with a cross AT EACH RIGHT-ANGLE TURN to facilitate cleaning. For PRESSURES OF 200 POUND STEAM PRESSURE OR LESS, THE WATER CONNECTION, IF PIPE IS USED, SHALL BE OF BRASS.

PAR. 323 REVISED:

323 Methods of Support. A horizontal-return-tubular boiler over 78-inch in diameter shall be supported from steel lugs by the outside suspension type of setting, independent of the boiler side walls. The lugs shall be so designed that the load is properly distributed between the rivets attaching them to the shell and so that no more than two of these rivets come in the same longitudinal line on each lug. The distance girthwise of the boiler from the centers of the bottom rivets to the centers of the top rivets attaching the lugs shall be not less than 12 inches. The other rivets used shall be spaced evenly between these points. If more than four lugs are used they shall be set in four pairs, THE LUGS OF EACH PAIR TO BE SPACED NOT OVER 2 INCHES APART AND THE LOAD TO BE EQUALIZED BETWEEN THEM.

Additional revisions of the Boiler Code will appear in the May issue.

Mechanical Stokers—Sales, Horsepower, and Kinds of Installation for the Months of January and February, 1923.

The Department of Commerce, Washington, D. C., announces that according to the returns made to the Bureau of the Census the sales of mechanical stokers for the months of January and February, 1923, were as follows:

	Number of establish-	Number of stokers	Total horse- power of	firetu	led under be boilers		led under
	ments re-		stokers	Total	Total	Total	Total
January February .		145 1129	83,270 66,619	29 9	3,400 1,172	116 120	79,870 65,447

¹Exclusive of two stokers equaling 150 horsepower installed under furnaces.

Over a billion dollars for railroad equipment has been authorized for expenditure during the present year. Of this amount \$160,000,000 is to be devoted to locomotive construction. From January 21, 1922, to March 15, 1923, the railroads of the country placed orders for 4,219 new locomotives and of this number 2,106 have already been put in service. The reports since the first of the year up to April 1 show orders for 1,358 locomotives and the requirements for new power have not yet reached the peak.

Resolutions recently adopted by the American Railway Association form the basis of a definite policy for the railroads to follow in meeting an expected record demand on transportation facilities. These resolutions deal with car repairs, fuel requirements, maintenance of way, coal movement, building programs, car loading and mileage, storage facilities, car shortage and the like. One of the resolutions provides that by October 1, 1923, locomotives awaiting heavy repairs be reduced to a basis for the entire country of 15 percent.

At present the number of locomotives in line for general repairs is about 21 percent. The fulfilment of the program outlined would add 4,250 to the number of locomotives for service. The objective of 15 percent is lower than has prevailed for years and is beyond hope of attainment unless personnel and equipment are able to handle the increased output. This demand for speedier turn-around in the shop is a problem that the boiler department must meet and means that the forces of first class boiler makers should be expanded to take care of the work. Men who have drifted into other lines of work will find that better opportunities now exist in their own trade of boiler making. Those now engaged in the shops will have a prominent place in making the transportation program a reality.

The convention season is almost here and plans for the two principal meetings for the members of the boiler industry are nearly completed. The programs for the annual meeting of the American Boiler Manufacturers' Association and for that of the Master Boiler Makers' Association convention appear elsewhere in this issue. No effort is being spared by the officers of the associations to make the meetings this year the best ever held and it only remains for the members to do their part by attending and entering fully into the proceedings.

As has been customary in the past, the American Boiler Manufacturers' Association will combine its business sessions with sports and social activities, selecting as the scene of its meetings this year The Homestead at Hot Springs, Va. The secretary of the association suggests that members make reservations as early as possible in order that no difficulty be experienced on arriving at the hotel. The dates for the meetings are June 4, 5, and 6.

The Master Boiler Makers' convention is scheduled for May 22 to 25 at the Hotel Tuller, Detroit, Mich. In connection with the meeting the Boiler Makers' Supply Men's Association will also hold its convention and present the products of its members for the inspection of the master boiler makers. The opportunity for the supply men to make this feature of the convention of maximum benefit to all concerned is better than ever before. This is particularly true because of the decision to omit the exhibits at the June convention in Chicago of Section V—Mechanical of the American Railway Association. The Master Boiler Makers' convention offers an excellent chance to present shop equipment and supplies covering at least one section of the railroad field.

The secretary of the Supply Men's Association has sent notices of the convention and exhibits to all manufacturers who sell equipment to railroads and who are interested in the boiler department. These manufacturers have been invited to join the association and exhibit their products. Application for membership and exhibit spaces can be obtained from W. H. Dangel, secretary of the Boiler Makers' Supply Men's Association of the Lovejoy Tool Works, Chicago, Ill.

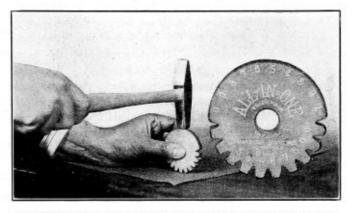

Engineering Specialties for Boiler Making

New Tools, Machinery, Appliances and Supplies for the Boiler Shop and Improved Fittings for Boilers

All-In-One Steel Figures Save Time

An ingenious arrangement of steel figures, with important advantages over the individual steel figures or letters commonly used, is shown in the illustration and has been placed on the market recently by Marburg Bros., Inc., New York. The method of using these figures is plainly shown at the left in the illustration and a close-up view at the right.

Many obvious advantages result from this arrangement including in the first place the saving of a large amount of

View Showing Method of Using All-In-One Steel Figures

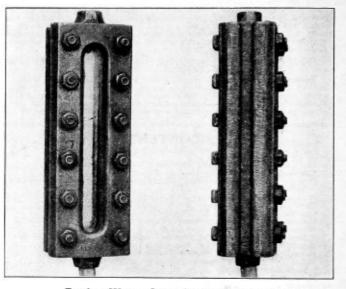

time formerly spent hunting for the correct individual figures. The All-In-One is more convenient to handle, with less danger of smashed fingers, and vertical figures or letters are produced with ease. In addition, the speed of stamping is greatly increased and the figures never get upside down. Shattering is prevented and the general appearance of the lettering is improved. Individual figures cannot be lost.

The All-In-One can be furnished for metal, wood, or leather in seven sizes from 1/16 in. to 3% in. In case alphabets are desired they can be furnished on three discs.

Water Gage Glass Designed to Be Unbreakable

The Duplex glass water gage, shown below, is a new development recently brought out by the Duplex Glass Water Gage Company, Youngstown, Ohio. The following advantages, substantiated by actual service tests, are claimed for this glass: It permits accurate reading of water level from both sides of the gage, enabling the water level to be determined by both the engineer and fireman from their respective positions in the cab. The glasses used are 1/2 inch thick and smooth on both sides, eliminating the possibility of corrosion which makes reading difficult. The glass will last indefinitely barring accidents and, having no intricate parts to get out of order, it can easily be assembled by anyone and kept in good operating condition. The Duplex glass embodies all the advantages of the tubular glass without its objectionable features. It eliminates the danger of flying glass in the event of breaking. It will withstand indefinite pressure and can be applied to steamboat, stationary, and other types of boilers as well as locomotive boilers. No additional illumination is required at night other than that provided for the types of glass now in use. A composition gasket, made from sheet Permanite packing is used between the glass and central metal part to make a steam tight joint.

This gage was applied to a switching locomotive in steel mill service for ten months with no maintenance or repair

Duplex Water Gage Glass for Boilers

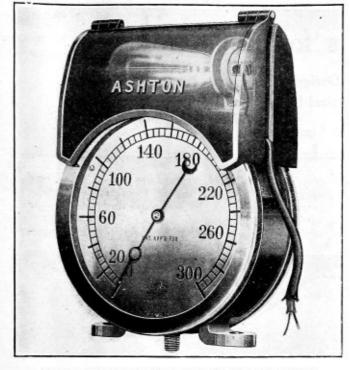

cost. The gaskets were renewed at the end of this period. The same gage was then applied to a railroad switching locomotive and remained in service three months with no repairs or renewals. It was removed at this time on account of the locomotive being transferred from the Youngstown territory. Each of the above tests was unofficial, being made as experiments with the consent of the local managements.

Double Dial Locomotive Steam Gage

The double dial locomotive steam gage, illustrated, is a recent development of the Ashton Valve Company, Boston, Mass. It is particularly designed for use on large oil-burning locomotives and locomotives having large fireboxes with boiler heads extending back into the cabs, requiring two steam gages, one visible to the engineman on one side of the cab, and one for the fireman on the other side.

The gage is constructed with two hands and also two dials which are opposite and parallel to each other. The hands work clockwise on one dial and contraclockwise on the other. Illumination for both dials is provided in the practical and compact manner illustrated. The particular advantage of this gage is in eliminating the necessity of two gages which take up valuable space in the cab and require duplicate piping.

The gage housing is self-contained and is equipped with

Double Dial Steam Gage with Electric Light Bulb

an A. R. A. standard receptacle for lamp bulbs, substantially fastened to the top of the gage. The arrangement is such that light is reflected downward on the two dials in such a manner as not to interfere with the vision of the engineman. The dials are finished either silvered or black, as specified, and are regularly graduated to 300 lb. or 400 lb. These gages are made only in the $3\frac{3}{4}$ -inch dial size, being contained in dust-proof brass, or iron cases, with threaded valve brass rings and having $\frac{1}{4}$ -inch standard pipe thread connection. When desired, gages are furnished without the electric light attachment.

Chain Hoist Swivel Hook

A new style of ball bearing swivel hook connection for the ends of hoisting chains has been developed by the Wright

Manufacturing Company, Lisbon, Ohio, as illustrated. This swivel eliminates the necessity of pulling and tugging at the load to get it into the desired position. Ease of swiveling permits heavy loads to be turned on this hook by a small expenditure of energy.

In construction the hook connection is practically indestructible, with a large drop forged housing enclosing the entire bearing and chain connection. The housing is split its entire length, being clamped together by three steel bolts, held by castellated nuts. The top bolt passes through the lower chain link but only acts as a reinforce-

Ball Bearing Swivel Hook

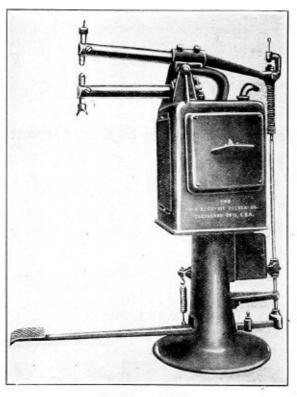

ment to the connections and clamp for the housing as the load on the hoist hook is supported by bosses forged in each half of the housings, these bosses meeting each other inside the lower chain link so that the hook is held on an area of forged steel equal to the clearance on the inside of the chain link. The two lower bolts of the connection serve only as housing clamps.

The lower ball race rests on a shoulder at the bottom of the housing. The upper race rests on the top of the large capacity balls which easily accommodate any overload hung on the hook. The straight shank of the hook passes up through the lower part of the housing and the inside of the ball races and is retained in place by a washer and extra large nut screwed and riveted to the threaded end of the shank.

The ball bearings are thoroughly lubricated so as to insure easy frictionless action and to overcome all difficulty in positioning heavy loads.

Spot Welding Machine

The U. S. Electric Welder Company, 327 Permanent Building, Cleveland, Ohio, has placed on the market a new type of welder, S A F, for light and medium stock. The internal automatic reactance prevents breakdown at overload and enables the welder to handle heavy stock without overheating. The automatic switch is equipped with magnetic blowout, removable contacts and is enclosed. A 5-point pivot

U. S. Spot Welder

switch provides different voltages at the welding point, which are water-cooled by means of a new system. All mechanical movable parts are of a special alloy or cast steel, therefore light.

About four seconds per weld is required for 3/16 inch stock and about 4,000 welds per hour can be made on 1/16 inch bright sheets.

Robert F. Eissler, for the past two years assistant to the vice-president of the Chicago Pneumatic Tool Company, Chicago, Ill., has resumed his former position as district manager for the company at Pittsburgh, Pa.

Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor-is given permission to do so.

Boiler Explosions

Q.—Why is a boiler when blowing up always thrown forward instead of backward?—C. B,

A.—A boiler on exploding may be thrown in any direction depending on where the rupture occurs in the boiler and the type.

There may be some other matter in connection with this question that you want information on, but, if we understand your question correctly, our reply seems sufficient.

Details of Thermic Syphon Layout

Q.-Please show me the method of laying out a "Nicholson Thermic Syphon."-J. F. D.

A.—A typical installation of three Nicholson syphons is shown in Fig. 1, as ordinarily applied in the fireboxes of locomotive boilers. A general view of the syphon is illustrated in Fig. 2. The neck of the syphon at a fits in the diaphragm plate to which it is welded as indicated at b, Fig. 3. The syphon is made usually from one plate of firebox steel, $\frac{3}{8}$ inch in thickness, being first cut to shape, then punched for the staybolts and then formed under hydraulic pressure with suitable dies to the shape shown in Fig. 2. After the body of the syphon is pressed, the top flange b is turned under

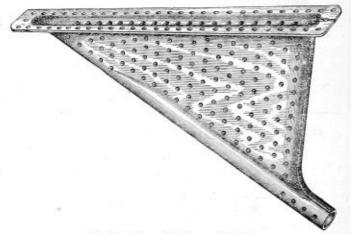

Fig. 2.-General View of Syphon

hydraulic pressure and the edges c are welded by the gas or electric method.

The construction, Fig. 4, is not produced to the required dimensions of the syphons, Fig. 1. It is enlarged somewhat to show the general method of producing sections on w-w, x-x and y-y. Owing to the sloping sides, the sections w-w and y-y are ellipses when the sections o-o at the ends of the

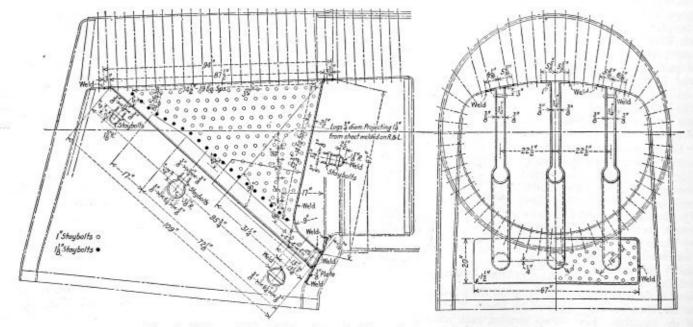

Fig. 1.-Side and End Elevations of Three Syphon Firebox Installation

plan view are semi-circular; or, if sections on w-w and y-y are semi-circular sections, o-o would be elliptical. Owing to the shape of the syphon and as it is formed from a single sheet, a developed pattern can cover only the principal dimen-

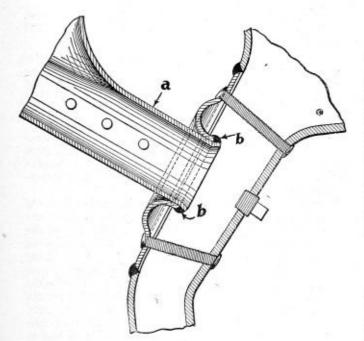

Fig. 3.-Connection of Syphon with Throat Sheet

sions, allowances must therefore be made for the curvature in the flange and where the circular section gradually runs into the elliptical section w-w.

Fig. 4 is drawn to the neutral layer of the plate and the curved section spaced off as required for securing the development lines 1-1, 2-2 and 3-3, etc. The one-half pattern, Fig. 5, is laid off from Fig. 4 and, as the respective construction lines are numbered the same in both views, the layout should be readily understood.

Effect of Mercury in a Boiler

Q.-If a pint or quart, or even a gatlon of mercury is placed in a steam boiler what effect will it have on it?-C. J. V.

A .- The specific gravity of mercury is 13.6 therefore the mercury would settle to the bottom of the boiler and remain there under working conditions. Mercury boils at a temperature of 357 degrees C. Under a disturbed condition, as when the mass is poured into the boiler, it would break up into globules. The specific heat of mercury is much less than that of water, being 0.0333. It would therefore absorb the heat more rapidly as it requires 1/30 or 0.0333 times the heat required to raise the temperature of water one degree F. If a large quantity of mercury is, for example, at the bottom of a tubular boiler the only possible effect that I can see is that it may lead to a violent ebullition of steam or to foaming.

Large Tank Problems

Q.—Having been a subscriber to THE BOILER MAKER a good many years, and seeing that you answer questions on laying off to subscribers, I wish to submit the following: 1. How to lay off an oil fuel tank 100 feet diameter or over? 2. Could a conical roof be laid off plate by plate by versed sine and chord, to save the cost of laying plates out in mass to mark (would top overlap of seam have a different length of chord and radius to bottom)? 3. Thirty or 40 feet high not particular to size in example, and if clinker built would the camber in top and bottom edge be a negligible quantity (but show how to get *it*)? 1a. Could bottom be marked off without laying plates out in mass to mark?—F. W. J.

A .- The conical roof layout and calculations will be given in answer to this question which in general covers the same conditions involved in the plating for the cylindrical section of the tank. Fig. 1 illustrates conventionally the section ele-

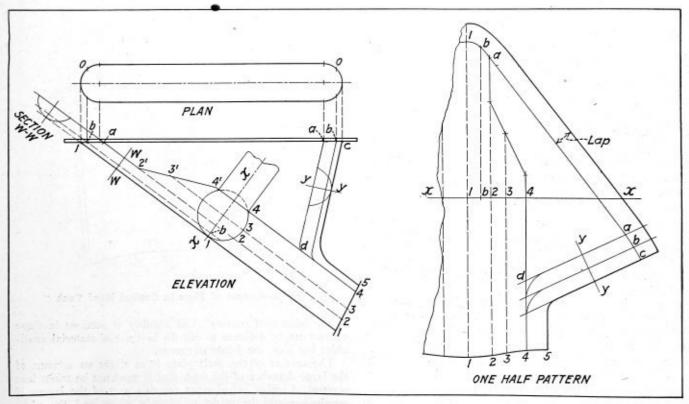

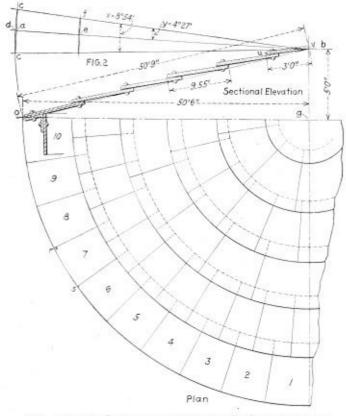

Fig. 4.-Construction Details of Syphon Layout

Fig. 5.-One Half Pattern of Thermic Syphon

vation and a one-fourth plan of the roof segments. The lower ring in each quarter is made of 10 segments and in the roof there are 5 rings, each of which is 9.55 feet in length measured as shown in the elevation. The top row or ring of segments is capped with a dished circular head. The number of segments in each of the overlapping rings depends on the general design required to meet the most economical use of the material available. This question will not be

Figs. 1 and 2-Plan and Elevation of Conical Roof Tank

considered in this case. To illustrate the conditions arising in the segment developments and calculations a solution is given for one of the segments in the lower ring, as follows: The roof diameter taken to the overhang end *o* equals

 $50\frac{1}{2} \times 2 = 101$ feet. The circumference equals $3.1416 \times 101 = 317.3$ feet.

There are 40 sections in the outer ring, so that the arc length of one section along r-s equals $317.3 \div 40 = 7$ feet 11 13/16 inches.

Height of roof measured as indicated in the sectional elevation is 5 feet. Length of the hypothenuse o-b of the right angle triangle o-g-b equals

 $\sqrt{50\frac{1}{2}^2} + 5^2 = 50$ feet 9 inches.

From these data the calculations of the angle between the sides of the segment 7 and the versed sine will be determined for the camber. Referring to Fig. 2, which shows the graphical construction of the pattern, the radius for describing the arc ϵ - ϵ is 50 feet 9 inches and the arc length is 7 feet 11 13/16 inches.

The length of the arc *c-c*, Fig. 2, is to the circumference of the circle of which it is a part, as the number of degrees in the angle *x* is to 360 degrees. Thus angle *x* equals $360 \times 7.15/16$ 8° 54′

$$\frac{360 \times 713710}{3.1416 \times 101} = 8^{\circ} 54' \text{ and angle } y = \frac{3^{\circ} 54'}{2} = 4^{\circ} 27$$

Sine 4° 27' = 0.07759

Length $a-c = bc \times sine$ of angle 4° 27' = 503/4 × 0.07759 = 3 15/16 feet. $ab = \sqrt{50\frac{3}{4}^2} - 3 \frac{15}{16^2} = 50.6$ feet.

Versed sine or distance a-d equals 50.75 - 50.6 = 0.15feet = 1.8 inches.

The length $b - e = bd - de = 50\frac{3}{4} - (9.55 \text{ feet} + 1.8 \text{ inches}) = 41.05 \text{ feet}.$

The length f-d = L-c - 9.55 = 50.75 - 9.55 = 41.2 feet. The distance $cf = 41.2 \times sine 4^{\circ} 27' = 41.2 \times 0.07759 = 3.2$ feet.

In Fig. 3 is shown the development of the pattern for segment 7. Line *a-e* is made 9.55 feet in length. Lines *c-c* and *f-f* are drawn through points *a* and *e* respectively, and at right angles to *a-e*. Make a-4 on line *a-e* 1.8 inches; from point *e* lay off the same distance. This length is the camber depth. The camber line may be developed in several ways. In this case, draw a circle with *a-4* as a radius, divide one-quarter into equal parts as I-2-3-4. Divide *a-c* into the same number of equal divisions, as *c-d-e-a* and erect perpendiculars to *a-c*. On lines drawn from *e* and *d* set off respectively the lengths 3-n and 3-m.

Through the points c, 2', 3', 4 draw the camber line. At the small end make a similar development. Extend the camber line beyond the points c and f to take care of the lap. From point 4 at the large end run off with a traveling wheel on each arc length 4-c a distance of 3 15/16 inches plus the necessary lap. Likewise at the bottom lay off on arcs 4-f from point 4 a distance of 3.2 feet and draw in the sides c-f and c-f, through the points so located. This pattern can now be used for marking off the remaining 39 sections. Rivet holes should be marked and punched on the rivet lines and used in marking off the other sections. This method of obtaining the segment size and shape is applicable to the other segment sections in the remaining rings. The pattern for the dished head is to be laid off with the radius u-V, making the dish diameter equal u-v-u.

The same procedure is followed in the layout of a segment

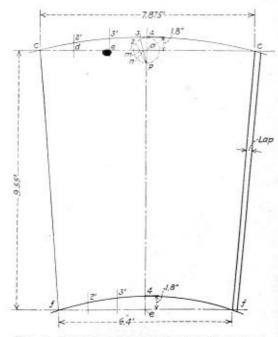

Fig. 3-Layout of Plate in Conical Roof Tank

of the other roof courses. The number of sections in these courses can be different to suit the best use of material available; but have the joints staggered.

The camber of the shell plate is so slight on account of the large diameter of the tank that it need not be taken into account. Camber calculations for this part of the layout if required would be made as already given and the plate stretchouts would be figured from the *neutral line*.

Letters from Practical Boiler Makers

Temporary Method of Repairing a Cracked Firebox Side Sheet

The sketches show a repair which was done to the firebox of an express locomotive to enable the engine to obtain a better mileage before being sent into the shops. The side sheet was found to be cracked about 2½ inches long between the stays, the copper being deteriorated in this neighborhood and-thinned to 0.13 inch. The thinning did not cover a large area and the remainder of the plate was in good condition.

The boiler was allowed to work for some time before the crack went through and commenced to leak. It was then decided to fit specially made studs and caps in place of a patch. These were made as shown in Figs. 3 and 4. Three holes were drilled and screwed and the studs drawn up the water space by string until the square portion entered the They were then screwed in by a wrench fitting on hole. the square portion which was then sawn off. A copper washer, Fig. 5, was then fitted to cover the area under the caps and the caps screwed on the studs close to one another, care being taken that the studs were not turned out during the operation. The extent of the crack is shown in Fig. 6 and the completed repair in Figs. 1 and 2. The working pressure of the boiler is 175 pounds per square inch and the studs did not leak excepting when the boiler was cooling. The engine was able to run a further 24,000 miles at the end of this period when it was run down and sent to the shops where a patch was fitted. This method of repair is quite good and safe and is superior to the lock stud method when the plates are thin.

CREWE, England.

A New Field for Boiler Disasters

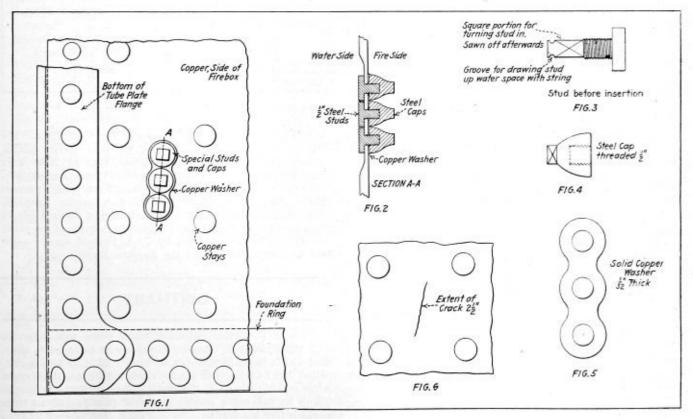

"Boilers."

The following interesting news item appeared in a recent issue of a North Dakota newspaper:

"In a threshing machine explosion that tore the steam engine to fragments, scattering heavy parts sixty rods from where the machine stood, Gunder and Lars Larson, brothers, age 35 and 39 years, were instantly killed and five other workmen injured.

"The accident occurred yesterday afternoon at the Vaagen farm five miles from Carpio. A defective safety valve which failed to operate when a pressure of 300 pounds of steam was generated is blamed for the tragedy. The victims were blown to pieces, fragments of their bodies being picked up a hundred yards from where the engine stood."

Sounds somewhat as though they were testing the safety valve with a boiler full of live steam at 300 pounds pressure, doesn't it?

Locomotive Firebox Repair Details

If this news item is true it simply proves the writer's contention that MOST boiler explosions are preventable. Newark, N. J. N. G. NEAR.

An Old Time Oil Field Boiler

The accompanying illustrations show what we used to call the Wood and Mann type of boiler which was used extensively in the oil fields of Canada and also to a great extent in Pennsylvania. The sectional front and side views of the boiler are given in Figs. 1 and 2. It will be seen from these sketches that there was no water front, and only a 2-inch space left between the firebox sides and the outside shell. A segment was flanged and fitted to the top of the firebox and attached to the crown sheet and to the reinforcing bar. Otherwise the front was left open.

DETAILS OF BOILER

The section of the front containing the firedoor and draft door was of cast iron; this front being bolted on with stud bolts. There were a great many staybolts used in the construction, spaced 5 inches on the side sheets and $4\frac{1}{2}$ inches on the crown.

When it was necessary to move the boiler skids were

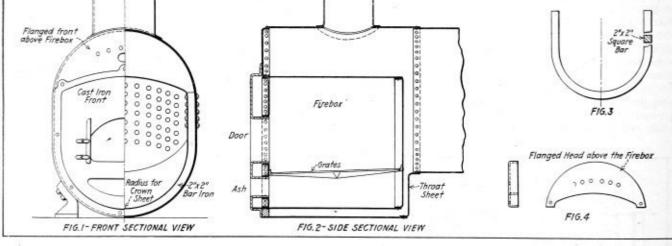

BUSINESS NOTES

C. A. Dunn, formerly sales representative of The Prime Manufacturing Company, has been appointed manager of sales of The Weldless Tube Company, Wooster, Ohio.

The Gibb Instrument Company, Bay City, Mich., manufacturers of electric welding equipment, has opened a sales office in Cleveland, Ohio, at 2104 East Superior avenue, in charge of W. O. Little.

The Combustion Engineering Corporation, Ltd., and the Uehling Instrument Company have recently entered into an agreement whereby Uehling interests in the Dominon of Canada and Newfoundland will be handled exclusively by the Combustion Engineering Corporation, Ltd., with principal offices located in Toronto, Montreal, Winnipeg and Vancouver. The Uehling line includes such fuel economy equipment as CO2 recorders, SO2 recorders, draft recorders, combined barometer and vacuum recorders, absolute pressure indicators, etc.

Joseph T. Ryerson & Son, Inc., with main plant and offices in Chicago, has purchased the plant, stock and good will of

Type of Oil Field Boiler Used in the Old Days

used. This boiler could never stand the usage that either the Tiftt or Nunday boiler could stand on account of the narrow water space which filled up with mud when the boiler was in service. There was a 4-inch space between the tube sheet and throat sheet, but that did not help it any. I have been told the drillers could not sink a single well without some repairs being done to the boiler in order to put it in serviceable condition. JOHN COOK.

Springfield, Ill.

located at Chicago, St. Louis, Detroit, Buffalo, New York and Cincinnati. The plant of the Cincinnati Iron & Steel Company occupies a full city block at Front and Freemont streets, with about 110,000 feet of floor space. Lewis E. Skinner, who is well known in steel circles, through his 18 years with the Ryerson Company, now has charge of the plant. Mr. Skinner will be assisted by C. A. Parnell, former assistant to Arthur Allshul, at the Ryerson Buffalo plant.

OBITUARY

the Cincinnati Iron & Steel Company, Cincinnati, Ohio. The

Ryerson Company will now have six steel service plants,

Thomas T. Parker, who for many years was connected with the Fidelity & Casualty Company in their home office, died at his home in Chicago on March 28. Ill health compelled that he relinquish his activities for the last three years. After making what was thought a gallant effort to regain his health he suffered a sudden stroke of paralysis about three weeks before his death.

TRADE PUBLICATIONS

WELDING AND CUTTING APPARATUS .- The Alexander Milburn Company, Baltimore, Md., has recently issued catalogue No. 1122 illustrating its line of welding and cutting apparatus. A price list is also included.

WELDING AND CUTTING APPARATUS .- A piece parts catalogue of 15 pages has recently been issued by the Torchweld Equipment Company, Chicago, in which is illustrated and listed a complete line of welding and cutting torches and their parts, gas pressure regulators and gages.

MISCELLANEOUS EQUIPMENT .- The Western Tool & Manufacturing Company, Springfield, Ohio, has issued catalogue No. 19 illustrating its line of expanding mandrels, tool holders, lathe dogs, C clamps, shop furniture, emery wheel dressers, and vises. Prices also are given.

ZEOLITE WATER SOFTENERS .- Water softeners in which zeolite is used to remove every trace of lime and magnesia are described in Bulletin 509 recently issued by the Graver Corporation, East Chicago, Ind. The chemistry of Zeolite water softening is described as well as the details of operation of the Graver Zeolite softener.

OXY-ACETYLENE OUTFITS .- The Air Reduction Sales Company, New York, has issued two booklets describing and illustrating its line of oxy-acetylene welding and cutting apparatus and equipment, together with its tube welding machines and acetylene generators. The bulletins devote some attention to the history of these subjects, and the use of equipment.

INGERSOLL-RAND PRODUCTS .- A condensed catalogue of the products manufactured by the Ingersoll-Rand Company, New York, with a special index feature has recently been sent out. In the space available complete data on all products was impossible so the company requests that readers send in requests for individual bulletins where desired. Particular attention is called to the engineering data section devoted to information of value in solving pneumatic problems.

SELECTED BOILER PATENTS

Compiled by

GEORGE A. HUTCHINSON, Patent Attorney,

Washington Loan and Trust Building Washington, D. C.

Readers wishing copies of patent papers, or any further information regard-ing any patent described, should correspond with Mr. Hutchinson.

1,447,154, TUBE EXPANDER, WILLIAM F. SAWADSKI, OF CHARLESTON, SOUTH CAROLINA.

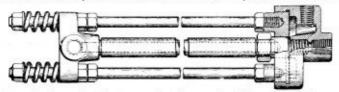

Claim 1.—In a tube expander, a stock having a bore therein, elongated slots whose opposed side walls are rounded inwardly and which provide pockets thereby, expansion rollers freely seated in the pockets, a conical pin movable longitudinally in the bore for contacting with the rollers and projecting the

same, said stock having an elongated slot therein arranged between the inner terminal of the bore and inwardly of the rollers, and the longitudinal walls provided by the slot being arranged at opposed angles, and a substantially V-shaped head on the widened end of the pin projecting through the slot and whose angle side surfaces of which are designed to frictionally engage with either of the angle walls provided by the slot, when the stock is revolved, as and for the purpose set forth.

1,448,530, AUTOMATIC CUT-OFF FOR FUEL OF OIL-BURNING BOILERS. PERRY H. GENTZEL, OF NEWTON, MASSACHUSETTS.

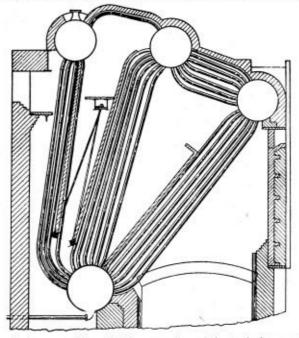

Claim 1.—A device for automatically cutting off the flow of fuel of an oil-burning boiler when the water reaches a predetermined level in the boiler, consisting of a frame, a head carried by said frame and formed with ports for connection with the oil supply and with the burner, said ports being formed to normally communicate with each other, a diaphragm mounted over

the end of one of said ports, a spring for normally holding said diaphragm away from said end to maintain communication between said ports, an expan-sible tube mounted beneath said diaphragm and arranged to support and operate the same, and a connection from said tube to the boiler at the predetermined low water level therein, whereby when said level is reached steam will enter said tube and expand the same and operate to force said diaphragm sgainst the end of the port and close the fuel passage way to the burner, substantially as set forth. Three claims.

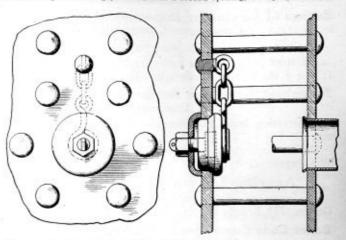

1,447,443. BAFFLE SUPPORT FOR WATERTUBE BOILERS. WILLIAM J. STOOP, OF WHEELING, WEST VIRGINIA.

Claim 1.—In a watertube boiler the combination with an inclined baffle for guiding and deflecting the products of combustion with respect to the banks of watertubes, of a mounting for said baffle comprising a horizontally

disposed pipe arranged in underlying supporting relation to the lower end of of said baffle, said pipe having its ends opening outward through the side walls of the boiler, and suspension rods by which said pipe is carried, said rods being attached to a stationary supporting member occupying an elevated position within the boiler. Three claims.

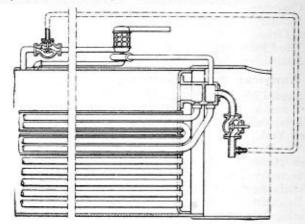

1,446.812. SAFETY BOILER PLUG AND METHOD OF INSTALL-ING SAME. GEORGE A. SAGER, OF ALBANY, NEW YORK. Claim 1.-The combination with a boiler sheet having a tapered opening therethrough and being provided with a second opening, of a plug closing the

latter opening from the inner side of the sheet, an anchoring member having a tapered shank fitting through said opening from the inner side of said sheet, and connecting means between said member and the plug. Four claime

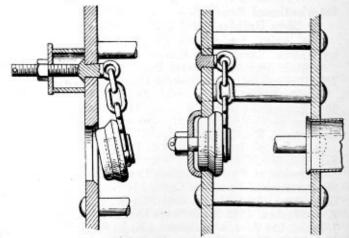

1,449,228. LOCOMOTIVE BOILER. SEIGO HASEGAWA TAKASHI IKEGI, OF OSAKA, JAPAN. AND

Claim 1.—The combination with a boiler having a superheater provided at its receiving end with a saturated steam header and at its discharge end with a superheated steam header, of valve controlled means for supplying steam

from said superheated steam header to steam-consuming means, means con-necting the discharge and receiving ends of said superheater, and means in said connecting means for causing a positive circulation of steam through said superheater when the supply to said steam-consuming means is shut off. Seven claims.

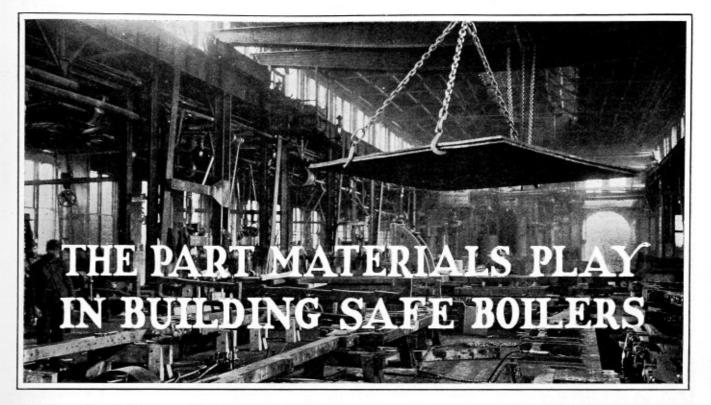

1,446,813. METHOD OF INSTALLING SAFETY BOILER PLUGS. GEORGE A. SAGER, OF ALBANY, NEW YORK. Claim 1.—The method of installing a plug upon a boiler sheet which con-sists in fitting an attached anchoring bolt for the plug through the sheet

from the inner side thereof, drawing the bolt outwardly into wedging en-gagement with the sheet, and securing the bolt against inward retraction through the sheet. Four claims.

THE BOILER MAKER

MAY, 1923

HE safety of a locomotive boiler begins and ends with the materials of which it is constructed. Three factors enter the development of a locomotive and of its boiler - design, materials and workmanship. Of the three, materials is probably least understood by the men in the shops; that is, the methods employed by the steel mills and in the laboratories of the railroads themselves to insure that the best of material for a given purpose is used and the standards of the mill or road are maintained.

The methods employed by one of the greatest locomotive building concerns in the world have been used as the basis for the following de-

Locomotive boiler design and construction are advancing-bigger boilers, higher pressures, the extensive development of economizing devices are all working toward higher efficiency. Are materials keeping pace with this development? The answer of course is that they are, but how many realize the rigid requirements to which boiler materials are manufactured and the steps taken by the mills and the locomotive builders to insure that these standards of development are maintained. The purpose of the following article is to briefly outline certain modes of procedure established to bring about a freedom from defects of both chemical and physical origin in material entering the fabrication of a locomotive boiler.

tails of specification, test and inspection procedure which over a long period of time have proven their value in supplying a large proportion of the motive power of the United

States and, in fact, a considerable part of the locomotive tonnage of the world.

HIGH STANDARDS NECESSARY

The great need of industry today is standardization and the locomotive industry is no exception to the general rule. Standards of design, materials and fabrication are all necessary and, in spite of the fact that in many instances acceptable standards are already available, they are not utilized to their greatest advantage.

The locomotive builders referred to above, realizing the value of well developed standards in the matter of material, have, in effect, adopted as their own the standards promulgated by

the American Society of Testing Materials.

The steel mills work in very close conjunction with the Locomotive Works in the matter of material and the greatest dependability can be placed on them to furnish materials in strict accordance with specification requirements. Details will first be given of the procedure followed in handling ma-

^{*}The information and illustrations used in the preparation of this article were made possible by the courtesy of the American Locomotive Company, Schenectady, N. Y.

terials made strictly to Locomotive Works specifications. When material is supplied to the Works on a railroad company order the methods of inspection and checking are varied somewhat.

In each of the steel mills supplying material, company inspectors are located who follow plates, bars, tubes, flues and other supplies through the work, checking the serial numbers, heats, order numbers and the like on records which are sent to the home plant. On company work, material is manufactured to requirements for a specific locomotive and the records are maintained accordingly. On arrival at the plant, the plates, or whatever the material may be, are applied to that particular locomotive and to no other. The steel companies are required to indicate on their bills the locomotive

Fig. 1.-Chart for Recording Tests on Boiler Materials

number for given material order and this is checked in the material storage yard against the order upon its arrival. A later section of this article will be devoted to details of the storage yard and the inspections made here before the material is put into production.

Specifications for Material

In brief, the steel mills are required to supply two classes of steel for boilers—flange and firebox—each made by the open-hearth process. The chemical composition of the steel is given in Table 1.

À ladle analysis of each melt of steel is made by the manufacturer to determine the percentages of the chemical elements of which it is composed, the sample being in the form of a test ingot made during the pouring. A report of the composition is supplied to the Works. A check analysis is also sometimes made from a broken tension test specimen from the plate itself.

It must be possible to bend a test specimen cold through 180 degrees without cracking on the outside of the bent portion. For material one inch or under in thickness the specimen is bent around a pin, the diameter of which is equal

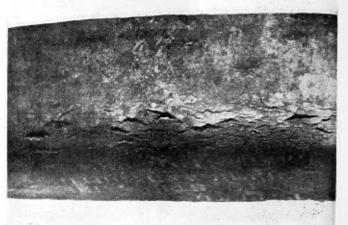

Fig. 2.-Test Specimen Taken from Burned Firebox Sheet

to the thickness of the specimen while for material over one inch in thickness it is bent around a pin of a diameter equal to twice the thickness of the specimen.

In the case of firebox steel a sample is taken from a broken tension test specimen to determine the homogeneity of the

Sulphur, not over			over 0.04 1	

material. This sample must not show a single seam or cavity more than $\frac{1}{4}$ inch long in either of the three fractures obtained in the test for homogeneity, which are made as follows: The specimen is either nicked with a chisel or grooved on a machine transversely about 1/16 inch deep in three places approximately 2 inches apart. The first groove is made 2 inches from the square end and each succeeding groove is made on the opposite side from the preceding one. Specimens are then firmly held in a vise with the first groove about $\frac{1}{4}$ inch above the jaws, the projecting end is then broken off by light blows of a hammer, the bending

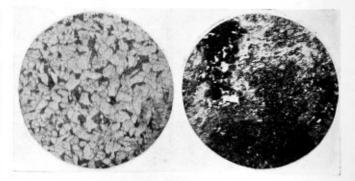

Fig. 3.—Photomicrographs of Burned Sheet. Specimen from Unburned Section (Left), Burned Plate at Right

MAY, 1923

being made away from the groove. The specimen is broken at the other two grooves in the same manner. As can be readily understood, the object of this test is to open up and render visible any seams due to failure to weld up or due to interposed foreign matter or any cavities caused by gas

Table 2-Tensile Proper	rties of Boiler	Steel

percent is made for each increase of 1/32 inch of the specified thickness above 34 inch. For material 34 inch or under in thickness the elongation

is measured at a gage length of 24 times the thickness of the specimen.

bubbles in the ingot. One side of each fracture is examined and the lengths of the seams and cavities determined, the inspector using a pocket lens if necessary.

The specimens used in making tension tests are taken longitudinally from the bottom of the finished rolled material while the bend test specimens are taken transversely from the middle of the top of the finished rolled material. Longitudinal test specimens are cut in the direction of the longitudinal axis of the ingot and the transverse specimens at right angles to the axis.

A tension and bend test are made from each plate as rolled. If any test specimen shows defects of machining or develops flaws it is discarded and another specimen substituted.

Certain limits are allowed in the specification requirements; for example, the thickness of plate has an upper limit of .01 inch greater than that ordered but must not exceed this allowance above or below the thickness. All plates of each width and group thickness constituting a lot in a shipment must not exceed the amount of overweight given in Table 3. In this table one cubic inch of rolled steel is assumed to equal 0.2833 pound.

When material is furnished the manufacturer's brand or name, melt or slab number, class and lowest tensile strength for the class specified is legibly stamped on each plate. Test specimens are also stamped with the melt or slab number. Sometimes it is specified in the order that the plates must be match-marked so that the test specimens representing them can be readily identified. When more than one plate is sheared from a single slab or ingot each one should be match-marked so that all of them may be identified with their respective test specimens. The match-mark consists of two overlapping circles each not less than $1\frac{1}{2}$ inches in diameter placed upon the shear lines and made by separate impress of a single circle steel die. Match-mark coupons are required to match with the sheets represented and only those which match properly are acceptable.

Any material showing injurious defects subsequent to its acceptance by the manufacturer's works is open to rejection and the manufacturer notified of this.

STEEL PLATES FOR TANK AND MISCELLANEOUS USES

Two grades of steel are required for special tank work made by the open-hearth process. In both cases the sulphur contained must not exceed 0.06 percent. The difference in quality is recognized in the method of testing. Certain plates over 3/16 inch thick are subjected to a bending test in which test pieces are cut from the plates after the shear edge is removed by grinding or machining. These specimens are required to bend over a mandrel whose diameter is over one and a half times the thickness of the plate without sign of fracture. The other plates covered in this

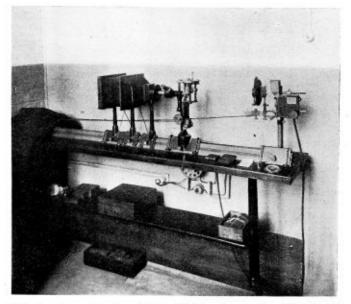

Fig. 4.-Apparatus for Making Photomicrographs of Material

section are 3/16 inch and under and are not required to meet the above bending test. In the case of the plates tested, two pieces 12 inches long and $1\frac{1}{2}$ inches wide are furnished for each melt or for every twenty plates ordered. The plates must be true to size, flat, free from buckles and surface defects and must not vary from the thickness ordered by more than 0.01 inch. All plates have the engine order number, size, scale, weight and similar data painted on in white lead.

FLUES, SAFE ENDS AND ARCH TUBES

The tubes used by this company are made from knobbled hammered charcoal iron. The tests made on tubes and flues

are quite interesting and extensive. They come under the head of quench bend tests in which strips 1/2 inch in width by 6 inches in length are planed lengthwise from tubes, heated to a cherry red and quenched at once in water, the temperature of which is 80 degrees F. This test specimen must be able to bend in opposite directions at each end without showing cracks or flaws. Nick bend tests are also made on strips 1/2 inch in width by 6 inches in length planed lengthwise in tubes. These specimens when nicked by light hammer blows are required to show a wholly fibrous fracture. Expansion tests are also made. In this case a test specimen 12 inches in length is used which is heated to a length of 5 inches to a bright cherry red (1,200 to 1,400 degrees F.), placed in a vertical position and a smooth taper steel pin at blue heat (600 to 800 degrees F.) forced into the end of the tube by pressure or by light blows of a 10-pound hammer. In this test the tubes are required to expand to one and one-eighth times their original diameter without splitting or cracking. The pin is of tool steel tapered 11/2-inch per foot of length. A specimen 21/2 inches in length is used in the crushing test.

Tubes 10 B. W. G. or lighter are required to withstand crushing longitudinally without splitting or cracking or bending at the weld to a height of $1\frac{1}{8}$ inches. If heavier than 10 B. W. G. they must withstand the test to a height of $1\frac{3}{4}$ inches.

Tubes under 5 inches in diameter are subjected to an internal hydrostatic pressure of 1,000 pounds per square inch and tubes 5 inches or over in diameter are given a hydrostatic pressure of 800 pounds per square inch, provided that the fiber stress does not exceed 16,000 pounds per square inch. In the latter case the following formula is used to determine the test pressure:

P

in which: P = the pressure in pounds per square inch.

t = the thickness of the weld in inches.

D = the inside diameter of the tube in inches.

If the quality of the material is in doubt a cross section of the tube is ground to a perfectly true surface, polished free from dirt or cracks and etched until the soft parts are sufficiently dissolved for the iron tube to show a decided ridged surface with the weld distinctly indicated. A steel tube would show a homogeneous surface. Physical tests are made on each of two tubes taken from a lot of 250 or less. The name of the manufacturer, the words "knobbled charcoal" and the test pressure in pounds are legibly stenciled on each tube. When tubes are inserted in the boiler they must stand expanding and beading without splitting or breaking.

LAP WELDED AND SEAMLESS STEEL BOILER TUBES

Lap welded and seamless steel boiler tubes, boiler flues, superheater flues, safe ends and arch tubes for the Works are all made from steel manufactured by the open-hearth process. The steel is required to conform to the following chemical composition:

Carbon	0.08-0.18	percent
Manganese	0.30-0.60	percent
Phosphorus, not over	0.04	percent
Sulphur, not over	0.045	percent

Test specimens taken from tubes 6 inches or under in diameter and having a thickness less than 9 percent of the outside diameter are required to be flanged at right angles to the body of the tube without showing cracks or flaws. This flange as measured from the outside diameter of the tube must not be less than 15 percent of the outside diameter but the flange in no case should exceed $\frac{1}{2}$ inch in width. For all tubes except tubes in superheater pipes on which Tubes for company work must stand expanding and beading without showing cracks or flaws or opening at the weld. Superheater flues properly manipulated should have the necessary forging, welding and bending operations made without developing any defects.

BOILER RIVET STEEL

Boiler rivet steel is made by the open-hearth process and is required to conform to the following chemical composition:

Managnese	. 0.30-0.50 percent
Phosphorus, not over	
Sulphur, not over	. 0.045 percent

A ladle analysis is made of each melt of steel to check the chemical composition.

Tension tests are made from test specimens on bars which must have the following requirements as to tensile properties:

Tensile strength, pounds per square inch	45,000-55,000
Yield point, min	0.5 tens, str.
Elongation in 8 in. min. percent	1,500,000

Tens. str.

Cold bend tests and quench bend tests are made on test specimens. The diameter of each bar must not vary more than 0.01 inch from that specified. The above requirements are for rivet steel in bar lengths. Slightly different requirements exist for rivets. Tests are made on the rivet shank which must be able to bend cold through 180 degrees flat on itself without cracking on the outside of the bent portion. The rivet head must flatten while hot to a diameter two and one-half times the diameter of the shank. One tension test is made on each size of each lot of rivets offered for inspection and three flattening tests are also required.

STAYBOLT IRON

Staybolt iron used in the Works is rolled from a bloom, slab pile or box pile made from reworked all-pig puddled iron or reworked knobbled charcoal iron. The puddle mixture and the component parts of the bloom, slab pile or box pile must be free from any admixture of iron scrap or steel. The iron is limited to 0.10 percent of manganese.

It is required to conform to the following tensile properties:

Tensile strength, pounds per square inch (1¼ square inches and under in sec- tional area)	48,000-52,000
square inches and under in sectional area) Elongation in 8 inches min. percent Reduction of area, min. percent	0.6 tens. str. 30

Etch tests are also made on the iron to indicate whether it was rolled from a bloom, slab pile or box pile and whether or not it is free from steel. Tension tests are made on two bars taken from lots of 100 or less.

Hollow staybolt iron is required to conform to the standards of regular staybolt iron. The tensile tests in this case being as follows:

 Tensile strength, pounds per square inch...
 48,000-52,000

 Yield point, min.
 0.6 tens. str.

 Elongation, when measured in 8 inches,
 28

 Elongation, when measured in 4 inches,
 35

 min. percent.
 35

 Reduction of area, min., percent.
 42

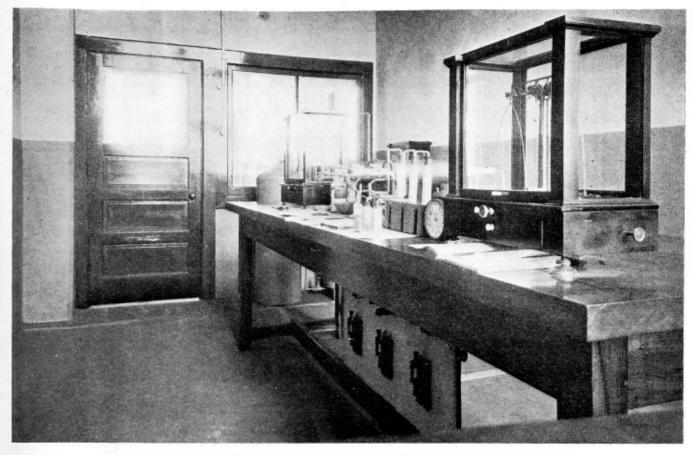

Fig. 5 .- Section of Laboratory Used for Making Carbon Determinations in Steel

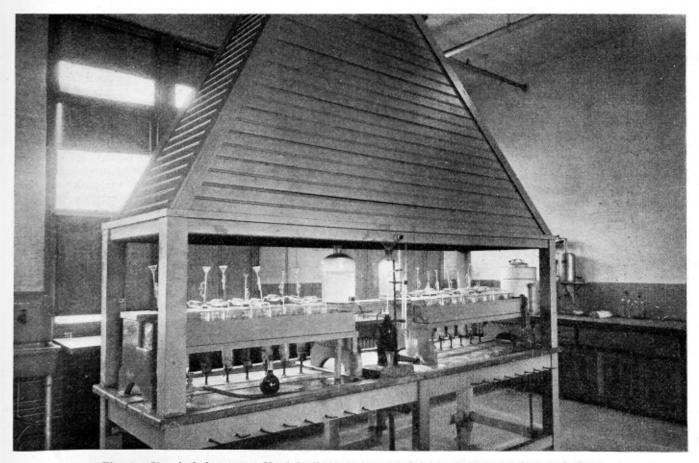

Fig. 6.-Chemical Apparatus Used in Determining the Sulphur Content of Iron and Steel

In this case, however, additional tests are made by splitting a 2-inch length open from end to end by means of a drift or wedge driven into the hole. The structure thus shown must be free from signs of imperfect welding and the presence of slag or scale in the weld. Bars of one size are sorted into lots of 1,600 linear feet. Two samples are selected from each lot for test. Bars must be smoothly rolled and free from slivers, depressions, seams, crop-ends and evidences of burning, the whole should be as nearly axial and as nearly round as the best manufacturing practice permits and should have an area equivalent to that of a round hole 3/16 inch in diameter. The holes should be free from slag and other obstructions.

Iron for radial flexible stays and boiler braces is rolled from a bloom, slab pile or box pile, entirely made from puddled pig iron or knobbled charcoal iron. Steel must not be present. Tension tests follow:

Tensile strength, min., pounds per square	3
Yield point, min., pounds per square inch	. 48,000 0.6 tens. str.
Elongation in 8 inches, min., percent	. 28
Reduction of area, min., percent	. 45

Lots of 100 each are the basis for taking test specimens, two bars being used from each lot or fraction of a lot.

SPECIFICATION REQUIREMENTS RIGIDLY ADHERED TO

The experience of the Locomotive Works has been that the steel mills will furnish material exactly as specified. At various times check tests have been made in the laboratories

Dute TO PATTERN OR SRETCH NO.	NG, PCL	192
PATTERN OR		GHECH
		GHECH

	1	
	-	_

Fig. 7.-Loading Material List Used in Storage Yard

of the Works to determine the chemical and physical compositions of materials and almost invariably these tests check closely with those of the mills so that it has been found unnecessary on material manufactured to Company specifications to duplicate the mill tests at the works except in very rare cases. The Company inspectors located at the mills maintain complete records of all material and its status in production. They supervise all tests, stamping and work in complete cooperation with the material manufacturers and their inspectors.

When material is ordered according to railroad company specifications, however, and supplied by the railroad, physical and chemical check tests are made in the laboratories at the Works. These tests are made to determine whether such material conforms to the Company requirements and are based on the regular specifications as outlined above. A staff of inspectors is constantly on the floor of the shop checking material, the heat and serial numbers in order to make sure that material is not used which develops flaws and also to see that the proper material specified for a particular locomotive is used on that locomotive and no other. Fig. 1 shows a testing department report of boiler steel. On this report a complete record of every bit of material entering the fabrication of the boiler can be maintained. Plates overheated in flanging, burnt in welding or developing cracks in working or flaws of any nature are tested in the laboratory to determine whether they are usable or not. In the course of production, the foreman, inspectors and the men themselves are constantly looking for flaws or defects and the material up to the time of completing the boiler is subject to replacement if found defective in any way.

The following example of laboratory procedure will indicate the general method used to determine the properties of material: The specimen of defective boiler plate, shown in Fig. 2 was taken from a firebox throat sheet which had been burnt quite badly. Test specimens were taken from the solid portions of the plate and from the burnt portion to determine the tensile strength and other physical properties and these are given in the table below. The chemical composition was also determined from the specimens taken from the burnt portion of the plate and from the part away from the defect. The photomicrographs shown in Fig. 3 were also made.

Chemical Analysis		Physical	Tests
Carbon Manganese Phosphorus Sulphur Silicon	0.19 0.36 0.013 0.019	Elastic limit Tensile strength. Elongation Reduction	54,280 pounds 29.5 percent

The photomicrographs were magnified 100 diameters, the parts being etched in nital, the objective on the miscroscope being 16 millimeters. The apparatus for making microscopic examination of material is shown in Fig. 4.

# The Determination of Chemical Properties of Boiler Metals

The procedure followed in determining the chemical properties of defective plate is exactly the same as that followed in all boiler material tests. The principal impurities in the metals which must be guarded against and those for which the tests are principally made are carbon, sulphur, phosphorus, manganese and silicon. The apparatus used for making the carbon content determination is shown in Fig. 5. Here a sample of steel is placed in a nickel boat lined with alundum (a highly refractory material), and the whole placed in a silicate tube heated to 950 degrees C. by means of electric coils. Oxygen is passed over the steel and the sample fused, the iron forming iron oxide and carbon dioxide. The oxygen mixed with the carbon dioxide is passed over platinized asbestos (to insure the complete oxidation of the carbon) and then passed through a tube containing granulated zinc (to remove sulphur dioxide) and through calcium chloride and potassium pentoxide (to remove water) and then through a bulb containing a sodium hydrate mixture which absorbs carbon dioxide, forming sodium carbonate. This bulb is weighed before and after the absorption and the gain in weight is due to carbon dioxide, which contains 27.27 percent of carbon.

# SULPHUR REACTIONS

The apparatus under which the tests for sulphur are made is shown in Fig. 6. In this test a 5 gram sample is placed in a Johnson's sulphur flask and attached to the apparatus shown in the illustration. One hundred cubic centimeters of hydrochloric acid is added. The hydrogen sulphide gas given off in the reaction is absorbed in 60 cubic centimeters of a solution of ammoniacal cadmium chloride diluted with 150 cubic centimenters of water, all contained in a 300 cubic centimeter tall form beaker. After the gas ceases to go over, (Continued on page 148)

# **Recent Locomotive Boiler Explosion Investigations**

# Overheating of Crown Sheet Due to Low Water Found To Be Cause of Fatal Boiler Failure

# By A. G. Pack*

N the month of February, two serious locomotive boiler explosions occurred which were carefully investigated by the Bureau of Locomotive Inspection and recently reported upon by the chief inspector. Details of the reports are given herewith.

On February 2, 1923, the boiler of Missouri, Kansas & Texas Railway locomotive 591 exploded resulting in the death of one employee and the very serious injury of two others.

This locomotive left Sedalia, Mo., at 6.20 p. m., February 1, hauling freight train 371, consisting of 20 cars, in charge of engineer Clyde E. Johnson, fireman Louis D. Igo and coal passer Wendal Farmer, and had proceeded to a point about two miles east of Louisburg, Kansas, or a distance of about 90 miles from Sedalia, when at 1.05 a. m. the boiler exploded, resulting in the fatal injury of Engineer Johnson, who died two hours later, and the serious injury of fireman Igo and coal passer Farmer, all of whom were bruised and scalded. Engineer Johnson was found with his feet caught under the cab apron and his body hanging out of right side of the gangway. Fireman Igo was thrown outside of rightof-way fence, a distance of over 25 feet. Location of coal passer Farmer was not ascertainable because he was unable to give any account of the accident, and was found by brakemen wandering along side of train.

#### DETAILS OF ACCIDENT

This locomotive was a 2-6-0 type, equipped with extended wagon top boiler, having wide radial stayed firebox of threepiece construction. The force of the explosion tore the boiler from the frame and running gear, hurling it forward for a distance of 184 feet. Parts of the boiler and appurtenances were thrown in various directions. The cab was found about 200 feet back and 60 feet to the right and the air compressor was found 60 feet to the left of point of explosion. The front end door was blown 150 feet ahead and 50 feet to the right, and apparently rolled about 200 feet further after striking the ground.

#### CONSTRUCTION OF FIREBOX

The firebox was of three-piece construction with riveted seams. The flue sheet was 1/2 inch thick, while other firebox sheets were 3% inch in thickness. The crown sheet was supported by radial stays with body varying from 1 inch to 11/8 inches in diameter, upset to 1 3/16 inches and 1 5/16 inches in diameter at the ends. The four center rows of radial stays beginning with the fifth transverse row, back of flue sheet, were tapered on lower ends, having a taper of 2 inches in 12 inches. The first four transverse rows were of the expansion stay type. The majority of staybolts were 15/16 inch in diameter, spaced 4 inches by 4 inches..

### EXAMINATION OF FIREBOX

Investigation disclosed that the crown sheet had been overheated from the flue sheet back to and including the twelfth transverse row of crown stays, and from between the fifth and sixth rows of stays on the right side of center of crown sheet to a similar location on the left side. The crown sheet had pulled away from all radial stays, and the side sheet pulled away from 257 staybolts. The line of low water was

*Chief Inspector, Bureau of Locomotive Inspection, Interstate Commerce ommission, Washington, D. C. Commission,

approximately 5 inches below the highest part of the crown sheet. The initial rupture of the crown sheet apparently occurred between the fifth and sixth rows of radial stays at the flue sheet on left side of center. The left side sheet tore diagonally down to the mudring. The right side sheet tore diagonally from a point near the flue sheet between the fifth and sixth rows of crown stays to the right of center down to a point in the welded seam of the patch, which was 32 inches above the mudring and approximately 16 inches back of the flue sheet. The tear then followed the welded seam for a distance of 18 inches, then through the side sheet for a distance of 7 inches, then again followed the welded seam back to a point 30 inches from the door sheet seam, and then diagonally up to top of door sheet.

### APPURTENANCES

This locomotive was equipped with one water glass and three gage cocks applied in the boiler backhead. Investigation disclosed that the drain pipe at the bottom of water glass was leaking before the locomotive left Sedalia, and later while attempting to repair the defect the drain pipe was broken off. The water glass cocks were then shut off, thus leaving the enginemen without other means of gaging the water in the boiler than the gage cocks.

#### TESTS OF WATER GLASS AND GAGE COCKS

Tests were made on locomotive 583, which was of the same class as that involved in this accident, for the purpose of comparing the registration of the water glass with the registration of the gage cocks. For the purpose of illustration an extra gage cock was placed slightly to the left and above the top gage cock and approximately 8 inches above the bottom gage cock. This test disclosed that with 1 inch of water in the water glass and the throttle opened, the additional gage cock showed full water, thus indicating that the water raised and was registered at the backhead at least 8 inches when the throttle was opened and steam rapidly escaping.

Numerous tests previously made by this bureau on different railroads have shown that gage cocks when screwed directly in the boiler backhead showed more water than actually prevails throughout the boiler while the locomotive is being worked hard or steam is rapidly escaping from the boiler. Since this boiler was being operated without the use of the water glass, it might be reasonably assumed that the registration of the gage cocks was misleading.

Some of the other appurtenances were damaged to such an extent that their previous condition prior to the accident could not be determined, while examination of others, which were not damaged, did not disclose a condition which was thought to have a bearing on the accident.

## INSPECTION AND REPAIR REPORTS

This locomotive received monthly inspection at Parsons, Kansas, on January 19, 1923, or 14 days prior to the accident.

Daily locomotive inspection reports on file at Sedalia, Mo., showing repairs needed, were examined and the following items were reported that may have had a bearing on the accident:

"Mudring leaking right front corner."

January 26, 1923– 5:07 A. M. Report approved by Foreman W. J. Brooks, with notation, "OK all but mudring." January 26, 1923-"Crown bolts leaking."

- Report approved by Foreman W. C. Riley, 9:30 A. M. without notation, indicating that repairs had been made.
- January 26, 1923– 11:30 A. M. -"Right front corner mudring leaking."
  - "Crown bolts leaking." Report approved by Foreman D. Q. Hounihan, without notation, indicating that repairs had been made.
- January 27, 1923-8:45 A. M. "Flues, side sheet and crown bolts leaking in firebox

'Mudring leaking all around."

"Tighten shoveling sheet and put it under

apron." "Engine leaks steam around both steam chests, is not safe to switch with."

Report approved by Foreman D. Q. Hounihan, without notation, indicating that repairs had been made.

- January 31, 1923-"Bore out flues."
  - 3:20 P. M. "Flues and mudring leaking."

"Tighten down shoveling sheet and put it under apron." "Tighten leaks around both steam chest, this

engine is dangerous to switch with." Report approved by Foreman W. J. Brooks, without notation, indicating repairs had been made.

Daily locomotive inspection reports on file at Parsons, Kansas, showing repairs needed, were examined for the following dates and the following items were found reported that may have had a bearing on the accident:

January 15, 1923-	-"Examine front end, engine don't steam at all." "Bore out flues." "Clean off flue sheet."
	Report approved by Foreman Tiler without notation indicating repairs had been made.
January 21, 1923-	
3:30 A. M.	"Bore out flues." "Mudring leaking in right front corner and both back corners." "Examine front end, engine will not steam." Report approved by Foreman Tiler without
	notation indicating that repairs had been made.
January 24, 1923- 11:20 P. M.	-"Examine right cylinder head and right valve head."

"Steam leaks so bad, can't tell that the head-light is burning."

"Put a gasket between steam chest and cylinder."

Report approved by Foreman Tiler, without notation, indicating that repairs had been made.

The following communications were found in the files of this carrier, at Sedalia, Mo., which tends to show the condition of the firebox prior to the accident:

"DQH (Day Roundhouse Foreman) 1/29/23. Calk flues and crown bolts in Engine 591. This Engine has one flue that has pin hole in it about a foot from flue sheet and the Engine has every indication of mud on the crown sheet. This Engine ought to be held and the crown sheet bumped with heavy air hammer to loosen the scale and then properly washed or we are going to have trouble with this Engine. I want you to know the condition the Engine came to us in.

(Signed) W. J. Brooks

(Night Roundhouse Foreman)"

#### Sedalia, 1/30/23.

"Mr. R. A. Walker, M. M. Franklin, Mo.

Condition engine 591 on arrival Sedalia for service on Holden Machinery is in fair condition. Firebox and flues in Division. poor condition. Crown sheet has 3 mud burnt spots and crown bolts leaking, both side sheets show evidence of mud burn and stay bolt heads have started to pull through sheet. Flues do not look so bad but from the way they leak after being worked must have a good deal of mud in boiler. The mud ring leaks all around and grates and side bars will have to be removed and mud ring caulked. I have washed this engine once but did not do much good. Engine should have firebox gone over with air hammer to loosen mud and a few staybolts renewed where heads are the worst. We have only four engines on high line, and I have no engine to put in place of 591. I can not hold engine and do the work. The

condition of this engine is likely to cause failure any time. (Signed) D. Q. Hounihan"

Investigation disclosed that on January 22, 1923, engineer W. H. Neeley was called to run this locomotive out of Parsons, Kansas, at 7 p. m., and that after reaching the locomotive he refused to take it out until repairs had been made, stating that crown sheet, side sheet and mudring were leaking. It being necessary to remove the fire in order to make repairs, the crew was released at 9.40 p. m.

On January 25, engineer Neeley was again called to take this locomotive out of Parsons, when upon arriving at the locomotive he was informed by the fireman that only one crown bolt was then leaking. He ran this locomotive from Parsons to Sedalia, Mo., where he was relieved and the locomotive continued on to Franklin, Mo., at which point it was cut out and ordered to return to Sedalia. Engineer Bestgen was called for this trip and before starting noted that crown bolts were leaking and so reported it on regular inspection report, but ran the locomotive to Sedalia without repairs being made. On his arrival at Sedalia, the following report was made:

"Right front corner mud ring leaking. Crown bolts leaking."

On January 26, at 6 p. m., engineer E. G. Voss was called to run this locomotive out of Sedalia to Paola. He completed the round trip to Paola, arriving at Sedalia on January 28, at 8.35 a. m., but dated his inspection report January 27, and reported:

"Flues, side sheets and crown bolts leaking in firebox. Mud ring leaking all around.'

He was again called to run this locomotive out of Sedalia at 3.45 p. m., on January 29, arriving at Paola at 10.55 a. m. on the same date. When interviewed, engineer Voss stated that upon his arrival at Paola he wired superintendent S. B. Moore as follows:

"Engine 591 has both side sheets, crown sheet, mud ring and flues leaking and will have to have boilermaker to make repairs before handling train on 370."

He further stated that a boilermaker came to Paola and made repairs and that the locomotive was run from Paola to Sedalia, arriving at Sedalia at 3.20 p. m., January 31, at which time the flues and mudring were reported leaking. This locomotive then remained at Sedalia until the beginning of the trip on which the accident occurred.

Fireman Igo and coal passer Farmer were so badly injured that an interview was not deemed advisable at the time of the investigation. However, fireman Igo has since made a sworn statement with respect to this accident, in which he stated in substance as follows:

"That he was called to leave Sedalia at 5:50 P. M. on February 2, and that upon arrival at locomotive 591, in company with engineer Johnson, they found a small leak around water glass When an attempt was made to inspect the interior drain pipe. of the firebox it was found that due to a large amount of coal having just been put on the fire, he was unable to see the firebox The right injector was tested and seemed to operate satissheets. factorily, but afterwards when pulling out of Sedalia and passing the Katy Car Shops, the right injector was inoperative, and although repairs were attempted at different times, they never got it to work.

"The engine was foaming shortly after leaving Sedalia and continued to do so at intervals. While at Brysons, which is 16 miles from Sedalia, the fire had burned down so that they could see the crown sheet, and it was noted that water was falling on the fire in the front end of the firebox. He and engineer Johnson looked at the crown sheet and saw a mass of small leaks around the crown bolt heads, some of the leaks being large enough that water was dripping and others so small that the water was just boiling out from the bolt heads. There were also quite a few leaks around the side sheet bolts. Mr. Johnson remarked to him that if he had had a chance to inspect this firebox before leaving Sedalia he would not have operated the locomotive and that he

(Igo) felt the same way about it. "At Holden which is 49 miles from Sedalia, they found the leaks were somewhat worse, especially the larger ones, as water was

now running down, instead of dripping. The water foamed several times between Holden and Gunn City Tank, and engineer Johnson remarked that he didn't like this very much, on account of the condition of the firebox. At Freeman Tank, which is about 79 miles from Sedalia, the sheets were leaking worse than ever, and after engineer Johnson had looked at the crown sheet and side sheets for possibly four or five minutes, he got up slowly and and see what you think of it.' They left Freeman and had reached a heavy grade near Louisburg, Kansas, when the accident occurred."

#### SUMMARY

While it is evident from the lines of demarcation on the crown sheet that this accident was primarily due to the failure of the crown sheet because of having been overheated, due to low water, it is apparent that the condition of this firebox, as ascertained by the frequent reports and statements herein referred to, covering the leaky and defective conditions thereof, and the absence of suitable means for registering the general water level in the boiler under all conditions of service, were strong contributory causes for the failure, and evidences a fact that this locomotive was not in proper condition and safe to operate without unnecessary peril to life or limb, as anticipated by the law.

# A Second Disastrous Explosion

On February 16, a stud blew out of the boiler of Erie Railroad locomotive 3024, resulting in the injury of three employees. This locomotive left Jersey City, N. J., at 10.45 p. m. in charge of engineer E. J. Murphy and fireman H. J. Spears, and had reached a point near Highland Mills, N. Y., or approximately 49 miles from Jersey City, when, at 1.30 a.m., a stud applied in the boiler to support the running board bracket blew out resulting in the injury of engineer Murphy, fireman Spears and brakeman Brigham.

This stud was located on the left side of the boiler near the cab floor and directly in front of the cab door, and when blown out forced the jacket back against the cab which in turn deflected the escaping steam and scalding water into the cab and upon the men therein.

#### EXAMINATION OF STUD

This stud was 7/8 inch in diameter with 12 threads per inch on that portion which screwed into the boiler. The stud fitted so that it could be screwed all of the way in without the aid of a tool, although threads in the sheet were in good condition and those on the stud slightly worn. That portion of the stud on which the running board bracket rested was badly worn, indicating that the bracket was loose on boiler and working, which was confirmed by the loose condition of the cab and brackets at the time of our investigation, also by the daily inspection reports later referred to.

Daily inspection reports on file at Port Jervis, N. Y., and Secaucus, N. J., were examined for the following dates and there were reported the following items which have a bearing on this accident:

Port Jervis, N. Y. February 4, 1923. "Staybolt leaking in left side of cab. Cab fastened to boiler." February 7, 1923.

"Cab bolted fast very loose."

11, 1923. February "Staybolts leaking under jacket in front of cab left side."

Secaucus, N. J. February 7, 1923.

"Cab very loose, left side." February 15, 1923, 3:20 P. M.

Staybolts on left side of cab under jacket leaking bad. Fills cab full of steam.

Investigation disclosed that there was no evidence of broken staybolts in the left side sheet, nor of any leakage from staybolts from which it is apparent that the leaks reported were coming from the stud which later blew out.

When interviewed, the master mechanic stated with reference to the daily inspection report of the engineer on

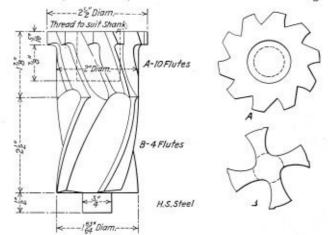

February 15, at 3.20 p. m. "That the boiler inspector made an inspection of the left side sheet in the vicinity described by the engineer, and failed to find any broken or leaky staybolts, but did find a stud leaking. This he reported to the roundhouse foreman, who in turn inspected the stud and stated that he did not consider it bad enough to remove."

It is evident that this accident was due to the improper fit of the stud and to failure to make necessary repairs to the defective stud, which had been the cause of numerous reports and which was contributed to by the loose condition of the cab, and had the requirements of the law and rules been complied with this accident would have been avoided.

# Cutting and Reaming Tube Sheet Holes By George Bexton*

"OR rapid and smooth cutting of boiler tube sheet holes, the combination cutter and reamer illustrated has been found very satisfactory. It reduces costs and speeds up the work. Previous to the development of this tool cutting was done in two operations. All the tube holes were cut out to within 1/64 inch of the size required, by a tool similar to the cutter illustrated at B. Then the tool was changed to a reamer similar to A. This made it necessary to set each hole twice, whereas by combining A and B in one tool the job could be done in one operation. Cutter B is fed by the machine until it has cut through the plate, the feed being released and reamer A finishing the job, being fed by hand since this is quicker than machine feed.

The tool, illustrated, is made of Double Mushet high-

Combination Cutter and Reamer Saves Time on Tube Sheet Holes

speed steel. Cutting section B has 4 flutes with a spiral of 1 inch in 12 inches right-hand, giving the cutter a rapid cutting action. The reaming section A is cut 10 flutes, lefthand spiral to prevent the reamer from seizing and leaving a rough hole. The reamer has a recess 1/4 inch wide and 1/16 inch deep between A and B to allow any cuttings to escape from the cutting section. Section A has a taper of 3 inches in 12 inches for a distance of 7/16 inch and then paralleled cutting edges 7% inch long to finish the hole to the correct size. A round filleted shoulder at the top removes the sharp edges of the tube sheet holes and prevents the copper ferrules from being cut in the process of beading or expanding. The tool is detachable from its spindle, which is turned down to 1 1/16 inch in diameter and threaded 12 threads per inch. This threaded end of the spindle turns into the threaded cavity in the cutter. The use of a heavy oil on the threads enables cutters to be readily removed so that the operator may use any number of cutters on one spindle.

# Boiler Inspecting In Australia

By George Cecil

A LTHOUGH Australia's population amounts only to five millions odd, of whom at least a million are descended, directly or indirectly, from the aboriginal blacks, the country decidedly is a progressive one. There are some fourteen thousand manufacturing establishments; railways have long passed their infancy; there is a fair amount of inland river steamer communication; and merchant vessels are forever plying between the coast ports. There are mills in plenty and numerous mines provide their owners with respectable incomes—so respectable that in some countries a super-tax would be imposed on them. Prosperous, in short, is the commonwealth; its machinery imports from the United States and England prove this agreeable state of things—and these imports include boilers.

#### Boiler Inspection Appointments

They also include boiler inspectors, though not to the same extent as formerly. At one time the imported article was considered a necessity. But of late years Australia has taken too great a pride in her good name to tolerate what she terms "the English interloper." Consequently, Australian-born aspirants rising to the occasion have qualified for these appointments, filling them with credit to everyone concerned. Soon the British variety will, it is hoped, have completely disappeared. "Advance Australia!" is the people's motto, and they live up to it.

The "black fellows," as the natives are called, have no aspirations in this direction. The colored man will act as assistant to the white boiler inspector for a dozen years without taking any interest in the work. He asks nothing better than to receive his pay every Saturday afternoon. The soul of contentment is the native.

# INTENSE PATRIOTISM SHOWN

The calling is not a highly-paid one, while the pension is but a trifle-scarcely admitting of life's least expensive luxuries. The point, however, is that the Australian by proving his worth, has kept the Englishman out of the field. And this is the wish of every patriotic colonial. All cheerfully admit allegiance to the "mother country," which, by the way, few of them have ever seen, or are likely to see. But, at the same time, it is considered that Australia should be as selfsupporting as possible and, to that end, no pains are spared to train men for the position of boiler inspector. Indeed, things have been rather overdone, for if there are not as many inspectors as there are boilers, the country might advantageously do with fewer and increase the salary attached to the post. Meanwhile, the matter is said to be under the consideration of those who have it in their power to improve conditions. These certainly need improving.

# INCOMPETENTS ON THE JOB

Not so very long ago derelicts and "remittance men" who had drifted out to Australia from England were ready to turn their hands to boiler inspecting. Some, being intelligent, mastered all details and afforded satisfaction; to this day they remain an ornament to the profession. Others, proving hopeless from the very first, had to be gently but firmly shunted. Several half-castes from India, having retired on a pension, also emigrated to the Commonwealth, there to carry on the job to which they had been accustomed for so many years. But their triumph was short-lived. Australia, finding that they already were in receipt of an assured income, quickly sent them packing. Greatly saddened and perhaps wiser than when they left their native land, each had to return to India. The Australian boiler inspecting element rejoiced at the departure of the would-be intruders.

Nor are the homemade half-castes encouraged to oust the colonial of pure blood. Besides, they are not suited to the work, nor, for that matter, to any other sort of employment upon which important issues depend. Boiler inspectors do not even care to utilize them as assistants.

### THE ROUGH ROAD

The Australian is admirably suited to his task, which, in the remote country districts includes roughing it. Upon reaching a point where the railway ends-and there are many such-he may have to ride miles to his destination, mile upon mile without meeting a soul. At nightfall he puts up in a ramshackle inn, tumbledown and dusty, glad to get a plate of cold mutton, a handful of biscuits, and a glass of beer, before turning in between a pair of coarse sheets which probably are none too clean. Sometimes the boiler man drives himself to the mill where his services are required and over an uncommonly rough road, the conveyance being in and out of formidable ruts half the time. As the local highways have long since deprived the cart of its springs, the unhappy driver is dog-tired by sundown. Despite the drawbacks of a ricketty bed, which may not be free from bugs, he welcomes "sleepy time." The most bloodthirsty biters cannot keep the worn out fellow awake.

In the large towns, such as Melbourne, Sydney (the attractive and civilized capital of New South Wales), Ballarat and Bendigo (the famous mining centers), Brisbane, Adelaide and Perth, the car line takes the boiler inspector wherever he wants to go. His life is one of ease compared with that of the man whose duties take him into the provincial wilds. But, whether employed in the town or the country, he always is reliable, doing the job thoroughly and giving an honest report. When examining a boiler which has seen better days, outside considerations do not weigh with him; he is a stranger to graft. Recently, one of the fraternity had to inspect an extremely dilapidated boiler at a small country flour mill owned by his father. The conscientious one unhesitatingly condemned it.

There are, of course, exceptions, when and where are there not? But the black sheep are few; the boiler inspector is almost invariably above suspicion. That is why he dies poor.

# DRASTIC MEASURES

As a rule, all repairs can be carried out on the premises and a boiler is soon put in going order. Sometimes, however, the local mechanics find the job beyond their powers, with the result that the steam gage works badly while the stop valve refuses to function. The opening to the manhole, being jammed, the boiler remains long uncleaned; and, for want of new plates, it is a danger to all in the vicinity. The inspection gives the proprietor an uncommonly bad quarter of an hour. "I am," argues the last-named, "over three hundred miles from a town. The cost of new plates is beyond my wretched means. I cannot afford railway freight and cart transport—even if I needed what you consider necessary." But all in vain. The boiler is ordered to be put out of action pending repairs, and the aggrieved machinery user, finding that there is no escaping from the decision, produces the money and all that is necessary is done. Boiler inspectors, as may well be imagined, are not always popular. "They do their duty unpleasantly" is the opinion of those who fail to satisfy them.

When on his provincial rounds, the boiler inspector sees nothing of the light side of life. Except for an occasional kangaroo hunt, the monotony of a singularly drab existence is unrelieved. In the large towns there are the movies and the theater; and the man who wishes to improve his mind is afforded opportunities of doing so. But this is not true in the "bush."

Still, the boiler inspector is satisfied with things as he finds them. Never having known anything better, he is contented. A philosopher.

# Report of a British Marine Boiler Explosion

# Board of Trade Investigation of Disaster Indicated Low Water as the Cause of Overheating

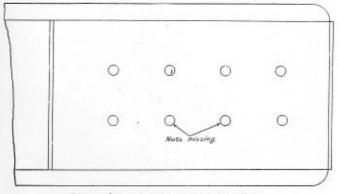

A S in this country, it is the custom of government officials to thoroughly investigate all boiler explosions, both marine and railway. The results of such investigations are valuable to all those who design, construct or inspect boilers since reports of this character indicate methods that may be adopted to prevent a recurrence of such disasters.

The British Board of Trade report of the explosion on board the steamship *Kelburne* is given below:

The explosion occurred at about 5:45 P. M. on June 27 last, when the vessel was on a voyage from Birkenhead to Dublin. The vessel is owned by Messrs. J. Gale & Co., Preston. No person was injured in the accident.

#### DESCRIPTION AND PRINCIPAL DIMENSIONS OF THE BOILER

The boiler is of the single-ended cylindrical multitubular marine type, made of steel, and worked under natu-

Plan of Combustion Chamber Top

ral draft at a pressure of 120 pounds per square inch. It is 8 feet 4 inches in length and 9 feet in diameter; the shell is 11/16-inch in thickness, with double butt straps, double riveted. There are two furnaces of the Fox corrugated type, 27 inches in internal diameter, and one combustion chamber to each furnace, stayed at the top by four girders, with two stays to each girder. The usual mountings were provided, including a water gage and two test cocks on the column. The feed arrangement consists of two feed check valves, one in connection with the main engine feed pump and the other with the donkey pump; there being no connection between the two discharge pipes.

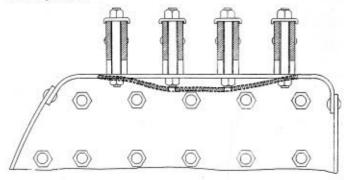

# BOILER OF AN OLD TYPE

The boiler was made by Messrs. Bow, McLachlan & Co., in the year 1904, and is therefore 19 years old. With the exception of the renewal of the furnaces and tubes, in 1919, no repair of importance is recorded.

The boiler was inspected periodically by surveyors to Lloyd's Register of Shipping and inspectors to the Manchester Steam Users' Association, the last survey in each case being held in July, 1921.

### NATURE OF THE EXPLOSION

The port combustion chamber top partially collapsed. Two of the stay nuts were carried away, and the plate, being forced off the stays, allowed free escape of steam through the stay holes.

, Sectional Elevation of Combustion Chamber Top

The boiler had been short of water, causing overheating of the combustion chamber top plate, and the overheated plate, in its weakened condition, was unable to withstand the pressure of the steam.

### GENERAL REMARKS

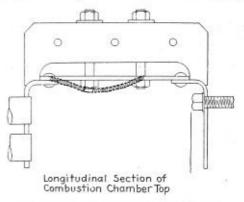

The *Kelburne* is a vessel of 199 tons gross, engaged in the coasting trade, and has one boiler which supplies steam to a set of compound engines at a pressure of 120 pounds per square inch.

The boiler and its mountings were surveyed by one of

the surveyors to Lloyd's Register of Shipping, in July, 1921, and also by an inspector to the Manchester Steam Users' Association, at the same time, and, according to their reports, everything was in a satisfactory condition.

The vessel left Birkenhead for Dublin on June 26, 1922. On the following day, at 4:30 P. M., the chief engineer relieved the second engineer, the boiler pressure being then 110 pounds per square inch, and it is stated that there were  $3\frac{1}{2}$  inches of water showing in the gage glass. At 5:45 P. M. the explosion occurred, and steam, escaping through the stay holes in the combustion chamber top plate, put out the fire in the port furnace. The fire in the starboard furnace was then drawn, and, shortly afterwards, the engines stopped through lack of steam. When the boiler was sufficiently cooled, an examination was made, and it was found that the damage was so serious that the boiler could not be used. The vessel was then taken in tow by the steam trawler *Rose of England* and towed to Dublin.

On further examination, at Dublin, it was found that the combustion chamber top plate was distorted, two stay nuts had been carried away and the plate at these two points

### Sagged Plate in Combustion Chamber

had been forced over the ends of the stays; other stays in close proximity were badly strained, otherwise the boiler did not appear to have suffered in any way.

A new combustion chamber top was fitted, all the girder stays were renewed, and the tubes expanded. The boiler mountings were found to be in order, with the exception of the main feed check valve chest, which had to be renewed. On completion of the repairs, a hydraulic test was applied, with apparently satisfactory results. Steam was raised, and it was found, after about one hour's steaming, that the tube ends in both combustion chambers were leaking, the leakage gradually becoming worse on the run to Preston. At Preston, the tubes were re-expanded and steam again raised preparatory to leaving that port, when it was found that leakage still took place from the top rows of tubes at both ends.

It appears that, in March of this year, a clip had been fitted around the main feed check valve chest at the fillet of the bottom flange, in order to stop a slight leak that was showing. When this clip was removed at Dublin the chest was found to be cracked for about seven-eighths around the circumference of the inlet branch. A valve seat covering the fracture had at some time been fitted, and the inside of the casting appeared to have been screw-cut, presumably with a view to screwing in a seat. The seat fitted, however, had simply been driven in and pinned. Neither the chief engineer, who joined the vessel three days only before the explosion took place, nor the second engineer had any knowledge as to when the seat was fitted, but as the second engineer states that he saw the clip put on in March last, when he joined the vessel, it may be assumed that the crack had shown at some previous time, subsequent to the survey in

July, 1921, and the valve seat had been put in as a precautionary measure.

Both engineers state that, after leaving Birkenhead, a considerable amount of water was being lost through the defective valve chest, necessitating an almost constant supply of extra feed water, although until 4:30 P. M. on the day of the explosion no difficulty had been experienced in maintaining the level in the gage glass. I am therefore of the opinion that the shortness of water was most probably due to a sudden extension of the crack in the chest, causing increased leakage, which was not noticed by the engineer on watch, the result being overheating of the combustion chamber top and consequent failure of the plate. Had both fires been of equal fierceness, no doubt the starboard chamber top would have suffered similarly.

OBSERVATIONS OF THE ENGINEER SURVEYOR IN CHIEF

This explosion was undoubtedly due to overheating consequent upon the boiler being short of water.

The main feed check valve chest was known to be defective and was apparently in such condition as to require the normal feed water supply to be supplemented almost continuously, and it is, therefore, surprising that greater care was not exercised to maintain the water in the boiler at a safe level.

The explosion resulted in the temporary disablement of the vessel, and it is for unate that assistance was available.

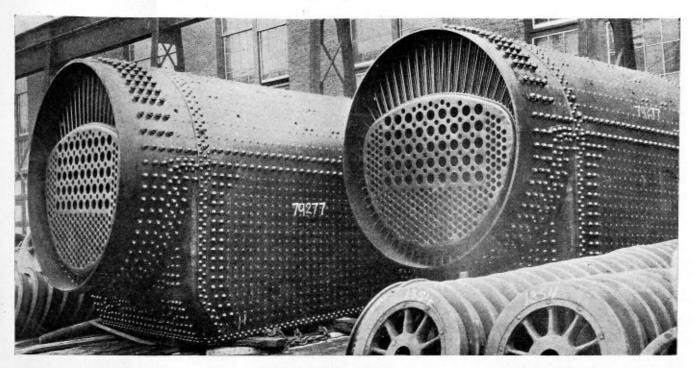

Fig. 1.-Side View of Boiler, Back End, Showing Ball and Sleeve Application in Breakage Zones

# New Staybolt Designed to Promote Flexibility

# Details of Double Articulated Staybolt Design for Use in Locomotive Boilers

BECAUSE of design features which have been incorporated in a new type "double articulated" staybolt developed by A. F. Pitkin, assistant superintendent of the American Locomotive Company, at the Schenectady Works, the following details of its construction and features are given. The material, tests and information given were prepared by Mr. Pitkin to demonstrate the features of the bolt.

In the days of small locomotive boilers, and therefore short sheets, the "rigid" type of staybolt was satisfactory as the expansion of the sheets was well within the flexible limits of

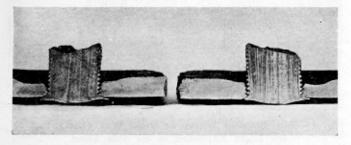

Fig. 2.-Result of Weaving Action on Inner Bolt Connections

the "rigid" bolt. As the larger boilers were developed increasing difficulty was experienced with the "rigid" bolts breaking near the outer sheet.

This was due to the fact that the outer sheet, being the heavier, held the bolt in a rigid vertical position throwing all the strain on the bolt at its junction with the sheet; whereas the inner sheet, being of lighter weight, took up some of the strain by bending, thus to a certain extent relieving part of the flexing strain at the inner "rigid" bolt connection. By experience, it was found that only certain areas, in the

back end, were affected; since called the "breakage zones." In order to eliminate the failure at the outer connection various types of "semi-flexible" staybolts were introduced in the breakage zones. The development of the "semi-flexible" bolt has resulted in the almost universal use of what is known as the "ball and sleeve" connection.

The adoption of this "semi-flexible" bolt has practically eliminated breakage, at the outer sheet connection, but has failed to relieve the strain at the inner connection so that the injurious action, on this connection and the lighter sheet, is still there.

It is for the purpose of eliminating this condition that the following experiments and recommendations have been developed.

In Fig. 1 is shown a side and back end view of boilers illustrating the ball and sleeve application in the breakage zones.

Fig. 2 illustrates the effect of the continual weaving strain on the inner bolt connection.

The bolt being screwed into the inner, or firebox sheet, increases the mass of metal at these various points so that the heat units are not carried away as rapidly as through the plain sheet. This makes numerous hot points where oxidation will more rapidly take effect.

Even though the bolt may have a tight thread fit in the sheet the continual weaving motion, due to expansion and contraction of the outer and inner sheets, gradually enlarges the connection hole on the water side allowing oxygen in the water to attack the thin metal threads. At the same time minute surface cracks are exposed and assist in the oxidation of the sheet immediately adjacent to the bolt connection.

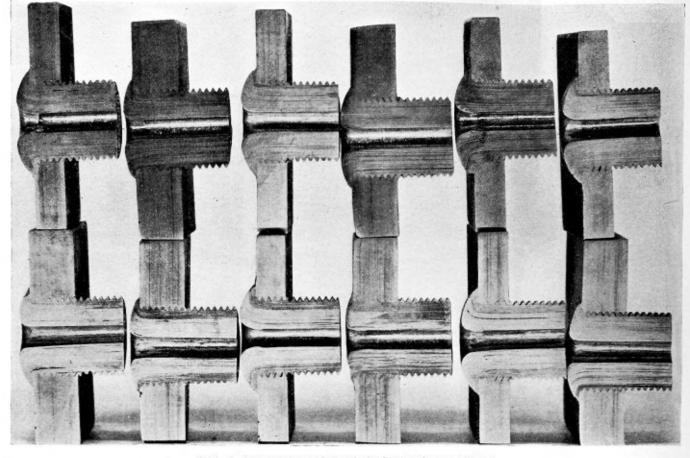

Fig. 3.-Usual Type of Staybolt Connection to Sheet

Lime and other deposits will fill up the enlarged hole and cracks but is broken down by the weaving action, thereby presenting new surfaces for attack. This process continues until it becomes necessary to replace both the sheet and bolts.

The usual form of threaded bolt connection to the sheet is shown in Fig. 3, the end being driven and trimmed from the outside of the sheet.

By examining the etched sections it will be noted that the "upsetting" effect only extends into the threaded connection about one (1) thread, leaving the balance of the threads more or less exposed to the oxidizing effect as illustrated in Fig. 2.

It will be noted that all of these bolts are made of staybolt iron; a material developed on account of its fibrous structure better withstanding the weaving action between the two sheets.

Fig. 4 illustrates two steel staybolt connections—one driven over in the "standard" way showing how the threads remain open at the inner side of the sheet. The other expanded from inside the bolt by first taper-reaming the "tell-tale" hole then driving in a three corner taper pin rotating at the same time and afterward driving and trimming the head.

By this latter method *all* the threads are expanded into the threaded hole, in the sheet, making a tight joint throughout.

It has been found that, due to the fibrous nature of staybolt iron, the pin expanding will split the iron, so with this style of connection steel must be used.

The action of the "semi-flexible" and "double articulated" staybolt on the inner sheet is indicated in Fig. 5.

"A" is a thin sheet of metal, mounted in a wood frame, into which is rigidly fastened the rod "C," representing the "semi-flexible" bolt, and the "double articulated" bolt "B."

Any movement of the outer plate carrying the latter will produce no appreciable effect on the plate "A" while the slightest movement of the rod "C" will produce a bending or warping effect.

As the actual movement between the outer and inner sheets of a boiler is so slight the angular pull on the inner ball connection of the bolt "B" will be practically nil.

By eliminating this weaving effect it is obvious that the fibrous nature of staybolt iron is not essential in its construction. This will make it possible to use steel and the expanded method of connection as illustrated by Fig. 4.

This demonstrates the fact that the present type of bolt

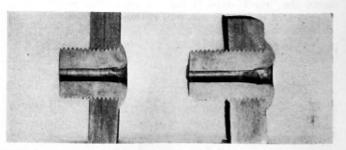

Fig. 4.—Steel Staybolt Driven in Usual Way (Left), that at the Right Expanded in the Side Sheet

is only flexible because the light firebox sheet bends and that this flexibility is gained at the expense of the life of the sheet.

The "double articulated" bolt consists of a connection to the outer sheet, which is in the form of a hollow tapered plug, with a tell-tale hole drilled to the ball.

A tell-tale hole is also drilled through the center of inner threaded connection to the ball. The light sections, at these two points, constitute the breaking points.

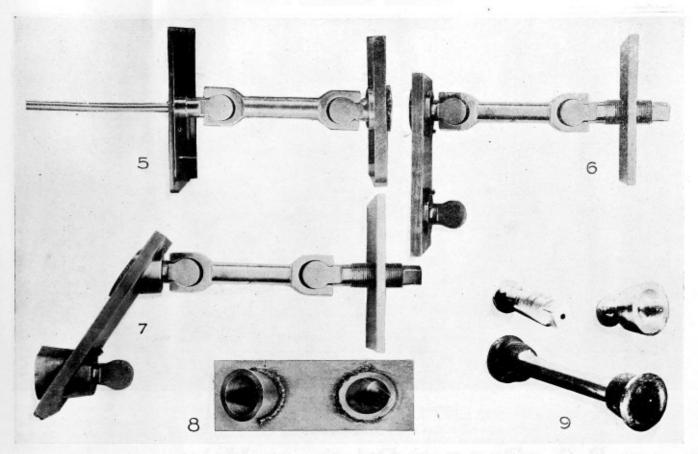

Fig. 5.—Demonstration of Double Articulated Bolt Action. Fig. 6.—Bolt with Standard Plug Connection. Fig. 7.— Staybolt with Hollow Plug Connection Welded to Sloping Sheet. Fig. 8.—Appearance of Plugs Welded. Fig. 9.—Staybolt Parts.

All other sections of the bolt are made considerably stronger, so if, by some remote possibility, a break should occur it would be immediately obvious from outside the boiler or in the firebox.

By making the inner threaded connection of steel the "pin expanded" method of fastening can be used. The hole in the outer sheet is taper reamed, using the hole in the inner sheet as a guide, assuring perfect alinement on application. The taper plug, being welded to the outer sheet, eliminates the expensive operation of tapping with all its attendant troubles of bad threads, leaking and cracked sleeves on the boiler test.

A modified form of bolt has also been developed, so that if desired staybolt iron can be used for the inner connection.

As previously shown, staybolt iron cannot be pin expanded which would make it necessary to drive it over in the regular way. In this form of connection it is desirable to "hold on" the opposite end to prevent stripping the thread.

In order to make "holding on" possible the outer taper plug carries a taper threaded ball connection so that after the bolt is pulled down and plug welded to the outer sheet the outer ball can be screwed down, taking up the expansion spaces in the two sockets, making the bolt temporarily rigid so a "holder on" can be placed at the outer end while the firebox end is driven over.

After the inner connection is made the outer ball is screwed back and the projecting bolt cut off and joint welded.

Fig. 6 illustrates the staybolt with standard plug connection for parallel sheets; also the "flush" type of connection welded to the outer sheet.

Either type, applied under a combustion chamber, it is claimed, will overcome the difficulty experienced with the "semi-flexible," where the sleeve is inverted, making it a convenient receptacle for dirt washing about inside the boiler shell, also eliminating the danger of freezing when the boiler is drained and the engine placed outside in cold weather. Note the slight projection of the standard welded plug

Note the slight projection of the standard welded plug

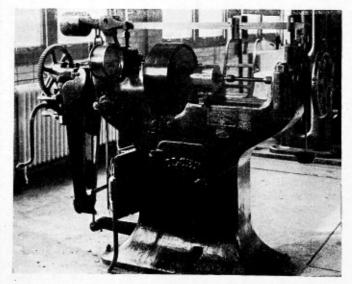

Fig. 10.—Machine Used in Making Vibratory Tests on Staybolts

above outer sheet and consequently little interference with the boiler lagging.

Interior View of British Locomotive Shop

# Boiler Design in Relation to Maintenance

Practices Employed in British Shops in Building and Repairing Locomotive Boilers to Give Maximum Service

# By A. E. Kyffin

THE most common British type of firehole is a solid forged ring between the outer and inner firebox plate; this is often the full width of the water space, but sometimes the copper plate is dished to reduce the width of the ring to anything down to about 1³/₄ inches with the object of shortening the rivets to ensure a tight joint and also of keeping the heads out of the flames; the objection to this practice is that with bad water the scale rapidly collects above the ring and is not easy to wash out. The rivets round a firehole are a constant source of trouble, and to avoid their use various methods are used of flanging both the copper and steel plate to form a ring without any joint. Other constructions are sometimes used to advantage.

Foundation or bottom joint rings are almost invariably of rectangular section of an average width of 3 inches to 4 inches. For boilers having a medium working pressure the riveting can be single, but above 160 pounds double riveting is to be recommended. At the corners the rings are often made with a thinner downward extension to enable either a second or third row of rivets to be worked in according to whether the main portion of the rings is single or double riveted. This method of construction is very expensive, not only as regards the ring itself, but also in the machining of the boiler plates, and if a well-designed corner is used with the plain ring, equally good results can be obtained. The

*Second installment of a paper read before the Institution of Locomotive Engineers, Manchester, England, November 13, 1922. The first installment appeared on page 100 of the April issue. examination of the corners of many fireboxes occasions wonder as to how they keep tight at all, so badly are the rivets pitched, being either too large on the outside to be steamtight, or the inside copper plate is so cut away by the cluster of rivets that it cannot bed on to the ring. The use of screw rivets should be avoided as far as possible because if once

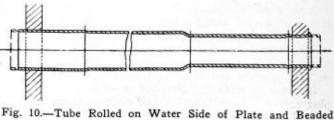

Fig. 10.—Tube Rolled on Water Side of Plate and Beaded on Fire Side

they develop leaks they cannot be laid up again like an ordinary rivet, as this only tends to loosen the thread; and as the squares are always cut off they cannot be screwed up when it is found necessary.

## FLANGED PLATES

The two principal plates are the throat or saddle and the back plate; the former is fairly immune from trouble with the exception of the flat between the shoulders at the top, where cracks sometimes develop, more especially if the joint is only the width necessary for single riveting. Regarding the back plate, an interesting difference of opinion exists as to the best radius for the flanging of the sides; the more usual figure is about  $3\frac{1}{2}$  inches inside, but some engineers specify not less than 6 inches. The author has in his recollection a class of boiler which had the back plate flanged with a large radius, and in a comparatively short time it

Fig. 11 .- Washout Plug with Gun Metal Cap

developed bad cracks at the junction of the radius and the flat of the plate at the upper portion of the firebox; this was attributed to the rigidness of the large radius resisting the breathing of the back, and certainly the trouble disappeared when these plates were replaced with others of less radius.

The form of back plates used on the L. & N. W. Railway and some other lines, in which the flange is reversed in direction from the conventional form, has certain claims made for it, but there are disadvantages also.

There is also a very considerable distance between the line of the riveted joint and the first row of water-space stays; this throws a very heavy stress on the latter and leaves a relatively large unstayed area of steel plate, and even when a few cross stays are put in, experience has shown that long vertical cracks occur. Similar

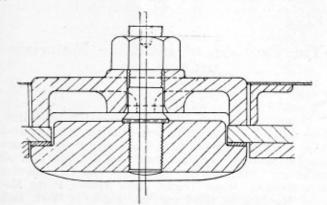

Fig. 13a .- Removable Hand Hole for Access to Firebox Crown

trouble is experienced with the back plate, and generally it would be most instructive to hear from engineers who have to maintain and repair boilers of this type as to how, over a period of years, they compare with the ordinary type back plate.

#### TUBES

The author does not propose to enter upon the very debatable subject of the material of tubes, but much benefit is to be derived from a discussion regarding the methods of securing tubes in the firebox tube plate. The tubes may be simply rolled into place and slightly bell-mouthed, or they may be beaded right over; or again, they may have a shoulder rolled on them next the water side of the tube plate and beaded on the fire side, as in Fig. 10. The use of ferrules is more

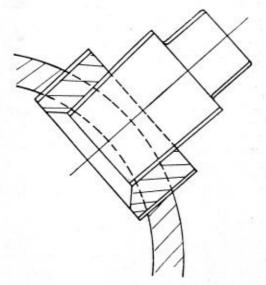

Fig. 12 .- A Type of Readily Removable Plug for Washing Out

common with copper and brass tubes than with steel, but there is not apparently any settled practice regarding whether ferrules should or should not be fitted into new boilers whatever be the material of the tubes.

#### WASHOUT ARRANGEMENTS

As relatively few railways have good water all over their systems, the provision of ample and convenient washout and

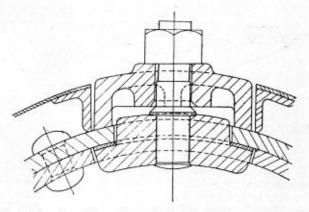

Fig. 13b.—An Adaptation of the Handhole to a Curved Portion of Shell

inspection doors is of the utmost importance, as the cleanness of a boiler has much to do with its active life, not to speak of its steaming qualities.

The average engineer in charge of the running of locomotives usually has to content himself with a few plugs, etc., in the region of the firebox foundation ring, a few in the smokebox tubeplate—often very inaccessible—two or three on the back of the firebox on the line of the firebox crown, and if the boiler has a Belpaire firebox, washouts on the firebox sides. These may, of course, be sufficient, but the provision of extra plugs or capped washouts on the **radii** of the front and back plate about half-way up, to enable the side water legs of the firebox to be washed out, would be a boon in most cases. Some railways fit a large mud door on the underside of the barrel a little ahead of the firebox so that any scale, etc., washed off the tubes and front end of the barrel may be removed there instead of being washed into the front water-leg of the firebox. Provision is also made for washing the tubes and firebox top from above by fitting capped washouts on the front ring of the barrel and on the firebox crown next the barrel.

Regarding the actual details of washouts, these at the foundation ring are either taper plugs screwed direct into the the steel plate—which is usually thickened by the provision of patch plates—or else into gun-metal seatings; or washouts with screwed capped tops are riveted or screwed on to the corners; the bodies of the latter may be of steel or gunmetal, with gun-metal seatings; or washouts with screwed capped tops are riveted or screwed on to the corners; the bodies of the latter may be of steel or gunmetal, with gun-metal seatings; or gun-metal, with gunmetal caps on the lines of Fig. 11. The last mentioned practice is not so common on locomotives in use in Great Britain as on those for overseas. With a taper plug screwed direct into the plate it is only possible to get one plug at each

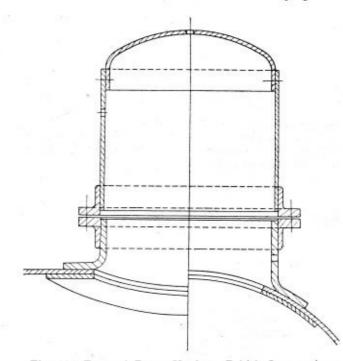

Fig. 14.—Type of Dome Used on British Locomotives Intended for Export

corner of the firebox on the same level, but if seatings are used two plugs at right angles can be provided, while these can easily be arranged with capped washouts, provided, of course, there is room inside the frames. This method has been found entirely satisfactory.

The taper threads in the plates are soon damaged or worn and have frequently to be retapped, and in time become larger than the standard plugs. An interesting scheme for providing readily renewable holes is seen in Fig. 12, consisting of a steel ring screwed with a fine thread into the plate, the taper plug then being screwed into it, with the idea that the ring can be renewed when worn; but whether the remedy is worse than the evil is a debatable point.

The side washouts provided on fireboxes are usually taper plugs, capped washouts or removable handholes, one type of the latter being shown by Fig. 13; the handhole certainly provides the best access to the firebox top. These washouts are commonly located just above the line of the firebox crown, but are sometimes placed on the shoulders of the firebox to enable the stream of water to be directed downwards on to the firebox crown.

#### STEAM DOMES

As these house the regulator and are the only means of getting to the main steam pipe, they are of great importance to the running shed force, yet on how many boilers are they of the type in which the joint line of the top is either above the regulator head or only just level with it. The type of dome now most used on engines built in this country for overseas lines is shown in Fig. 14 with this. When the upper portion is removed, the regulator head is so exposed that it can be easily refaced or otherwise attended to; also the main steam pipe joint is fairly accessible, especially if the dome is, say, 2 feet 3 inches or 2 feet 6 inches inside diameter.

A leaking dome joint is always a nuisance and gives rise to considerable work; yet railway men do not seem to have decided whether the joint is best made by a copper ring of the continuous turned variety or the so-called boiled oil joint.

There are other important details of the boiler which, it may be claimed, have been ignored, but the author's excuse must be that the paper is not intended to be even moderately comprehensive, but he hopes that these somewhat disjointed notes will serve the purpose for which they are intended, namely, the gathering together of the experiences and opinions of the members of this institution regarding the features in question.

# Steam Boilers in India

ORD has just been received that late in January the Legislative Assembly, in India, passed a new bill, amending the laws relating to the construction and operation of steam boilers and providing a single law that will apply throughout the entire country. Copies are not yet available here, but have been requested. Manufacturers and exporters shipping steam boilers to India should be careful to see that they comply with these new requirements, in order that there should be no disappointment at destination upon delivery.

As previously stated, the Bureau of Foreign and Domestic Commerce of the United States endeavors to maintain a complete collection of the steam boiler laws for all foreign countries, and interested parties can ordinarily secure needed information by communicating with the Industrial Machinery Division.

# The Problem of Handling Materials With Safety

CAFE Practices Pamphlet No. 54 entitled, "Handling Material," has just been published by the National Safety Council, 168 North Michigan avenue, Chicago. Handling material is generally recognized as one of the greatest safety problems in industry, and according to state reports handling material by hand causes more accidents than all machinery. The pamphlet is divided into the following main divisions: Power Trucks, Hand Trucks, Piling Ma-terial, Handling by Hand and Safe Habits of Work, each of which is again subdivided into paragraphs dealing with the different types of equipment used and the different methods employed in handling various types of material. The pamphlet is freely illustrated with photographs and diagrams. A large number of industries are covered, and owing to the fact that handling material is common to every industry, the pamphlet has an unusually wide range of usefulness. The experience of many members of the National Safety Council was contributed in the preparation of the pamphlet and the assistance of a committee of seventy-five safety engineers was employed in preparing the material.

# Southern Pacific Boiler Shop at Bay Shore

Machinery and Layout of Small Locomotive Boiler Repair Plant Designed for Efficiency

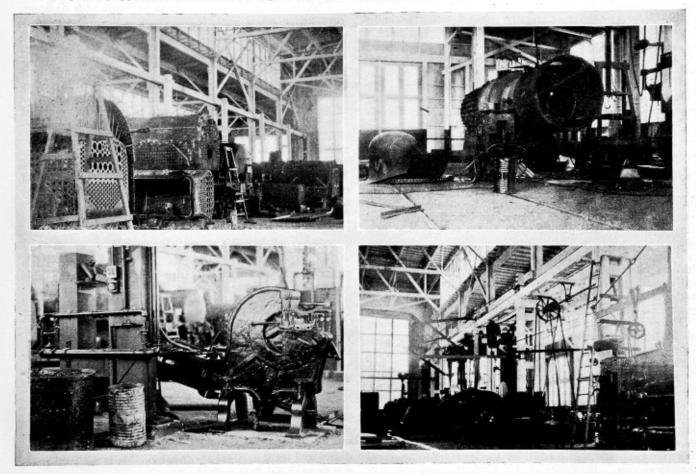

#### By Charles W. Geiger

THE boiler shop at the Bay Shore shops of the Southern Pacific Railroad Company near San Francisco is a model of its kind. The building is a wooden structure with corrugated iron sides and roof. Almost the entire walls are glass. There are also numerous skylights and the building is well ventilated. An experiment has been made in the use of crushed rock and oil for the floor, which has given perfect satisfaction, this combination being much easier to stand on than concrete.

The shop is equipped to do all kinds of repair work on

building, with 11/4 inch leads and connections at each column.

There is a transfer pit 490 feet in length that extends between the erecting shop and the roundhouse and the boiler shop, which provides a quick means of transferring both locomotives and boilers from the erecting shop to and from the boiler shop and for transferring locomotives from the erecting shop to the roundhouse. A novel feature of this pit is the transfer table trailer. This trailer was built to enable hand trucks to be taken across the pit between the erecting shop and the boiler shop. It is seldom necessary to move the

Section of Bay Shore Shop, Showing Type of Structure (Upper Left). A Boiler in Process of Stripping (Right). Some of the Pneumatic Tools in the Shop (Bottom).

locomotive boilers and tenders. The equipment in the shop includes one flanging machine operated by compressed air. There is a utility forge for light jobs, and an oil burning flange fire with straightening block and flanging clamp; two combination punch and shears with 50-inch throats. A combination angle shear and punch machine, one Landis staybolt cutter, one large drill press for heavy work and small drill press for light work are also included in the equipment. There are several stationary oil forges for heating rivets and a portable forge. Acetylene welding and cutting outfits are used in cutting and welding and for brazing. These outfits are portable and use gas manufactured by portable plants. There are two 3-inch air mains, one on each side of the trailer, the only time being when the transfer table is to be moved to the extreme west end of the pit. Then the transfer table is used to push the trailer out of the way and is again towed to place when the transfer table again moves to the other end of the pit.

BIGGEST TESTING MACHINE IN THE WORLD.—A crushing force equal to the weight of fifty loaded coal cars of a hundred tons each can be exerted by the largest testing machine in the world which is now being installed at the Bureau of Standards. This machine has been in use for several years at the branch laboratory in Pittsburgh and has recently been moved to the main laboratory in Washington, D. C.

# Boiler Maintenance in the Roundhouse

# Details of Defects and Repairs That Constitute the Most Important Part of British Terminal Maintenance

#### By A. Wrench

L OCOMOTIVE boiler management in the roundhouse is a subject that should be thoroughly understood by all those in charge of this work, as this important branch of maintenance work has been somewhat under-rated.

For many years, in this country (England), fitting crews had control of the boiler repairs, resulting in much inefficiency, as the average fitter does not study the stresses to which a boiler is subjected and the work suffers accordingly.

In most large terminals now, the boiler work is controlled by a foreman or master boiler maker, who has full authority to stop engines for boiler repairs, or condemn them when unfit for service. He is usually selected from the boiler makers working in the running department, who have a general knowledge of shed working, as well as an all round knowledge of the trade. He should have jurisdiction over all grades having work in connection with the maintenance of the boilers in his charge, including boiler makers, tube fitters, boiler washers, tube cleaners, firebox cleaners, firebar men, etc. If the work of these grades is neglected, the efficiency of the locomotives will be impaired by bad steaming.

#### TYPES OF REPAIRS REQUIRED

The work generally in a running shed is different from that in railway or contract shop. The boiler maker has to be an all-round man, capable of doing a variety of work. In addition to firebox and tube repairs, he should be capable of doing repairs to engine frames, smokeboxes, tanks, and various smithing and plating work, which from time to time arise.

Tube fitters are employed in some terminals to deal with leaking tubes. These are expanded when only leaking locally, but when many are leaking or are worn thin at the ends, or there is a suspicion of dirt among the tubes, the engine is stopped and the repairs effected.

Before an engine is stopped, the foreman boiler maker should make inquiries as to the condition of the running gear, etc., and also obtain the mileage since the last shopping. If the locomotive is in a run-down condition, it may be possible to make the boiler good for 6 or 8 weeks' service by a slight repair.

Supposing a locomotive is reported by the engineer, on completion of a journey, to have leaky tubes; and, on examination, all the tubes are found to be leaking and about 40 tube ends thin, inquiry shows that the locomotive is getting run down and will be due for a general repair in about a month's time. In a case of this kind, it is possible that a further term of service can be obtained by re-expanding the tubes and inserting ferrules in those that are thin, to prevent further wear and help to keep the expanded joint tight. When the engine is stopped for general repairs, the tubes can be removed and a more permanent repair effected.

#### COOPERATION OF DEPARTMENTS

A good deal of locomotive stopping can be avoided by the foreman boiler maker working in conjunction with the foreman fitter.

When an engine is stopped in the roundhouse for a heavy motion repair, the firebox should be overhauled, and any repairs necessary taken in hand. It is also advisable to anticipate repairs likely to be necessary shortly after the locomotive is placed in service again. Sometimes when an engine is stopped for a heavy repair, it will be found that the tube ends are worn, but not sufficently badly to be renewed. If these tubes are allowed to remain in, they may give trouble after a few weeks' service, which will necessitate the locomotive being stopped for a further period. Therefore, it is good practice to renew these tubes during the first stopping.

A periodical examination should be adopted, in addition to the thorough overhaul, whenever the engine is stopped. Valuable information can also be obtained from engineers and others, whose duties keep them in touch with fireboxes, when under steam pressure.

#### WASHING OUT BOILERS

An important branch of boiler maintenance is boiler washing. This is done on most railways, two or three times a week, and in some cases with hot water. Cooling down boilers too suddenly, prior to washing, accounts for a lot of firebox trouble. In smaller depots, when this work is under the control of persons not skilled in boiler maintenance, the boilers are often cooled too rapidly with detrimental results to the boiler structure, tubes, etc. The foreman boiler maker should see that the cooling is gradual.

The boiler washers should understand the construction of the water spaces they are expected to keep clean, so that, by means of rods and various shaped nozzles, they may reach any desired place where scale and sediment is likely to collect.

#### CLEANING TUBES

The tubes of locomotive boilers should be regularly cleaned, preferably after each trip. The dirt inside the tubes is removed by compressed air or steam blast, and any burrs which collect on the tube ends in the firebox are removed by a rake and wire brush.

Ash, which tends to collect at the front of the brick arch, should also be removed regularly, since if this is neglected, the bottom rows of tubes get blocked, reducing the heating surface and causing bad steaming. Superheater flues also get blocked with ash, owing to a clinker building up on the end of the element tubes, and falling inside the flues.

The bands which hold the elements together, sometimes become displaced and broken, and cause an obstruction in the flues against which ash will collect. If the air or the steam blower will not clear this ash, the element should be withdrawn and the flue cleaned with a mop. It is not good practice to wash the flues with the hose.

Dirt in the boiler among the tubes is often the cause of bad steaming and necessitates the removal of tubes to clean away.

It will be seen by the foregoing that boiler management in locomotive terminals plays an important part in the efficiency of the locomotive, and all work in this connection should be directly under control of a person specially skilled in boiler maintenance work.

The City of Scranton by ordinance introduced in council, adopted the boiler code of the Industrial Board of Pennsylvania as effective in that city ninety days after the approval of the mayor. The mayor signed the ordinance on March 7, 1923. This step assures uniform boiler regulations throughout the commonwealth of Pennsylvania.

# Rules for Preventing Boiler Failures

Proposed A. S. M. E. Rules on Care of Power Boilers To Be Discussed at Spring Meeting

THIS Report of the Sub-Committee of the Boiler Code Committee on Code for the Care of Power Boilers is suggestive only and will be proposed for discussion at the Spring Meeting of the Society at Montreal, Que.

The work of this Sub-Committee of the A.S.M.E. Boiler Code Committee has been actively pushed forward during the past year and its report is here presented for public discussion. This report is intended to form a section of the A.S.M.E. Boiler Code, the Sub-Committee which was appointed in 1922 to consummate this work being as follows:

F. M. GILSON,	Chairman W. H.	LARKIN, JR.	
E. G. BAILEY	J. S. S	J. S. SCHUMAKER	
W. G. DIMAN	H. F.	SCOTT	
J. R. GILL	N. STA	HL	
J. W. HAYS	J. Woi	J. Wolff	
S. F. JETER			

It is the request of the Committee that these proposed rules be fully and freely discussed so that it may be possible for any one to suggest changes before the rules are brought to final form and presented to the Council for approval. Discussions should be mailed to C. W. Obert, Secretary of the Boiler Code Committee, 29 West 39th St., New York, N. Y., in order that they may be considered by the Boiler Code Committee.

The following outline of the proposed "Rules for the Prevention of Direct Causes of Boiler Failures" will indicate the scope of the work. The first sections on "Over-Pressure" and "Weakening of Structure" are given below. Additional sections will be published in later issues of THE BOILER MAKER.

RULES FOR THE PREVENTION OF DIRECT CAUSES OF BOILER FAILURES

Over-Pressure Indicators steam gages water glasses and gage cocks Relief Equipment safety valves intercommunicating valves between systems of different pressures Feed Water Control pump regulators feed water regulators Excessive Combustion damper regulators fuel supply regulators Operation manipulation of valves Weakening of Structure Overheating lack of water supply fouled heating surface excessive combustion secondary combustion and flaming through localized heating damper regulation insulation Corrosion general internal feed water boiler out of service external leaks boiler out of service electrolysis Erosion Stresses other than Internal Pressure boiler supports pipe line supports supports of equipment or other structures

#### **Over-Pressure**

#### INDICATORS

C-1 Steam gages. Steam gages shall be placed where they will be free from vibration and where they can be conveniently adjusted. They shall be so placed that they will not be subjected to a temperature of less than 40 degrees F. or more than 150 degrees F. They shall be of such size and so proportioned and marked that the position of the pointer and the graduations can be clearly determined by a person with normal vision standing on the operating floor at any point within a radius of one and one-half times the width of the boiler setting measured from the center of the boiler front. Steam gages on all boilers, where set in battery, shall be practically the same in size and graduation of face.

C-2 Steam gages shall be well lighted at all times. When natural light is used the gage shall be so placed that the rays of light will not cause a reflection upon the glass cover thus obscuring the dial when viewed from the most desirable points of observation. When artificial light is used the light shall fall directly upon the face of the gage. Whatever form of light is used, no light shall fall directly into the eyes of the operators when looking at the gage from the most desirable points of observation.

C-3 Where steam gages are installed with waterleg, compensation shall be made in the gage to neutralize the effect of the water in the gage connections. Where steam gages are placed high above the operating floor, they shall be tilted forward at a sufficient angle (not to exceed 30 degrees with the vertical) to permit a proper view of the dial graduations.

C-4 Piping for steam gages shall be as short as practicable and shall be free from pockets and air traps. When the pipe line is longer than 10 ft., the pipe size shall not be less than 3% inch standard pipe size. C-5 A steam gage shall be considered tested when it has

C-5 A steam gage shall be considered tested when it has been compared and made to agree with a test gage or dead weight testing device, unless compensation for waterleg has been made, in which case an equivalent allowance shall be made in the reading of the test gage or dead weight testing device. The test gage shall be a reliable gage that is used exclusively for testing gages in service and one that is tested and maintained in agreement with a dead weight testing device.

C-6 Boiler gages shall be tested frequently, at times of external inspection, when boiler is placed in service, and when safety valve is operating and the pressure indicated by the steam gage is not in agreement with the pressure at which the safety valve is set to open.

C-7 A master gage is an auxiliary gage attached to the main header indicating the composite boiler pressure of the whole battery; it is used in the general operation of the plant mainly as a matter of convenience. Master gages shall be tested at least every three months and more frequently when trouble is experienced with boiler compounds, foaming, priming and other feed water troubles that are apt to cause choking of the gage piping.

C-8 All steam gages shall be within two per cent of error in the range between the working pressure and the pressure of the opening of the safety valve.

C-9 Before a steam gage is tested, it shall be disconnected at the gage union while the piping, cock and siphon is being cleared by blowing through. A tee with a plug shall be placed between the siphon and the gage for the purpose of connecting the test gage. Care shall be taken not to admit steam directly into the gage, making sure at all times that the siphon is filled with water. In opening the connection to the gage, the operator shall open the cock slowly while holding one hand on the siphon until the gage indicates full boiler pressure; if the temperature of the siphon indicates that steam instead of water is entering the gage, the cock shall be closed until a sufficient amount of water has accumulated in the piping.

C-10 When laying up a boiler, particularly in freezing temperatures, the gage connection shall be drained and the gage shall be disconnected and stored away in a non-freezing room.

C-11 The dial and glass cover of steam gages shall be kept clean at all times. The glass cover joint shall be tight and, whenever the glass is broken, it shall be replaced as soon as possible.

C-12 Water Glasses and Gage Cocks. The valves and connections between the boiler and water column shall be kept free and clear and shall be tested by blowing down the water column, noting the return of water in the glass, and trying the gage cocks until sure of the water. They shall be tested by the responsible operator on the relieving shift before the relieved shift has gone off duty, also after replacing or cleaning the water glass and when a boiler is put in service.

By *shift* is meant a person or group of persons who relieve a person or group of persons in rotation in standing watch or operating a steam generating plant for an allotted time. It is synonymous with watch, vigil or tour of duty.

C-13 The water glasses and their connections shall be kept free from leaks and no alterations, allowing a flow of water from the piping between the water glass and the boiler, shall be made.

C-14 The outlet end of the discharge pipes from the water columns, water glasses and gage cocks shall be kept open and either in sight or in hearing of the operator while blowing down.

C-15 The water glasses shall be so lighted that the level of the water in the glass can be readily seen from the most desirable points of observation and the light shall be so shaded that it will not shine directly into the eyes of the operator when looking at the glass. The inner and outer surfaces of the water glass shall be kept free from deposits of dirt and the connections of the water glass shall be so arranged that the inner surface of the glass can be cleaned by forcing through the glass a piece of cloth, free from lint and dirt, wound about a smooth piece of wood. Types of gage glasses and guards which prevent the free observation of the glass shall not be used.

C-16 Where automatic alarms for indicating extreme low water level or extreme high water level are used, they shall at all times be kept in good working order but shall not be depended upon in maintaining a proper level of water in the glass. When an automatic alarm sounds and the level of the water is not visible in the glass, the operator shall test the try cocks to determine the water level before manipulating the feed water valves.

C-17 Fusible Plugs. Fusible plugs, if used, shall be kept in good condition and shall not be used for more than one year as provided for in Par. 428 of the Rules for the Construction of Power Boilers. When the boiler is open, the exposed surfaces of the fusible metal shall be scraped clean and bright and the surface of the boiler near the plugs shall be scraped clean. If the fusible metal does not appear sound, the plug shall be renewed. If used plugs are refilled, all of the old filling shall be removed, the surfaces of the shell scraped bright and properly tinned and the plug filled with pure tin as specified in Par. 428 of the Rules for the Construction of Power Boilers. Fusible plugs shall not be refilled with used metal.

#### Relief Equipment

C-18 Safety Valves. All safety valves shall be kept clean and in working order.

C-19 The capacity of safety valves shall be calculated as provided for in Pars. 269-290 (inclusive) of the Rules for the Construction of Power Boilers, under the following conditions and if necessary a larger safety valve installed; when the allowable working pressure of a boiler has been reduced, when a boiler is equipped with increased stoker capacity or when a change in fuel permits increased combustion.

C-20 Whenever the stipulated blowing pressure of a safety valve is ten percent higher or lower than the pressure for which the spring of the valve is designed, the safety valve shall be equipped with a new spring complying with the requirements given in Pars. 269-290 (inclusive) of the Rules for the Construction of Power Boilers.

C-21 When a safety valve spring has weakened and has been further compressed to secure the stipulated blowing pressure, an examination of the spring shall be made in order to insure its compliance with the rules given in Pars. 281, 282 and 284 of the Rules for the Construction of Power Boilers.

C-22 Where boilers are set in battery and operating under the same working pressure and some of the boilers have allowable working pressures greater than others, all safety valves shall be set to blow off at a pressure not in excess of that allowed on the weakest boiler.

C-23 Safety valves shall be tested at least once a day by gently raising the valve off the seat by hand and, when practicable, shall be tested daily by raising the steam pressure to the blowing pressure of the safety valve. Small chains or wires attached to the lever of pop safety valves and extended over pulleys to other parts of the boiler room may be used. C-24 When a safety valve sticks or fails to operate at the stipulated blowing pressure, no attempt shall be made to free it by striking the body or other parts of the valve but the boiler shall be taken out of service and the safety valve examined.

C-25 The safety valve, when blowing, shall be checked against the boiler gage and when the pressure noted on the boiler gage varies more than five pounds from the stipulated blowing pressure, the boiler gage shall be tested and if found correct, the safety valve shall be corrected.

C-26 The setting and adjusting of safety valves shall be done by a competent person. When safety valves are set or adjusted, the level of the water in the boiler shall not be above the highest gage cock.

C-27 In order to insure that the freedom of the spring is in compliance with the Rules given in Pars. 282 and 284 of the Rules for the Construction of Power Boilers, it shall be tested whenever the valve spring is adjusted.

C-28 After a hydrostatic test has been made, special care shall be taken to see that the safety valve is immediately restored to its proper operating condition.

C-29 Leaking safety valves shall be repaired or replaced as soon as discovered.

C-30 Care shall be exercised to prevent the accumulation of dirt, scale or other foreign matter between the coils of the spring.

C-31 The discharge from the open end of the escape pipes shall be unobstructed and, if practicable, inside of the boiler house within hearing of the operator.

C-32 All supports and anchors that are attached to the escape pipe, shall be tested every six months and the proper tension maintained.

C-33 Escape pipe drains shall be examined monthly and the escape pipes shall be disconnected once a year in order that the drain may be kept free and clear at all times.

C-34 Intercommunicating Valves Between Systems of Different Pressure. Where intercommunicating systems of different steam pressures are installed with boilers on each system, the boilers on the low pressure systems shall be equipped with non-return check valves. All low pressure headers and their outlets shall be protected by a relief valve or valves whose combined capacity shall be equivalent to the total amount of steam that can pass from the higher pressure system into the lower pressure system. Where a reducing valve is used, a hand valve shall be installed. Also a steam gage shall be installed at a convenient point for the guidance of a person when operating the hand valve in lieu of the reducing valve.

C-35 Whenever the total amount of steam that can pass from a higher pressure system into a lower pressure system has been increased, the relief valve capacity shall be increased an equivalent amount in accordance with Par. 34.

#### FEED WATER CONTROL

C-36 Pump Regulators. Feed pump pressure regulators shall be maintained in good condition and shall be frequently tested under closed discharge. When duplicate pump is not installed the pressure regulator shall be by-passed.

C-37 When feed water pressure increases above normal, the feed lines shall be examined for possible choking due to scale or other causes.

C-38 Feed Water Regulators. Where feed water regulators are used they shall be by-passed and shall be kept in good working condition but shall not be depended upon to maintain a proper level of water in the boiler.

#### EXCESSIVE COMBUSTION

C-39 Damper. Damper regulators and draft control devices shall be kept in good working condition and shall be so installed that any failure of or accident to the mechanism of the damper will cause the damper to open and not to close.

C-40 Fuel Supply. Fuel supply regulators shall be kept

in good working condition and shall be so installed that any failure of or accident to the mechanism of the regulator will shut off the supply of fuel to the boiler and, once having shut off the supply of fuel, will not automatically resume the supply of fuel.

#### **OPERATION**

C-41 Manipulation of Valves. When cutting in a boiler, the stop valve shall be opened slowly to avoid water hammer and, where non-return check valve or stop and check valve is not installed, it shall be opened only when the pressure in the boiler is exactly the same as the pressure in the main boiler header. Where a non-return check valve or stop and check valve, as the case may be, is installed, it shall always be used automatically for cutting in and cutting out of the boilers; the main stop valve, in cutting in a boiler, shall be opened when the pressure on the boiler is still ten or fifteen pounds less than that on the main and, in cutting out the boiler, the main stop valve shall not be closed until after the non-return check valve has closed. Care shall be taken to drain the piping between the main stop and nonreturn check valves before cutting in the boiler.

#### Weakening of Structure

#### OVERHEATING

C-42 Lack of Water Supply. Special and constant care shall be exercised to maintain a proper and uniform water level in the water gage glass and to provide a continuous rather than intermittent supply of water to the boiler.

C-43 The water tender or any operator responsible for maintaining water in the boiler shall not permit any inattention, other duties or reliance upon automatic devices to interfere with the performance of his duty in preventing low water level in the boiler.

C-44 Where practicable, a duplicate source of supply of feed water, pump or injector and piping systems to the boilers shall be installed. Where two systems of piping to the boilers are used, it is recommended that the two systems enter the boiler at different points. Feed pumps and injectors shall be maintained in good condition.

C-45 Leaks in the feed discharge line or elsewhere shall be stopped as soon as possible.

C-46 Sufficient water shall be maintained in feed water tanks to prevent loss of suction in the feed pumps and, where hot water is fed to or allowed to splash in feed water tanks, sufficient water shall be maintained in the tank to prevent entrainment of vapors.

C-47 Feed lines shall be free from objectionable vibration due to feed pump.

C-48 Where electrically-driven feed pumps are used, there shall be maintained, ready for service, steam-driven feed pumps of sufficient capacity to safeguard the boilers in case of failure of electric power.

C-49 Restricted areas in feed lines, such as meter tubes, orifice plates, etc., shall have a by-pass equivalent in size to pipe line.

C-50 Where economizers are installed in the feed line, they shall have a by-pass equivalent in size to pipe line.

C-51 All feed water tanks shall be cleaned out frequently to prevent the accumulation of objectionable sediment.

C-52 When feed water tanks are installed, and the water level cannot be observed easily by the water tender, suitable water glass or water level indicators shall be installed.

C-53 Frequent inspections shall be made to detect scale and defective check valves in the feed line.

C-54 Feed water regulators or other automatic devices shall be maintained in good working order.

C-55 If difficulty is experienced in maintaining the proper water level, the combustion shall be checked and the draft dampers and ash pit doors closed until the cause is discovered and corrected.

C-56 If the level of the water is not visible in the water glass, the gage cocks shall be tested to ascertain whether the level of the water is above or below the water glass. If the level is below the water glass, the supply of fuel and air shall be stopped and the dampers and ash pit doors closed. The feed water valve shall be closed and under no circumstances shall any attempt be made to admit water to the boiler. The fire shall be hauled or in case of stokers or chain grates, the grates shall be kept in motion and the fire doors shall be left open. Water from fire or other hose shall not be thrown upon the fire. The safety valve shall not be opened, steam outlet valves shall not be changed nor shall any change be made that will cause a sudden change in the stresses acting upon the boiler. The blow-off valves shall be examined and, if found defective, repaired. The cause of the failure of water supply shall be determined and remedied.

C-57 Where both cock and valve are used in the blowoff line, the cock shall be placed between the valve and the boiler. All blow-off cocks and valves shall be kept free from leaks and in good working order.

(To be continued in the June issue)

# Complete Program of Master Boiler Makers' Convention

THE business sessions of the fourteenth annual convention of the Master Boiler Makers' Association will be held May 22, 23, 24 and 25, 1923, at the Hotel Tuller, Detroit, Mich., which will be headquarters for the association

The secretary will have an office in the hotel for the transaction of general business outside of the convention.

Registration will begin at 2 P. M. Monday, May 21. Each member is urged to report promptly at Registration Booth, after his arrival for himself and ladies, etc., and receive convention badges, with such instructions as may be of value during the convention. This will prevent confusion and possible disappointments.

No badges will be issued until after registration, at which time dues must be paid to the secretary or his representative.

#### FIRST DAY

#### Tuesday, May 22, 1923.

REGISTRATION OF MEMBERS AND GUESTS CONTINUED AT 8 A. M. In order to participate in entertainments badges will be required. None will be issued unless your dues are paid and you are properly registered. No deviation from this rule.

#### BUSINESS SESSION

10:00 A. M .- Convention called to order.

Invocation.

Address-Mayor of Detroit.

Annual address-Thomas Lewis, President of the Association. Routine Business-

Annual report of the Secretary, Harry D. Vought.

Annual report of the Treasurer, W. H. Laughridge.

Miscellaneous Business

Unfinished business.

New business.

Appointment of special committees to serve during convention : Resolutions.

Memorials.

Announcements.

Adjournment.

#### SECOND DAY

#### Wednesday, May 23, 1923.

9:00 A. M.-Convention called to order.

9:05 to 9:25 A. M.—Addresses—Walter H. Flynn, of Detroit, S. M. P., I. C. R. R. A. G. Pack, Chief Inspector of Locomotives, I. C. C.

#### Committee Reports

9:30 to 10:00 A. M .- "Hammer Testing of Staybolts on Our Modern Locomotive Boilers Is Now One of the Most Important Duties of Local Boiler Inspectors."-J. A. Holder, Chairman. 10:00 to 10:30 A. M.-"Are the New Combustion Chamber

10:00 to 10:30 A. M.—"Are the New Combustion Chamber Boilers as Easy to Maintain as the Straight Standard Firebox?" —Henry J. Raps, Chairman.
 10:30 to 11:00 A. M.—"The Finished Material (Boiler Plates) Should Be Sound and Free from Cracks, Surface Flaws and Laminations, and No Hammer Dressing, Patching, Burning or Electric Welding Is Allowed."—Charles P. Patrick, Chairman.
 11:00 to 11:30 A. M.—"Is the Use of Automatic Stokers on Locomotive Engines Injurious to the Eirebox Sheets? Do the

Locomotive Engines Injurious to the Firebox Sheets? Do the Firebox Sheets Crack More Readily in a Stoker-fired Engine Than in a Hand-fired Locomotive?"—H. A. Bell, Chairman. 11:30 to 12 M.—"What Are the Best Methods of Detecting De-fective Boiler Sheets in the Shop Before Going to the Laying Out Bench and Put Into Service?"—John J. Keogh, Chairman.

Announcements.

Adjournment.

#### THIRD DAY Thursday, May 24, 1923.

#### 9:00 A. M .- Convention called to order.

9:05 to 10:00 A. M.—Address—Frank McManamy, Mechanical Division, Liquidation of Claims, U. S. R. R. Administration, Washington, D. C.

#### Committee Reports

10:00 to 11:00 A. M .- "What Is the Standard Method of Ap-plying Flues in Locomotive Boilers; Also in Stationary Boilers?"

pring Flues in Locomotive Boilers; Also in Stationary Boilers?" —Albert F. Stiglmeier, Chairman.
11:00 to 11:30 A. M.—"The Life of the Superheater Tube and the Number of Safe-ends That Should Be Applied Before They Are Cut Down for a Smaller Boiler."—J. P. Malley, Chairman.
11:30 to 12:00 M.—To report Topics for 1924 convention.—John F. Raps, Chairman.
12 M. to 12:30 P. M. "Crement With The Cut Down

12 M. to 12:30 P. M.—"Care of Water Tube Stationary Boil-s."—J. J. Davey, Chairman. ers.

Announcements. Adjournment.

#### FOURTH DAY

#### Friday, May 25, 1923.

#### 9:00 A. M .- Convention called to order.

9:00 to 10:00 A. M.-Addresses-

"Steam Leaks and the Bad Effects on the Boiler Plate."-D. A. Lucas, Chairman. (No report filed.)

"What Experience Has Been Had in Connection With the Electric Weld Heater?"-John W. Holt, Chairman. (No report filed.)

Report of Committee on Rules for Recommended Practice and Standards.-Leonard C. Ruber, Chairman.

10:00 to 10:30 A. M .- Report of Committee on Law .- Thomas

F. Powers, Chairman. Unfinished Business: 10:30 to 10:35 A. M.—Report of Committee on President's

10:35 to 10:45 A. M .- Report of Committee on Resolutions.

THE BOILER MAKER announces the removal of its office from the Woolworth Building to 30 Church street, New York.

The locomotive boiler explosion reports of the Chief Inspector of the Bureau of Locomotive Inspection, noted elsewhere in this issue, bring home rather forcibly the humanitarian side of disasters of this kind. The method of detailing the events leading up to the boiler failures, even to including the conversations of the principals in the-tragedies just before their lives were snuffed out emphasizes the fact that these men, through no fault or carelessness of their own, were compelled to forfeit their existence because of the demands of service.

Not all explosions are preventable, but many of them can be avoided by the careful observance of those principles of practice—and we are speaking of boiler maintenance practice—that are known to be good and that will insure safe locomotives on the road. The tendency of some roads is to keep locomotives in service when it is evident that, although they may not be absolutely unsafe to operate, nevertheless they do require certain repairs to keep them out of the danger class.

It would be difficult to imagine a more seemingly unimportant item of boiler attachment than the running board bracket stud connected to the boiler, mentioned in the Chief Inspector's report as responsible for the serious injury of three men. Even a loose stud where it is exposed to the working pressure of the steam in the boiler may thus become a menace to safety. Apparently no item is so small that it can be overlooked, and here is where the function of the boiler maker begins, for it is his duty to see that boilers are properly conditioned when brought to the shop and that every part, however small, is as it should be. The safety and incidentally the happiness of a great many individuals rest on the shoulders of the men whose duty is the proper maintenance of boiler equipment.

Two papers on boiler materials, prepared by special committees of the Master Boiler Makers' Association for discussion at this year's convention, introduce a subject upon which the safety of the finished boiler largely depends. Too few of the men in the shops understand how materials are produced and the methods employed to insure freedom from flaws and defects of a chemical or physical nature which would possibly be detrimental to the structure if used in boiler construction.

It may be argued that information of this character is too general and unnecessary for the practical work of boiler. fabrication or repair. But actually a better understanding of the boiler materials required is as essential as a knowledge of the tools used in building a boiler. At every stage in the construction, sharp watch must be kept to detect any flaws that might develop in the working of the material and, if a man knows how flaws are liable to develop, or what form defects of both an ordinary and unusual character assume he will be better able to fulfill the work entrusted to him, and do his part in building safer boilers.

Laboratory methods for testing materials have been adopted by many roads and locomotive builders in this country and, although a knowledge of laboratory procedure is not absolutely necessary, it is well for every boiler maker—particularly master boiler makers and foremen, to understand how the qualities of the materials they use are determined. The article in this issue on "Materials" briefly outlines the laboratory methods employed by one of the greatest locomotive building concerns in the world and represents the most up-to-date practice in testing boiler materials.

# Engineering Specialties for Boiler Making

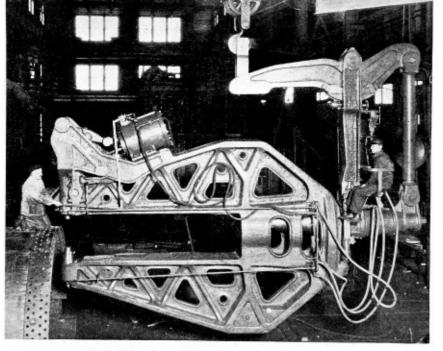

New Tools, Machinery, Appliances and Supplies for the Boiler Shop and Improved Fittings for Boilers

# **Portable Pneumatic Riveter**

The Hanna Engineering Works, Chicago, Ill., has recently completed a 150-ton portable pneumatic riveter of 118 inch reach and 30 inch gap, which it designed and built specially for the Niagara Falls Power Company.

The riveter is built primarily for fabricating the plates forming the volute of the casing (spiral or snail shell) and penstock for a 70,000 horsepower hydraulic turbine. The greatest distance across the volute is approximately 48 feet and the diameter of the entrance for water into the volute is 15 feet. The plates vary in thickness from  $1\frac{1}{4}$  inch at the entrance to  $\frac{7}{8}$  inch at the end of the volute, with rivets of diameter from  $1\frac{1}{2}$  inch to 1 inch and 7,800 in number. on the spindle or tilting it upward or downward from the horizontal, the center of gravity of all the parts hanging upon the crane hook is neither raised nor lowered. This is accomplished by the suspension beam (at top)), the two vertical links, the spindle housing and spindle which form a parallelogram with overhung support at the crane hook directly above the center of gravity of the entire machine. With this arrangement the friction of the bearings and the inertia effects are the only forces to be overcome. These two motions, revolving and tilting, are performed by two reversible, close quarters, air drill motors of approximately 2 horsepower each, manufactured by the Chicago Pneumatic Tool Company. The motor for tilting is mounted upon the inner vertical (tension) link and drives a worm gear which

The longest grip for the 11/2-inch rivets is approximately 5 inches. The penstock is approximately 18 feet in diameter with plates of 11/2 inch thickness and about 110 feet long. Three such penstocks are to be riveted. Since the volute and penstock are to hold water under a pulsating pressure of about 110 pounds per square inch, the character of this work must be of boiler quality. Owing to the immense size and weight of the volute and penstock, a portable riveter is required. The large rivets and large plates call for a riveter of high tonnage and long reach.

Side Elevation of Portable Pneumatic Riveter

The riveter is clearly shown in the accompanying illustration which is a side elevation with the spindle horizontal, the frame vertical and with riveting mechanism above.

The total portable weight of the riveter is 57,750 pounds and the weight of the frame, a one-piece steel casting, without spindle or riveting mechanism, is 33,000 pounds. The largest portable machine built by Hanna Engineering Works prior to this weighed 25,000 pounds, and was believed to be the heaviest portable machine in use. The great weight of this later riveter, combined with its form of suspension, which approaches complete universability, makes it of unusual interest.

#### MECHANICAL POWER OPERATES RIVETER INTO POSITION

It is evident that mechanical power is necessary to move this riveter into the operating positions. The supporting mechanism is designed so that when revolving the frame quired position, roller bearings and ball bearings are employed at all points of rotation. The frame is mounted upon the spindle by two radial roller bearings, and is restrained from longitudinal motion upon the spindle by roller thrust bearings. Four roller bearings, one at each end of the vertical links, and two large ball bearings at the crane hook end of the suspension beam, come into action when tilting the frame. The roller bearings on the inner vertical link carry a load of approximately 150,000 pounds each.

Lubrication is by oil bath and positive pressure grease system. All moving parts are so arranged as to be completely protected from the elements.

The Hanna motion, or riveting mechanism mounted upon this machine is a combination of toggles which merge into a lever action, developing a known and pre-determined maximum uniform pressure during the lever action, which is the last half of piston stroke, or what amounts to the last inch

gear sector upon the suspension beam. The tilting motion is limited to 30 degrees below the horizontal. The motor for rotating is mounted upon the spindle housing and drives a full worm gear upon the frame. This makes it possible to set the frame at any required angle around the spindle. Incorporated in this drive is means to absorb the shock of stopping the massive frame, thus relieving the drive mountings of what otherwise would be unmanageable forces.

engages with a worm

In order to minimize the power necessary to set the frame into the reof die travel. This assures of tight rivets being driven with each stroke of the piston, without any adjustment of the die screw being necessary to overcome the ordinary variation in length of rivets, thickness of plates, diameter of holes, etc. An accurate adjustment of the die screw is, therefore, unnecessary, and no particular knack or skill is required of the operator.

Three other features of interest may be mentioned. The first is the demountable head or rivet driving mechanism, which possesses obvious advantages. The second is the movable buck-up die, or dead die. Engaging sets of crown cams, one set upon the die and one set upon the frame, serve to raise the die when die is given a motion of rotation through 60 degrees. When in this raised position, the die is supported upon flat surfaces, normal to its axis. The third feature is the design of frame, which is best shown in the illustration.

By employing the true truss or continuous beam form with open webs, the casting problem is simplified, owing to the absence of continuous surfaces with their resulting strains, due to cooling. In addition to this, the stress conditions under service can be more definitely determined, and hence the material may be more advantageously proportioned and located.

Complete manipulation of this machine is possible from one position at the head or dies, three valve operating handles being located here for riveting, rotating and tilting. A seat is provided near the rear of the machine from which the rotating and tilting motor valves may be manipulated when operating conditions make this point of control more desirable. In the latter case, the standard reversing valves built into the motors are utilized.

#### New Spiral Fluted Staybolt Tap

A staybolt tap, designed for long life and having special construction and operation features, has been developed and patented by W. L. Brubaker and Brothers Company, Millersburg, Pa. In producing this tap Brubaker engineers utilized the vast amount of data on boiler staybolt tapping collected over the period of nearly forty years in which this company has been active and attempted to eliminate the troubles common to staybolt taps.

After the design was completed, taps were put in use in shops all over the world and tested through a period of three years, in order to determine the value of the tap in service. The results obtained indicated that the new tap had a decided advantage over any tap that the Brubaker Company had made prior to this time.

Due to the special taper with which the tap is designed, the life of the tap, as nearly as can be determined from tests, has been increased about 20 percent. This taper is so designed that it distributes the work along the entire length of the tap, thus making each part of the tap perform the same amount of work as every other portion. At high speeds, it is claimed that vibration is very greatly reduced, thus permitting more holes per day to be tapped and decreasing the man power required to hold the tap in place while in operation.

The tap has a free cutting edge and it has been found that the motor speed can be increased without injuring the tap, because of the reduced friction. The results of overheating taps are too well known to require comment. By reducing friction, the heat generated during the tapping operation is decreased and consequently the dulling action which takes place when the heat softens the tap in spots. Reducing friction also brings about a saving in power.

This tap has a special standardized relief which is uniform for every tap. It is a combined machine and hand relief.

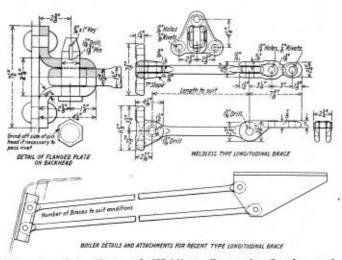

Spiral Fluted Staybolt Tap in Action

Another feature of the tap is that it is made of a special steel having a composition that gives long life and eliminates breakage under ordinary service conditions. The tap is specially tempered so that it is kept within the lead tolerances after machining, and so that the cutting quality is in no way impaired. The temper is standard for all taps giving a proper cutting quality and a soft center.

The new Brubaker staybolt tap is made in all styles and to meet all tapping requirements.

## Weldless Boiler Brace

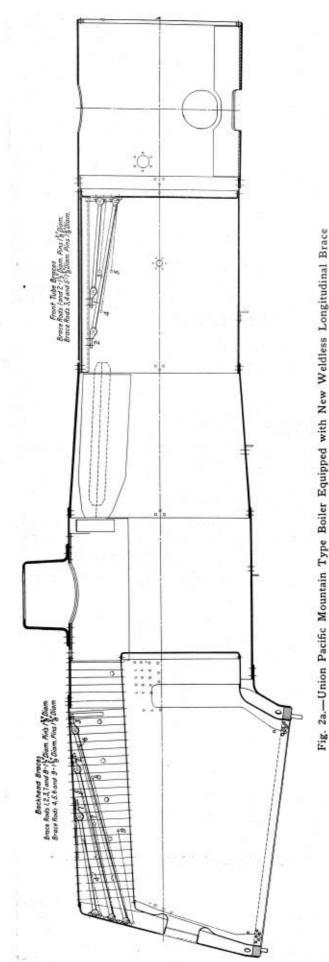

A weldless brace for use in locomotive boilers has been developed by J. G. Blunt, chief mechanical engineer of the American Locomotive Company, Schenectady, N. Y. This brace, as may be noted in the arrangement shown in Fig. 1, has no jaws on the rod, the jaws being formed in the brace

Figs. 1 and 3.—Type of Weldless Brace in Service and Recent Developments in Brace

feet, which are drop forged. With this type of brace it is claimed that a smaller brace can be used and still meet the requirements of the American Society of Mechanical Engineers' Boiler Code.

This style brace was applied on the Union Pacific, Moun-

tain type locomotives recently completed. Figs. 2a and 2b show the installation as made on these locomotives. It is now the American Locomotive Company's practice to apply

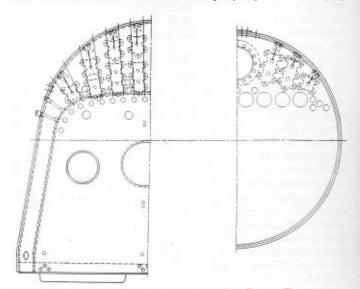

Fig. 2b .- Boiler Sections Showing Brace Feet

the boiler brace foot on the barrel courses, thereby doing away with one weld in the rod and putting the jaw on the other end to fit the tee iron, riveted to the backhead and front tube sheet.

A later development of the weldless brace is shown in Fig. 3, which is designed to do away with the drop forgings which constitute the most expensive feature of this device. This type is being used on the Canadian National locomotives now under construction at Montreal.

Either type brace will meet the American Society of Mechanical Engineers' Boiler Code requirements or those of the Interstate Commerce Commission.

## BUSINESS NOTES

Thomas O'Brien, who has been connected with John F. Allen Co., New York, as engineer and sales manager for the past 12 years, has been made general manager.

Rex C. Wilson has severed his connection with the Coatesville Boiler Works, Coatesville, Pa., as designing engineer to assume like duties with the Downingtown Iron Works, Downingtown, Pa.

W. C. Thatcher, assistant superintendent of construction of the National Boiler Washing Company, with headquarters at Chicago, has been promoted to general superintendent of construction, succeeding J. M. Weir, resigned.

Thomas E. Williams, superintendent of the Empire plant at Niles, of the Youngstown Sheet and Tube Company, Youngstown, Ohio, has also been placed in charge of the Thomas sheet mill works, succeeding Harry H. Holloway, who resigned to become identified with the Apollo Steel Co., Apollo, Pa.

The following changes in personnel have been announced by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.: Graeme Ross has been appointed manager of the Kansas City branch office of the Electric Company to succeed F. F. Rossman. E. L. Doty, district service manager of the Buffalo branch office of the Electric Company, is appointed engineering assistant, service department, with headquarters at East Pittsburgh. J. A. Atkinson has been appointed Buffalo branch service manager.

# Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

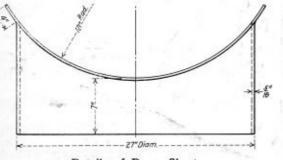

#### Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor is given permission to do so.

## Flanging Dome Shells

Q.—Will you kindly give me information as to the method you would suggest for flanging on the sectional flanging machine the boiler dome sheet as shown on sketch attached. There is some difference of opinion as to which is the best way to flange this sheet and any suggestion that you may have to offer will be gratefully accepted.—S. T.

A.—The flanging of dome shells where there are a large number of the same size to be flanged, can be carried out to

Details of Dome Sheet

the best advantage by the use of *formers* or *dies*; either on a four column or sectional flanging press. With the use of dies the flange starts to form at the point of least bend as shown at a, Fig. 1. From the point a the metal is upset gradually around the entire base of the dome to the point b which is at the maximum or right angle bend.

This system of flanging should be applied in any other method of flanging, because the metal will flow or shape it-

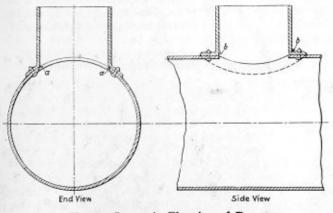

Fig. 1.-Stages in Flanging of Dome

self gradually from the point of least resistance to the point where the greatest resistance occurs, thus offsetting any undue stresses in the metal and reducing the possibility of tearing the plate from the outer edge toward the knuckle of

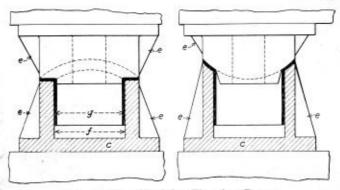

Fig. 2.-Dies Used for Flanging Domes

the flange. Buckles are not so likely to occur by this method in hand flanging.

The dies are made to conform with the shape of the flange required and based on the developed views of Fig. 1. Thus in Fig. 2 is shown the male die c and female die d so constructed along their flanging faces to form the developed flange. Castings are made of sufficient strength and reinforced against lateral stress by webs e.

The inside diameter f of the female die should equal the outside diameter g of the dome shell, plus a clearance allowance of  $\frac{1}{16}$  inch. The female die is made in two sections hinged and clamped so that the shell can be easily installed and removed. Both dies can be so designed sectionally that domes of the same size but of different plate thickness can be handled on the one set.

# Calculating Plate Thickness

Q.—In THE BOILER MAKER of July last appeared an article entitled "Calculating Thickness of Plates and Size of Stays for Rectangular Tanks" by John S. Watts. The last paragraph of the said article is not quite clear to me. Will you please arrange to make it clear for me by an example? Also will you please show me how to find the test pressure of the following pumps chambers. Examples will be much appreciated. Feed Pump, bilge pump, oil fuel pump, air pump, circulating pump (centrifugal type).—L. T.

A.—The application of the formula

$$t = 0.62 \sqrt{\frac{P \times L^2 \times l^2}{S (L^2 - l^2)}}$$

in the tank problem given in July issue of THE BOILER MAKER may be illustrated as follows:

Assume that the sides of a tank are divided into rectangular sections 24 x 26 inches and so stayed as explained in the article, consider that the lateral pressure is  $1\frac{1}{2}$  pounds per square inch. Substituting the values chosen in the formula

$$= 0.62 \sqrt{\frac{\frac{11}{2} \times 26^2 \times 24^2}{10,000 (26^2 - 24^2)}} = 0.32 \text{ or } 5/16 \text{ inch.}$$

#### TESTING PUMPS

The test pressure in testing for tightness is usually taken at the working pressure. For illustration, in testing pump air chambers the openings into the chamber are closed and air admitted until the working pressure is reached, as indicated by a pressure gage. The air chamber under pressure is allowed to stand for a certain period, usually 24 hours, and during this test there should be no reduction in the pressure. If there are a number of leaks, the chamber should be condemned.

The tightness of the pump plunger, or piston, stuffing boxes and valve arrangement are also tested. The manner of testing depending on their design.

The pump cylinder or cylinders in such tests are subjected to air or hydrostatic pressure on one side of the piston, equal at least to the working pressure. During the period that pressure is on one side of the piston, the other side is suitably exposed for inspection. The suctions and discharge valves are tested separately. Special testing apparatus is essential for testing centrifugal pumps and their capacity.

High pressure pumps, as fire engine pumps, are tested, from 11/2 to 2.4 times the working pressure to determine strength.

# **Bracing and Heating Surface** Calculations

Q.—Please let me know how to find out what pressure a 1%-inch welded boller stay will support with 6,000 pounds stress on it. Also a 1%-inch stay not welded. What is the best rule for finding the heating surface of the boiler? I would like to take an examination for boiler inspector at Harrisburg, and anything that will help me in accordance with the Boiler Rules of the A. S. M. E. Boiler Code will be appreciated very much. I have studied the Boiler Code, but there are lots of rules that I cannot understand. If it is not too much trouble, you might show me how to find the pressure on stayed surface and rule for bracing boiler.—J. D. B.

A .- The allowable stress on a stay 11/8 inches in diameter having an allowable stress of 6,000 pounds per square inch is determined as follows: First find the cross-sectional area of the stay and multiply the result by the allowable stress per square inch.

Thus,  $1\frac{1}{8} \times 1\frac{1}{8} \times 0.7854 \times 6,000 = 5,946$  pounds.

#### STRESS ALLOWED ON UNWELDED STAYS

According to the A. S. M. E. Boiler Code, the allowable stress for unwelded stays for lengths not exceeding 120 diameters is 9,500 pounds per square inch; for stays exceeding 120 diameters 8,500 pounds per square inch. The allowable stress on a 11/8-inch stay, according to the first condition, equals  $1\frac{1}{8}\times1\frac{1}{8}\times0.7854\times9.500=9.443$ pounds.

For the latter condition, the allowable stress equals 11/8  $\times 1\frac{1}{8} \times 0.7854 \times 8,500 = 8,449$  pounds.

To determine the required cross sectional area of a stay, first compute the total load on the stay and divide the load by the value of the allowable stress on the stay.

Example: A plate is stayed so that the pitch is 6 inches between stay centers, the working pressure allowable on the boiler is 125 pounds per square inch. What is the required cross-sectional area of the stay, if unwelded stays less than 120 diameters in length are used?

Solution: The total load on the stay equals 6  $\times$  6  $\times$ 125 = 4,500 pounds.

Allowable stress per square inch on hollow stay less than 120 diameters in length equals 8,000 pounds per square inch. Then,  $4,500 \div 8,000 = 0.568$  square inch.

The diameter of such a stay equals

$$\frac{0.56}{0.7854} = 0.84$$
 inch say  $\frac{7}{8}$  inch.

The formula for calculating the maximum allowable working pressure on a stayed surface is given as follows:

$$P = C \times \frac{T^2}{p^2}$$

in which:

- P = maximum allowable working pressure, pounds per square inch.
- T = thickness of plate in sixteenths of an inch.

= maximum pitch, inches.

C = constant, for various conditions of staying plate. (These are given in the A. S. M. E. code.)

Consider in the previous example that the plate is 7/16inch thick, what pressure is permissible in the stayed surface?

Use the formula  $P = C \times \frac{T^3}{p^2}$  and substitute the values ven.

given.

Thus,  $P = 112 \times \frac{7 \times 7}{6 \times 6} = 152.32$  pounds per square

inch.

The value of C = 112 for stays screwed through plates not over 7/16 inch thick with heads riveted over.

The heating surface of a boiler is considered to be that part of the boiler shell, tubes and flat plates that are exposed to the heat from the gases on one side and with water on the other side. The heating surface calculations depend on the size and type of the boiler.

Example: A horizontal return tubular boiler 60 inches in diameter, 14 feet long, has eighty 3-inch tubes. What amount of heating surface is in such a boiler?

Solution: It is customary to consider that two-thirds of the shell is exposed to the heat.

Circumference of shell =  $60 \times 3.1416 = 188\frac{1}{2}$  inches. Length of shell =  $12 \times 14 = 168$  inches.

Heating surface of shell =  $188.5 \times 168 \times \frac{2}{3} = 21$ ,-112 square inches.

Circumference of tube =  $3 \times 3.1416 = 9.425$  inches.

Heating surface of tubes =  $9.425 \times 80 \times 168 = 116.572$ square inches.

Area of one head  $= 60 \times 60 \times 0.7854 = 2,827.4$  square inches.

 $\frac{2}{3}$  area of 2 heads = 2,827.4  $\times$  2  $\times$   $\frac{2}{3}$  = 3,769.9 square inches.

Sectional area of tubes =  $3 \times 3 \times 0.7854 \times 80 = 565.5$ square inches.

Total heating surface

 $21.112 + 116,572 + 3,769.9 - 565.5 \times 2$ 144

= 974.4 square feet

The value 144 is the number of square inches in one square foot.

If you will state definitely the particular examples you are having difficulty with in the bracing of boilers, we can assist you. It is advisable that you make a study of some treatise on boiler design and calculations. A boiler inspector should be able to handle such problems and interpret the various boiler rules and regulations.

#### Mechanism of Boiler Scale Formation

At the Pittsburgh, Pa., experiment station of the Bureau of Mines, a study is being made of the mechanism of scale formation in steam boilers, including the effect of temperature, pressure, character of surfaces, and concentration of the water. At the present time a continuous test is being conducted on a commercial boiler in actual operation, in which a part of the suspended matter is being continuously removed by an external filter through which the boiler water is circulated. A complete record and account of the scale forming constituents is being kept and the influence of added constituents is being noted.

# Letters from Practical Boiler Makers

This Department Is Open to All Readers of the Magazine —All Letters Published Are Paid for at Regular Rates

# The Camber Line in Laying Out Problems

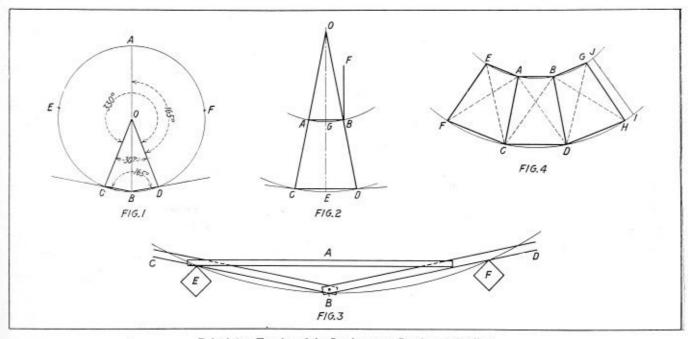

A RTICLES have been published from time to time on the laying out of taper cylinders having so little taper that it is difficult to make the arcs which go to make up the bases, top and bottom of the cylinder.

The term generally used in connection with such problems is "the camber line." Many other readers have given their best rules on camber layout and all seem to be very good, too. The one given here may still win recognition by readers of THE BOILER MAKER however.

the trammel, or whatever tool is used in common practice to make arcs, then it would be a case for the method herewith explained.

In Fig. 2 OE bisects the figure ABCD, and line BF is drawn at right angles to AB at point B. This gives the same result in the angle of the lines, BF and BD at B, as when making the whole circle to get this angle, as in Fig. 1, where the angle was 165 degrees.

Thus in Fig. 2 the angle at B is equal to the angle at E and it still remains the same angle, no matter where the point E is located on the arc *CED*. When turning out jobs of this kind, we often have to make the circle in a number

Principles Employed in Laying out Cambered Bodies

In Fig. 1 I have endeavored to make clear the principle employed in the following article. Assuming that the angle, OCD, Fig. 1, is 30 degrees and is bisected by the line, AOB, the arcs, A-F-D and A-E-C each of 165 degrees, would result. If we draw straight lines through B-D and O-D, Fig. 1, the angle thus formed will also be 165 degrees. This is easily determined, because the sum of all the angles in OCBD must be 360 degrees. Subtracting 30 degrees we get 330 degrees. Half of this is 165 degrees.

This is made more clear by reasoning that if the four equal angles at C, B and D, will total 330 degrees, then two of the angles measure half as many degrees, or 165. This holds good no matter where the point B would be located on the arc CBD, so far as the angle formed by lines CB and BD are concerned. Therefore, we could make the arc by sliding the tool shown in Fig. 3, the use of which we will endeavor to explain later, across arc CBD.

Fig. 2 is drawn to represent the elevation of a tapered cylinder, in which AB is the upper base, and CD is the lower or larger base. Now if the point O were beyond the reach of

of pieces, so the figure is always made to the full size of the side elevation, that is, "diameter sizes and not circumference," to make the required arc. Then to get the pattern out, take the diameter multiplied by 3.1416 for each respective end. Divide this by the number of pieces that it takes to make the course or ring, then measure half each way on the arcs from the points E and G, Fig. 2, to get the required length of the respective ends. The side elevation would make a little less than a third of the full ring.

#### INSTRUMENT FOR DRAWING CAMBER LINES

To proceed to use the tool described in Fig. 3, take two straight edges, or straight wooden strips, each longer than the large diameter of the work in hand. CB and BD, Fig. 3, are the strips required. Bolt them together at B about 2 inches from the end of each stick. Lay this apparatus upon the lines FB and BD in Fig. 2, making it come to the same angle and keeping the points B together in each case. Then with a third stick, shown at A in Fig. 3, nailed across to keep the angle from changing, we can go ahead with the work. The squares at E and F, Fig. 3, represent two square cornered blocks of iron used as holding points. By placing a pencil in the corner of the sticks at B and keeping the sticks pressed against the iron blocks E and F, Fig. 3, it will scribe the arc while the tool is moved across by sliding the point B from block E to block F.

By placing these blocks at points C and D, Fig. 2, and then proceeding as explained above, we can make the arcs CED and also placing the blocks at A and B, Fig. 2, we can make the arc AGB without changing the set of the sticks. It can be seen that all this could be done without the use of the point O, in Fig. 2.

When the cylinder can be made in one piece, the work is done as in Fig. 4. The side elevation is drawn up as before and all the work carried on as explained. Then join on like figures or side elevations on each side of the center section as ABCD, Fig. 4. The other side elevations are treated with the same operations as before and the lengths of the arcs EAGBJ and FCDHI are measured by taking 3.1416 times the small diameter from E to J on the small arc and the large diameter times 3.1416 gives the length from F to I on the larger arc.

#### TYPES OF JOINTS USED

If the joints are to be lapped the lines are used for rivet holes and the lap added. For butting joints together cut on the lines as no thickness allowance need be considered. This would be necessary in a real job, and could be easily taken care of by always using neutral dimensions both in the drawings and in making calculations.

Trammeling off the lengths in Fig. 4, to join on the side elevation on each side can be done easily by assuming that all the dotted lines, which are the diagonals are the same length, and can be trammeled off by triangular methods that are known to all layout men and need not be explained here, the strange part about this tool is that it makes an arc of smaller radius without being changed, but this is due to the blocks being different distances apart in each case.

Columbus, Ohio.

PHIL NESSER.

# The Part Materials Play in Building Safe Boilers

#### (Continued from page 122)

the delivery tube is detached and 2 cubic centimenters of starch indicator added, as well as a 30 cubic centimeter concentrated solution of hydrochloric acid. The mixture is titrated to a blue color with potassium iodide iodate solution. One cubic centimeter of the latter should equal 0.001 percent sulphur in a 5 gram sample of iron or steel, according to the solution used at the Works.

#### CHECKING THE PHOSPHORUS CONTENT

A 2 gram sample of the steel to be tested is placed in a 350 cubic centimeter flask and dissolved in 50 cubic centimeters of nitric acid. When the solution is complete a few cubic centimeters of a saturated solution of potassium permanganate are added. This mixture is boiled for 3 minutes and the excess reduced with ammonium bisulphite solution. This is boiled until the brown precipitate of manganese dioxide becomes clear. The excess bisulphite solution is boiled off and allowed to cool to 70 degrees C. Add 40 cubic centimeters of ammonium molybdate solution and shake for 5 minutes. Filter and wash until free from acid and return the mixture to the flask. Dissolve in excess standard sodium hydroxide solution. Add a few drops of phenolphthalein and titrate excess sodium hydroxide with a standard nitric acid solution. It should require one cubic centimeter of standard sodium hydroxide solution to equal 0.01 percent of phosphorus in a 2-gram sample.

#### MANGANESE

Weigh out 0.2 gram of iron or steel and transfer it to a 150 cubic centimeter Erlenmeyer flask and dissolve in 25 cubic centimeters of nitric acid. Boil until the sample is dissolved. Add 40 cubic centimeters of silver nitrate solution, then 15 cubic centimeters of ammonium persulphate and heat until fine bubbles begin to rise. Cool and add 10 cubic centimeters of sodium chloride solution and titrate with sodium arsenite solution. One cubic centimeter of this solution is equal to 0.0002 gram of manganese.

#### MATERIAL STORAGE YARD

When plates are found to be defective in production or develop defects in working, replacements are made from stock. This material is checked very carefully and made to meet the exact requirements of the original material. It is inspected for defects that it may have developed in manufacture and for any that might have resulted from its storage —such as corrosion. In addition, it is watched closely all through its fabrication for the possible development of flaws in working.

All steels are segregated in the storage yard, so that it is possible to locate either special orders, or material having certain specifications, very readily. The saving in time made possible by carefully systematizing the storage yard can hardly be overestimated.

# OBITUARY

WILLIAM A. BURNHAM, president Burnham Boiler Corporation and of the Lord and Burnham Company, died at his home in Irvington, N. Y., on April 19, in his 77th year. He was also prominent as a banker.

JOSEPH H. MCNEILL, Chief Inspector of the Hartford Steam Boiler Inspection & Insurance Co., died suddenly at his home, Irvington-on-Hudson, April 18, 1923, of heart failure.

He was born Feb. 14, 1865, in Charlottetown, Prince Edward Island, where he received his education in the public schools and in the Prince of Wales College. In his early life he was connected with the Prince Edward Island Railway, and he held the position of chief engineer of oceangoing vessels under licenses both from the United States government and from the British Board of Trade, and for several years was an engineer officer of the Eastern Steamship Co., sailing out of the port of Boston. Later he was engineer of the New England Piano Co. at Cambridge, and of the Hood Rubber Co. at Watertown, Mass. He left the latter company in 1898 to enter the service of the State of Massachusetts as a boiler inspector of the District Police of the Commonwealth of Massachusetts. About ten years later he became chief inspector and chairman of the Massachusetts Board of Boiler Rules. In both capacities he had much influence in shaping the laws and rules governing the construction, installation and operation of boilers.

Mr. McNeill resigned from the Massachusetts State Inspection Department on July 8, 1912, and became Chief Inspector of the Boston Department of the Hartford Steam Boiler Inspection and Insurance Co., in which position he remained until he was transferred to the New York office in May, 1915.

He was a member of the Board of Examiners of the Industrial Commission, Boiler Inspection Department, State of New York; A.S.M.E.; Diana Lodge A.F. & A.M., Melrose, Mass.; and Flatbush Chapter, No. 177, O.E.S., Brooklyn, N. Y.

# New Staybolt Designed to Promote Flexibility

#### (Continued from page 131)

sheet are shown in Fig. 7. The plug, above, shows the position when welding before the excess rim is removed.

This example shows a maximum slope of 32 degrees. Shorter outer plug connection would be used for less acute slopes.

The top of the sloping sheet connection before and after burning off the excess rim as it will appear welded to outer sheet is shown in Fig. 8. The welding is only carried part way to show the accessibility for welding.

The possibility of driving over firebox connection without "holding-on" is demonstrated in Fig. 9. In order not to loosen or injure the thread it is essential that the threaded bolt be a good fit in the sheet before driving.

Fig. 10 illustrates the machine used for making vibratory tests of both semi-flexible and double articulated bolts. In both cases a tensile stress of about 3,100 pounds was maintained with an oscillation of 1/4 inch at one end-the opposite end being held rigid; the semi-flexible bolts breaking near the rigid end in from 4,500 to 7,000 revolutions; the double articulated bolt running 128,400 revolutions without showing signs of breakage.

Tensile tests, on the latter, resulted in the bolt breaking in the "breakage point" at 51,000 pounds per square inch, while the outside diameter of the socket showed no enlargement by micrometer measurement before and after test.

## TRADE PUBLICATIONS

TAPS.—The Geometric Tool Company, New Haven, Conn., has just issued a 26-page booklet which is devoted exclusively to illustrations and a description of the construction and operation of its line of adjustable collapsing and solid adjustable taps.

PRODUCTION TOOLS.—Scully-Jones & Co., Chicago, has issued catalogue 33 outlining the advantages and adaptability of each of its Wear-Ever production tools, which include chucks, milling cutters, special tool holders, collets, etc. Practical suggestions for improvements in machine shop practice, reference data, charts and tables have also been included in this 40-page booklet.

HOISTS AND CRANES.—The Link-Belt Company, Chicago, has recently issued a comprehensive and instructive treatise on electric hoists and overhead cranes. The book is not only profusely illustrated with photographs of actual Link-Belt installations, but with line and wash drawings the subject of proper installation and efficient operation is fully covered. Practices and methods employed by users in widely divergent fields are also outlined.

PIPE THREADING MACHINERY.—The Landis Machine Company, Waynesboro, Pa., has recently issued catalogue No. 24 in which its line of stationary pipe die heads, pipe threading and cutting machines, rotary pipe and nipple threading die heads, pipe and nipple threading machines, automatic die heads and chaser grinders are illustrated and described in detail. The catalogue is carefully prepared and printed, containing 75 six-inch by nine-inch pages.

TUBE CLEANERS.—Air, steam or water-driven tube cleaners for fire tube and water tube boilers, fuel economizers, condensers, evaporators, feed-water heaters, etc., are illustrated and described in a neatly arranged booklet of 32 pages which has recently been issued by the Roto Company, Hartford, Conn. A chart, outlining a practical method of finding the percent of fuel saved by keeping boiler tubes free from scale, is also included. The booklet is indexed so that information regarding any of the Roto tube cleaning machines can be quickly and easily located.

ARC WELDING AND CUTTING.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has recently issued special publication No. 1659, in which the subject of electric arc welding and cutting is treated in a thorough and interesting manner. The booklet, which contains numerous illustrations, begins with a chapter on the reasons for organizing and standardizing the welding organization, the training of arc welders and the inspection of metallic electrode arc welds. This is followed by chapters on the principles of arc welding, the physical characteristics of arc metal, the use of the graphite electrode, and cost and application data. Several pages are then devoted to a brief description of Westinghouse arc welding apparatus.

MACHINE TOOLS AND CRANES.—In a large, well illustrated booklet entitled, Recent Developments in Machine **Tools** and Cranes for Railroads, Manning, Maxwell & Moore, Inc., New York, describe improvements in some of its more important products used by the railroads. Comparatively dull years since the armistice have been used in changing designs and patterns so that with the improved equipment shopmen can obtain maximum production with minimum physical effort. First position in the booklet is given to the Putnam wheel lathes which are followed by heavy duty car wheel borers, axle lathes, boring mills, slotters and other standard tools handled by the company. Several pages are devoted to shop crane, steam hammers, wheel presses, punches and shears, flue welders, staybolt threading, radius grinders and other shop machines.

# SELECTED BOILER PATENTS

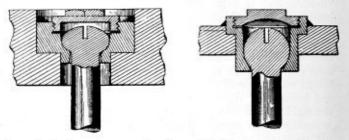

Compiled by

GEORGE A. HUTCHINSON, Patent Attorney, Washington Loan and Trust Building Washington, D. C.

Readers wishing copies of patent papers, or any further information regarding any patent described, should correspond with Mr. Hutchinson.

1,447,068. STAYBOLT STRUCTURE FOR BOILERS. JOHN ROGERS FLANNERY, OF PITTSBURGH, PENNSYLVANIA, AS-SIGNOR TO FLANNERY BOLT COMPANY, OF PITTSBURGH, PENNSYLVANIA.

Claim 1.-In a staybolt structure, the combination with a boiler sheet provided with an opening having portions thereof differing in diameter whereby an annular shoulder is formed between the planes of the respective

faces of the sheet, of a mounting for a staybolt having parts different in diameter located in said opening, the part of said mounting having the greater diameter resting upon said annular shoulder in the boiler sheet and welded to the latter, a staybolt having a head seated in said mounting, and a removable closure engaging said mounting over the head of the staybolt. Three claims.

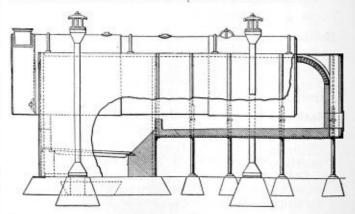

1,429,296. AUXILIARY PRESSURE-RELIEF DEVICE FOR STEAM BOILERS. CASIN W. OBERT, OF MOUNT VERNON, NEW YORK. Claim 1.—In a pressure device, a branch pipe having a relief valve in one branch of the pipe, a rupturable diaphragm in the other branch, cush-

ioning means for engaging the diaphragm at its edges, and means for confining the diaphragm and the cushioning means in the pipe branch. Two claims.

1,446,937. BRIDGE-WALL FOR BOILERS. PATRICK J. SHANA-HAN, OF NEW ORLEANS, LOUISIANA.

Claim 1. In means for the purpose set forth, the combination of a boiler, a fire box arranged beneath the forward end of the boiler, an inclined wall formed in rear of the fire box and sloping upwardly toward the

boiler, an inclined wall pitched upwardly toward the rear of the boiler and abutting an arch wall in rear of the boiler, and a bridge wall formed at the forward end of the last named inclined wall and abutting against the upper end of the inclined wall that is arranged in rear of the fire box; said bridge wall terminating slightly below the boiler, and adapted to surround the sides and bottom of said boiler.

# JUNE, 1923

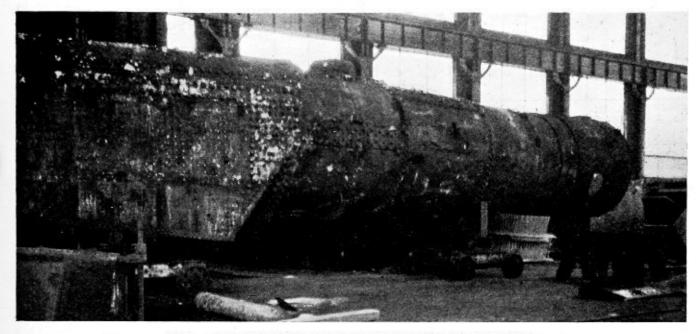

Fig. 1 .- One of the 2-8-2 Type Boilers Coming Into the Boiler Shop

# **Boiler Repair Methods at Columbus Shops**

S in other lines of industry, specialization has begun to find a field in the boiler shop. At least the operation of the boiler repair department of the Pennsylvania Railroad at Columbus, Ohio, would indicate that the system can be operated with a great degree of success. With a nucleus consisting of a welltrained master boiler maker, an assistant, a foreman boiler maker, a supervisor, inspectors and an experienced layerout, an organization has been built up here which not only functions

Without the all around boiler maker of former years, the railroad boiler repair shops throughout the country are facing a problem that requires immediate solution if the increasing demands for power are to be met. The Pennsylvania Railroad shops at Columbus, Ohio, have found one method of accomplishing excellent results in boiler and locomotive maintenance even under the present difficult conditions of finding trained men. Details of the plant and some of the work done at Columbus are given below.

Production at present with 275 men is 60 repairs a month. This is being accom-plished as previously in-dicated with a few welltrained department heads and with men who are being trained in the various special operations of boiler work that the old-time boiler makers combined in their general knowledge of the trade. This specialized operation system, however, has the advantage of speed and the comparatively rapid development of skill in the limited scope of work performed by an individual. The plant equip-

efficiently but which is gradually accomplishing a repair record that few shops in the country are able to equal.

Production is gradually being developed so that within a short time about 75 heavy repairs will go through the shop a month. Of these, about 20 will be class 2 or complete firebox repairs and the remainder half and three-quarter side sheets and other miscellaneous boiler and mechanical repairs. Approximately 325 men in two shifts will be employed turning out this work,—a day shift consisting of about 250 men and 75 on the night shift. ment is complete and facilities for performing the required operations are of the best—this equipment and some of the methods which have met with success are outlined below.

#### THE BOILER SHOP AND EQUIPMENT

The main boiler shop is placed in a north and south direction and is at the west end and at right angles to the main erecting shop. The entire plant is of brick and steel construction with modern steel window frames providing a maximum of natural light to the shop. At the south end

JUNE, 1923

Fig. 2.-Corner of the Layout Section, Looking Across the Main Shop

of the main boiler shop, as indicated in the accompanying floor layout, is located a 150-ton 15-foot gap pneumatic bull riveter served by a 50-ton floor controlled electric crane. This crane having a span of about 35 feet runs transversely of the shop but is within range of the main shop crane so that it is able to pick up a boiler to be riveted from the floor and control it through the riveting operation. This crane is operated on 230 volts direct current. The main hoist motor is of 50 horsepower, the trolley travel is 15 horsepower and the bridge travel 35 horsepower.

In the main section of the shop the crane used runs the entire length and has the following characteristics: The capacity of the crane is 60 tons and it is operated on 220 volts direct current; the main hoist motor has a rating of 50 horsepower; the auxiliary hoist motor, 25 horsepower; the main trolley travel, 10 horsepower; the main hoist of the auxiliary trolley is 50 horsepower; the auxiliary hoist, 25 horsepower; the auxiliary trolley travel, 10 horsepower, and the bridge travel, two 35 horsepower motors.

At the west side of the shop is a bay containing a laying out floor, flange fires, punches, shears, rolls, drills, staybolt machines, etc., which constitutes the machine tool section of the boiler shop. This department is served by a 10ton crane using 220-volt direct current; the main hoist motor is of 25 horsepower, the trolley travel 5 horsepower, the bridge travel 25 horsepower. At the north end of the shop are located the offices of the master boiler maker and his assistant, the time offices, small tool room, locker and wash

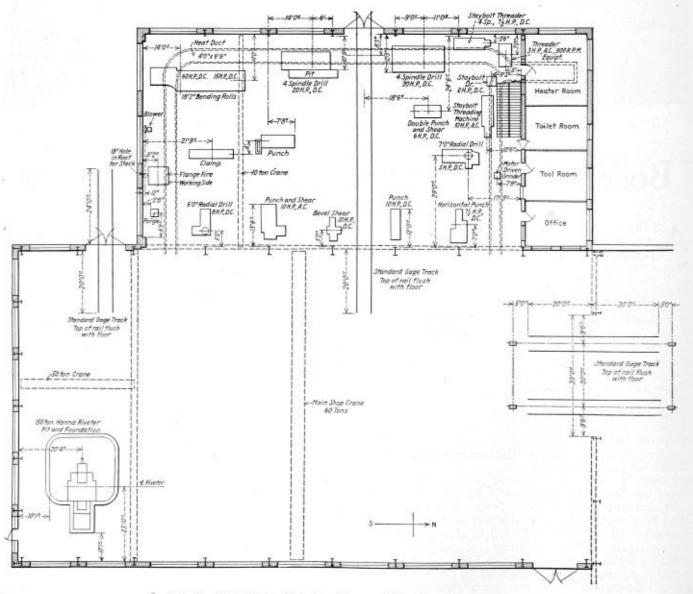

Fig. 3.-Floor Plan of Boiler Shop and Machine Arrangement

rooms and heater room; the entrance into the erecting shop is also at this end.

#### MACHINE TOOL EQUIPMENT

The machine equipment in the shop, as noted, is complete, all work necessary to boiler repairs being carried out here with the exception of flanging new throat sheets. Work of this character is done on the presses at the Altoona Works of the Pennsylvania System. Punches and shears of various types, both for straight and bevel work, are provided, as well as a complete radial drill equipment. The details for these machines are indicated on the floor layout. A set of 18-foot 2-inch bending rolls is provided, two 4-spindle drills, a 71/2-horsepower 4-spindle staybolt threading machine is included in the equipment as well as a 10 horsepower machine with six heads, two double heads, one for turning crown stays and the other for threading at the same time, so that both bolts are threaded and turned in a single operation. The remaining four heads are used for threading This machine will turn out 60 crown stays an staybolts. hour and 120 staybolts under the control of one operator.

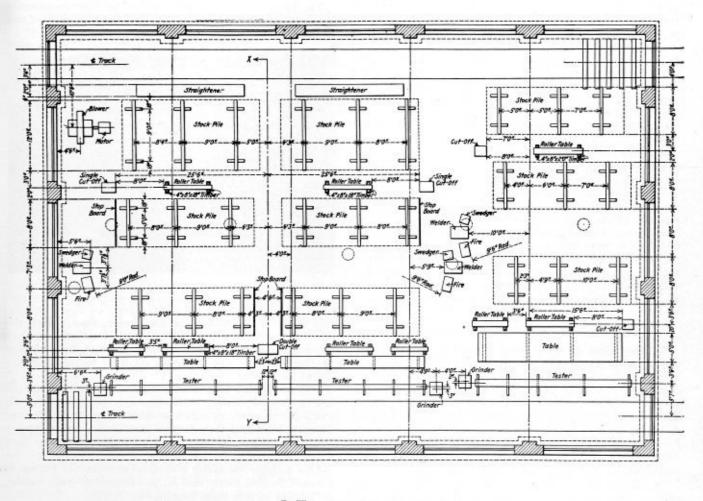

#### PRODUCTION POSSIBILITIES WITH SHOP LAYOUT

An absolutely clear floor space is provided in the main section of the boiler shop in which to carry out the boiler repair

Fig. 5.—Machine Operations Are Carried Out in Side Bay, Leaving Main Bay Clear of Machinery

operations, all machine work being done in the machine bay and the shell riveting at the south end of the shop. The boilers requiring heavy repairs are stripped on the erecting floor and mounted on horses on the boiler shop floor where

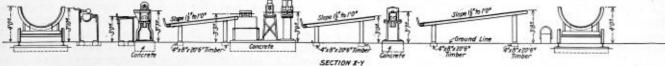

Fig. 4.-Machine and Production Details of Flue Shop

JUNE, 1923

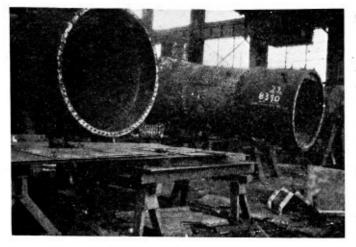

Fig. 6 .- Method of Supporting Boilers During Repairs

work is carried on without interference with other operations. The space is sufficient for about 12 of the larger L or N type boilers to be worked on the floor at the same time.

#### MANEUVERING BOILERS INTO THE SHOP

It may be well to introduce the details of shop procedure with the problem of bringing boilers into the boiler shop from the erecting floor. That this originally was a real problem may be understood when it is recalled that boilers on the erecting floor are in an east and west direction while the boiler shop runs north and south. Thus all boilers have to be turned at right angles to their original position when brought into the boiler shop. The opening between the two shops is 39 feet between columns and some of the boilers which are required to be brought through this opening run up to 45 feet or so in length. The solution found for this difficulty is simple and effective.

A boiler is carried by the main erecting shop crane close to the opening into the boiler shop. The front end is lowered onto a special turntable mounted on a small heavily built truck running on a set of standard gage tracks into the boiler shop. The rear lift of the erecting shop crane swings the rear end of the boiler so that it is heading into the boiler shop; then the crane is used to push the boiler, the front end of which is resting on the truck, through the opening into the boiler shop. A second truck support is wheeled under the rear end of the boiler shop crane. The entire operation and transfer from one shop to the other requires less than 3 minutes.

#### SMALL DETAILS NOT OVERLOOKED

Various minor details of shop management and arrangement, tending to promote efficiency and speed up the work, are incorporated in the general scheme of things. For example air for tools is piped to every column in the shop, the lines terminating in manifolds having 9 outlets. Thus no matter in what section of the shop air is required or how many tools within certain limits are needed on a job, an opportunity is given every man to tap into the air line. For electric motor-driven tools and welding outfits convenient current outlets are provided throughout the shop.

One feature that is overlooked in many shops is the time and space saving possibility of providing standard tool boxes for individual tools which belong personally to the men. Here at Columbus, instead of carrying a miscellaneous assortment of tool boxes into the shop where they are employed and tying up wall space with them, the men are given steel lockers which are used for this purpose. These lockers are each about 32 inches long (64 inches for double lockers) and are ranged in cabinets along otherwise unused portions of the shop wall.

Small tools that are the property of the company—pneumatic and electric equipment, drills, jigs, gages and the like, are kept in the tool room where a constant check is maintained on them. One man is kept busy repairing air tools.

#### FLUE SHOP AND EQUIPMENT

The flue shop is located in a separate building adjacent to the boiler shop. Two motor-driven wet rattlers mounted on a cleaning platform are located just outside the flue shop. These rattlers are served by an overhead electric crane so that as the tube bundles are brought on to the platform on special trucks they are picked up in chain slings and deposited as a unit in the rattlers. This does away entirely with the time wasting method of hand charging. In unloading the rattlers, the entire charge of tubes is dumped on to suitable bent rails arrange in shallow pits adjacent to the rattlers where the chain slings may be readily adjusted around the tubes. The crane then deposits them in the tube buggies and they are wheeled into the shop. As noted on the accompanying floor layout, sets of standard gage tracks run along each side of the flue shop entering at the corners so that they serve every part of the plant and are used either for bringing the tubes in for reconditioning or for removing them after safe ending into the erecting shop.

The layout of the flue shop also indicates the departments into which it is divided, and the equipment installed for

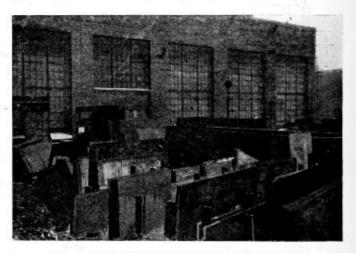

Fig. 7 .- Plate Storage Adjacent to Boiler Shop

safe ending small tubes and superheater flues. Both departments are quite distinct so that no interference occurs between the crews working on different size flues. Roller welding machines are used and oil fired furnaces are installed for heating.

It is customary to test each tube after safe ending and new hydrostatic testing units are now being installed in which the tubes are subjected to about 300 pounds' pressure. Three welders and their helpers handle the safe ending turning out about 600 small tubes and 50 superheater flues a day.

Flue practice standard with the Pennsylvania System is followed in this shop; that is, the method of safe ending, the number of safe ends, lengths, etc.

So far as possible, locomotives on which repairs are contemplated are scheduled far enough ahead so that whatever plates or special fittings are to be used may be ordered and ready for the locomotive when it comes into the shop. A supply of plates and other materials is kept in stock (Continued on page 183)

# Boiler Manufacturers Meet at Hot Springs, Va.

# Thirty-fifth Annual Convention of American Boiler Manufacturers' Association, June 4 to 6, Well Attended — Abstracts of Papers and Discussion

MEMBERS of the American Boiler Manufacturers Association began to assemble at The Homestead, Hot Springs, Va., on Saturday, June 2, for the thirtyfifth annual meeting of the association which was scheduled to open on Monday morning, June 4, for a three days' session. Preliminary to the regular meetings the executive committee held a meeting in the Secretary's rooms at 8 P. M. on June 3.

Shortly after 11 o'clock on Monday morning A. G. Pratt, of the Babcock & Wilcox Company, president of the association, called the convention to order in the theater of the hotel and delivered his annual address, which in part was as follows:

### Abstract of President's Address

The past year has been one of varying emotions, during which we have hoped and worked for and seen improved business conditions, and now that the period of better business has arrived, we are perplexed to know how long it will last, and have become cautious concerning the future.

This is not only natural but proper considering the conditions which this better business have brought about; pyramiding of material prices, the difficulties in obtaining materials, high wages, and difficulties in obtaining labor. The material supply is becoming somewhat easier and it is probable that maximum prices have been reached, but the difficult labor situation will undoubtedly continue throughout the present business cycle.

While no one can predict the immediate future with certainty, some very comforting facts appear to be pretty definitely established. It seems inconceivable that business can fall to the depths reached in the latter half of 1920 and in 1921; there is no over-extension of credit; corporate, as well as governmental finances are in satisfactory shape and the banks are in good condition; there is and has been little if any production in excess of requirements; stocks of all commodities are low; and many improvements, public and private, are merely held up until they can be undertaken without bidding against today's necessities. While the present high rate of production may not be maintained there appear to be many legitimate outlets in sight for American manufacturers for a long time to come. As a matter of fact, what we desire, and that which is best for the community, is good business, not periods of tremendous activity, which are always followed by periods of depression.

#### TAXES

The question of taxes is still a most important one to industry of every character. While the Government has made good headway in reducing expenditures in certain quarters, it seems certain that an attempt will be made to revise the tax laws at the session of Congress which meets in December next. While it is, of course, true that up to six or seven years ago this country never had any really great tax problems, it is to be hoped that a definite tax policy may some day be adopted which will be adhered to, rather than subject the nation to constant changes in the laws which makes planning ahead difficult and uncertain.

It appears probable that Congress will attempt to pass bonus, immigration, railroad and tariff legislation and that government ownership and regulation of certain industries will come in for considerable discussion. Past experience shows, however, that the national legislation rarely enacts much business in the session immediately preceding a Presidential election, and it is generally believed that this will prove the case in this instance.

Legislation has become in too many instances the result of pressure brought to bear upon the lawmakers by "blocs" or combinations of interests. I do not wish to see an industrial or a business "bloc," but I do feel that industry and industrial leaders should take a greater interest in government affairs. I do feel there should be more business in government. Possibly the present administration has done morein this respect than previous administrations but there is still room for improvement. One of the outstanding evidences isthe interest of the Department of Commerce in business. This is not interest of a regulatory character but one which is calculated to benefit American industry, both at homeand abroad, and through the benefit to industry, to benefit the nation at large. If business desires a greater share in government, it must do everything possible to make the work of the Department of Commerce successful so that it will become an increasingly effective business department and so that it must be recognized that business men of the caliber of the present Secretary, Herbert Hoover, must be appointed to head this department in future administrations. It devolves upon the business men of the country to see to this; unless they create the demand, the department will go backward and be as ineffective as it was for many years before Secretary Hoover took hold of it.

#### SCARCITY OF LABOR

Our industry, in common with others, is suffering at present from a lack of labor, both common and skilled, although the chief shortage is unskilled labor. The increases in wages caused largely by this condition will not increase the available supply of labor. These increases can only result in extremely high rates without enabling us to obtain or hold men, decreased production through lessened efficiency of the men, and eventually a hardship on labor itself due to the higher cost of living, a stoppage of buying and the eventual lack of business and of employment.

While employers generally are demanding a revision of the existing immigration laws and many would like to see all immigration restrictions removed, labor leaders and other individuals throughout the country are insistent that the present minimum be decreased. From economic and humanitarian viewpoints I do not feel that either extreme is correct, but believe that some revision in the law should be made which will make it possible for some appreciable number of healthy, intelligent individuals to come into the country in greater numbers than at present, and I further believe that an earnest and intelligent inquiry should be made as to whether a shortage exists, what causes it and what is the best remedy. Possibly this could best be carried out by a commission appointed by the President of the United States.

We do not desire a shortage of labor, nor do we wish a large over-supply. Both conditions bring hardships to the community. What we should have if possible is a flexible supply, and the question is how best to obtain it.

One simple measure which will surely give considerable relief is the postponement of public works during times of great business activity, that is to say, when labor is scarce and hard to get, the Government should not be bidding against the industries which form the backbone of the nation's prosperity. This is going to be difficult to work out in practice as, generally speaking, government work is not as exacting nor as efficiently done as is private work; the rates of pay are higher, hours of labor are shorter and the results that must be produced are easier of attainment in public than in private work. Again, the absence of public work during times of national prosperity will insure economies in such work which cannot be obtained if the construction is done during times of abnormally good business.

Another relief measure which is receiving strong support is the stoppage of many large private building and construction enterprises throughout the country; this will release men to other industries and keep down construction costs and, incidentally, have its effect on wage rates and living costs.

I believe another answer will be found in increased production per man through better machinery and a decrease in the demand for unskilled labor through the reduction of manual handling operations. It has long been recognized that the greatest opportunity to reduce labor costs is through the reduction of handling operations and costs between machine operations, and it seems certain that the American manufacturer must learn this. Our salvation and that of manufacturers generally will come through improved machines, better methods and increased production by skilled workers; but while we bend our energies toward those ends so far as our own immediate interests are concerned, we must also appreciate that the question of labor supply is and always will be important and that a satisfactory solution should be sought and found if this country is to continue to be a prosperous manufacturing nation.

The last couple of years have brought about several developments which affect our industry possibly more than we realize and tend to increase our difficulties in the design, manufacture and operation of our products. I refer particularly to the increase in size and pressure of units which we build and the methods of firing them. These matters are of the utmost importance not only to us but to our customers and the communities in which our boilers are installed and operated, and we must give proper consideration to these **new** developments if we accept our responsibilities as we should.

#### BOILERS BEING BUILT IN LARGER UNITS

The manufacture of larger units is comparatively simple; we follow generally the same designs which have proven satisfactory in the smaller units of the past; but we must bear in mind that the smaller plants containing large units are not always as flexible as the older type of plant made up of a number of smaller units, and that the investment idle when one unit is down for any reason is higher than heretofore. Improved methods of burning greater quantities of fuel per foot of furnace width have been developed, resulting in operation at higher ratings. All of these elements necessitate better design, manufacture and operation and a full understanding of the things which go to make these up.

The increase in prime mover efficiency due to higher steam pressures and temperatures is something of which we have recently come to hear a great deal. High pressure of yesterday is considered medium or low pressure today. Above all else, a steam boiler must be safe. We cannot afford to take chances and must so design and build that there can be no question of 100 percent performance, not only for our individual good names but for the protection of the community.

#### USE OF POWDERED FUEL

We have seen some wonderful advances in the burning of fuels. Results have been obtained with mechanical stokers which a few years ago were regarded as beyond their capacities. In the last couple of years the burning of powdered or pulverized coal under boilers has become more common. Some go so far as to say that powdered fuel installations will outnumber stoker plants in the future. I personally feel that this is improbable, but the facts are that two stoker manufacturers are now selling powdered fuel equipment and several others are seriously considering doing so. Undoubtedly powdered fuel applied to steam boilers, to some considerable extent at least, is here to stay.

The burning of pulverized fuel opens up an entirely new field of trouble for the boiler manufacturer. It brings about new furnace and setting designs and conditions, and while a boiler manufacturer will not be expected to design these furnaces and settings, he will surely hear of what are assumed to be his shortcomings if troubles occur. The burning of pulverized coal under boilers is relatively new; it is spreading like wildfire. Many people will enter the field because of the opportunities it seems to present and many of these same people will be irresponsible and know little or nothing of our problems. The manufacturers of successful powdered fuel equipment will have to be careful that their engineering and practical experience does not become warped or commercialized by the competition which will spring up, and we as boiler manufacturers will have to make sure that our products are protected from improper equipment of this character.

It seems to me that we must come to the realization that we have an entirely new set of conditions to meet in larger units, higher pressures and different methods of burning fuel, and that for our own protection and the good name of our industry, the protection of our customers and the public generally, we must redouble our vigilance in every direction to ensure a safe and an orderly advance in the part which we play in these developments.

## **Open Versus Closed Shops**

At the conclusion of his address the president introduced Mr. Homer D. Sayre, commissioner of the National Metal Trades Association, who outlined the history and development of the metal trades association and reviewed the present status of organized labor in the United States and England.

Tracing the movement of organized labor in the United States from the first strike in 1786, through the activities of the Knights of Labor shortly after the Civil War and the growth of the present American Federation of Labor, Mr. Sayre declared that the movement for amalgamation, which is opposed by Mr. Gompers, will be the outstanding feature of the labor convention in October. Although the independent unions are growing by leaps and bounds he did not believe that this country will be organized to the extent that labor is in England because in this country the employee of today is the employer of tomorrow.

Mr. Sayre was optimistic about the future of the metal trades associations which today comprise 31,000 establishments that are wholly free from labor domination. Labor in England, he said, is 90 percent organized while in the United States only 10 percent of the labor is organized and the British wage earner is only one-third as well off as the American wage earner. The real danger here, he warned, is the tendency of labor to control the government and he urged the employer, as a duty to the employe, the industry and himself to maintain an open shop.

At the close of Mr. Sayre's address, the president appointed the auditing and nominating committees, instructing them to report at the Wednesday morning session.

#### REPORT OF THE SECRETARY AND TREASURER

H. N. Covell, secretary and treasurer, reported that the membership of the association consists of 72 active, 22 associate members and one honorary member. The treasury showed a favorable balance of \$308.55. S. H. Barnum, chairman of the entertainment committee, outlined the rules for the golf tournaments to be held during the convention.

### MONDAY EVENING SESSION

On Monday evening the members and guests of the association assembled in the main lounge of the Casino where the president introduced Mr. G. A. Richardson, of the Bethlehem Steel Company, who delivered a short address illustrated by moving pictures showing the manufacture of plates, flanged and dished heads, charcoal iron lap welded boiler tubes and staybolt iron at the Brandywine plant of the company at Coatesville, Pa. These pictures were of special interest both because this was the first time these films had been shown and because of the unusual size and precision of the work shown.

#### Practices and Conditions Existing in the Industry

Following Mr. Richardson's address a series of questions concerning practices and conditions in the industry, which had previously been mailed to the members, was discussed informally.

Referring first to the raw material situation Mr. Pratt, president of the association, expressed the belief that prices had reached the top, would be lower rather than higher and that no more premium prices need be expected. Deliveries, he said, were easier.

As to the labor situation, boiler manufacturers in all parts of the country reported a scarcity of labor, particularly of skilled labor. In most cases this was due to the higher wages and more attractive conditions offered by other metal working industries such as the automobile builders or the railroads. The scarcity of unskilled labor could be traced in part to the immigration restrictions.

M. F. Moore stated that at the Kewanee Boiler Works there is no shortage of skilled labor except molders but that no foreigners are employed at this boiler shop. Here the labor conditions are ideal, he said, for young men are recruited from the neighboring farm districts, taught progressively the various shop operations and kept employed the year round on day work at relatively high wages without premiums or bonuses.

A. R. Goldie, of the Goldie-McCulloch Company, Galt, Ont., stated that in Canada conditions are different as there has not been the rush of work that has occurred in the United States and the problem has been to keep the men busy the year round.

Mr. Brink, of the American Hoist and Derrick Company, St. Paul, Minn., called attention to the apprenticeship system employed in his plant and stated that the best men in their employ are those which they have brought up themselves both in the shops and in the drawing room.

A query disclosed the fact that no closed shop was represented at the convention.

Isaac Harter, of the Babcock & Wilcox Company, described at length the welfare work carried out by his company, which is all handled by the employment department. The men are supplied to the foremen by the employment department, within certain limits of rates. If a man is discharged by a foreman he goes out through the employment department and the reasons for his discharge are checked up. In this way it is seldom found necessary to change the conditions in the shop. This balance of power he considered a marked improvement as under it the foreman is no longer omnipotent.

The company also has a physical examination department that serves to keep the men from assignments of work for which they are physically unsuited. This system has shown the doctor to be a very valuable asset to the plant for he comes into a relationship with the men that no other man can have. A mutual aid association, controlled by the men, is maintained, which takes care of the health compensation among its employes; the accident cases are taken care of by the state compensation laws. The company carries group life insurance for the employes.

Discussion of the insurance question showed that there is a tendency to favor insurance in which both the company and the men share in paying the premiums.

In discussing difficulties in the manufacture of boilers it was disclosed that trouble is frequently experienced in obtaining drawings of apparatus to tie up with the boiler. In the case of trouble with the operation of boilers it appeared to be the general opinion that the manufacturer should give the services of a field engineer to the customer for two or three times but for any trouble developing after that the customer should be willing to pay at least the expenses of the field engineer.

In discussing the loss of repair part business to local foundries, competitors, etc., A. G. Pratt, president of the association, urged manufacturers to make a drive to secure orders for repair parts, not only because it would eventually mean a considerable item of business for them, but on the other hand no manufacturers should be held responsible for the performance of equipment, parts of which have been supplied in the way of repairs by parties other than the original manufacturers.

One nuisance with which the boiler making industry is afflicted today is the great number of requests received from appraisers for information regarding details, drawings and prices of completed contracts. It was the opinion of those present that when such requests come from the customer direct the information should be given free but that when it comes from appraisers a suitable fee should be charged for the information.

#### TUESDAY MORNING SESSION

On Tuesday morning the program comprised the presentation for discussion and adoption of reports from the following standing and special committees:

#### Membership

H. N. Covell, Lidgerwood Manufacturing Company, chairman, reported the loss of one and the addition of two members during the past year.

#### A. S. M. E. Code and American Uniform Boiler Law Society

E. R. Fish, the Heine Boiler Company, chairman, reported progress.

#### Ethics

F. C. Burton, Erie City Iron Works, chairman, read a copy of the Tile Makers Association Code of Ethics as best adapted for the boiler manufacturers' association and this report was referred back to the committee to be re-drafted.

#### Standardized Ratings of Steam Boilers

Prior to the February meeting, the committee sent out a questionnaire to the entire membership of the association, and a summary of all the replies was given in our preliminary report on February 12. The following is therefore recommended for final action:

 Question—Define the basis of boiler ratings, i.e., horsepower or square feet of heating surface.

Your committee wishes to recommend that all specifications and other data pertaining to the subject of "boiler horsepower" be specified both on a square-feet-of-heatingsurface basis and also on a horsepower basis, and that preference be given to the square-feet-of-heating-surface basis if any preference be given.

(2) Your committee recommends that for all types of

boilers, ten (10) square feet of heating surface constitutes a horsepower.

(3)Your committee recommends that heating surface shall be calculated in the manner outlined in the A.S.M.E. Power Test Code, which reads as follows:

"Heating surface for boilers comprises the total area of surface in actual contact with hot gas and below the normal water level of the boiler, provided the heating surface comprises a part of the circulation system of the boiler proper. If any such surface is not in the boiler circulation system, and is not connected to the steam space of the boiler, it is to be considered as preheater, or integral economizer surface, and not as boiler heating surface. Superheater surface is the total area of all surface in contact with the hot gases. Superheater, boiler and preheater surfaces should be separately stated. Since the gas side of the surface offers the controlling resistance to heat transmission, the surface will be figured on the outside diameter of tubes for watertube boilers, and on the inside diameter for firetube boilers.

Your committee wishes to bring to your notice that the A.S.M.E. Power Test Code specifically states that superheating surface, boiler heating surface, and pre-heating surface should be separately stated, and the committee therefore recommends that in all specifications this rule be followed.

We also wish to call your attention to the fact that in calculating the heating surface of watertube boilers, the outside diameter of the tubes should be used, and for firetube boilers, the inside diameter of the tubes.

(5)We recommend that for plain vertical firetube boilers, the rule be adopted that in calculating the heating surface of same, the normal water line or center of the gage glass be taken as the top point of the heating surface, and that only such surface of the shell and tubes as is below the center line of the water glass be calculated as heating surface.

Your committee would recommend that in calculat-(6) ing the heating surface of return tubular boilers, only onehalf the circumference of the shell be calculated as heating surface on account of the brick walls closing in on the boiler at a point about half way up on the shell. Your committee understands that some boiler builders calculate two-thirds of the shell as heating surface.

At the midwinter meeting, Mr. E. C. Fisher, of the Wickes Boiler Company, pointed out the fact that three sizes of tubes are used in a 72-inch by 18-foot return tubular boilerthe diameter of the tubes depending upon the part of the States in which the boiler was built. Some manufacturers have standardized on 70 4-inch tubes, which would give a total heating surface in a 72-inch by 18-foot boiler of 1,594 square feet.

The same diameter and length of shell containing eightysix 31/2-inch tubes would have 1,645 square feet heating surface, and the same boiler with one hundred and ten 3-inch tubes would give 1,760 square feet heating surface.

Practically all of the builders of the 72-inch by 18-foot boiler specify same in their catalogue and specifications as 150 horsepower regardless of which diameter of tubes is used. W. C. CONNELLY, Chairman.

#### DISCUSSION

The discussion of this report emphasized the advisability of rating boilers according to the number of square feet of heating surface rather than on the horsepower.

The report was adopted.

#### Height and Diameter of Stacks

The engineering committee of the Stoker Manufacturers' Association submitted a report to that association on November 23, 1922, which included the following statements and recommendations:

Stack Diameters and Heights: It would be desirable if the boiler and stoker manufacturers could agree on some common formula or rule for the determination of both diameter and height so as to present a united front to contractors and

owners on the question of dimensions of stacks. It was decided that this matter was one that should be referred to the joint committee of the boiler and stoker manufacturers' associations.

Draft Over Fire: Inasmuch as the effect of pressure at the top of a high furnace is something that directly affects the boiler manufacturer and only indirectly the stoker manufacturer, it was decided that this matter should be referred to the joint committee of boiler and stoker manufacturers' associations.

A meeting of the joint committee was held in New York March 20, 1923, at which the following were present:

A. G. Pratt, The Babcock & Wilcox Company.

- E. C. Fisher, The Wickes Boiler Company. A. H. Blackburn, Sanford Riley Stoker Company.
- R. L. Beers, Detroit Stoker Company, H. E. Preston, American Engineering Company.

 A. D. Pratt, The Babcock & Wilcox Company.
 R. A. Foresman, Westinghouse Electric & Manufacturing Company. S. H. Barnum, The Bigelow Company.

Stack Diameters and Heights: This subject was referred to a sub-committee consisting of E. C. Fisher, S. H. Barnum, R. L. Beers and A. H. Blackburn, and the report of that sub-committee, which has been approved by the joint committee, will be presented separately by E. C. Fisher.

Draft Over Fire: The following recommendation was unanimously agreed upon:

"That the draft over the fire should be taken as follows: On horizontal watertube boilers, midway between the heating surface of the boiler and the grate surface of the stoker. On vertical and semi-vertical watertube boilers, at a point midway between the inside face of the front wall and the front face of the bridge-wall, on a line with the top of the bridge-wall. And that the draft at this point is to be not less than 0.15-inch suction."

The committee discussed the forms of data sheets exchanged between boiler and stoker manufacturers and those present stated that as far as they could learn these forms were satisfactory to all. Since the meeting of the committee. the stoker and boiler associations have checked this question with their respective memberships. While all of the companies of the two associations have not been heard from the general consensus of opinion is that the data sheets are helpful and should be continued in their present form; in fact, many companies have strongly urged that the use of these sheets be continued. Slight modifications have been suggested by some of the companies and it is recommended that these points be brought up and some conclusion reached at this meeting.

The meeting discussed the possibility of enlarging the joint committee to the extent of having represented on it fan, superheater, economizer, soot blower and similar manufacturers and it was determined that if either association felt such contact to be necessary that it should undertake to bring it about independently rather than through the joint A.B.M.A.-S.M.A. committee.

The question of rating boilers upon a square foot basis was discussed with the purpose of placing the representatives of the stoker manufacturers on record, and it was recommended by the meeting that such rating rather than a horsepower rating be used by all boiler manufacturers, with the qualification, however, that there could be no objection to boiler manufacturers also stating the rated horsepower which. however, should be based upon 10 square feet of heating surface per horsepower.

Respectfully submitted,

A. G. Pratt, L. E. Connelly, G. W. Bach. S. H. Barnum, E. C. Fisher.

In addition to the foregoing committee report Mr. E. C. Fisher, of the Wickes Boiler Company, presented a very comprehensive supplementary report, going exhaustively into the determination of the diameters and heights of stacks for steam boilers, which will be published in full in the July issue of THE BOILER MAKER.

 Owing to the absence of Mr. Fisher on account of sickness this paper was read by Mr. Barnum,

#### DISCUSSION

A. G. Pratt, Babcock & Wilcox Company, president of the association, stated that the same report had been submitted to the Stoker Manufacturers' Association and that they had adopted a resolution recommending that the tables be used but that the 100 percent rating should never be used and that the 150 percent rating be considered as the minimum.

E. R. Fish, Heine Boiler Company, called attention to the fact that the proportioning of stacks requires a lot of scientific calculations for which data are lacking and that the real stack temperatures have never been determined with accuracy. Further he pointed out that the tables and curves are based on experience only and while this makes little difference with small boilers greater care must be exercised in the case of large units. He stated that tests are to be made by the Johns Hopkins University for securing accurate data for determining the constants used in the calculations.

G. S. Barnum, of the Bigelow Company, pointed out that the primary object of the report was to take care of the small return tubular boilers. Mr. Barnum did not agree with the stoker manufacturers' recommendations.

A. G. Pratt, Babcock & Wilcox Company, stated that the charts and tables are based on experience gained principally by the Westinghouse Electric and Manufacturing Company during the past two years and that they have been used for two years with good success. He stated that the estimates are fair and the results come within safe limits.

W. C. Connelly, D. Connelly Company, believed that the 100 percent rating gives stacks of too small diameter as 34 inches is the smallest anybody uses.

The committee report was adopted and a vote of thanks extended to Mr. Fisher for his special report.

# A. S. M. E. Boiler Code Sub-Committee on Rules for Inspection

This committee reported progress and it was voted to refer any further revision to the committee.

## Uniform Setting Heights of Horizontal Return Tubular Boilers

This subject had been considered in conference with the Smoke Prevention Association, the secretary of which believed that the local inspectors should not have the authority to set the heights but that a standard should be established by the American Boiler Manufacturers' Association. It was moved that the association send a delegate to the meeting of the Smoke Prevention Association in Minneapolis, June 20 to 22, to urge the association to take definite action and adopt the A. B. M. A. standard. The president appointed G. W. Bach of the Union Iron Works, Erie, Pa., to act as the association's delegate at this meeting.

#### Steel Heating Boilers

W. A. Drake, the Brownell Company, reported that the committee had obtained considerable data but not enough from which to draw conclusions and that data sheets would be sent to members of the association at an early date. He stated that the information now available came from Government tests, etc., and that what was wanted was data from users.

# National Board of Boiler and Pressure Vessel Inspectors

Two representatives of the National Board of Boiler and Pressure Vessel Inspectors presented reports on the activities of this body, Mr. Joseph F. Scott, the president, and Mr. C. O. Myers, the secretary and treasurer.

#### Abstract of Mr. Scott's Address

I am glad to say we are now self-supporting and will be in a position to call our national convention which is very much needed. Although it was within your power to crush an organization of this kind at its inception, nevertheless you have signified to the members of the National Board of Boiler and Pressure Vessel Inspectors by your substantial support, your sincerity in desiring uniformity, standardization and the adoption of every method that would increase and tend to improve the business of boiler making in the United States.

We have considerable room for improvement, and cooperation is needed among a few of the boiler manufacturers in certain sections of the country, but we know that eventually such manufacturers will be cooperating with the National Board or it will come to the point that the customers of such boiler manufacturers will raise the question or why such manufacturers are not cooperating with other manufacturers who are members of the National Board.

Members of the National Board have important work cut out for them. It is not only essential that steam boilers be constructed in accordance with the A.S.M.E. Boiler Code, but it is high time that necessary steps be taken so that the manufacturers of such boilers will be protected against practices prevalent among firms that are dealing in second-hand boilers. Our experience with second-hand dealers shows the necessity of registering every dealer of second-hand boilers in the country and adopting specific rules and regulations with which they must comply and providing penalties to the violators of these rules. In my mind the activities of the second-hand boiler dealers are more dangerous and should be of more concern to the heads of the State and municipal steam boiler inspection bureaus than boilers that are built by responsible manufacturers in accordance with the A.S.M.E. Code.

In nine cases out of ten a prospective customer is not acquainted with the construction of a boiler. His prime interest is in obtaining a boiler as cheaply as possible and where a boiler is offered to him as a first class second-hand boiler he will invariably purchase it depending upon some method to get around the boiler inspection laws in his particular territory. This is what the National Board of Boiler and Pressure Vessel Inspectors must stop. It is very essential therefore that representatives of the National Board draw up regulations covering the handling of second-hand boilers throughout the country. Such rules can be easily put into effect, I believe, without changing the present wording of the law under which steam boiler regulations are created. This matter should receive first consideration at the next convention of the National Board.

In checking up the number of boiler explosions as compared with the number of explosions of air and other pressure vessels, it is apparent that the latter are far more numerous than the former. The sooner legislation is enacted or laws amended covering the construction and inspection of air and other pressure vessels the sooner this danger will be removed. There is no reason why this should not be made one of the most popular sets of regulations that could be adopted throughout the country.

#### Abstract of Mr. Myers' Address

We have been observing very closely the inspection and stamping of A.S.M.E. Code boilers and within the last two years no case has been brought to our attention where a boiler bearing the Code symbol was not in fact a Code boiler. This is very encouraging and, upon the strength of it, my purpose will be to have the Ohio Board of Boiler Rules consider the adoption of the 1922 edition of the A.S.M.E. Code and eliminate the present Ohio Code. The Ohio law provides that a public hearing must be held when changes in the rules are contemplated and this hearing will be arranged at a special meeting of the Ohio Board just as soon as the revised edition is available.

Since the Ohio situation has been satisfactorily cleared up a number of concerns have started stamping their boilers "National Board." The work of the Board is gradually increasing, our finances are in good shape and we are selfsupporting. We are accumulating a fund to take care of a National Board convention which we believe should be held as soon as possible.

At your annual meeting in June, 1922, 503 boilers were registered by 18 concerns. At that time the registration fees were revised and we reported at your mid-winter meeting in

February that 2,664 boilers were registered by 26 concerns. At the present time we are pleased to report 6,387 boilers registered by 35 concerns, making a total increase for the last year of approximately 1,200 percent.

For the benefit of the boiler manufacturers who are not taking advantage of the National Board in stamping their boilers we desire to advise that the following States and cities will accept without question boilers stamped with the National Board stamp: Rhode Island, New York, New Jersey, Maryland, Ohio, Indiana, Pennsylvania, Wisconsin, Minnesota, Oklahoma, Oregon, California, Utah and Arkansas, Chicago, Ill.; Seattle, Wash.; St. Louis, Mo.; Parkersburg, W. Va.; Nashville, Tenn., and Kansas City, Mo.

It can be seen from the foregoing that the progress of the National Board during the past year has been very gratifying which is due to the support and co-operation of the officers and members of the Board, the American Boiler Manufacturers' Association, the American Uniform Boiler Law Society and the Boiler

Code Committee. If indications are correct the coming months will show material gains in the strength of the Board.

#### American Uniform Boiler Law Society

Charles E. Gorton, chairman, Administrative Council of the American Uniform Boiler Law Society, congratulated the National Board on its excellent progress and stated that no instance had been found where a boiler stamped by a National Board inspector was not a Code boiler.

Mr. Gorton said that the Administrative Council of the Uniform Boiler Law Society believed it advisable for them to use their efforts to strengthen the boiler laws now in existence.

He said that they had been called in by nine states for this specific purpose. He further pointed out that 17 bills had been introduced in legislatures during the past year that were inimical to the interests of the association.

Taking up the steps which had been taken to secure legislation covering the construction and inspection of boilers in states which have not yet adopted the A. S. M. E. Code he explained the reasons why such bills had failed in Washington, Arkansas, Arizona, Florida, Georgia, Alabama, Indiana, Kansas, Iowa, Illinois, Michigan, North Carolina and Virginia. In many cases there apparently is good prospect of securing the enactment of such legislation in the near future and every effort will be exerted to secure this end.

In conclusion he declared that the Administrative Council and the Executive Committee realize that they must keep in intimate touch with the state departments or the administration of the laws will be anything but uniform.

# WEDNESDAY MORNING SESSION

The final session of the convention was called to order at 9.50 A. M. on Wednesday, with A. G. Pratt, president, in the chair. Mr. Pratt called Mr. G. S. Barnum of the Bigelow Company, vice-president of the association, to the chair to take charge of the meeting during the reading and discussion of his paper on cost accounting.

costs of all but four of which are close together and are thrown into a general average while the other departments have a different rate and are kept independent. A poll of those present showed that practically all are using some form of cost accounting. F. G. Cox, Edge Moor Iron Company, spoke of the ten-

F. G. Cox, Edge Moor Iron Company, spoke of the tendency to install too elaborate a system and advised making it as simple as possible.

#### Election of Officers

The following officers were elected to serve for the following year:

President-E. R. Fish, Heine Boiler Company, St. Louis, Mo. Vice-President-E. C. Fisher, The Wickes Boiler Company, Saginaw, Mich.

Secretary-Treasurer-H. N. Covell, Lidgerwood Manufacturing Company, Brooklyn, N. Y.

Executive Committee—George W. Bach, Union Iron Works, Erie, Pa.; G. S. Barnum, The Bigelow Company, New Haven, Conn.; F. G. Cox, Edge Moor Iron Company, Edge Moor, Del.; W. C. Connelly, D. Connelly Boiler Company, Cleveland, O.;

W. A. Drake, The Brownell Company, Dayton, O.; A. R. Goldie, Goldie-McCulloch Company, Galt, Ont.; J. F. Johnston, Johnston Brothers, Ferryburg, Mich.; M. F. Moore, Kewanee Boiler Works, Kewanee, Ill., and A. G. Pratt, The Babcock and Wilcox Company, New York.

The secretary read a letter from Calvin W. Rice, secretary of the American Society of Mechanical Engineers, regarding his recent trip to South America where he found that the A.S.M.E. boiler code is held in high esteem. Mr. Rice urged the translation of the code into Spanish and Portuguese.

It was voted that the secretary reply to the above letter to the effect that the American Boiler Manufacturers Association would be very glad if the American Society of Mechanical Engineers would translate the code and suggesting that the price of the English edition be increased to cover the cost of the translation.

It was also voted that a committee of standards be appointed to get out a loose-leaf handbook containing the A.B.M.A. standards adopted by the association.

#### **Opposes Government Ownership of Railroads**

The association unanimously adopted the following resolution offered by W. H. S. Bateman, of the Parkesburg Iron Company, Philadelphia, Pa.:

Resolved that this association go on record in upholding the railroads of the United States in the fight which they are making for their very existence and that we as a body emphatically are opposed to government ownership and will use our best efforts individually to encourage public sentiment in sympathy with the railroads and will at all times endeavor to counteract the influences which are constantly working in opposition to the railroads of our country.

#### Entertainment Features

The annual banquet of the association was held in the main dining room of The Homestead on the evening of Tuesday, June 5. The afternoons of Monday and Tuesday, June 4 and 5, were given over to golf tournaments, the prizes for which were awarded at the annual banquet.

#### **Registration at the Convention**

The following members and guests attended the convention:

Bach, George W., Union Iron Works, Erie, Pa.
Baldwin, Frank M., Oil City Boiler Works, Oil City, Pa.
Barnum, George S., The Bigelow Company, New Haven, Conn.
Barnum, Starr H., The Bigelow Company, New Haven, Conn.

# An Improved Type of Staybolt Set

"HE new "clover-leaf" staybolt set shown for the first time at the Master Boiler Makers' Association convention, is an improvement over the standard staybolt set made by the Lovejoy Tool Works, Chicago, Ill. Its unique construction is obtained by milling out approximately two-thirds of the metal from the driven surface as shown in the accompanying illustration. With it the operator is able to drive the staybolt head more quickly because only about one-third of the metal of the tool is in contact with the staybolt iron at one time. The set is driven in No. 60 to

"Clover-Leaf" Staybolt Set

No. 90 pneumatic hammers. By turning the tool in the driving process the staybolt is headed up to the sharp points, while at the same time the ragged edges are trimmed, thus making a clean, finished job.

It is claimed that this set is easier to operate than the old one, as there is no tendency for it to jump all around the staybolt as in the old style. The Lovejoy Tool Works makes this rivet set from special Vanadium steel and guarantees it to give satisfactory service. It is furnished with square, round or hexagonal shank as desired, to fit any pneumatic hammer and in all sizes from 7/8-inch up.

# The Industrial Importance of Conserving Eyesight

MPLOYING the methods of engineering, research in eye conservation on a nationwide scale has been undertaken by the Eyesight Conservation Council of America. The work is in charge of J. E. Hannum, a former member of the teaching staff of Purdue University, and a member of the American Society of Mechanical Engineers.

(Continued on page 163)

# Testing Flexible Staybolts Electrically

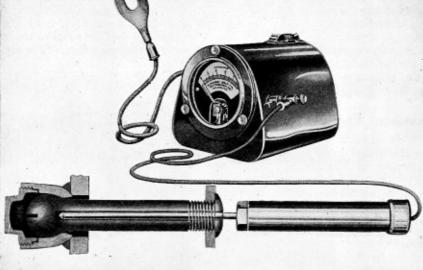

# Method Developed to Make Tests More Positive and to Remove Uncertainties of Hammer Testing

A S far back as 1916 a method of testing flexible staybolts by other than the hammer had been developed by the Flannery Bolt Company of Pittsburgh, which was described at the Master Boiler Makers Association convention of that year. Again at the convention this year after seven years of experimentation and test the device was shown in its perfected state. For the past three years actual locomotive service tests have been conducted demonstrating that this method is a positive means for determining the condition of flexible staybolts in service.

In all the experiments the thought has been continually kept in mind that no method of testing that depends upon the human element can be entirely satisfactory where danger to human life is concerned. Innumerable reports can be produced to prove the uncertainty and inefficiency of the present method of testing.

Recently an authority on the subject of testing stated in an a r t i c le which appeared in the March issue of the Railway Mechanical Engineer:

"In my opinion, in going over a boiler on a staybolt test, the inspector cannot get all the broken and cracked bolts. I have witnessed inspectors undergoing examination who are classed as good, but the results they obtained varied, some locating only one defective bolt, while others located as many as 12 or 14. Some bolts which they marked as broken or cracked

Electrical Equipment for Testing Flexible Staybolts

were of the flexible type and were merely unseated.

"To test flexible bolts, we remove all caps and strike the head of the bolt two or three good smart blows, so as to finish the break if possible; then we take a round nose tool and strike the head first on one side then on the other, twisting it so that in case it is fractured it will break loose. I have seen several tell-tale holes leaking on hydrostatic tests, but have very seldom seen an inspector locate them while testing the bolts from the firebox side of the boiler.

"In striking a staybolt, if the hammer gives a quick rebound, the bolt is all right, but if it does not rebound and apparently sticks to the bolt, it is cracked or broken. One must not depend altogether on the rebound, but upon the sense of hearing as well; a fractured bolt gives off a dead sound and is very often easily detected by one standing close to the inspector at the time."

#### DESCRIPTION AND METHOD

The new method of inspection requires no change in the standard parts of a flexible staybolt assemblage, with the exception of providing a bolt with a tell-tale hole extending from the inner end into, but not through, the bolt head. Inspection is accomplished by establishing electrical contact at the extreme inner end of the tell-tale hole by means of a device consisting of a meter, batteries, an indicating rod and connection to the boiler. The apparatus is simple and compact, and requires no particular care except the occasional renewal of a dry cell battery. These are of any small popular type used commercially and can be procured anywhere.

Reference to the illustration shown herewith will probably suffice as an explanation as to how the tester works.

The connection to the boiler may be made at any point where good contact can be secured.

The indicating rod is inserted in the tell-tale hole. As soon as the tip of the rod has reached the end of the telltale hole the electric circuit is completed and is registered on the meter, thus insuring the tell-tale hole being open its

full length and properly functioning.

If the indicator rod is stopped before the meter indicates contact, this would show the hole to be obstructed in some manner. In this event clean the hole by means of a drill and small m o t o r, until contact can be established.

The method of test is quite simple and there is no phase of the test that depends upon the human element except the simple act of inserting the testing rod into the tell-tale hole.

If the bolt were fractured, this condition will be apparent

in the hydrostatic test that is applied after the electrical contact has been made with all the bolts. The tell-tale holes, being clean, will immediately indicate a fracture by water leakage from the bolt that is unfit.

The basis upon which this electrical contact test has been developed is that staybolt breakage will be easily detected if the tell-tale holes are kept open and extend to every part of the bolt which can possibly break. A tell-tale hole, under this method, must extend from one end of the bolt into, but not through, the head at the other end, and therefore, covers every breakable part of the bolt. To insure clean tell-tale holes, a fireproof porous cement is provided, which is easily removed, to seal the end of the tell-tale hole after the bolts are installed and riveted.

Occasionally a mechanic may neglect to seal a hollow Tate bolt with the porous cement and in that event, a small drill should be used to bore out the tell-tale preliminary to inserting the testing rod for inspection.

If the tell-tale hole has been sealed with the porous cement, sediment, or any other obstruction that would prevent contact between the testing rod and the end of the tell-tale hole, can only come from a fractured bolt.

# New Type Electric Welder for Safe-Ending Locomotive Boiler and Superheater Tubes

THE electric welding process of safe-ending locomotive boiler and superheater tubes was instituted about 1912 by the Thomson Electric Welding Company of Lynn, Mass. The welding was done on a type 40-A welder.

The electric process showed so great a saving in time and money over the oil furnace process, besides making stronger welds, that it was adopted by several of the larger railroad systems of this country and abroad.

In 1919 an extensive campaign of development was begun by the Thomson Electric Welding Company which resulted in a complete new line of resistance welders of greatly improved power factor, efficiency, operating characteristics and appearance.

The new standard 60 S. P. welder had a capacity of work of from 6 to 9 square inches which was from two to three times greater than was required for large flue welding. Hence, to avoid excessive weight, electrical and mechanical capacity, standby charges, etc., it became desirable to develop a special 60 S. P. flue welder of lighter weight, and reduced electrical capacity for this class of work. Accordingly, the flue welder shown in the illustration was standardized for locomotive work and already there are two of them in successful operation—one in the Illinois Central Shops at McComb, Miss., and one in the shops of the Duluth & Iron Range Railroad at Two Harbors, Wis.

The welder is equipped with pneumatically operated clamps having interchangeable copper dies for flues from 2 inches to 6 inches diameter. The pressure necessary to push up and consummate the weld is secured by means of a double acting hydraulic cylinder mounted directly on the welder as shown in the illustration.

This hydraulic cylinder may be operated by any one of the following methods: (1) By hand pump actuated by a lever; (2) by connecting cylinder piping direct to an accumulator; (3) by connecting the cylinder piping directly to an oil gear pump made by the Oil Gear Company of Milwaukee, Wis.

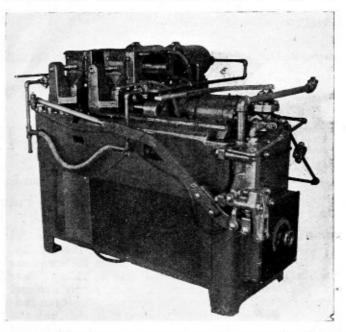

Reversal of direction of platen travel is secured, when using method (1), by throwing a reversing lever through an angle of about 45 degrees; when using method (2), by means of a four-way valve, and in method (3) by means of a control lever or handle on the oil gear pump itself. Method (1) has been most commonly used in the past for it gives the operator complete manual control of the push up of the weld, but the physical effort is somewhat tiring on him. Method (2) has been used to a lesser extent, but is favored by some because it relieves the operator from any exertion in pushing up the welds or in withdrawing the platen.

Method (3) is a new development within the last year and due to its ease of operation and fine control gives great promise of a wide use in future. This latter method is now used by the Illinois Central Railroad at McComb, Miss.

The voltage and current regulation for various sizes of flues is obtained by means of a special five-point regulator switch mounted on the right hand end of the welder frame. By turning an insulated knob, the current can instantly be changed to suit the particular weld being made. All copper dies are thoroughly watercooled as is also the secondary lead connections, thus insuring cool operation of the outfit at all times. The transformer is of improved design with series primary windings and multiple secondary leads, covered by U. S. Patent No. 1375765 giving the highest efficiency ever attained in a welding transformer.

The dependability of the electrically welded flue and its economy over the force process has been vouched for by many prominent railway officials, among whom are Mr. W. H. Lewis, superintendent of motive power, Norfolk & Western Railway Company; Mr. J. J. Sullivan, superintendent of machinery, Chattanooga, St. Louis & Nashville Railroad; Mr. George B. Halstead, shop superintendent of the Virginian Railway Company, and many others.

The great western railroad systems are rapidly adopting the electric flue welding process and officials of the greatest

Type 60 S. P. Welding Machine for Safe-Ending Boiler Tubes.

systems of the East have the matter under advisement at the present time. A Thomson flue welder was recently installed and is now operating steadily in the Lehigh Valley Shops at Sayre, Pa.

## The Industrial Importance of Conserving Eyesight

#### (Continued from page 161)

The plan, which follows revelations of human and industrial waste in industry, made by the Hoover Committee on the Elimination of Waste in Industry of the Federated American Engineering Societies, of which J. Parke Channing of New York is chairman, aims to determine the extent to which attention is being given to the conservation of vision in the educational, commercial and industrial activities of the United States. A study of statutory provisions now in force and affecting eyesight will be carried on.

Experiments to determine the true economic value of perfect vision will be made. It is proposed to measure the improvement in health, increase in quality and quantity of production, advancement of individual performance, and decrease in losses due to waste and accident.

Members and Guests of The Master Boiler

# Master Boiler Makers Hold Annual Convention

# Great Interest Shown in Committee Reports and Discussions and in Future Plans of Association

THIS year the Master Boiler Makers' Association held its fourteenth annual convention at the Hotel Tuller, Detroit, Mich., May 22-25. Although the attendance was slightly less than that of last year at Chicago, there

were almost six hundred members, guests, supply men and members of the Ladies' Auxiliary present. Almost two hundred and fifty members of the association registered and practically all of these kept in close attendance at every session of the convention up to the closing meeting. The interest in all proceedings of the association throughout the entire week was keen.

The convention came to order at 10:15 A. M. Tuesday, May 22, with President Thomas Lewis in the chair. After the opening invocation J. C. McCabe, general boiler inspector of the state of Michigan, acting for the mayor of Detroit, welcomed the association to the city. In part his address was as follows:

For the past fifteen years I have been actively engaged in boiler matters, as the state inspector of boilers for the state of Michigan, and also in the city of Detroit. While the inspection of boilers, in Detroit, has been conducted for the past forty-two years, my connection dates back to 1908, at which time I entered the office and found that there was really no standard for boilers.

I looked about and found that the state of Massachusetts had, a year or two prior, adopted a high standard for boiler construction, and so later, June first, 1910, it was adopted as a law for the city of Detroit. In 1917 a bill was passed, which was adopted by the state legislature, which provided for the use of the A.S.M.E. boiler code for all boilers constructed in Michigan. It happens that I am a member of the Board, and Chief Inspector of Boilers for the state of Michigan.

I have always had much admiration for the high technique of design and the materials used in locomotive boilers, particularly on some of the principal roads of the country. Of course, as in stationary practice, you find some obsolete boilers in use.

There is no question but that locomotive boilers are well

cared for and we have very few accidents. In fact, if an explosion or a failure occurs in a locomotive boiler in the use of a railroad, the users and the owners are much surprised.

The best possible materials are used, but at the same time it is unreasonable to expect that a boiler of such high pressure as locomotive boilers will not have a small percent of failures. They are to be expected, a very few of them.

President Lewis' address to the association followed:

#### PRESIDENT'S ADDRESS

The past year has been a year of constant strain. Never before have master boiler makers been in such demand by their employers, and from the outlook the future holds no relief. It has been said that the boiler on a locomotive must be maintained to not less than 99 percent efficiency, in order that the locomotive of the present day can be used to its full capacity. An inefficient boiler means an inefficient locomotive. Someone said some time ago that the boiler on a locomotive is not less than 97 percent of the efficiency of the entire locomotive. That being the case, then we as master boiler makers, and all foreman boiler makers, and all boiler inspectors must educate ourselves to the highest degree in our life's work to meet the demands that are placed upon us.

The foreman boiler maker of today, as a practical man, cannot be ignored. The emergency of the present day will not permit it, and it has been very strongly demonstrated during the past year. The boiler foremen on the railways of the United States during the year that has just passed, have done a work for their employers which can never be repaid in dollars and cents. And, judging by the outlook in the future, the master boiler makers' responsibilities have no limit.

The remainder of the opening session was taken up with the secretary's and the treasurer's reports. Membership at present is about 400 with almost 200 members delinquent in dues in addition. Questions on finance that were brought before the convention were referred to a later session of the convention for discussion.

Makers' 'Association at the Convention in Detroit

Secretary H. D. Vought brought up one other matter at this time. At the convention last year Dr. Koyl, engineer of water service of the Chicago, Milwaukee and St. Paul railroad, requested that a committee be appointed to investigate the experience of the members in the matter of corrosion and pitting of locomotive boilers. This committee compiled complete data on the subject taken from the records of practically all the more important roads in the country and submitted the report to Dr. Koyl. The subject is of great interest to the members of the association and the secretary advised the convention that a copy of the report is on file in the secretary's office.

(This report will be published in an early issue of THE BOILER MAKER.)

A. G. Pack, chief inspector, Bureau of Locomotive Inspection sent his regrets to the association because of his inability to attend the convention this year. An abstract of his communication to the secretary follows:

#### Abstract of A. G. Pack Letter to the Association

"It is with deep regret that I now find it impossible for me to attend the fourteenth annual convention of the Master Boiler Makers' Association and share with it the pleasure and profit which I feel sure will result from the exchange of ideas and the greetings of many friends and the new acquaintances which such conventions bring.

"I trust that the results of their labors will be handed down to future generations as a guide post in improved methods of construction and repair of one of the most important parts of the machinery which at the present time goes to make up great transportation systems of the world. Without the locomotive boiler strongly constructed and kept in good repair, the great arteries of transportation would become greatly congested, if not completely blocked.

"I believe that the railroads of this country can make no better expenditure of money than that of not only allowing, but compelling their master boiler makers to assemble annually for the purpose of exchanging ideas regarding their profession.

"Under our present system of transportation the steam locomotive is the most important factor in its successful operation and without a boiler properly constructed and maintained the locomotive becomes a menace to the great army of railroad employees and travelers thereon. On the other hand, when in good condition it becomes one of the most useful instrumentalities."

# Wednesday Morning

The meeting convened at 9:15 A. M. with President Thomas Lewis in the chair. At the opening of the Wednesday session applications of 30 new members were ratified unanimously by the convention.

Because of the absence of A. G. Pack, chief inspector,

Bureau of Locomotive Inspection, J. A. Shirley representing him read a paper on boiler failures. An abstract of this paper will appear in the July issue.

The subjects scheduled for discussion at this session of the convention were then introduced.

#### Hammer Testing Staybolts

THIS report embodies the substance of individual reports by the other committeemen as well as information gathered by the chairman from various railroads through the country.

In making hammer tests, size and weight should be left entirely with the inspector. Every inspector and boilermaker has a hobby of his own and wants a hammer just a little different from the other fellow's. For this reason, it should be left somewhat to the inspector, as it is his touch or sound that detects broken staybolts, and not the size or weight of testing hammer.

As to whether staybolts should be hammer tested or under hydrostatic pressure, the Laws, Rules, and Instructions for Inspection and Testing of Locomotive Boilers, promulgated by the Interstate Commerce Commission, must be complied with first.

We believe it practical to hammer test staybolts while the boiler is under hydrostatic or air pressure. However, this cannot be successfully done on monthly inspection in roundhouse, or when engine is undergoing classified repairs. We believe, and recommend that staybolts should be hammer tested while boiler is empty. In the roundhouse, we believe this should be done just as soon as the boiler is emptied of the hot water and while the firebox is somewhat expanded. In back shop, when engine is undergoing classified repairs, the staybolts should be hammer tested and inspected from interior of boiler, and all defective bolts renewed. When repairs to boiler are completed and hydrostatic pressure applied, all staybolts should be hammer tested again while boiler is under pressure.

Report prepared by a committee consisting of J. A. Holder, chairman; C. F. Petzinger and William G. Bower.

#### DISCUSSION

Charles P. Patrick, Meadville Machinery Company: I want to say that the committee's report on hammer testing of staybolts is common sense and logical. Each man has his hobby, in regard to hammer testing. He has his sense of touch and he should use it, but I rise to make a motion that this association, since we have had so many broken bolts in combustion chamber engines, those equipped with flexible bolts, particularly, that we go on record that we hammer test flexible staybolts each time we test the other staybolts.

W. J. Murphy, Pennsylvania System: Mr. President, I think that is the rule now on all railroads, that you test all staybolts when you go into the firebox, hitting all the bolts in the firebox.

H. J. Wandberg, Chicago, Milwaukee and St. Paul: On our railroad, we hammer test all staybolts, whether flexible or not, but we have the end of our flexible staybolts marked with red so that we can distinguish them from the rigid staybolts. I think most railroads are carrying out that practice of testing all staybolts.

A. W. Schelton: On the Frisco System we have no flexible staybolts marked and every bolt is hammer tested once a month—all of them. We are of the opinion that we find almost as many flexible staybolts broken as we do rigid staybolts in our monthly tests. We find those broken bolts by going over them with at least one hundred pounds of steam, and then we cool the engine and go over the rest of the bolts.

Charles P. Patrick, Meadville Machinery Company: I

Number Sixteen states: "Method of testing flexible staybolts having caps. All flexible staybolts having caps over the outer ends shall have the caps removed at least once every two years and also whenever the United States inspector or the railroad company's inspector considers the removal desirable in order to thoroughly inspect the staybolts. The firebox sheets should be examined carefully at least once a month to detect any bulging or indications of broken staybolts. Each time a hydrostatic test is applied, the hammer test required by rules 21 and 22 shall be made while the boiler is under hydrostatic pressure not less than the allowed working pressure and proper notation of such test made on Form Number Three."

In order to overcome any mistakes we instruct our men, where it says, "Firebox sheets should be examined carefully at least once a month to detect any bulging or indications of broken staybolts," to examine flexible as well as rigid staybolts, and they cannot examine sheets without testing each and every staybolt. They will detect bulging or any other flaws when they examine the sheets carefully, and we instruct them to test all staybolts.

Charles P. Patrick: It is not in the rule to hammer test staybolts.

E. W. Young: No, but to overcome the trouble in the

Thomas Lewis, Retiring President

want to make an explanation of my motion. Some railroads make tests on flexible bolts, but the law requires you to test those bolts only once a year under pressure, and so all are not tested. Now, in the company with which I am associated, we test our bolts every month. If an inspector knows that a combustion chamber is equipped with flexible staybolts and that he is not required to test them, he is liable not to do so each month, since the law requires taking off the caps every twenty-four months. We find broken flexible bolts under the hammer test. We find them broken every month. It is only a short time ago that we found four in one engine and four in another under the hammer test. Even if you do not do so usually, if you suspect the bolt is broken, from the hammer test, it will pay you to remove the cap.

L. E. Hart, Atlantic Coast Lines: We have a class of engines equipped with flexible staybolts in the combustion chamber, and we hammer test them and find lots of them broken. We hammer test all of the bolts, and whenever we have the expansion stays in front, we find some of them broken.

A. N. Lucas, Oxweld Railroad Service: Is it not a fact that the federal boiler law and rules requires us to test all bolts every month? According to the rule, the cap shall be removed every twenty-four months, but does it not say we should test the bolts every month?

E. W. Young, Chicago, Milwaukee and St. Paul: Rule

E. W. Young, President

Frank Gray, First Vice-President

sheet, we must examine the bolts, and there you have the rule. W. J. Murphy, Pennsylvania System: I have had some little experience in testing staybolts and here is what we have found in testing flexible staybolts. We have a medium sized hammer for testing the ordinary staybolts and about twice the size for testing flexible bolts. We have found that by using a larger hammer we get better results. The question came up as to whether you find flexible bolts broken or not, and I will tell you that you can find them by hammer testing them. Any good inspector will find broken flexible staybolts, but he will get better results with a larger hammer.

R. C. Young, Chicago and North Western: I would like to know if a flexible staybolt, when the boiler is not under pressure, is not in the same condition as other broken staybolts? It is loose, not bent nor separated, and there is not much success from testing flexible staybolts unless you have pressure on the boiler and tension on the bolts, because when there is no pressure in the boiler, it seems to me much the same as when a bolt is broken.

T. W. Lowe, Canadian Pacific: We find in the law, as agreed, that there is nothing in it which tells us that we cannot do something better than what the law suggests. Therefore, on the western line of the Canadian Pacific, where we use the flexible staybolts, in general, we find it very advisable to have water pressure to the extent of 140 pounds at every test, every thirty days' test—shop test or

A Few of the Convention "Notables" 1. The new president and his smile. 2. "Lew" Stewart. 3. W. J. Murphy. 4. "Doc" Bateman. 5. E. J. Reardon. 6. Major Lester. 7. A. S. Greene and John Campbell. 8. "Abe" Lucas, the M. B. M. movie star and his running mate. 9. "Andy". 10. "Dan" the other Lucas twin. 11. J. O. Crites of the "Ancient and Honorables," 12. P. J. Conrath. 13. Frank Gray. 14. Tom Lewis the latest addition to the "Past Presidents," 15. "Ed" Rogers. 16. "Charlie" Patrick. 17. J. F. Raps. 18. "Tom" Powers. 19. W. H. Laughridge, "The watch dog of the treasury." 20. "Uncle" George Riley. 21. "Harry" the "Pooh Bah" secretary. 22. H. J. Wandberg. 23. One of the Crowd. 24. "Jim" Kelly, 25 and 26. Just a few of the High Lights.

any other kind of test. This is done for the very reason, that you will not find broken flexible bolts otherwise. We have found, from our experience, in applying a test with 140 pound pressure, that you find a greater number of broken staybolts than you ever expected to find.

Mr. Wallough (Omaha): I believe in this discussion, here today, you will find that the hammer testing of staybolts is very nearly a lost art. We do not have the old-timers on the job that we used to have and you find very few inspectors get on the job and find the flexible, or any other kind of staybolts, that are broken with the hammer test. When a man follows them up, he finds some more. I have done that, myself. I think when it comes down to broken staybolts, flexible staybolts in particular, that we ought to get together and find some other method so that we can determine whether they are broken or not. I understand there is such a move on, now.

H. V. Stevens, Atchison, Topeka and Santa Fe: I would like to ask the convention if they want to go on record to remove the brick furnaces on oil burning engines? There are screw bolts and there are detector holes throughout the bolt, and does this include the matter of hammer testing them every thirty days? time we have had a few broken staybolts; and everything that can happen in a combustion chamber, can happen anywhere else, where a combustion chamber boiler is in use. I would like to know what others are doing to get away from this trouble, because I cannot do it. The broken staybolts, both flexible and rigid in the combustion chamber engines cause trouble. I know it is due to the construction of the crown sheet being almost flat with the radial stayed wagon top. If there are any Pennsylvania men here, who have had experience with combustion chamber engines in this connection, I would like to hear them tell us about it. I imagine with Belpaire boilers they are not having the trouble as with the radial stayed boilers.

H. J. Wandberg, Chicago, Milwaukee and St. Paul: We have a number of combustion chamber boilers but we have none that Mr. Raps refers to, that is Belpaire boilers. As far as maintaining combustion chamber boilers, I find they are no particular trouble, with the exception of the short combustion chamber boilers. We have a number of broken bolts at the bottom, but as far as any other part of the boiler is concerned, or the firebox, we have no bad results at all. We get best results with 36-inch combustion chamber.

L. M. Stewart, Atlantic Coast Lines: We have a lot of

T. F. Powers, Second Vice- J. F. President

J. F. Raps, Third Vice-President

W. J. Murphy, Fourth Vice-President

T. F. Powers, Chicago and North Western: I think that is specifically covered in a rule handed down by the Department of Locomotive Inspection. As I remember it, it says when bolts are applied back of the brickwork, having a hole all the way through, they do not have to be hammer tested.

H. V. Stevens: Was not the motion that all screw bolts be hammer tested?

Chairman Lewis: I think this gentleman is justified in this question. Mr. Patrick includes every staybolt in the firebox, and I think that is well taken. We have a number of those bolts, as you suggest, Mr. Stevens, and if we had to hammer test them all, we would have to take out the grates. I think we should change the motion.

Charles P. Patrick: I will change my motion, Mr. President, and make it that we treat all flexible bolts just as we treat rigid bolts.

A rising vote on this motion resulted in its passage.

## Are the New Combustion Chamber Boilers as Easy to Maintain as the Straight Firebox?

This report was prepared by a committee consisting of H. J. Raps, chairman; Emil Ziegenbein and F. J. Howe, and will appear in full in the July issue of THE BOILER MAKER.

#### DISCUSSION

John F. Raps, Illinois Central: We have some government standard locomotives received two years ago and since that trouble with combustion chamber engines, with inside flue sheets cracking. We did not have fire cracking from the rivet, but we certainly do have trouble with cracked knuckles inside the flue sheet. Not only that, but we have a great deal of trouble with broken staybolts in the combustion chamber, regardless of whether they are flexible or rigid type.

John Harthill, New York Central: We have combustion chamber engines on our road. With our large engines we have twenty foot flues and combustion chamber of forty-two inches, and we have more trouble with that class of engines than any others that I know. Our trouble is in the flue sheet, cracked arch tubes, broken staybolts, and so on. In our large Mallets, when they came in for inspection, they always had from thirty to forty rigid bolts broken, even when we had made careful inspection and installation of them. Now, we find flexible bolts broken on the right and left side, the first seven in the flue sheet and fourteenth to eighteenth row from the bottom. That is where we find the broken flexible boltsthat is, on the large combustion chamber engines. On the smaller ones, with shorter flues, we find broken staybolts on the bottom of the chamber. Our flues crack top and bottom on these combustion chamber engines and it seems the flue sheets are leaking continually.

W. H. Laughridge, Hocking Valley: We have the combustion chamber engines and we have them from twentyfour inches to seventy-two inches. The majority are seventytwo, with twenty-four foot flues. We have quite a number

of engines that the sheets are welded in and we have no trouble at all with them. The seam in the combustion chamber is at the bottom and if it is welded, you never have any trouble. We have found a few broken bolts in the first row, next to the flue sheet, when in service three years; some of them five. We renew the flue sheets every few years.

So far as the maintenance is concerned, after you get the sheets welded in, I do not think they are any harder to maintain than a straight sheet. I do not think it would be practical, with a class of engines that we have, to increase your flues six feet, but you have to have a boiler to suit that engine and the only remedy, then, is your combustion chamber and the advantage of the combustion chamber is your increased crown sheet heating surface. So far as trouble with broken staybolts is concerned, we have had very little of it.

T. W. Lowe: I would like to state a few words, in connection with this subject, along the lines of design. Shortly before leaving Winnipeg, I had the opportunity of seeing a blueprint which, at first sight, I took very grave objection to, but after some thought I began to lean toward the suggested design shown on this print. This refers to the belly stays, which according to the design of combustion chamber engines which you have in universal use in the United States and in Canada, those belly stays are secured from the flue sheet to the shell of the boiler, whereas on this suggested print, that I saw, these belly stays are secured to the shell of the combustion chamber. It strikes me, forcibly, gentlemen, that that is the proper place for them. You want your flue sheet to move with your combustion chamber and if it does not move with your combustion chamber, it is not a free working portion of the boiler, as it should be. It is liable to all the defects, which we find in that lower combustion chamber.

Now, just how you would secure them, is uncertain as yet, but I believe by placing them around the bottom of the shell of that combustion chamber, that you leave a more free passage for the bottom shell of the boiler in the firebox.

A. N. Lucas: I was with the Milwaukee Railroad for years and I believe this subject has been thrashed out previously on the floor of this convention, especially in regard to the braces from the bottom of the shell to the inside

flue sheet. I had it up with our people at the time, that the braces in the combustion chamber boiler, such as we had, were of no benefit and should not be there. There is a tension strain different from the expansion of the shell and firebox, and after I left the service of the Milwaukee Road, the mechanical engineer, and others, gave orders that these braces be removed. I found that in applying the combustion chamber boilers, that there was a difference in the roll of the inside flue sheet. On our combustion boilers we found a very large roll on the flue, a good radius, and for that reason we did not need those braces. In looking over the design for many other railroads, we found they had a flat surface, there, and called for braces, but with our design it was not necessary, and so the majority of the combustion chamber boilers on the Milwaukee Railroad were running without braces. I notice in getting around the country, as I do, that they do have trouble with broken bolts, leaky seams and keeping up short combustion chamber, but the best results are obtained from thirty-seven-inch combustion chamber. Furthermore, many of these railroads do not watch them properly. They watch the bottom of the shell, but do not know whether there is congestion of mud between the com-

the arch tube was applied. The cracking of the flues comes at the bottom, one on each side, and we have no trouble otherwise, except the pitting of crown sheet over the top of the combustion chamber. We feel we have had good success with the combustion chamber engines.

C. A. Seley, American Flexible Bolt Company: As a designer, I would like to put in a plea for consideration of the combustion chamber. If you are going to make boilers just for the boiler makers, then your straight sheet would be the thing, but you are making them for the engine, and it has a wheel arrangement and that calls for a certain length of boiler. If you can save that length of flue in the combustion chamber, which has a value six to one, practically, in evaporative effect to each foot of flue surface that runs over eighteen feet, I think the point is worth consideration. In regard to breaking staybolts, and every other staybolt in the boiler has practically one flat surface on which to relieve a certain amount of staybolt stress, the combustion chamber is tying two circular sheets together and that construction makes it just as rigid as your outside sheet, however thick it may be. Consequently the lateral movement, and fore and aft movement of the chamber in relation to the shell, sets up

L. M. Stewart, Fifth Vice-President W. H. Laughridge, Treasurer

H. D. Vought, Secretary E. J. Reardon, Chairman, Executive Committee

an angular movement on those bolts. Now those bolts get as much movement as those below, but they are long and can absorb movement, and then, it is a much less degree of angular movement, though it measures the same in extent that you get below, being six inches or less.

## Wednesday Afternoon

The afternoon session opened at 2 P. M. with President Lewis in the chair.

Frank McManamy of the Interstate Commerce Commission, who was to have addressed the convention, sent his regrets as official duties in Washington prevented his attending the meetings.

### Inspection of Boiler and Firebox Plates

IN the opinion of the committee the subject is one which should be handled by the American Society for Testing Materials. However, the suggestion offered relative to rejected plates is a good one and we submit the report with the recommendation that after it has been discussed and passed upon in convention, it be turned over to the American Society for Testing Materials and that they pass upon it.

All boiler and firebox plates must be of shape and size ordered, sound and free from cracks, surface flaws and lam-

bustion chamber and the shell, and that is the trouble many times, I believe. I think they should be washed from the

front end, and a thorough inspection made to see that it is kept clean. I believe we should have at least six inches of water space down there so if they are getting less, you can tell it, and that will overcome some of the breaking of your staybolts.

E. W. Young: I am very much surprised to hear that they have been having so much trouble with combustion chamber engines, because we feel the advantage of the combustion chamber engine is much greater than the disadvantage. We eliminated the belly braces also, and where the flue sheet was cracking, we put in flexible bolts around the bottom, and also increased the thickness of the flue sheet and we have gotten away from nearly all of that trouble. They are giving us so much better service than any other engines that we do not want to do without them. We have had some in service for over twelve years and never had a firebox removed.

Mr. Foley, C. B. & Q.: We have several combustion chamber locomotives on our line, especially lines West. In fact, we have some that have been in service for seven years and we do not have trouble with them. We did have, in regard to our staybolts breaking, when we were using rigid staybolts, but since applying the flexible bolts, we have no trouble. We had a little trouble with cracking in the flue sheet in the combustion chamber engines, but that was before

inations. The thickness of each plate shall not vary under the gage specified, more than 0.01 inch. Any plate showing injurious defects such as seams, pits, scale laminations, cracks at the sheared edges, or other serious defects, or which develop defects in working, will be rejected. No hammer dressing, patching, burning or autogenous welding to correct rejected plates shall be allowed.

Boiler plates showing indentations of five percent of thickness and firebox plates showing indentation of three percent of thickness will be rejected. No autogenous welding shall be allowed to rebuild these to the required thickness.

This report was prepared by a committee consisting of Charles P. Patrick, chairman; C. H. Browning and John J. Orr.

# What Are the Best Methods of Detecting Defective Boiler Sheets in the Shop Before Going to the Laying-Out Bench and Put Into Service?

UR method of inspection of firebox steel in our shops before going to the layout bench is as follows:

Surface Inspection: In making the surface inspection, a close examination is made of both sides of the plates and all edges, and the plates are rejected when the following defects are found to be present:

Blister	Dished	Crop ends
Pitted	Piped	Knifed
Slivers	Scored	Snakes
Seams	Imbedded scale	If any grinding has been
Burnt	Cambered	done
Bricked	Laminated	Cracked
Scabby	Roll marked	Wrong dimensions
Cinder spots	Bad edges, caused	
Split	by shearing	Not bearing proper
opine	ey encuring	stamping required, i. e.,
		heat numbers, serial
		numbers, manufac-
		turer's name or initial
		tarers name or mittar

Material inspectors in inspecting firebox and boiler sheets follow the following procedure, making their tests as listed:

Bend Test: In the case of boiler steel, a test specimen for bend test is cut traverse to the length of the sheet as rolled, at the top of the sheet. This test specimen is then bent cold 180 degrees, for material one inch and under, around a mandrel having the same diameter as the thickness of the specimen, and for material one inch and over, around a mandrel having a diameter twice the thickness of the specimen.

In the case of firebox steel, a bend test specimen is cut from each sheet as ordered. The sheet as rolled is cut into the dimensions of the individual firebox sheets ordered, this test specimen being cut longitudinally. Before and after quenching, it must bend cold 180 degrees flat without fracture at the bent portion. The quenching is done at a bright cherry red, in water at 80 degrees to 90 degrees. In the case of firebox steel, in addition to the bends before and after quenching, a nick bend is made on each firebox sheet from one end of the tensile specimen, and this nick bend test must not show laminations exceeding  $\frac{1}{4}$  inch in length, seams, cavities of foreign interposed matter, such as cinder, slag, etc.

Tensile Test, Boiler Steel: One test piece cut longitudinally from each sheet as rolled is pulled in the testing machine and the following determined:

> Tensile Strength Yield Point Elongation in 8 inches

In making the tensile tests, a check on the gage of the material is made, and also the fracture and edges examined for any defects, such as laminations, etc. To determine that all plates are represented by the test piece, where more than one plate is sheared from a single slab or ingot, each plate is match-marked so that all plates sheared from a single slab or ingot can be identified with the test pieces identifying them.

Firebox Steel: A tensile test specimen cut longitudinally from each sheet as ordered is pulled and the following determined from the test:

> Tensile Strength Yield Point Reduction of Area Elongation in 8 inches

In making the tensile tests, a check on the gage of the material is made, and also the fracture and edges examined for any defects, such as laminations, etc.

Chemical Analysis: Drillings are taken from the tensile specimens and submitted to the laboratory for chemical analysis to determine the following:

> Carbon Manganese Phosphorus Sulphur Copper, when specified

Gage: All the plates are checked for gage and our specification states that the thickness of the plates shall not vary more than .01 inch under that ordered, the full dimension being controlled by the weights as specified.

Weight: The plates are weighed and all plates having the same width and thickness must conform to the permissible variation in weights as outlined in specification.

This paper was prepared by a committee consisting of John J. Keogh, chairman; John P. Powers and J. C. Keefe.

### DISCUSSION

J. F. Raps, Illinois Central: When a plate is on the bench, there may be a gas pocket found that will not be apparent unless they shear through it. We often place a sheet over the forge and heat it in order to expand the gas to determine whether or not a gas pocket is in it. That, I believe, was the intention of this paper and not go into the inspection in the mill, but the inspection and testing of the plate after it is turned over to the shop.

J. A. Anderson, Industrial Works: The only system we use, in inspecting boiler plates when they come to the laying out bench, is to give them a thorough inspection with the eye, on both sides, to see that there are no visible defects. If there is any suggestion that there might be something wrong, we put the plate under a magnifying glass and that will detect any small flaw. The plate is laid out and rolled and after it is rolled, that is the time to find the defects. After it is rolled, we find, sometimes, a small piece will roll out, showing that scale was present. Sometimes we find laminations after rolling. We scarcely ever find any defects before the plate is punched and rolled.

President Lewis: We have found occasionally that after sheets have arrived at the plant, notwithstanding the tests made at the mills, where the sheets have been defective, laminations and blisters in the inspection in the shop, and often by the man who is laying out the work.

John F. Raps: A great many times, in shearing a plate, we run into laminations or we find defects by rolling the plate. Sometimes we find a gas pocket. Again we have put in the sheets and found when they were in service a few weeks, that there was bulging on the sides of the sheet, and then it cracks an eighth of an inch, and there would be a gas pocket or lamination. You may find it necessary to chip it off with the hammer in order to show it up. Now, the intention of these topics is to find out if any member, here, is following out any system of inspection of these plates, or doing anything before applying them to the boiler, to determine whether there are laminations or gaspockets in them. We all give them visual inspection on the layout bench, but sometimes these things happen after they have been applied. If any one is following out some other system than has been mentioned, such as putting plates over fire and heating them in order to bring out the gas blisters, or any other method of inspection, let us hear about it.

Edward Hunt, Illinois Central: In making center punch marks on the layout bench you will often run into a blister. Sound the plate with a hammer to see the surface defects. Watch the laminations around the edge of plate and take a general view of it. Follow up the plate when it is sheared. Sometimes, you find laminations away from the original edge, after you have cut through it. Close observation is important, watching your surface and the thickness. Sometimes by cutting you can see defects.

### The Use of Automatic Stokers in Locomotives

THIS report was prepared by a committee consisting of H. A. Bell, chairman; C. A. Nicholson, and C. J. Baumann. The complete report will appear in the July issue of the magazine.

### DISCUSSION

John Harthill, New York Central: We are applying mechanical stokers on our road, now, and we have not had a great deal of experience, but I would like to find out whether members have more leaky staybolts with mechanical stokers than with hand fired locomotives.

T. W. Lowe: We have a stoker fired engine on the Canadian Pacific and we operate in the same district, with the same water, as hand fired engines of the same type and get the same service. These engines are three years old, of the combustion chamber firebox design of fireboxes.

Mr. Kessel, Burlington: We have about one hundred locomotives that have been in operation eight to ten years, with stokers. The side sheets have not been renewed, nor have the fireboxes been renewed in that period of time.

W. H. Laughridge, Hocking Valley: We have been using stokers for ten years and we usually renew the side sheets in three years. We have eleven engines that have been using a stoker for ten years and we are just now renewing the side sheets. On the larger power, we have three different types of stokers, and I see no difference between the stoker fired engine, in regard to staybolt leakage or other firebox leakage. We have considerable staybolt leakage, naturally, because we have very bad water, but if there is any favor at all, it would be in favor of the stoker fired engine.

D. A. Lucas: My experience is that the stoker is a benefit to the firebox when no cold air is admitted. We know that cold air is a detriment to the firebox, when the fire door has to be opened and shut whenever coal is put into it. The stoker is a big benefit. The firebox is bigger, the engine is bigger, and it is pulling more tonnage.

J. F. Shea, Missouri Pacific: We have stoker fired engines on our railroad that have caused us a great deal of trouble. In fact, we renewed the side sheets one year and a half after the engine was built, and there were leaking staybolts then. We have other engines that are two years old that we are not having any trouble with, so it may be a good deal in the steel that is put into the firebox.

H. J. Wandberg, Chicago, Milwaukee and St. Paul: We have a number of stoker-fired engines and we have not experienced the trouble the gentlemen have been speaking about. We do not find any difference, so far as maintaining the firebox or side sheets are concerned.

W. J. Murphy, Pennsylvania System: We have some stoker-fired engines on the Pennsylvania. I believe the stokerfired engine is preferable. We do not have any more trouble with a stoker-fired engine than we do with a hand-fired engine, and I really do not see any difference between them. We have never had any trouble with the side sheets cracking, as some of you have said, and I move that this discussion be closed.

After the completion of the discussion the subject of association finance was introduced and discussed quite exhaustively at this and later sessions of the convention. As has been the experience of all associations, expenses of maintenance, printing of proceedings and reports, convention expenses and the like have increased far more rapidly than membership and income. In the case of the Master Boiler Makers' Association, the same remedy was necessary as in other associations. After careful consideration the Executive Board recommended to the convention that the annual dues be raised, to go into effect April 1, 1924. The subject was carried through two sessions of the convention and annual dues were finally fixed at \$5, while the initiation fee remains the same as before—\$3.

## Thursday Morning

The meeting convened at 9:15 A. M., President Lewis presiding.

# What Is the Standard Method of Applying Flues in Locomotive Boilers?

THIS report which was prepared by a committee, consisting of A. F. Stiglmeier, chairman, E. C. Umlauf and James F. Walsh will appear in full in the July issue of THE BOILER MAKER.

### DISCUSSION

D. A. Lucas: In putting in flues, I am not in favor of the narrow shim at all. At one time we used the shim an eighth of an inch wider than the sheet, but when you prosser, the ferrule sticks up and forms a mud pocket between the flue and sheet. In the bad water districts, some time ago, it was impossible to keep the flues tight. We were using a narrow shim and the idea struck me to use the wide shim. We put in a set of flues in the same engine, where we were having trouble with the narrow shims, with ferrules wide enough so that when you expanded your flues you expanded them into the shims. The copper formed a shoulder right over the prosser shoulder, in the flue. In performance this was ninety percent better than with the narrow shim.

C. E. Elkins, Pennsylvania: I am very much in favor of the wide ferrule myself. One time the mechanical superintendent of machinery, on our road, advocated the use of the flue copper the same width as the thickness of the flue sheet, and we had all kinds of trouble with our flues. So now we use the ferrules one-quarter of an inch wider than the sheet, and we also use very heavy flue material.

R. A. Creger, Missouri Pacific: On new back flue sheets, . we drill holes one-sixteenth of an inch smaller than the size of the flue. On copper ferrules, we use number eighteen Birmingham wire gage on the new flue sheets and on the old flue sheets we use number fifteen. We have very little flue trouble and as far as the copper ferrules are concerned, we use thirteen-sixteenths on all sheets.

A. F. Stiglmeier, Baltimore and Ohio: I would like to ask some members if they have any trouble with the flue cracking, tightening them with the straight sectional expander.

President Lewis: Do you mean, Mr. Stiglmeier, when applying them?

A. F. Stiglmeier, Baltimore and Ohio: No, lots of roads are applying them without using the roller, tightening them with the straight sectional expander. I made a test and found it cracked the flue. I did not detect it until after it was in the boiler for a short time. They seem to crack in the boiler. Lots of them are putting it to the electric welding. I believe the cracking is due to using the sectional expander,

when applying the flues. Seventy-five percent of the railroads, from whom we have answers, are applying them with the sectional expander, getting away from the roller expander, and I believe that is what is cracking our flues.

F. L. Biklen, C. B. & Q .: I want to say that the C. B. & Q. has done away with the rolling in the back end since 1904. With copper ferrules we use a standard, now, that is one inch wide and that has been our practice since 1904, and we have found it very satisfactory.

W. Wallough, Omaha: I have used the sectional expander for the last few years and never split the steel flues that I remember. We have split iron flues. You cannot back them out of the sheet and you do not need to roll them when you get through.

C. F. Young, Chicago and North Western: There is one feature about this, where the holes are oblong, after the holes are reamed out, the diameter of the holes increases to the same size as the ferrule. That is, practically, reducing the gage of the flue. I think if the holes are larger in diameter, that the thickness of the ferrules should be increased to maintain the flue to its original gage.

D. A. Lucas: We use copper ferrules a half an inch wider than the flue sheet and the thickness through the water side is another half inch, then when you expand it, you do not crack it. In actual experience, we found with the wide copper ferrule you eliminate what we call "simmer" and at no time do you have a flue spurt, as you will with the narrow shim. When cold air hits it, with the narrow ferrule, it cracks and you have flue leakage, and with the wide copper ferrule, when cold air hits it, it contracts, shortens it and pulls it up to the joint made by the prosser expander and eliminates the simmer and helps your flue in several ways. By actual experience, I have found we decrease the failures and increase the mileage on our flues in many cases (without exaggerating), over sixty percent.

T. W. Lowe, Canadian Pacific: Our practice, on the Canadian Pacific, is that our coppers are cut the width of the tube sheets, and they are pushed into the sheets onesixteenth short of the fire side of the sheet, allowing them to project one-sixteenth into the water. The purpose of allowing them to stand into the water, is that when we are driving in our flues, it prevents the copper from moving toward the fire. Therefore, when our tube is set, we are positive that the ferrule, which is hidden from view after setting, is not going to be exposed to the action of the gases and create a deterioration around your tube sheet hole. I notice, in the paper, that there is no reference made to the angularity of the rollers, as set in the body of the tube expander. This is one of the most important features of application, and furthermore, it is more important still when it comes to maintenance. This is true for the very reason that if you use a roller expander, set with a different angle, for maintenance, after you have applied your flues you are certainly going to shorten the life of your tube because the metal has been rolled from a certain position in the sheet and you oppose that and crumble the metal, and it is certainly very disastrous to the tube. In putting in flues, it is an advantage to roll them first. That is shop practice, but when we come to the roundhouse, one of our men, who had been studying application and maintenance, to overcome the difficulties that we were encountering, in the roundhouse, conceived the idea that he could get up a tool that would perform dual duties. These duties were that he could stretch the tube in the same operation as the beading of the tube, and he developed a tool which we have in use, today, in our roundhouses, performing these two functions.

H. J. Wandberg: Our practice on the Chicago, Mil-waukee and St. Paul is that we clean holes, ream them or fill them as the case may be, and get them as near one size as possible, and apply our copper shims. The flue is cleaned off, the scale is taken off and it is made a driving fit and is driven in through the sheet, the proper length, and then turned over. We do not use any expander except the expander that we finish the flue with. We do not roll our flues in the firebox end. The roller is used for the front end, but not for the firebox end. We test all of our flues first. The reason for doing this is not to depend on the beading tool to make a flue tight. The expander must do that work. We have found, through experience, that lots of tubes are only half expanded, and then the beading tool made them tight, but it failed to do a good job. We have found that testing the boiler, before allowing the flue to be beaded, works out very well. We use a copper ferrule onesixteenth of an inch wider than the thickness of our sheets. We have two thicknesses, 1/2 inch and 5/8 inch.

J. A. Anderson, Industrial Works: Fifty years ago I went into a boiler shop. That was before we, in that place, had ever seen a roller expander. The tubes were iron. The ordinary prosser expander has not been improved upon to any great extent, however, in that time. At that time, we had no trouble with flues, when we used the prosser expander. They were expanded with the prosser and beader. However, coming up to recent time, we made an experiment, recently, in the shop, by testing out the boiler before the flues were beaded. We had a special order from a railroad, who required that the flues should be welded at both ends. This was a boiler of sixty-five inches in diameter, and so they were applied, as the rule states here, by having the hole through, the edges sheared, and the copper ferrule a quarter of an inch wider and one-sixteenth of an inch back from the face of the sheet, and fastened by the expander. Then the flues were rolled and cleared about forty-five degrees, and then sand blasted and tested for beading, and we found scarcely and trouble with any flue, and, if there was, it was then beaded and welded and was a very satisfactory job.

President Lewis: Some men are using copper ferrules onequarter of an inch wider than the sheet. Others are using copper ferrules one-eighth of an inch wider than the sheet, and one member said he was using copper ferrules almost flush, or a little narrower than the sheet. Now, which is better? We are using copper ferrules one-eighth of an inch wider than the flue sheet. If a quarter of an inch is better and gives better service under conditions where the flue service is so very severe and requires attention almost every trip, or once every month under some conditions, I would like to know about it.

D. A. Lucas: To get the best results, the flue has to be long enough so that it covers your sheet. If your flue is going to give you better service in bad water conditions, it surely is going to give you better service in good water conditions. Now, when our road extended up into the West, and went through the worst water conditions-alkali water -and you would take an engine out of the shops with a set of flues set in copper 5% inch wide, at that time, and send the engine up to that division, and from three to five months the engine had to come back to the shops on account of flues. The first set of flues put in with wide copper were made from a copper pipe. We could not buy wide copper at that time. We got a set of copper ferrules and put them in an inch wide, or a little better. There was not a lot of care taken in the cutting of their length. A set of flues were applied to that same engine, wide enough so that the expansion was made right in the copper, and that same engine went back to that division and stayed sixteen months without having the flues removed, or having any flue trouble. Now, if those conditions are better served with a wider flue, that ought to be enough to induce a man to use them, and to believe that there is something in the wide shim.

Charles P. Patrick: How do you swage your flues?

D. A. Lucas: They are swaged with gradual taper and all swaged when you use wide shim, and swaged far enough back so that you have a gradual taper and then they stick tight—not an abrupt taper.

Charles P. Patrick: I want to know what kind of swage you use, the gradual?

D. A. Lucas: Gradual, yes, and turned two or three times to get it perfectly round, and, when you swage with that, it thickens the flue and maintains the full thickness of the flue, or a little better, all over. Our method was to prepare the flue sheets, clean out holes and in all cases see that there was a bevel on both sides of the flue sheet, to do away with the Then the flue sheet was applied, and rolled sharp edges. in lightly. Then the flue was driven in and then prossered with the sectional expander that had a taper on the outside that set the bead back to 30 degrees, ready for calking. It did away with that practice of turning the bead over. When you turn the bead over-lots of shops have a turning hammer -you hit the flue right in the neck, where you want the full thickness and, if you put in some flues and cut them, you will find your flue is reduced in the heel of the bead, where you want your strength.

Now, with this method that we use—and I have put in many flues and cut them, and then went into detail to find out the results—when the flue is expanded with this sectional expander, having a flare on the back to throw out flue (no hammer to throw it over), and the proper bead put on, you cut that flue open and you will find out that your bead is thicker right in the heel than in any other part of the flue.

President Lewis: I would like to know those who are using copper one-eighth of an inch wider than the sheet, and those who are using copper one-quarter of an inch wider than the sheet.

Mr. Glenway (Northern Pacific): Our copper extends three-sixteenths of an inch wider than the sheet.

W. H. Laughridge: I would state that we use oneeighth of an inch and get good results.

H. J. Wandberg: I may say that we use one-sixteenth of an inch, and have good results.

Mr. Howe (Burlington): We use one-half inch.

Mr. Mitchell: We use our coppers one-quarter of an inchwider than the sheet and our results are very satisfactory.

P. J. Conrath, National Tube Company: I would like to say that I have used the copper material wider than the flue sheet-one-half inch wider-for twenty-five years. The advantages claimed for the long copper come under two heads. First, you make an easier joint with the prosser on your expander in the shouldering of your flue sheet. Secondly, the closer the copper, if long enough around the back of the flue, the more prevention against sediment getting in between copper and the flue. That is the idea and that is the claim for the longer copper. Now, when your copper is made only one-eighth of an inch longer, it does no good. You simply create a mud pocket because it stands out of your copper only one-sixteenth of an inch and you catch it with the prosser of your expander and almost break the expander to set your flue. That is about all there is to these coppers being longer. Another thing about the setting of flues. I have set quite a few in my time. I have heard no one say where they begin to set flues and where end. That should be taken into consideration. Try to work the flues from the right to the left and you will find you have all the holes oblong. As soon as there is strain, and it gets hot, away goes the hole. Start a set of flues in a diamond in the center of the sheet. That is my method, but it might be a circle. Then work the flues all around so as to allow a place for your expansion in this pocket in the center. The sheet is flexible and will go wherever the expansion will drive it, which is not the case otherwise. If you work the flues all around into this pocket in the center, you keep this undue strain away from the flange.

A. N. Lucas: I believe a sixteenth wider than the sheet is the most satisfactory. We are using a light shim and it is all right. I believe you can use a shim, an expander in putting it in, and have it so that they will set the copper at least a thirty-second inch inside of the sheet, so that when the flue expands it will come out flush with the sheet, and there is no copper between the bead and sheet.

A. F. Stiglmeier: I would like to tell you that the majority of the railroads from whom I have information, are using ferrules 1/8 inch wider than the sheet. We have taken the majority on all points on which we secured information, and placed it into the report.

A. N. Lucas: I believe the flue subject is one of the best subjects that we have. The roundhouse should know how to take care of flues after being put in, in the proper manner, taking care of them in the right way.

P. J. Conrath: If the copper is only one-eighth of an inch wider than the sheet you turn them over, always. Otherwise you are going to have one long and one short, on account of rolling and the different ways of putting them in. The sheet of copper only one-eighth of an inch longer should be turned over against the sheet.

# The Life of the Superheater Tube and the Number of Safe Ends That Should Be Applied Before Cutting Down for a Smaller Engine

T is the consensus of opinion of your committee: That great care should be exercised so that as nearly as possible there will be only one weld on each flue. This can be accomplished by applying a five-inch safe end for weld No. 1;  $6\frac{1}{2}$ -inch for No. 2;  $7\frac{1}{2}$ -inch for No. 3; and  $8\frac{1}{2}$ -inch for No. 4, thus cutting off each old weld before applying the new safe end. Welds on the front or large part of the flue are not desirable on account of applying units, etc.

We find it is the practice of some roads to weld on the large end after applying the limit of welds on the small end, while the practice of other roads is to apply only one weld before cutting down for a smaller boiler. This would seem to us a very expensive proposition if the locomotives are equipped with superheater tubes of the same length or nearly so.

We are also of the opinion that a safer weld can be obtained on a superheater tube than on a  $2\frac{1}{2}$  and  $2\frac{1}{4}$  tube owing to the difference in the thickness of the metals.

This report was prepared by a committee consisting of J. P. Malley, chairman; H. Howard and Daniel S. Rice.

### DISCUSSION

H. Howard, Illinois Central: We will all admit that we cannot determine the life of a flue, definitely, on account of the water. If we have good water, they will last a number of years, and, if there is bad water, the life is very short.

Andrew S. Green, Big Four: I do not believe you can put a 5-inch end on there, and the next time put a  $6\frac{1}{2}$ -inch end, or your tube will be too short for the boiler. If you cut the ragged end off, it will be too short. You have to have more than 1 inch, there. I do not think that will work at all. If you put a 5-inch end on there, as you say, and next weld with  $6\frac{1}{2}$ , you must have more metal or the tube grows too short for the boiler. You will have to have 7 inches on there.

A. N. Lucas: I believe that the best method of safe-ending is, after the tubes have made their first run, without any beads, to apply a 5 or  $5\frac{1}{2}$ -inch piece at the first safe-end, and when it has made the mileage and comes in, you cut the tube again for welding. That is an extra operation that you can do in the fraction of a minute, and then put the next safe-ends on the opposite end and you still have left, when you cut the tube, enough to go into the boiler—about 4 inches of the first safe-end, and that will give you a good safe-end into the front end and avoid any cracking of the tube. The next time the tubes are taken out, having made the mileage, you cut the tubes to the length for welding and cut off the original weld and put on a piece and it again goes into service with only three welds. On every third operation, you lose a weld. We run for ten or twelve years with only two welds, most of the time, on a tube.

H. J. Wandberg: This report deals with the life of the superheater tube. Now the life of the tube depends somewhat on the number of pieces, and how we apply them. What I would like to know about all this is what the scrapping weight of the superheater tube is?

T. F. Powers: I want to disagree with the report to the extent that I do not believe it is possible, as Mr. Green says, to safe-end superheater tubes or any other kind of tubes, with only a waste of one inch and a half from one safe-end to another. As I understand this report, the first weld is to have seven and one-half, or one inch waste. Our experience has been that to properly safe-end, and even with the most rigid economy, you have to figure on a waste of at least three and one-half inches for each time the safe-end is applied. That is, if you adopt, to start with, the five-inch safe-end. The second safe-end, including the waste of the front end, in cutting off any waste necessary to cut back of the old weld, must be three and one-half inches, and, if it is only five inches to start with, that makes eight and one-half inches. I do not believe it is possible to have a variation of only one inch between the safe-ends.

T. W. Lowe, Canadian Pacific: We still continue to weld our safe-ends at the smoke box end, and I want to repeat that again, today, where we have the possibility of having a tube that will not carry a safe-end at all.

We do not have any trouble with reference to getting the superheater units to pass by the welds when we do weld on the smoke box end, and by welding on the smoke box end, we continue our standard of swaging at the back end, which is very helpful toward providing sufficient water space next to the back flue sheet.

# Steam Leaks and Their Effect on Boiler Plates

THE committee after going into details and close observation find that steam leaks cause very bad defects to boiler plates and should be given attention at once and not allowed to leak. We find that when a leak is not cared for and allowed to continue leaking, it will waste away the sheet adjoining the leak, causing a weak and unsafe condition and in time will cut a hole through the sheet. We have found when a leak had not received attention at the top of the flue sheet it had cut the sheet away to such an extent as to cause a serious defect and, in some cases, where it had cut the rivet head off and blown a hole in the sheet. Under no condition should a leak be neglected to that extent, but should be given the proper attention at first appearance or starting of the leak.

It is the firm belief of the committee that a steam leak in the boiler should be given immediate attention and proper repairs made and at no time should a leak under the jacket or around the steam dome be allowed to go after it is discovered. There is no way to tell how serious the cause of the leak may be until the jacket or covering has been removed and the cause of the leak found. A leak under the jacket often has been found to be very serious and liable to cause loss of life if neglected for one day. Often a crack develops in the shell sheets along the seams and the first signs of a leak is a warning, and the committee again recommend that all steam leaks in or around the steam boiler be given first and immediate attention.

This report was prepared by a committee consisting of D. A. Lucas, chairman; D. A. Stark, and C. C. Dean.

The remainder of this session was devoted to committee

next time the tubes are taken out, having made the mileage, reports on law, the president's address, memorials, miscelyou cut the tubes to the length for welding and cut off the laneous details of the convention and the election of officers.

### OFFICERS OF THE ASSOCIATION FOR THE COMING YEAR

President, E. W. Young, mechanical assistant to the general superintendent motive power, C. M. & St. P., Dubuque, Iowa; first vice-president, Frank Gray, tank foreman, C. & A., Bloomington, Ill.; second vice-president, Thomas F. Powers, assistant general foreman, boiler department, C. & N. W., Oak Park, Ill.; third vice-president, John F. Raps, general boiler inspector, Illinois Central, Chicago; fourth vice-president, W. J. Murphy, general foreman boiler maker, Pennsylvania Lines West, Allegheny, Pa.; fifth vice-president, L. M. Stewart, general boiler inspector, Atlantic Coast Lines, Waycross, Ga.; secretary, H. D. Vought, 26 Cort-landt street, New York; treasurer, W. H. Laughridge, general foreman boiler maker, Hocking Valley, Columbus, Ohio. Executive board, three years: E. J. Reardon, district inspector locomotive boilers, I. C. C., Chicago; Henry J. Raps, general boiler foreman, I. C.; E. J. Nicholson, foreman boiler maker, C. & N. W., South Kankakee, Wis. Executive board, two years: Jeremiah Hart, foreman boiler maker, C. B. & Q., Hannibal, Mo.; K. E. Fogarty, general boiler inspector, C. B. & Q., Lincoln, Neb.; John Harthill, general foreman boiler maker, New York Central, Cleveland, Ohio. Executive board, one year: Henry J. Wandberg, traveling boiler inspector, C. M. & St. P., Minneapolis, Minn.; George Austin, general boiler inspector, A. T. & S. F., Topeka, Kan.; C. H. Browning, foreman boiler maker, Grand Trunk, Battle Creek, Mich. Chairman of the executive board, E. J. Reardon; secretary, H. J. Raps.

# Officers Elected for the Supply Association

A^T the business meeting held during the convention of the Master Boiler Makers' Association the following officers were elected for the Boiler Makers' Supply Men's Association:

President, Geo. R. Boyce, A. M. Castle & Co., Chicago; vice-president, J. P. Moses, Jos. T. Ryerson & Son, Chicago; secretary, W. H. Dangel, Lovejoy Tool Works, Chicago; treasurer, S. F. Sullivan, Ewald Iron Co., Chicago.

#### EXECUTIVE COMMITTEE

One Year: J. C. Campbell, J. C. Campbell Co., Chicago; H. F. Gilg, Penn Iron & Steel Co., Pittsburgh, Pa.

Two Years: F. J. O'Brien, Globe Steel Tubes Co., Milwaukee, Wis.; J. W. Kelly, National Tube Co., Pittsburgh, Pa.

Three Years: W. M. Wilson, Flannery Bolt Company, Pittsburgh, Pa.; A. W. Clokey, American Arch Company, New York.

At this meeting the Association passed a resolution offered by H. F. Gilg and unanimously carried as follows:

"That the Boiler Makers' Supply Men's Association give their best efforts, collectively and individually, to counteract the vicious legislation of members of the Congress and of the legislatures of the several States against the railroads."

# List of Exhibitors and Supply Men at Master Boiler Makers' Convention

THE following members of the Boiler Makers' Supply Men's 'Association were represented at the Master Boiler Makers' Convention and held exhibits of equipment and supplies which proved of great interest to the members:

Air Reduction Sales Company, New York.-Represented by F. E. Rogers, G. Van Alstyne, W. H. Ludington, B. N. Law, J. N. Harkins, A. Blaser, E. M. Sexton, S. H. Calender, G. M. Calm-back, R. T. Peabody, E. Phelps, G. A. Rogers. The exhibit in-cluded Airco oxygen and acetylene; Airco D-B welding and cutting torches and pressure regulators; Airco D-B portable outfit; welding supplies; locomotive valve gear levers cut with camo-graph for Pilliod Company; demonstrations of radiograph and camograph cutting boiler flanges to height and calking angle, and handholes.

American Arch Company, Inc., New York.-Represented by T. Maher, W. E. Salisbury, J. B. Brandon, A. Sucese, C. Pfeiffer, G. Wagstaff, T. F. Kilcoyne, E. T. Mulcahy, J. T. Anthony, J. P. Neff.

American Flexible Bolt Company, Pittsburgh, Pa.-Represented by L. W. Widmeier, W. F. Heacock, C. A. Seley, J. B. Cannon, T. J. Leahey. The exhibit included general display of flexible

J. Leaney. The exhibit included general display of flexible and rigid reduced body staybolts.
 American Locomotive Company, New York.—Represented by W. E. Corrigan, E. Rogers. The exhibit included Alco flexible staybolts and parts; Alco reduced body rigid staybolts. The Bird-Archer Company, New York.—Represented by J. L. Callahan, L. F. Wilson, C. J. McGurn, C. A. Bird. The exhibit included holer chemicals used in mater treatments.

included boiler chemicals used in water treatment.

THE BOILER MAKER, New York.—Represented by George Slate, Homer Beach, L. S. Blodgett. The exhibit included sample copies

Homer Beach, L. S. Blodgett. The exhibit included sample copies of Simmons-Boardman publications. Brown & Co., Inc., Pittsburgh, Pa.—Represented by J. B. Armstrong, L. E. Hassman, F. M. Sterrett. Brubaker, W. L., & Bros. Company, Millersburg, Pa.—Repre-sented by G. Mark Brubaker, C. E. Davis, W. Searls Rose. Burden Iron Company, Troy, N. Y.—Represented by J. C. Kuhns. The exhibit included samples of solid and drilled stay-bolts: engine bolt iron and Burden iron rivets bolts; engine bolt iron and Burden iron rivets.

J. C. Campbell Company, Chicago, Ill.-Represented by J. C. Campbell.

A. M. Castle & Co., Chicago, Ill.-Represented by G. R. Boyce and L. J. Quetsch. The exhibit included pressed and fabricated steel; boiler and firebox plates; rivets; staybolt and engine bolt iron.

Central Steel Co., Massillon, Ohio.-Represented by Orving

Central Steel Co., Massilion, Olio.—Represented by Original H. Jones. Champion Rivet Company, Cleveland, Ohio.—Represented by G. R. Boyce, L. J. Quetsch, D. Champion, T. J. Lawless. The exhibit included Victor rivets. Chicago Pneumatic Tool Company, Chicago, III.—Represented by J. M. Stayman, E. K. Lynch, H. G. Barbee, D. E. Cooke, J. D. Crowley, N. S. Thulin, J. L. Rowe, T. G. Smallwood. The exhibit included staybolt riveter; superior chipper; close quarter drill; grinders; riveting hammers; electric drills; air hoists; rivet cutters: flue rollers; reaming drills; scaling hammers. cutters; flue rollers; reaming drills; scaling hammers. Cleveland Pneumatic Tool Company, Cleveland, Ohio.-Repre-

sented by C. J. Albert. The Dayton Pneumatic Tool Company, Dayton, Ohio.—Repre-sented by A. B. Clausen, L. B. George. The exhibit included Bull Dog safety nail driver; Champion riveting hammer; new Dayton

Chipping hammer; universal hose couplings. Dearborn Chemical Company, Chicago, Ill.—Represented by J. D. Purcell, Ira L. Beebe, H. B. Ross, L. O. Bowen, Nelson F. Dunn, L. E. W. Bailey.

Dunn, L. E. W. Bailey. Detroit Seamless Steel Tubes Company, Detroit, Mich.—Repre-sented by C. H. Hobbs, H. C. Kensing, C. C. Rosser, E. E. Ertel, L. R. Phillips. This company entertained members of the Master Boiler Makers' Association at its plant. Everlasting Valve Company, Jersey City, N. J.—Represented by R. N. Corning, J. W. Patterson, F. B. Dawson. The exhibit included the Flatplug valve. Ewald Iron Company Louisville Ky.—Represented by S. F.

Ewald Iron Company, Louisville, Ky.-Represented by S. F. Sullivan, R. F. Kilpatrick. The exhibit included staybolt iron;

hollow staybolt iron. The J. Faessler Manufacturing Company, Moberley, Mo.-Rep-resented by G. R. Maupin, J. W. Faessler, F. E. Palmer. The exhibit included flue expanders and cutters.

Flannery Bolt Company, Pittsburgh, Pa.—Represented by J. Rogers Flannery, E. S. Fitzsimmons, M. McAllister, R. W. Benson, W. M. Wilson, M. Costello. The exhibit included F. B. C. and Tate flexible staybolts; a new method of testing flexible staybolts, consisting of a drilled bolt and an electrical contact

Gary Screw and Bolt Company, Chicago, Ill.—Represented by P. Robinson, R. W. Dierker. The exhibit included rivets and bolts.

bolts. Garratt-Callahan Company, Chicago, Ill.—Represented by J. G. Barclay, W. Caspers, A. H. Hawkinson, W. J. Rowe. Huron Manufacturing Company, Detroit, Mich.—Represented by H. N. Reynolds, W. H. Bentley, E. H. Willard, W. C. Jacobs. The exhibit included washout plugs; arch tube plugs. Globe Steel Tubes Company, Milwaukee, Wis.—Represented by F. J. O'Brien, J. W. Floto, T. F. Clifford, A. A. Loeffler, R. R. Lally, J. S. Bradshaw. The exhibit included 30 samples of loco-

motive boiler tubes, arch tubes and superheater tubes; safe ends; stationary boiler tubes; seamless steel bushing stock for motion parts of locomotives.

Independent Pneumatic Tool Company, Chicago, Ill.—Repre-sented by V. W. Robinson, H. G. Keller, W. A. Nugent, I. T. Cruice, C. A. Novinger, Blair J. Leslie. The exhibit included pneumatic tools and electric drills.

Ingersoll-Rand Company, New York.—Represented by J. S. Thompson, W. C. Taylor, G. C. Williams. Wm. H. Keller, Inc., Grand Haven, Mich.—Represented by J. Conway, Mike O'Connor, C. Humphrey. The exhibit included pneumatic tools,

Key Bolt Appliance Company, Orchard Park, N. Y.-Repre-sented by W. K. Miller, R. T. Hanscom. The exhibit included new type fitting up bolts especially adapted for boiler makers and railroad car construction work.

Liberty Manufacturing Company, Pittsburgh, Pa.-Represented by H. A. Pastre, W. R. Danley, W. W. Turner. The exhibit included Liberty type air, water and steam operated tube cleaners;

Lagonda type air, water and steam operated tube cleaners. Locomotive Firebox Company, Chicago, Ill.—Represented by C. M. Rogers, Harry Clewer, Jr.; E. J. Reardon, A. A. Taylor, C. A. Seley, B. E. Larson. The exhibit included Nicholson thermic syphons.

Lovejoy Tool Works, Chicago, Ill.-Represented by W. H. Dangel. The exhibit included frictionless roller expanders; allsteel roller expanders; Dixon multiple roller expanders; sectional tube expanders; flue-hole cutters; clover leaf staybolt sets; railroad flue cutters; "Leolok" lock nuts; beading tool retainers; journal jacks.

Lukens Steel Company, Coatesville, Pa.-Represented by Harry Loeb, L. J. Quetsch, G. R. Boyce. The exhibit included firebox and boiler steel.

McCabe Manufacturing Company, Lawrence, Mass.-Repre-sented by F. H. McCabe. The exhibit included working models

of pneumatic flanging machine, together with flanged flue sheets. National Tube Company, Pittsburgh, Pa.—Represented by G. N. Riley, J. W. Kelly, R. J. McAuliffe, P. J. Conrath. The exhibit included sample pieces showing crushing, flattening, expanding and beading tests; also methods of expanding and beading of large superheater 2-inch and 21/4-inch tubes into back tube sheets.

Otis Steel Company, Cleveland, Ohio .--- Represented by G. E. Sevey.

Oxweld Railroad Service Company, Chicago, Ill.—Represented by W. A. Hogan, W. A. Champieux, H. W. Schultz, A. N. Lucas, J. Keegan, F. C. Hasse, C. S. Wright, H. A. Gigandent, Otto Ladtkow, W. H. Thompson, G. R. Lichty, William Jones. The exhibit included Oxy-acetylene welding and cutting equipment.

Parkesburg Iron Company, Parkesburg, Pa.-Represented by W. H. S. Bateman, U. R. Wetherald, U. F. Wiese. The exhibit included section of charcoal iron boiler tube having been in service 42 years; sections of tubes showing various master mechanics'

tests—crushing, flanging and expanding. Penn Iron & Steel Company, Creighton, Pa.—Represented by Henry F. Gilg. The exhibit included samples of staybolt iron; drilled hollow staybolts up to 24 inches long, bars as tested for U. S. Navy.

The Prime Manufacturing Company, Milwaukee, Wis .- Represented by D. A. Lucas. The exhibit included malleable and brass

washout plugs. Rome Iron Mills, Inc., New York -- Represented by C. C. Osterhout. The exhibit included Superior staybolt iron; perfec-tion engine bolt iron; Rome hollow iron.

Jos. T. Ryerson & Son, Chicago, Ill.—Represented by J. P. Moses, A. W. Willcuts, C. F. Barton, E. W. Kavanagh, L. D. Hiner. The exhibit included Ulster special seamless hollow staybolt iron.

Scully Steel & Iron Company, Chicago, Ill.—Represented by J. W. Patterson, E. N. Corning, L. Verschum. The exhibit in-cluded tube expanders; tube cutters; flaring tools; staybolt taps; staybolts; reamers; welding flanges; flat plug valves for roundhouse installation.

S. Severance Manufacturing Company, Glassport, Pa.-Repre-sented by F. W. Severance, F. G. Pfahl. The exhibit included rivets of several different sizes, shapes and specifications, and a new type combination oil and gas burner, which is just being brought out.

The Superheater Company, New York.—Represented by G. E. Ryder, R. M. Ostermann, K. E. Stilwell and R. J. Van Meter. The Talmage Manufacturing Company, Cleveland, Ohio.— Represented by Frank M. Roby, Herman B. Thurston. The ex-hibit included Cleveland low-water alarm; Talmage blow-off valve,

drifting valve, hand-brake, ash pan. Thomson Electric Welding Company, Lynn, Mass,-Repre-sented by R. M. Taylor, F. H. Leslie, F. E. Taylor. The exhibit included samples of electric welded flues; photographs of the three

types of railroad flue welders; newly issued special railroad flue welder bulletin.

Torchweld Equipment Company, Fulton and Carpenter streets, Chicago, Ill.—Represented by W. A. Slack, A. W. Fry. The exhibit included oxy-acetylene cutting and welding equipment; machine and hand cutting torches; machine and hand welding

torches; regulators, accessories and supplies. U. S. Light and Heat Corporation, Niagara Falls, N. Y.-Represented by H. A. Morrison, Ernest Bauer. The exhibit in-cluded electric arc welding machines; samples of various types

of electric welds. The Weldless Tube Company, Cleveland, Ohio.—Represented by C. A. Dunn, O. H. Larwill. The exhibit included seamless steel tubing.

# The Boiler Maker

Published Monthly by ALDRICH PUBLISHING COMPANY in conjunction with

SIMMONS-BOARDMAN PUBLISHING COMPANY

EDWARD A. SIMMONS, President HENRY LEE, Vice-President and Treasurer GEORGE SLATE, Business Manager 30 Church Street, New York, N. Y.

Chicago: 608 South Dearborn Street Washington: 425 G Street, N. W. Boston: 294 Washington Street London: 34 Victoria Street, Westminster, S. W. 1, Cable Address: Urasigmec, London

H. H. BROWN, Editor L. S. BLODGETT, Associate Editor

Entered at the Post Office at New York, N. Y., as mail matter of the second class. The BOILER MAKER is registered in the United States Patent Office.

Subscription price, United States, Mexico and Canada, \$2.00; foreign \$3.00; single copy, 35 cents.

We GUARANTEE that of this issue 4,650 copies were printed, that of these 4,650 copies, 4,112 were mailed to regular paid subscribers; 20 were provided for counter and news company sales; 76 were mailed to advertisers; 63 were mailed to employees and correspondents, and 379 were provided for new subscriptions, samples, copies lost in the mail and office use, that the total copies printed this year to date were 28,950, an average of 4,825 copies a month.

THE BOILER MAKER is a member of the Associated Business Papers (A. B. P.) and the Audit Bureau of Circulations (A. B. C.).

Request for change of address should reach us two weeks before the day of the issue with which it is to go into effect. It is difficult and often impossible to supply back numbers to replace those undelivered through railure to send advance notice. In sending us change of address please be sure to send us your old address as well as the new one.

Boiler manufacturers report that in the last six or eight months they have been obliged to reject an unusual number of laminated boiler plates. These defects, in many cases, do not show up until the plate has been nearly fabricated in the boiler shop and the only recourse is to send to the mill for another plate and repeat the shop operations, which means a loss of time and money for the manufacturers not to mention the possibility of undetected hidden defects in plates that pass inspection and go into the finished boilers. Such defects are very serious and it is up to the steel makers to remedy the situation. Laminations may be due to poor workmanship or to imperfect methods of manufacture in the steel mills. Whatever the cause, they should not be tolerated in materials for pressure work. Experience has shown that American steel makers are capable of turning out the finest grade of boiler plates and in boiler work nothing else is acceptable.

One line of business which boiler manufacturers apparently have neglected to follow up is the supplying of repair parts for equipment which they have sold. If the user of the boiler is left to his own resources, the chances are that in nine cases out of ten, when some repair part is needed, he will go to the nearest local foundry or boiler shop and get something as quickly as possible to replace the broken part regardless of whether it will serve his purpose as efficiently as a replacement part from the original manufacturer. In such instances it is obvious that the manufacturer should not be blamed for any falling off in the efficiency of the boilers as the repair parts supplied by another firm may not work efficiently with the original installation, whereas if the repair part were supplied by the manufacturer himself the efficiency of the plant would not be reduced. Furthermore, the manufacturer might find the sale of repair parts a profitable line of business, well worth the effort required to secure it.

If all indications are correct, this year's convention of the Master Boiler Makers' Association at Detroit will open a new era of progress and prosperity to the association. In point of numbers, the attendance was slightly below that of last year but the spirit of earnestness with which the business of the convention was transacted made the meetings as successful as any ever held by the association. Almost without exception, every member was in his seat when the president opened the sessions of the convention and remained until the work of the meetings was completed.

About two hundred and fifty members of the association were not at the convention for one reason or another. In some cases distance, press of work, or personal affairs made it impossible for them to attend, but this probably applies to very few. Fortunately, with few exceptions, the association has the endorsement and direct support of the heads of the mechanical departments of the railroads of the United States and Canada and their complete cooperation in this matter can be counted upon, so that by another year those who were not in attendance will no doubt be required to come by their superiors.

Probably the most far reaching decision made by the association was that increasing the annual dues to five dollars. The expense of conducting the affairs of the association has been increasing much faster than the income, due to higher printing costs, the expense of the conventions, and the like, and some action to provide additional funds at this time was necessary. From now on the financial condition of the association will be on a firmer basis which will make possible the broadening of scope of its activities with a corresponding increase in its value to members.

# Engineering Specialties for Boiler Making

New Tools, Machinery, Appliances and Supplies for the Boiler Shop and Improved Fittings for Boilers

# **Portable Electric Rivet Heaters**

THE latest types of electric rivet heaters, manufactured by the Humil Corporation, New York, have a number of distinctive features, the most important of these being flexibility in operation, permitting the efficient heating of a wide range of sizes without the usual burning of the smaller rivets on machines of the higher ratings, and at the same time permitting the heating for non-continuous service of the largest rivets on the smallest machines.

Low power consumption, or high efficiency, has been secured by generous proportioning of copper and iron in the special type transformer, also by heavy cross sections in the long flexible leads that are autogenously welded into the pure copper electrodes or heads.

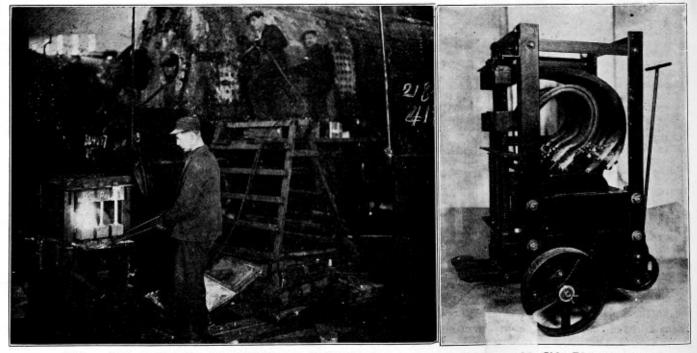

Regulation against heavy power surges on starting the heating action, and the maintenance of high power factors (79 to 94), are obtained by means of air gaps in the transformer magnetic circuit. The high efficiency and power factor is also maintained through placing the transformer low in the machine and remote from the radiated and conducted heat from the rivets. Air spaces, provided between the coils, permit a constant stream of cold air to pass up through the transformer, cooling it constantly and enabling it to maintain high efficiency all the time that it is under continuous full load.

All of the coils are positioned around a separate center core, the secondary coils of heavy cast copper completely enclosing the core, except for a small gap at the top to provide the open circuit necessary. This design provides for the complete cutting of all magnetic lines by both primary and secondary coils. The primary coils are wound with bare strip copper, insulated with asbestos and mica tape. This provides for rapid dissipation of the heat to the vertical air spaces and at the same time eliminates high voltage between layers of windings.

Stability and portability are secured in the Calorac heaters by keeping the center of gravity low in the frame and mounting the machine on large traction wheels. Provision has also been made for lifting by crane.

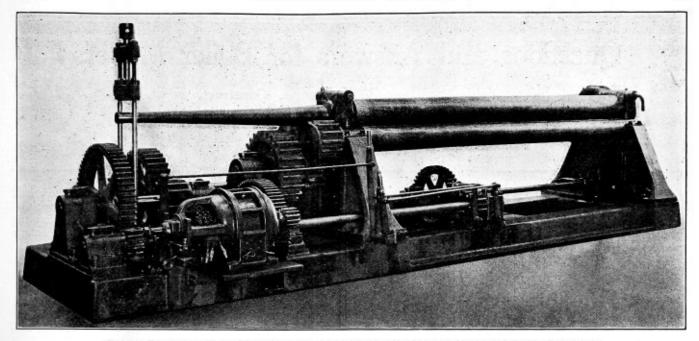

Close regulation of the power applied to the rivets is obtained by a five-speed controller, so mounted as to be readily accessible to the operator, thus permitting him to govern his production rate accurately. On the smallest two-contact Type A-2-H machine, rivets 1/4 inch by 1 inch can be heated at the rate of 720 per hour, while in the same machine rivets 5/8 inch by 21/4 inches are said to have been heated at the rate of 150 per hour. This same machine is also capable of heating much larger rivets. The large Type C heaters, when equipped with three or five sets of heating contacts, are capable of reaching a high production of hot rivets of the largest sizes. These machines are well adapted to heating the large mudring rivets used in locomotive boilers and other special sizes.

Safety of the operator is secured by the shielding of all live primary parts, while the electromotive force at the heads is so low that it cannot be felt by bare hands, this voltage never exceeding 3 volts. The machine is designed to be fool-proof and fire-proof. The comfort of the operator as well as that of other men in the shop is assured by the absence of smoke and fumes, with a resultant favorable effect on output.

Calorac 3-Head Portable Rivet Heater on Boiler Work

Riveter with Side Plates Removed

Power Bending Rolls Recently Made by the Cleveland Punch & Shear Works Company

# Direct-Connected Motor-Driven Bending Rolls

THE illustration shows a No. 2 Cleveland pyramid type bending roll, spaced to 10 feet 2 inches between housings, recently designed and built by the Cleveland Punch & Shear Works Company, Cleveland, Ohio.

This machine is direct connected, motor driven, entirely self-contained and is arranged for power raising and lowering of the top roll. One of the lower rolls (8 inches in diameter) has three splines; the other lower roll has two splines and a flanging groove. The upper roll is 11 inches in diameter. It will be noticed that none of the gears protrude into the foundation, hence no expensive pit is required. Two clutches are provided so that either end of the top roll may be raised and lowered. An additional single clutch is used for starting the rolls.

This bending roll, as shown in the illustration, is featured by rigid construction and parts so proportioned as to stand the stresses imposed on them with an ample factor of safety. The roll boxes, yoke and elevating screws are all scientifically designed and made with a view to strength and durability.

When it is desired to drop the hinge at the right end, the cover plate can readily be lifted from the shoulder belts and the yoke dropped by one man.

# Variable-Speed Drive for 150-Ton Press

THE advantages claimed for hydraulic variable-speed drive in perfect control of speed, absence of coasting, elimination of peak loads and low maintenance have been demonstrated in the 150-ton press installation illustrated. This press has been equipped recently with hydraulic variable-speed drive by the Oilgear Company, Milwaukee, Wisconsin. The type W Oilgear variable delivery pump which operates

The type W Oilgear variable delivery pump which operates this press (shown in the right foreground of the illustration) is well adapted to these conditions. The control handle at the corner of the press is so connected to the pump that the pump stroke can be varied from zero to a maximum in any direction. Changing the length of the pump stroke regulates the amount of oil that is pumped into the press cylinder and thus controls the movement of the ram with great accuracy.

This pump is featured by light weight and takes up considerably less room than a water pump. It is driven by

Type W Oilgear Variable-Delivery Pump Driving 500-Ton Press

a constant speed electric motor. The diameter of the press cylinder in this case is 19 inches the ram diameter being 10 inches.

### Locomotive Conditions in April Best Since July, 1922

Interstate Commerce Commission's monthly report to the President is the best since July, 1922. In April 5,266 locomotives were inspected by the Bureau of Locomotive Inspection, of which 3,049, or 58 per cent, were found defective and 511 were ordered out of service. The percentage of those inspected found defective is the lowest that has been reported for any month since the shopmen's strike began last July.

# Questions and Answers for Boiler Makers

Information for Those Who Design, Construct, Erect, Inspect and Repair Boilers—Practical Boiler Shop Problems

Conducted by C. B. Lindstrom

This department is open to subscribers of THE BOILER MAKER for the purpose of helping those who desire assistance on practical boiler shop problems. All questions should be definitely stated and clearly written in ink, or typewritten, on one side of the paper, and sketches furnished if necessary. Inquiries should bear the name and address of the writer. Anonymous communications will not be considered. The identity of the writer, however, will not be disclosed unless the editor is given permission to do so.

# Introducing Tanks into Buildings Having Small Openings

Q.—What is the best method of introducing a tank into an old building through an opening smaller than the diameter of the tank? We have this problem arise quite frequently where it is necessary to get a tank into an old building without cutting new openings in the building walls. One specific problem which we are handling at the present time is to introduce fourteen 42-inch by 12-foot tanks into as many existing buildings through 36-inch by 36-inch openings which cannot be cut. The best solution which we have found is to roll the sheets up in one piece to a diameter of 39 inches and then squeeze the shell to a diameter of 35 inches and hold it in this condition with wire bands. The tanks are then introduced into the buildings, where the shells are opened up, the heads introduced and the joints welded. The heads are bumped and flanged so as to set into the shell and the longitudinal joint of the shell is lapped 2 inches. These joints are then all bolted with erection holts on about 2-foot centers to hold the assembled tank in place, while the head and shell joints are welded inside and outside. We find that riveting tanks on the job which have been brought into the building knocked down is generally prohibitive on account of the noise. We should like to know what experience your experts have had with this problem and be advised of any improvement which you might have to suggest over the scheme which we are using.—P. W.

A.—Your method of preparing the sheets and introducing them into the building, seems to us the only solution in view of the circumstances mentioned.

We would, however, be pleased to hear from our readers on this problem.

# Effect of Temperature Changes in Water

Q.-Would you please answer this question. The maximum density of water is said to be at 39.2 degrees F. Why does it expand just at that point, i. e. above that point and contract below that point? What are the fundamental principles of the chemical change? I have read a lot on steam, but have never seen any book that explained why water changes its density at that point.-W. R.

A .--- Water expands and contracts with the changes in temperature. The temperature at which water freezes is 32 degrees F. If the water is cooled below that point it expands and its density decreases or if the water is heated from 32 degrees to 39.2 degrees F. it contracts instead of expanding and its density increases until it reaches the maximum density at 39.2 degrees F. This action which is unexplainable is an advantage in nature, for otherwise deep rivers and lakes would freeze to the bottom and thaw only on the surface during the warmer seasons. As the colder weather takes place the water gives up some of its latent heat by radiation and its temperature falls, as a result the cooler water circulates or settles to the bottom. This condition continues until the entire body of water has reached a temperature of 39.2 degrees F. Further cooling of the water arises on the surface which expands and its density becomes less. After the surface water has reached 32 degrees F., 142.6 units of heat must be radiated by each pound of water before reaching the freezing point.

Water being a poor conductor of heat, it would take a long time for the water at the bottom to give up its heat, for that reason in temperate zones under severe winters, ice does not form to the bottom of the lakes and rivers and at the bottom the water is never colder than 39.2 degrees F.

## **Gusset Sheet Layout**

Q.—I have tried time and time again to develop the gusset plate as shown on page 71 of the third edition of "Laying Out for Boiler Makers" and have had no success. I do not understand how the points 12, 22, etc., and 1°, 2°, etc., are established above the line  $E \cdot E$ . Also Fig. 16 puzzles me, for I do not see where the lines and distances *a.b.c.*, etc., and 1-2-3 are found or established. Please send me the solution as soon as possible, for I want to use it; also if there are other ways of working this gusset plate out please give me the same. Please send me the most accurate method of laying out a cone-shaped barrel sheet.—C. W. C., Jr.

A.—Fig. 1 will illustrate the development of a gusset sheet as made in the form of a scalene cone. The solution is the same as described on page 71 "Laying Out for Boiler Makers." The outline of the gusset sheet is indicated be-

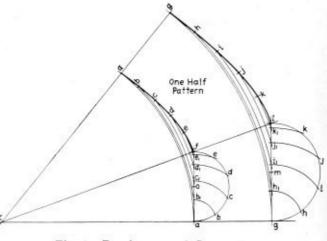

Fig. 1.-Development of Gusset Sheet

tween the reference letters a, f, l, g. The side a-g is extended and the side *l-f*, drawn to meet it in the point x. Locate the center of the sides a-f at o and g-l at m. With o and m as centers describe the semi-circle as shown for the large and small bases or ends. Divide them into any desired number of parts as indicated at a, b, c, etc., for the smaller semicircle, and g, h, i, etc., for the larger. With a as a center draw arcs from b, c, d and e to intersect the base line a-f, thus locating points  $b_1$ ,  $c_1$ ,  $d_1$  and  $e_1$ . With g as a center and from points h, i, j and k draw the arcs as indicated. Determine the arc lengths between the points on each semicircle by drawing a straight line equal to the length of each semi-circle. Divide each line into the same number of parts as contained in the semi-circle, in this case 5. The respective length between any two points on each line is used for developing the pattern.

One-half of the pattern is also shown in Fig. 1. From point l and with the dividers set to the arc length for the spaces at

the large end draw an arc. With x as a center, and the trammels set to  $x - k_1$  draw an arc to intersect the one drawn from point l. With k as a center and with dividers set to k - l draw an arc. With x as a center and the trammels set to x - l draw an arc to intersect the arc previously drawn, thus locating point j. Continue in this manner until the pattern is complete.

# Efficiency of Boiler Seams

Q.-I am about to make reports on several miniature boilers and am at a loss to know of a formula to figure on the efficiency of same where the boiler sheet is a piece of commercial pipe obviating the necessity of a longitudinal rivet joint such as are in the construction of the Hoffman, the Prosperity, the Oldfeldt and the Eclipse Fuel Engineering Company.-R. B.

A.—The following formula is given by the A. S. M. E. Code in their latest revision which is applicable in determining the allowable pressure on pipe.

Thickness of Steam Pipe.—In determining the thickness to be used for pipes at different pressures and for temperatures not exceeding 700 degrees F. the following formula is to be used:

$$=\frac{25(t-1/16)}{D}$$
 (1)

in which

- P = working pressure in pounds per square inch.
- t = thickness of pipe wall, inches.

P

- D = inside diameter of pipe in inches.
- S = 3,500 pounds per square inch for seamless steel pipe. 3,200 pounds per square inch for lap-welded steel
  - 2,500 pounds per square inch for butt-welded steel pipe.
  - 2,500 pounds per square inch for lap-welded iron pipe.
  - 2,000 pounds per square inch for butt-welded iron pipe.
  - 2,000 pounds per square inch for brass pipe.
  - 2,000 pounds per square inch for copper pipe.

By transposing the factors in the preceding formula to find the required thickness of the wall of the pipe, the following formula for

$$t = \frac{DP}{2S} + \frac{1}{16}.$$
 (2)

To determine the allowable working pressure for an 18inch seamless steel pipe ¹/₄-inch in thickness, substitute the values in formula (1) Then:

$$P = \frac{2 \times 3,500 \ (\frac{1}{4} - \frac{1}{16})}{18} = 72.9 \text{ pounds per sq. in.}$$

As the required working pressure equals 100 pounds per square inch, the thickness of the pipe wall must be increased. Use the formula (2) and substitute the given values.

Thus:

$$t = \frac{18 \times 100}{2 \times 3,500} + \frac{1}{16} = 0.32$$
 inch.

### Boiler Repair Methods at Columbus

### (Continued from page 154)

of such sizes and thickness as are required on most of the locomotives.

The welding and cutting department which works in close cooperation with the boiler shop is under the control of one of the ablest welding foremen in the country and the results, both in speed and quality of work, on firebox repairs, flue installation and the like are largely due to his efforts.

Further details of repair methods and special jobs carried out at Columbus will appear in an article to be published in the July issue of THE BOILER MAKER.

# OBITUARY

CLYDE MITCHELL CARR, until recently president of the iron, steel and machinery firm of Joseph T. Ryerson & Son, Inc., died on June 5 at his residence 1130 Lake Shore

Drive, Chicago. Mr. Carr was born in Will County, Illinois, July 7, 1869. For twelve years Mr. Carr was president of Joseph T. Rverson & Son, Inc. On account of poor health he had been unable to take an active part in the management of the firm for the past four years and last January resigned president, although as continuing until the time of his death as a member of the board of directors. Mr. Joseph T. Ryerson succeeded Mr. Carr to the presidency. Mr. Carr became associated with the

Clyde M. Carr

Ryerson organization in 1890. From 1904 he took an active part in the management of the firm's affairs and in 1911 was elected president. Mr. Carr was always an active leader in civic and industrial circles and his far reaching influence accomplished much wherever he was interested.

## BUSINESS NOTES

Joseph W. Hays is just completing the organization of a corps of consulting combustion engineers to be known as Jos. W. Hays and Associates. The headquarters of the organization will be Michigan City, Indiana.

The Detroit Steel Products Company, Detroit, Mich., will establish a branch factory at Emeryville, Cal., which will have 83,000 square feet of space. A. Lum has been appointed manager of the plant and will have charge of sales on the Pacific Coast.

Paul H. Brangs, for many years in charge of the New York office, Heine Boiler Co., St. Louis, has retired, and George F. Murphy, formerly Pittsburgh manager, will have charge of the New York territory, assisted by J. L. Daly and G. A. Knowles. Headquarters will be at 11 Broadway.

O. C. White, manager for the past two years at Fort Worth for the Youngstown Boiler & Tank Co., has been appointed general sales manager for the company, with headquarters at the home office in Youngstown. A. L. Scudder, formerly district sales manager for the Graver Corporation at Fort Worth, Tex., has resigned and accepted the position made vacant by Mr. White's promotion.

The Surplus Steel Exchange, Inc., has been formed for the purpose of presenting an outlet for surplus stock material of steel products. A commission will be charged only on sales actually made, as the exchange will not buy material but act solely in the capacity of agent. The officers of the new company are: Robert D. McCarter, president; George E. Dix, vice-president; William L. Cooper, treasurer, and Edward Michaud, secretary and general manager. The offices are at 7 Dey street, New York City.

# Letters from Practical Boiler Makers

This Department Is Open to All Readers of the Magazine —All Letters Published Are Paid for at Regular Rates

Evansville, Ind.

# Oil Storage Tank Failure

O^N Monday morning, April 10, about 8,000 gallons of kerosene spilled as the result of the bottom of a tank opening all the way around. This tank was welded throughout with a shell ¹/₄ inch thick and bottom ³/₈ inch thick reinforced with three 6-inch channels tacked with a torch. The top was apparently of 3/16-inch material and the welds were evidently very poor, only about 2 percent being good, as the plate broke at these points and showed very brittle; also the welds showed brittle and poor fusing all the way around.

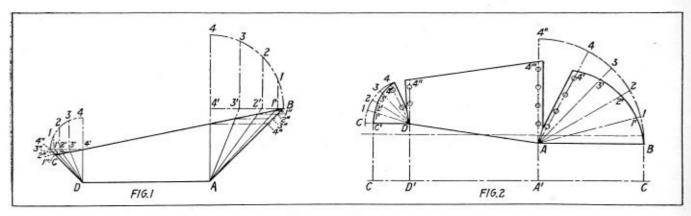

The tank was being filled at the time with a pump; evidently there was no vent and naturally there was a pressure man, Robert Minnette, truck driver, was near, getting ready to fill his tank when the accident occurred, and he was thrown down and nearly drowned and was taken to the hospital with a wrenched back.

E. Wotring,

Insurance Department, Mercantile Commercial Bank

# Layout of Wheelbarrow Body

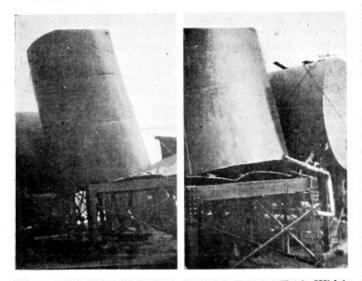

In developing the wheelbarrow body shown in the accompanying sketches first draw an elevation of the body as at A, B, C, D, Fig. 1. From A draw A-4 at right angle to A-D, from B draw B-4', at right angles to A-4; from point

Details of Special Sheet Metal Wheelbarrow Body

of sufficient force to cause the welds to open as shown in the accompanying illustrations.

The tank was moved to one side about 18 inches. One

Views of Opening in Bottom Seam of Storage Tank Which Failed

4', as a center and 4'-B as a radius draw the quadrant B-4. Divide this quadrant into any number of equal spaces as 1, 2, 3, 4. From 1, 2, 3, 4 draw lines parallel to A-4 to line B-4' locating the points 1', 2', 3'. Draw lines A-1', A-2', A-3'. Where these lines cross the line B-C draw lines parallel to B-4' out to the line B-A, locating the points 1", 2", 3", 4". These are the true lengths of the construction lines A-1', etc., and can be used as such in the actual layout.

### PATTERN DEVELOPMENT

To lay out the pattern draw the center line C-C, Fig. 2. On the line C-C lay out one-half the plan of the bottom of the body as shown at A-D-D'-A'. Draw A-B parallel to A'-C. With A as center and A-B, Fig. 1, as radius, draw the quarter circle B-4''. With the dividers set equal to one of the spaces B-4, Fig. 1, from B step of the four spaces 1, 2, 3, 4. Draw the lines A-1, A-2, A-3, A-4, make A-1', A-2', A-3', A-4'', A-4''' equal to A-1'', A-2'', A-3'', A-4'', Fig. 1. A line drawn from B through the points 1', 2, 3', 4' will give the circumference of the quarter circle at the top corner of the body. Locate the rivet holes on the lines A-4', and A-4'''. Make the necessary allowance for lap. The small end and the other half of large end are laid out in exactly the same manner.

Amarillo, Texas.

# SELECTED BOILER PATENTS

Compiled by

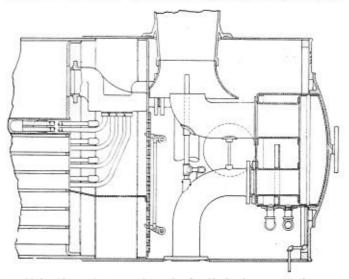

GEORGE A. HUTCHINSON, Patent Attorney, Washington Loan and Trust Building

Washington, D. C.

Readers wishing copies of patent papers, or any further information regarding any patent described, should correspond with Mr. Hutchinson.

1.454.161. LOCOMOTIVE. MARTIN J. FURLONG, OF HOUSTON, TEXAS.

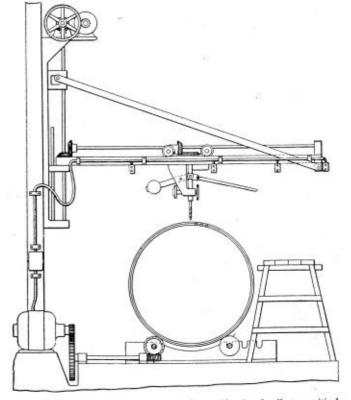

Claim 1.-In a locomotive, a superheater chamber, a front end chamber, a partition plate arranged in front of said chamber and provided with draft outlets, a movable damper plate arranged adjacent the partition plate and

provided with openings, opposite each of said chambers, means for automatically actuating the damper plate, and means for manually limiting the range of movement of the damper plate. 4 Claims.

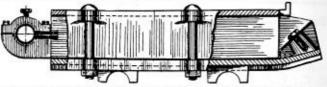

1,453,705. BOILER-TURNING CRADLE. JAMES CROMBIE, OF ST. LOUIS, MISSOURI.

Claim 1.-In combination, a boiler-turning cradle for a drill press comprising a set of supporting rolls two of which are connected to rotate as a

pair, a reversible electric motor connected to said pair of rolls to positively rotate the same in either direction, and controls for said motor located on the drill press convenient to the drill controlling mechanism. 2 Claims. 1,455,429. FURNACE OF STEAM BOILERS. THOMAS COLLIER, OF COLNE, ENGLAND.

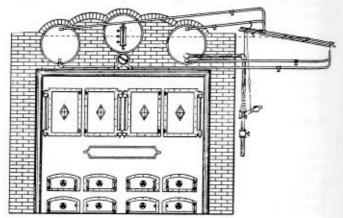

Claim 1.-A Bunsen blower, adapted to be secured under the dead plate of a furnace, comprising a fan-shaped body open at each end and divided by partitions into a series of compartments which are wider at their outlets

than at their inlets, the bottom of the outlet end portion of the body being inclined upwardly beyond the rear ends of the compartments, a deflecting plate secured over the inclined end portion and arranged at a steeper angle than it, and a steam pipe arranged crosswise of the open indet of the hody and having a series of nozzles which project into the air inlet openings of the compartments. 2 Claims.

1,454,146. BOILER FEEDWATER REGULATOR. ROGER W. ANDREWS, OF PITTSBURGH, PENNSLYVANIA, ASSIGNOR TO NORTHERN EQUIPMENT COMPANY, OF ERIE, PENNSYLVANIA, A CORPORATION OF PENNSYLVANIA.

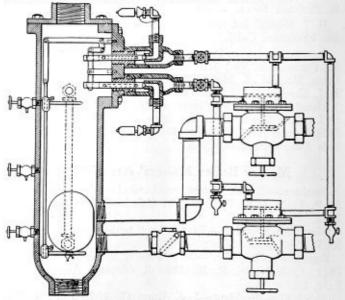

Claim 1.—The combination of a boiler, two feedwater regulators and a feedwater valve, said valve comprising a plunger and a seat therefor, said plunger and seat being relatively movable rotationally and longitudinally, the first of said feedwater regulators being operatively connected with said boiler and with said valve and arranged to move said plunger and seat

relatively longitudinally, and the second of said feedwater regulators being operatively connected with said boiler at a portion of said boiler remote from the point of connection of said first regulator, said second regulator being also operatively connected with said valve and adapted to move said plunger and seat relatively rotationally, said plunger and seat when in one relative position forming an opening through said valve, and said opening being varied as said plunger and seat are moved relatively either rotationally or longitudinally. 3 Claims.

1,455,211. BOILER WATER LEVEL CONTROLLER. JOHN F. KELLY, OF CHICAGO, ILLINOIS, ASSIGNOR, BY MESNE ASSIGN-MENTS, TO KELLY VALVE COMPANY, OF MUSKEGON, MICHI-GAN, A CORPORATION OF MICHIGAN.

Claim 1.--In a boiler water level controller, the combination of a casing, a float therein, a water supply pipe, a water delivery pipe, valves in said pipes, steam actuated means for operating said valves, manually operable

means for actuating said valves independently of said steam actuated means, valves for controlling the supply of steam to said steam actuated means, and an operative connection between said float and each of said last mentioned valves. 10 Claims.

# **Boiler Repair Practice in M.C. Shops at Jackson**

WHE average boiler maker is seldom given an opportunity to visit the shops of railroads other than his own, yet there is no better education available for a good boiler maker than a chance to study the methods used by others of his trade. Practically the only way then for the work of shops in general to be brought before the men in the shops is through the medium of the trade journal. With this thought in mind, THE BOILER MAKER is trying to supply information on some of the work of the more important repair shops in the country. The following article, for example, outlines some of the methods employed in the boiler shop at Jackson, Mich., including a record of oxy-acetylene cutting work which compares favorably with that of any shop in the country.

'N the Jackson shops the greater part of the locomotive repair and maintenance of the Michigan Central Railroad is carried out, which means that the boiler shop is generally working at capacity. This capacity seems to be an adjustable factor for when boilers are needed they always go through in whatever quantity is required by the schedule system which operates at this plant. This system acts as pacemaker for the entire works and, to a certain extent, its functioning depends on the boiler shop.

### How the Schedule Works

In order to understand how the work of the shop is carried out it is first necessary to become familiar in a general way with the schedule system. In the course of the routine business of the mechanical department, a meeting is held by the shop superintendent, master mechanic and other mechanical officials to determine what locomotives are due for shopping for classified repairs during a given month. Running reports, inspection reports and general service records are used as the basis for these determinations. The classification used is according to the 5-class standard adopted by the United States Railroad Administration which is in vogue on most railroad systems. From the findings of the mechanical department an outline of light, medium and general repairs with details of what the repairs shall consist is prepared and sent to the production department.

The foreman of this department lays out on a master schedule board the dates for every operation that will be required on the engines coming into the shop the following month, insofar as they apply to departments other than the boiler shop. Then about the twenty-third of the month a joint meeting of the shop foreman and the schedule or production department foreman and his assistants is held. The sketch of the schedule board shown below will indicate the scope of the repair work covered in detail at this meeting.

An explanation should be made at this point of the omis-

### Fig. 2.-Master Schedule Board-The General Dates

sion of practically all boiler work from the schedule. Since the assembly of the reconditioned locomotive depends on whether the boiler is ready or not, it may be said that the work of every department is gaged on the output of the boiler shop. Here at Jackson over a long period of time it has been found that boiler shop production not only goes through on time, but is ahead of practically every other department. As an example, monthly boiler shop production based on 100 percent efficiency for the month of March was 99.5 percent and for the month of April 106.9 percent. The schedule for the entire plant for March was 96.3 percent and for April 100.1 percent.

As mentioned, at the monthly meeting, department heads take down on individual department forms the dates for all work coming under their jurisdiction. From the general schedule the foreman of the boiler shop knows exactly what the requirements for his department will be for that month.

The foremen later reproduce their individual schedules on department boards in the shop and these boards, job orders and other follow-up and check work are supervised by the production foreman and his assistants. It is not necessary to go into general details of this work for it has little relation to the work of the boiler shop. However, the department is an efficient one and work is kept moving through the shop under constant check at all times.

Meetings with the production department are held every Monday, Wednesday and Friday at which time any difficulties which have arisen causing delay of work in any department are cleaned up and the system kept functioning smoothly. At this time, too, any minor repairs in the roundhouse that require immediate attention are introduced into the schedule so that there will be a minimum of interference with regular work. A great deal of the outside roundhouse work is taken care of by the boiler shop force, as maintenance work of this kind is general tightening of flues, staybolt replacement or other jobs coming under the head of boiler work.

At a meeting held about the eighth of each month the schedule is revised to take care of any work that has been carried from the previous month. Sometimes when routine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Side Rods Machined                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Ash Pan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | AirPump                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |    

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                  | -
